TEUCER, the name of two kings in ancient legend. The first, living in the Troad, whose people were called after him, Teucri, was the son, according to the mythologists, of the river-god Scamander and Ideæ. He married his daughter Batea to Dardanus of Samothrace, who was his successor, and the founder of Dardania. The second Teucer was the son of Telamon, king of Salamis, and Hesione, daughter of Laomedon. He came with the Greeks to the Trojan war, on his return from which his father would not allow him to land at Salamis because he had not avenged the death of his brother Ajax. Teucer sailed for Cyprus, where he founded another Salamis.

TEUFFEL, WILHELM, philosopher, was born at Ludwigsburg, Sept. 27, 1820; studied from 1838-42 in the theological seminary at Tübingen, where he became privat-docent in 1844; professor extraordinarius in 1849, and full professor of classical philology in 1857. His great work is his history of Roman literature (*Geschichte der römischen Litteratur*) first published in 1870 and twice re-edited by Schwabe, in 1881, and again in 1890. English translations by Wagner (1878), and by Warr (1891), have appeared. Teuffel also published *Studien und Charakteristiken zur griechischen und römischen sowie zur deutschen Litteraturgeschichte* (1871, 3d ed., 1889), and *Lateinische Stilübungen*, besides editions of the *Persæ* of Æschylus and the *Clouds* of Aristophanes. D. 1878.

TEUTOBURGER WALD (Lat. *Teutobergensis Saltus*). See HERMANN.

TEUTONIC, a term applied to a group of nations as well as of languages, forming an important division or stem of the Aryan (q. v.) family. The Teutonic languages will be found enumerated and classified in the table at the end of the article PHILLOGY. The Teutonic stock of nations, as they exist at the present day, is divided into two principal branches: (1) The Scandinavian, embracing Danes, Swedes, Norwegians, Icelanders; and (2) the Germanic, which includes, besides the German-speaking inhabitants of Germany proper (see GERMANY) and Switzerland (q. v.), also the population of the Netherlands (the Dutch), the Flemings of Belgium, and the descendants of the Anglo-Saxons in Great Britain, together with their offspring in North America, Australia, and other British colonies. It is necessary in this case, as in all similar cases, to guard against making language the sole test of race. In many parts of Germany where German now prevails, Slavic dialects were spoken down to recent times, and in some places are not yet quite extinct. And in Great Britain it is unreasonable to suppose that the Anglo-Saxon invaders exterminated the native Celtic population, or even drove more than a tithe of them into the Highlands. The mass undoubtedly remained as subject serfs, learned the language and customs of their masters, and gradually amalgamated with them.

Of the various tribes and nations spoken of as inhabiting northern Europe in ancient times, it is often difficult to determine which were really of Germanic race, and which Celtic or Slavic; the classic writers, having no skill in detecting the affinities of language, had only confused notions of ethnology. Of undoubted German nations who took part in the destruction of the Roman empire, the most prominent were the Goths (q. v.), Lombards (q. v.), Vandals (q. v.), and Franks (q. v.). The term Teutonic is derived from *Teutones*, the name of a nation or tribe first mentioned by Pytheas, who wrote about 320 B. C., as then inhabiting a part of the Cimbric Chersonesus, or Jutland. For the next 200 years there is no further mention of the Teutones, that is, not until 113 B. C., when they appear

in history as ravaging Gaul, and in conjunction with the Cimbri and Ambrones, threatening the very existence of the Roman republic. The Cimbri having gone into Spain, the Teutones and Ambrones were at length defeated by C. Marius in a great battle at Aquæ Sextiæ, or Aix, in Gaul, 102 B.C., in which from 100,000 to 200,000 of the invading army were slain, and many thousands made prisoners. A similar victory was gained by Marius in the following year over the Cimbri in the plains of Lombardy. It is disputed among ethnologists and historians whether the Cimbri so defeated were of the Celtic or of the Germanic race, and doubts have even been thrown on the claim of the Teutones to be considered Germans, although the best German scholars hold the claim to be established. Be that as it may, Roman writers, after the time of Cæsar and Tacitus, began to use the adjective *Teutonicus* as equivalent to *Germanicus*; and this practice was adopted in the middle ages by Germans writing in Latin. The native term was *theodisk*, from Goth., *thiud*, people; and it is from this word, and not from *Teutonic*, that the modern *Deutsch* is derived. See GERMANY.

TEUTONIC KNIGHTS, one of the more celebrated of the military and religious orders to which the crusades gave birth. The sufferings of the Christian soldiers at the siege of Acre excited the sympathy of certain merchants of Bremen and Lübeck, who rendered such important services by the erection of hospitals and otherwise, that duke Frederick of Swabia, with the sanction of pope Clement III. and the emperor Henry VI., enrolled them in an order of knighthood, as the Teutonic knights of St. Mary of Jerusalem. Only Germans of noble birth were made admissible to the order, the original founders having probably been ennobled before being enrolled. The members were at first all laymen, but priests were soon admitted as chaplains; and there was also added about 1221 a class of half-brothers similar to the serving-brothers of the Templars and Hospitalers. The habit of the order was a white mantle with a black cross; and the knights took vows of poverty and chastity, which in later times were not very strictly interpreted. Their first seat was Acre. On the overthrow of the kingdom of Jerusalem, the grand master removed to Venice, and from thence in 1309 to Marienburg, on the banks of the Vistula. In 1237, this order became united with the Brethren of the Sword in Livonia. In the course of the 13th c., the Teutonic knights were, with the sanction of the pope, engaged in a bloody war to enforce Christianity on the heathen nations inhabiting the southern shores of the Baltic, which resulted in the acquisition by the order of Prussia, Livonia, Courland, and other adjoining territories. Warriors from all parts of Europe in that and the following century joined their standard, including Henry IV. of England, accompanied by 300 attendant knights and men-at-arms. The conquests of the order raised it to the rank of a sovereign power, with a territory extending from the Oder to the Baltic, and embracing a population of between two and three millions, the grand master having his seat at Marienburg in Prussia. The decline of the order began in the 15th c., and its fall was brought about partly by internal dissensions, and partly by the attacks of neighboring states. Sigismund of Poland wrested w. Prussia from the knights; and Albert of Brandenburg, who was chosen grand master in hopes of his aiding the order against Poland, ended an unsuccessful war with Sigismund by an arrangement, according to which the territories of the order in e. Prussia were formed into a duchy, to be held by Albert and his successors. Mergentheim in Swabia then became the seat of the grand master, who was recognized as a spiritual prince of the empire. At the peace of Presburg in 1805, the emperor of Austria obtained the rights and revenues of the grand master; but in 1809 the order was abolished by Napoleon, its lands passing to the sovereigns in whose dominions they lay. The Teutonic order, however, still continues to preserve a titular existence in Austria.

TEWFIK I. See KHEDIVE.

TEWKESBURY, an ancient market-t. and parliamentary and municipal borough of Gloucestershire, in the vale of Evesham, on the Avon, and near its confluence with the Severn, 10 m. n.e. of Gloucester. The parish church, an ancient and noble edifice in Norman, is the most noteworthy architectural feature. Tewkesbury, which is a very ancient town, appears to be of Saxon origin. Within half a mile of it was fought (May 14, 1471) the famous battle of Tewkesbury, in which the Yorkists under Edward IV. and Richard III. inflicted a signal defeat on the Lancastrians. Pop. '91, 5269.

TEXARKANA, name of two cities with identical interests but separate governments; on the boundary line between Arkansas and Texas, and the Arkansas and Choctaw, the St. Louis, Iron Mountain, and Southern, the St. Louis, Southwestern, the Texarkana and Fort Smith, the Texarkana and Shreveport, and the Texas and Pacific railroads; the part in Arkansas being the co. seat of Miller co., and containing the post office; the part in Texas being in Bowie co., and containing a national bank. The twin city is in a rich pine lumber region, and has car shops, ice factories, cotton compress, cotton seed oil mill, machine and boiler works, and a daily and a weekly newspaper. Pop. '90, 6380 (in Arkansas, 3528; in Texas, 2852).

TEXAS, a s. western state, and the 15th admitted under the federal constitution; between lat. 25° 51' and 36° 30' n.; long. 93° 27' and 106° 43' w.; bounded on the n. by New Mexico, Oklahoma, Indian territory, and Arkansas; on the e. by Arkansas and Louisiana; on the s.e. by the Gulf of Mexico; on the s. and s.w. by Mexico, from which it is separated by the Rio Grande river; greatest length from n. to s., 825 m.; greatest breadth, 740 m.; land area, 262,290 sq. m.; gross area, 265,780 sq. m., or 170,099,200 acres. It is the largest state in the union.

HISTORY.—La Salle, the French explorer, erected a fort on Matagorda bay, in 1687. A Spanish settlement and mission was formed in 1690, but soon abandoned. In 1715 the country was settled by the Spaniards, under the name of New Philippines, and several missions established; but the Comanche and Apache Indians, among the most warlike in America, hindered the progress of the country. In 1803, when Louisiana was ceded by France to the U. S., T., claimed by both Spain and the U. S., became a disputed territory. From 1806 to 1816, settlements were formed, and several attempts made to wrest the country from Spain. In one of these, in 1813, 2500 Americans and Mexicans were killed, and 700 inhabitants of San Antonio. Mina, a Spanish refugee, gained some successes, but was defeated and shot. Lafitte, a gulf pirate, made a settlement at Galveston in 1817, but it was broken up in 1821. In 1819 the river Sabine was established as the boundary. In 1820 Moses Austin, an American, obtained a large grant of lands in T. from the Mexican government, and began a settlement, which rapidly increased; but many of the settlers were of so lawless a character that, in 1830, the government forbade any more Americans coming into T. In 1833 a convention of settlers, now 20,000 in number, made an unsuccessful attempt to form an independent Mexican state; and in 1835 a provisional government was formed, Sam Houston (q.v.) chosen commander-in-chief, and the Mexicans driven out of T. In Feb., 1836, Santa Anna, Pres. of Mexico, invaded T. with an army of 7500, invested the Alamo (q.v.), a fort near San Antonio, and on Mar. 6, put its garrison to the sword. On Mar. 2, a convention at Washington, on the Brazos, issued a declaration of independence; on Apr. 21, Santa Anna was routed by Houston, and the war was practically ended. In Sept. Houston was elected pres., and in Oct. the first congress of the new republic assembled. Its independence was acknowledged by the U. S. in 1837, and in 1840 by England, France, and Belgium. The political leaders of the "Lone Star State," as it was and is popularly called, advocated its annexation to the U. S., and this took place on Dec. 29, 1845. Mexico, which had never recognized the independence of T., invaded it, but in the war which covered the period May, 1846, to Feb., 1848, the Americans were uniformly successful. On Feb. 1, 1861, the state passed an ordinance of secession, and on Mar. 23, ratified the constitution of the Confederate States. Gov. Houston, who had neglected to take the oath of allegiance to the Confederacy, was removed from office. On Feb. 18, the U. S. troops, military posts, and munitions of war were surrendered to the state authorities by Gen. Twiggs. In 1862, Oct. 8, Galveston was occupied by a federal force, but was recaptured by the Confederates, Jan. 1, 1863. In Nov., 1863, western T. was occupied by federal troops, and here, May 13, 1865, occurred the last battle of the civil war, in which the confederates were successful. The state was under provisional and military government till Mar. 30, 1870, when an act was passed readmitting it to representation in congress. In 1876 a new constitution was adopted.

TOPOGRAPHY.—T. may be divided into four sections—the eastern, central or middle, western and northern. The first embraces the territory between the Sabine and Trinity rivers, and is the great lumber region of the state. The soil of the uplands of this portion has a light, loamy texture on a basis of red or yellow clay; in the valleys it is generally a deep vegetable mold or alluvium, very rich and productive. The second division lies between the Trinity and Colorado rivers, and contains a large portion of the wheat lands of the state, and extensive prairies. The western part includes a vast territory from the Colorado to the Rio Grande river, about four-fifths of which is prairie land and used extensively for stock-raising. The northern division contains the cos. along Red river, is about equally divided between prairie and forest, and has a yellow, loamy, sandy soil. The country on the coast is level, with a gradual ascent; the middle region undulating, with rolling prairies. The w. is a high table-land including the staked plain (*el llano estacado*) on the borders of New Mexico, a desert 2000 to 4000 ft. above the sea, without trees and almost destitute of vegetation, deriving its name from the stalks of the yucca plant which covers it. There are a few small mountains in the w.—spurs of the Rocky mts. The principal ranges, between the Pecos and the Rio Grande, are the Guadalupe, Sierra Hueca, Sierra Blanca, and Apache mts., which contain elevations of 5000 and 6000 ft. In eastern Texas, wooded lands called cross-timbers, alternate with prairies, and the country has a park-like appearance. The Texas coast line is about 400 m. long, and is bordered by a chain of sandy islands, bars, etc., divided from the main land by bays and lagoons. The largest of these bays, Galveston, extends inland 35 m. Matagorda bay is 60 m. long, and from 6 to 10 m. wide, but is rapidly filling up. San Luis Inlet and Aransas, Corpus Christi, and Espiritu Santo bays are from 20 to 25 m. in length, but obstructed by sandbars. The Rio Grande, forming the boundary line between T. and Mexico, is navigable for 400 or 500 m. The Red river, forming the greater part of the northern boundary, is navigable for nearly its entire course. The Sabine forms part of the boundary with Louisiana, but rises in Texas, as do the Nueces, Guadalupe, Colorado, Brazos, Trinity, all of which empty into the Gulf of Mexico. The only river of size emptying into the Rio Grande is the Pecos, which rises in New Mexico and crosses the western part of Texas. Though the country is level, as a rule, it is not destitute of grand scenery.

GEOLOGY AND MINERALOGY.—The principal geological formations are the alluvial, tertiary, cretaceous, and carboniferous. The alluvial extends along the gulf coast; back of this is the tertiary, having its widest expansion in the east; next, in the n.w., is the cre-

taceous, extending w. on Red river and s. to San Antonio. The carboniferous formation extends through the cos. w. of Cooke co. to the "staked plain," stretching s. from Red river to and beyond the upper Colorado. Copper is the most abundant metallic product, and a belt of the ore extends from the Red river and the cos. of Clay, Archer, etc., across to the Rio Grande, through Pecos and Presidio cos. Iron, lead, silver, and bismuth are also known to exist in the interior of the state. The large coal-field, mentioned above, is an outlying spur of the great Missouri coal-field, and yields a bituminous coal having 52 per cent. of fixed carbon. A smaller coal-field in Brown, Coleman, Comanche, and Hamilton cos. is anthracite or semi-anthracite of good quality. In the n.w. salt springs and salt lakes are numerous, and along the gulf shore, especially s. westward, there are extensive and productive salt lagoons. Potters' and fire-clays, marble, roofing-slate, grindstones, soapstones, feldspar, alum, antimony, arsenic, mineral oils and pigments, marls and other fertilizers, are found in great quantities here and there. At fort Worth, Gatesville, and elsewhere petroleum is obtained at depths of from 240 to 560 ft. Sulphur and chalybeate springs are numerous. Gigantic animal fossils and silicified trees are found in some localities.

ZOOLOGY.—Among wild animals are the bear, panther, jaguar, black wolf, Texas wolf, wild cat, antelope, deer, peccary, opossum, jack rabbit, marsh hare, prairie dog, and armadillo; among birds and wild-fowl, the Mexican eagle, raven, frigate, wild turkey, road runner, blackbird, whippoorwill, oriole, hairy woodpecker, logcock, swallow-tailed fly-catcher, cañon wren, ruby-throated and broad-tailed hummingbird, spoonbill, white heron, flamingo, crane, cormorant, and grebe. Scorpions, centipedes, lizards, and horned frogs are common, and the agricultural ant greatly interests entomologists. Shell-fish, turtles, and fish of fine flavor abound in the bays and inlets.

BOTANY.—The principal trees are the oak, elm, long and short-leaved pine, yellow pine, ash, buttonwood, mulberry, cypress, juniper, cedar, magnolia, live-oak, pecan, maple, hickory, walnut, gum, palmetto, willow, osage orange, mesquite and China tree. Cacti, many of which bear edible fruit, are abundant. The passion flower is indigenous, and there are 7 species of native grapes. Strawberries, blackberries, and dewberries are found everywhere. The prairies are covered with sweet-scented and brilliant flowers: the phlox, verbenas, crocus, lupine, etc.

CLIMATE.—This is pure, temperate, and remarkably salubrious. The summer heat is relieved by breezes from the gulf, and the winters are mild but invigorating. The climate of the gulf coast is semi-tropical. The eastern part is rainy; the middle, moderate; the s. western portion, dry. Cotton picking begins about July 1. Corn is planted in Feb. and harvesting is done in July. The mean annual temperature for the state is 69.29°. At Austin the av. summer temperature is 81.68°; in winter it is 51.16°; at San Antonio, the corresponding averages are 83.73° and 69.29°. The mean annual rainfall is about 48 ins.

SOIL AND AGRICULTURE.—The soil, of which there are 3 or 4 varieties, is in general very fertile. The stiff black soil of the river bottoms is fittest for sugar and cotton, though the latter grows well on the prairies and uplands; the finer black or chocolate-colored soil of the prairie lands yields abundant crops of corn and the cereals, and the lighter copper-colored soil of the uplands is well adapted for the grasses and fruits, while the fine silt of the islands produces the best sea-island cotton known. The soil of the desert tracts of the n.w. is sandy and charged with carbonate of soda and other alkalis, which when irrigated produces moderate quantities of grasses and herbage. In many places irrigation by means of canals or artesian wells is necessary, and market gardens cultivated by this method produce every kind of vegetable. In the northern parts of the state wheat, barley, oats, corn, and cotton are the staple products, while sweet and Irish potatoes and other vegetables common in temperate climates are raised to considerable extent. Apples, pears, peaches, plums, grapes, and strawberries are also cultivated. Along the gulf the orange, lemon, olive, fig, and other semi-tropical fruits thrive. Sugar-cane is raised in this region in profitable quantities, and also rice. Tobacco is cultivated to some extent both at the north and south. Pasturage is abundant, and more than one-third of the land of the state is devoted to cattle and sheep raising. The principal productions are corn, oats, wheat, potatoes, hay, sugar, molasses, sorghum syrup, vegetables, and fruit. The cotton crop averages from about 2,500,000 to 3,275,000 bales.

MANUFACTURES, ETC.—The abundance of raw material, the water-power of the w. central region, and the high price of manufactured goods have stimulated these industries a great deal, and manufacturing since 1870 has made much progress. The packing of meats, the manufacture of condensed-meat essences, meat biscuits, etc., and the shipment of hides are yearly increasing. The U. S. census for 1890 reported for Texas 5268 manufacturing establishments, employing \$46,815,181 capital and 39,475 persons, paying \$18,586,338 for wages and \$36,152,308 for materials, and having a combined output valued at \$70,433,551. The principal manufactures are lumber products, flour and grist mill products, cotton seed oil and cake, foundry and machine-shop products, malt liquors, brick and tile, clothing, and artificial ice. The various clay industries have an annual output exceeding \$1,000,000 in value; and the coal product is about 500,000 short tons per annum.

COMMERCE.—Among the articles of export are cotton, sugar, molasses, cattle, hides, packed meats, wool, and lumber. A large part of the state's trade is with Mexico. The ports of entry are Galveston, Paso del Norte, Corpus Christi, Brazos de Santiago, and Saluria. Important centers of trade are Galveston, the great Texan seaport, Dallas, Houston, and Waco. San Antonio is the greatest market in the United States for horses and mules. Brownsville, on the Rio Grande, has a large river trade. Corsicana deals in cotton, wool, and hides. Fort Worth is a great corn-mart. Texarkana, situated partly in Arkansas, is a busy railroad center. El Paso receives great shipments of silver. Austin, the capital, manufactures ironware, leather-goods, flour, ice, and dressed lumber. The foreign commerce of Texas has been greatly stimulated by the improvements in the harbor of Galveston (q. v.). In the fiscal year 1896-7 the imports of merchandise at all ports had a value of over \$4,000,000; exports, over \$71,000,000; imports of gold and silver coin and bullion, \$7,485,000; exports, \$108,000.

RAILROADS.—The total length of railroads exceeds 9250 miles. The combined capital stock of operating companies is over \$130,000,000; funded debt, \$175,500,000; total investment, \$311,000,000; cost of roads and equipments, \$302,500,000; net earnings, \$5,700,000. The principal roads are the Texas and Pacific, the Southern Pacific, the International and Great Northern, and the Missouri, Kansas, and Texas.

BANKS.—On Oct. 31, 1896, there were 206 national banks in operation, with a capital of \$21,570,000; outstanding circulation, \$4,981,459; deposits, \$30,614,621; and reserve, \$12,166,279; 8 state banks, with capital, \$885,150; deposits, \$1,034,021; and resources, \$2,219,132; and 25 private banks, with capital, \$3,090,434; deposits, \$3,270,571; and resources, \$7,269,011. The exchanges of the year at the clearing-houses at Galveston, Houston, Dallas, Fort Worth, and Waco, aggregated over \$390,000,000.

RELIGIOUS DENOMINATIONS, EDUCATION, ETC.—The leading denominations numerically are the Methodist Episcopal, Baptist, Presbyterian, Christian, Protestant Episcopal, Roman Catholic, Lutheran.

The public schools of the state are under the control of a board of education, composed of the governor, comptroller, and secretary of state. The public school system has a liberal endowment, consisting of over \$7,000,000 in interest-bearing bonds, over \$14,000,000 in interest-bearing land notes, and about 23,000,000 acres of land, nearly all of which is leased. In addition to this state endowment, each co. has an independent endowment of four leagues of land. The total state and co. permanent fund exceeds \$73,000,000. The public school population is over 900,000; enrollment over 600,000; average daily attendance, about 500,000; schoolhouses, over 10,000; value of public school property, over \$7,000,000; annual expenditure, nearly \$4,000,000. The higher institutions include the university of Texas, at Austin; Fort Worth university, Fort Worth; Southwestern university, Georgetown; Wiley university, Marshall; Trinity university, Tehuacana; Baylor university, Waco; Add-Rau Christian university; Thorp Spring; State agricultural and mechanical college, College Station; Sam Houston normal institute, Huntsville; State normal school, Prairie View; Blinn memorial college, Brenham; Mary Allen seminary, Crockett; Baylor female college, Belton; and female colleges at Chapel Hill and Waco. Among the charitable institutions are state insane asylums at Austin, San Antonio, and Terrell; state orphan asylum, Corsicana; state house of correction and reformatory, Gatesville; state asylums for the blind and the deaf and dumb, and institute for deaf, dumb, and blind colored youth, all at or near Austin; and the confederate soldiers' home. There are about 40 libraries in the state, of 1,000 volumes and upward each, with a total of nearly 150,000 volumes, and (1897) 746 periodicals of all kinds.

GOVERNMENT, ETC.—The capital is Austin. The term of the governor and all of the executive officers is two years. The governor's salary is \$4000. The legislature meets biennially, and consists of a senate of thirty-one members, elected for four years, and a house of representatives of 128 members, elected for two years. Each receives \$5 a day. Sessions are biennial, and limited to 90 days. Judicial officers are elected, and serve for limited terms. Voters must have resided one year in the state and six months in the district where the vote is cast; and if financial measures are voted upon, taxpayers alone are allowed to vote. State elections take place on the Tuesday after the first Monday in November. The supreme court consists of three judges elected by the people, and receiving \$3500 salary each. The penitentiaries are at Huntsville and Rusk. The new State Capitol at Austin, for whose erection 3,000,000 acres of public land were granted as an appropriation by the legislature, is one of the most magnificent legislative buildings in the world. It is built of red Texas granite, and is surmounted by a dome 311 feet in height. It was finished in 1888, and the cost was not far from \$3,500,000.

The electoral votes have been cast as follows: 1848, Cass and Butler, 4; 1852, Pierce and King, 4; 1856, Buchanan and Breckenridge, 4; 1860, Breckenridge and Lane, 4; 1864 and 1868 no vote was cast; 1872, Greeley and Brown, 8; 1876, Tilden and Hendricks, 8; 1880, Hancock and English, 8; 1884, Cleveland and Hendricks, 13; 1888, Cleveland and Thurman, 13; 1892, Cleveland and Stevenson, 15; 1896, Bryan and Sewall, 15.

The state militia consists of 3000 officers and men; unorganized but available for military duty, 300,000.

FINANCES.—The assessed valuations in 1896 were: real estate \$587,560.471, personal property \$262,748.775—total, \$850,309.246; tax rate, \$3.80 per \$1000. In 1897 the total bonded debt was \$3,992,030, of which various state funds held \$3,244,540, leaving \$747,490 in the hands of individuals.

POPULATION.—In 1806, 7000; 1850, 212,592—58,161 slave, 397 free col'd; 1860, 604,215—182,566 slave, 355 free col'd; 1870, 818,579—253,475 col'd; 1880, 1,591,749—394,512 col'd, including 136 Chinese, 992 civilized or taxed Indians; male, 837,840; female, 753,909; dwellings, 287,562; families, 297,259; persons to sq. m., 6.1; engaged in agriculture, 359,317; in trades and transportation, 34,909; foreign born, 114,616. Rank of state, 11th in pop. Population, 1890, 2,235,523. There are 246 organized cos.; for pop. 1890, see Census Tables, Vol. XV. The largest cities, 1890, were: Dallas, 38,067; San Antonio, 37,673; Galveston, 29,084; Houston, 27,557; Fort Worth, 23,076; Austin, 14,476, and Waco, 14,445.

See Thrall's *History of Texas*; Spaight's *Resources of Texas* (Austin, 1882).

TEXAS, a co. in s. Missouri, drained by Current river, and the branches of the Gasconade river; about 1145 sq. m.; pop. '90, 19,406, chiefly of American birth. The surface is hilly and heavily wooded. The soil in the river valleys is rich. The principal productions are corn, wheat, tobacco, oats, wool, and cattle. Co. seat, Houston.

TEXAS, a tp. in Wayne co., Penn. Pop. '90, 4409.

TEXAS CATTLE DISEASE, otherwise called Spanish fever, splenic fever, acclimation fever, American cattle plague, red water, black water, yellow murrain, and bloody murrain; a very fatal epizootic, contagious or infectious fever of cattle, confined to regions s. of the 37th parallel of n. latitude, except when communicated by cattle brought from there. It appeared in South Carolina as early as 1814, and subsequently Virginia and North Carolina passed stringent laws against the introduction of cattle from South Carolina and Georgia. The greatest losses have been caused by driving Texas cattle through Arkansas, Missouri, and Kansas, and distributing them to feeders in various western states. Missouri, in 1852–53, Kansas and Iowa, in 1856 and 1857, and parts of Illinois and Indiana, in 1868, suffered severely.

All observations indicate that in the permanently infected districts s. of parallel 37° the cattle become accustomed to the influence of the disease germs, and that the effect is much milder upon the organization, passing through it without creating much disturbance, and generally without being noticed. When, however, the southern cattle are taken into regions previously unaffected the native cattle, not being protected by previous habitual exposure, become the victims of the disease. The imported droves, also, when crowded, suffer to a certain extent, but not in comparison with the native cattle. Native cattle have been known to convey the disease to native cattle in other states, one instance being where native cows from Painesville, Ohio, brought the disease to Orange co., N. Y., causing the death of eight animals. *Symptoms.*—One of the first symptoms is an elevation of the animal temperature, which ranges usually from 106° to 108° Fahr. but occasionally not more than 104° to 105°, and sometimes as high as 110°. As death approaches the temperature falls to below the normal. The first outward symptoms are those of languor and fatigue, as drooping of the head, lopped ears, and arching of the back. The eyes are staring, the coat rough, the horns are hot and the nose dry. As the disease advances the head droops more, so that the nose almost reaches the ground; the hind legs are placed far under the body; the legs are very weak and the animal has a disposition to lie down, especially in water. The pulse is very frequent; sometimes soft and feeble, but often hard and wiry. The post mortem appearances are only to be seen soon after death, as decomposition rapidly sets in and speedily obliterates the pathological conditions. When soon enough examined the muscles have a dark red color, and the fat is of a deep brownish yellow, in some cases having a bronzed appearance. All the tissues, but particularly the muscles, have a peculiar sickening odor. On examining the alimentary canal the œsophagus and the first three stomachs have generally a not unnatural appearance, although the third stomach is often found dry and obstructed. In the fourth stomach there are characteristic changes. The whole mucous membrane is more or less congested, the cardiac portion especially, but the more peculiar lesions are at the pyloric end. It is not so much discolored, but is full of erosions, sloughs, and deep, excavated ulcers. The small intestines are the seat of congestions. Engorgements and extravasations of blood are common in the large intestines. The liver is usually enlarged, sometimes weighing from twenty to twenty-seven pounds, and fatty or waxy. The bile-ducts are injected with a yellowish-brown bile, and the gall bladder is almost always distended, with a dark, thick, flaky, and tarry looking bile, sometimes amounting to as much as four pounds. The kidneys are usually congested and enlarged, and the cortical substance softened. In a few cases they have a healthy appearance. The urinary bladder is generally distended with dark bloody urine, and the mucous membrane is frequently thickened and inflamed. The spleen is always enlarged, and engorged with dark colored blood. It is frequently softened, and in some cases is a mere pulpy, disorganized mass. It has been found two feet and a half long, and having a weight of over nine pounds. The lungs are generally healthy in appearance with the exception of small points of extravasation, and enlargement of some of the air-

cells The blood in the blood-vessels is nearly natural in appearance and coagulates quickly, but is generally rather more watery than in health. Dr. J. Cresson Stiles found that the white corpuscles were in excess only in one case, but the liquor sanguinis was yellower than in health, and contained minute flocculi of yellow granular matter. In some instances complete dissolution of the blood globules took place long before putrefaction. There is considerable difference of opinion as to the cause of the disease and the nature of the infectious principle, but the general opinion is that it is owing to the development of a disease germ. The period of incubation varies. All observers agree that it is always as much as ten days, but it is often from two to six weeks, and even longer. The chief measures against the disease are those of prevention.

TEXAS, UNIVERSITY OF; a co-educational institution of learning, with its academic and law departments (opened 1883) at Austin, its medical department (opened 1891) at Galveston, and its agricultural and mechanical departments (in existence before the university, and joined to it in 1876) at Bryan. In 1895 the students numbered over 900, of whom 406 belonged to the academic and law departments, and 180 to the medical college.

TEXEL, THE, an island in the province of n. Holland, separated from the Helder by a narrow strait, called the Marsdiep, contains about 35,000 acres of arable and pasture lands, and has a pop. of '89, 5878. Many sheep are kept, producing fine wool. Fishing, shipbuilding, grinding corn, etc., are also sources of prosperity. There is much wealth in the island, but recently no steamboat communication existed with the mainland. The northern part is called Eijerland, or the egg-country, immense flocks of birds coming thither from Scandinavia to deposit their eggs. The capital is Den Burg.

TEXTILE FABRICS. See WEAVING.

TEXTUAL CRITICISM is the criticism based upon the careful study and comparison of the existing texts of literary works with a view to the detection of errors that have crept in, and the restoration of the true reading, as intended by the author. Textual criticism finds its richest field in the remains of the Greek and Roman authors that have come down to us, in the study of the New Testament, and in the discussion of the meaning of some few great modern authors, such as Chaucer and Shakespeare.

In the first two cases, the criticism of the texts of the classical authors and of the New Testament, the results depend upon the minute investigation of the manuscripts or *codices*. A *codex* is, in general, a parchment book of folio or quarto size, written on both sides of each leaf, and with marginal notes usually later than the writing on the body of the page. Most of the Greek and Latin codices date from the XIII., XIV., and XV. centuries, though some are two or three hundred years earlier. The oldest are written in capital or uncial letters, the later in minuscules. The former have no punctuation or division, the latter have both. It is probable that all books were originally written in capitals, and that all the existing codices are traceable ultimately to these. The original book is technically known as the "Archetype."

No existing codex is free from error. Being copied by scribes who did their work mechanically and often ignorantly, there are in every manuscript sentences that, as they stand, have no meaning, and words that are not real words at all. These, in the case of a given manuscript, can often be corrected by reference to another manuscript which does not contain the identical blunders; but it occasionally happens that all the manuscripts have the same error. Again, it is not uncommon to find several manuscripts all giving intelligible readings—sentences that have a good meaning—and yet all differing from one another. Textual criticism, then, endeavors in the first instance to make intelligible that which is on the face of it unintelligible; and in the second instance, to discover which one of several intelligible readings is the one intended by the author; or else if this is not susceptible of demonstration, to offer a reasonable conjecture as to the original form of the sentence.

Errors in MSS. are of three kinds: (1) Accidental; (2) Unavoidable; (3) Fraudulent.

I. ACCIDENTAL ERRORS.—These are naturally the most numerous, and come from the ignorance, carelessness, or misunderstanding of the writer. These may be classified as follows:

(a) *Errors due to dictation.*—These are due to the imperfect enunciation of the words by the reader, or to the imperfect hearing of the scribe. Instances are found in the Vatican MS. of the New Testament in Acts xxvii. 30, ἐξώσαι for ἐκώσαι, the sound of the words being the same; and in 1 Thess. i. 3, ἀδεαλίπτορ for ἀδιαλείπτορ.

(b) *Confusion of Letters.*—This is common in the Greek capital letters, Α, Δ, Δ; Θ and Ο; Π and Τ; and in the Latin capitals, C and G, E and F.

(c) *Confusion of Words.*—Words like the Greek φόνον and φόβον and the Latin *voluntas* and *voluptas* are often confused, especially when either gives an intelligible reading.

(d) *Transposition of Words or Letters.*—An interesting instance is that in Virgil's Georgics (II. 356), when *sub vomere et ipsa* is in some MSS. converted into *submoveret ipsa*.

(e) *Incorrect Division of Words.*—This error easily arose when the MSS. had no punctuation and no separation of letters.

(f) *Letters or Syllables Omitted.*—This is technically known as *lipography*. An instance is thus found in Horace's Satires (II., iv., 11), where some MSS. read *celebitur* for *celebrabitur*. When a syllable or letter ought to be written double and is only once written, the name *haplography* is given to the error.

(g) *Ditto*graphy is the opposite of the preceding error, and consists in accidentally writing a letter, syllable, or word twice.

(h) *Loss of Plan*, which often leads to the omission of whole lines and is a particular instance of lipography.

(i) *Interpolation*.—This error often arises from the incorporation, by the scribe, in the text of an explanatory word or sentence written on the margin.

II. UNAVOIDABLE.—When the book set before the scribe was imperfect, mutilated, or in any way damaged, his copy of it would naturally be similarly corrupt. Thus the existing codices of Suetonius all contain a lacuna or gap at the beginning of the First Book, thus showing the Archetype to have been imperfect. Sometimes, again, a scribe who had accidentally omitted a line or several lines, would, on discovering his error write them at the bottom of the page. A subsequent copyist of his copy would suppose this to be the proper order, and thus perpetuate what was originally a mistake.

III. FRAUDULENT ERRORS.—These are due either (1) to a desire to modify an author's statements for some particular motive; or (2) a desire to improve upon the original. Of the first sort is said to be the mention of Athens in Homer's *Iliad* (II., 553-555 and 558), interpolated in the original in order to make Athens seem to have been a place of importance in the days of Homer. There are a number of such fraudulent "corrections" in the MSS. of the New Testament, intended to do away with some minor verbal contradictions in the different Gospel narratives. Numerous attempts at syntactical corrections occur in the MSS. of the Greek and Latin classics.

The old printed texts of many of the early English writers are often as full of errors as the written codices of mediæval times, for the first printers in England were generally foreigners. Hence the modern editors have had many demands made upon their ingenuity. Mr. Gow gives an interesting illustration from Shakespeare's *Henry V.* (II., 3), where the hostess says of Falstaff: "His nose was as sharp as a pen, and a' babbled of green fields." In the old folios the last four words were printed "*and a table of Green Fields.*" Later editions omitted them as making no sense. One critic suggested "on a table of green frieze," and another, "or as a stubble on shorn fields." The present universally accepted reading is that of Theobald. See Madvig, *Adversaria Critica* (1870); *Emendationes Latine* (1873); Cobet, *Varie Lectiones* (1873); *Collectanea Critica* (1878); Hagen, *Gradus ad Criticem* (1879); Hammond, *Criticism of the New Testament* (1880); Taylor, *History of the Transmission of Ancient Books* (1884); Vincent, *Word Studies in the New Testament* (1889); Gow, *A Companion to School Classics* (2d ed., 1890); and the articles, CODEX, PALEOGRAPHY, WRITING.

TEZCUCO (i.e., "place of detention"), an ancient and much decayed city of Mexico, stands on the e. shore of the lake of the same name in the state, and 16 m. e.n.e. of the city of Mexico. In former times it was the capital of a great state, and was the second city in Mexico. During the early part of the 15th c. the city rose to its greatest splendor. It then contained ranges of stately mansions, in which the nobles resided, and magnificent buildings, which served as the royal residence and as public offices. Tezcuco is now a poor place, filled with heaps of rubbish and ruins. Pop. '80, 15,626.

THACHER, PETER, D.D., 1752-1802, graduated at Harvard college, 1769, was a member of the state constitutional convention, in 1780, was often chaplain to the legislature, and was pastor of a Boston church from 1785 to his death. He wrote many works, among which are *Narrative of the Battle of Bunker Hill*, and *Observations on the State of the Clergy in New England*.

THACHER, THOMAS ANTONY, LL.D., 1815-1886, American educator, was born at Hartford, Conn., graduated at Yale college in 1835; in 1838 was appointed tutor at Yale college, and in 1842, professor of Latin, holding the chair until his death. He edited Cicero's *De Officiis*, Madvig's *Latin Grammar*, etc.

THACKERAY, ANNE ISABELLA. See RITCHIE, MRS. RICHMOND.

THACKERAY, WILLIAM MAKEPEACE, novelist and satirist, was b. at Calcutta in 1811. He was of a good old English family, represented about the middle of last century by Dr. Thackeray, an eminent scholar, and head-master of Harrow. His father was in the civil service of the East India co., and, dying young, he left his son a fortune of £20,000. The latter, when a boy seven years of age, was sent to England, and placed in the Charterhouse school, that ancient Carthusian foundation, which he loved to commemorate in his writings. He next went to Cambridge, but left the university without taking a degree. In 1831 he was at Weimar, and saw Goethe. His ambition was to become an artist, and he traveled over most of Europe, studying at Paris and Rome. His drawings were not without merit; they were quaint, picturesque, and truthful, but somehow they missed the bright touches of a master-hand. He next took to literature, beginning with rare patience and contentment at the lowest step of the ladder. Under the characteristic name of Michael Angelo Titmarsh, or that of Fitz-Boodle, he became a constant contributor to *Fraser's Magazine*, and wrote for it two of the best of his minor works, *The Great Hoggarty Diamond* and *Barry Lyndon*. The latter is the story of an Irish sharper, and is told with a spirit, variety of adventure, and humor worthy of Le Sage or Fielding. Under the pseudonym of Titmarsh he also published *The Paris Sketch-Book* (2 vols. 1840); *The Second Funeral of Napoleon*, and *Chronicle of the Drum* (1841); and the *Irish Sketch-Book* (2 vols., 1843). The greater part of Thackeray's fortune having been spent in foreign travel and unsuccessful speculations at home, he continued to work steadily at literature as a profession. He was never widely popular, but a few

good judges appreciated his keen wit, observation, and irony, and his command of a style singularly pure, clear, and unexaggerated. The establishment of *Punch* afforded a more congenial field for Thackeray, and *Snob Papers* and *James's Diary* were hailed with delight by all readers. Their author's reputation was still more advanced by his novel of *Vanity Fair* (1847-48), published in monthly parts in the style of *Pickwick*, and illustrated by the novelist himself, or, as he expressed it, "illuminated with the author's own candles." During the progress of *Vanity Fair* appeared *Notes of a Journey from Cornhill to Grand Cairo*, being an account of a journey undertaken for the benefit of his health; also *Mrs. Perkins's Ball*, a short Christmas tale, and two works of a similar kind entitled *Our Street*, and *Doctor Birch and his Young Friends*. In 1848 he began a second serial fiction, *Pendennis*, in which much of his own history and experiences are recorded. Next followed *Rebecca and Rowena* (1850), and *The Kicklegurys on the Rhine* (1851). The latter work was sharply criticised by the *Times*, and Thackeray replied in a caustic and humorous *Essay on Thunder and Small Beer*, prefixed to a second edition of the satirical sketch. In 1851 the indefatigable novelist delivered a course of lectures on the *English Humorists of the Eighteenth Century*—light, graceful, discriminating sketches, with passages of real power and eloquence. In 1852-55 appeared two more novels, the most richly imaginative and highly finished of his works, *Esmond* and *The Newcomes*. These were followed by *The Virginians* (a much inferior novel), by *Lectures on the Four Georges* (first delivered in America), by *Lovel the Widower* and *Philip* (two short tales of somewhat coarse texture), and by a series of pleasant gossiping essays, entitled *Roundabout Papers*. These originally appeared in the *Cornhill Magazine*, of which Thackeray was for a time editor; and in the same miscellany he had begun and published part of a new novel, *Dennis Duval*, which promised to be one of the most carefully elaborated and successful of his works of fiction. He contemplated also *Memoirs of the Reign of Queen Anne*, which would have served as a continuation to Macaulay's *History*. He knew that period well, from his previous studies for *Esmond*, and as a moral anatomist and master of English he stood unrivaled. But, alas! such dreams and anticipations were suddenly dispelled. To the grief of all lovers of genius and of manly and noble character, Thackeray was cut off in the fullness of his powers in his 52d year, dying alone and unseen in his chamber before daybreak on the morning of Dec. 24, 1863. His medical attendants found that death was caused by effusion on the brain, and that his brain was one of the largest, weighing no less than 58½ ounces.

In his delineation of the character and genius of Fielding, Thackeray has drawn his own. He had the same hatred of all meanness, cant, and knavery, the same large sympathy, relish of life, thoughtful humor, keen insight, delicate irony, and wit. There was, however, one personal difference: Fielding was utterly careless as to censure of his works, whereas his successor was tremblingly alive to criticism, and was wounded to the quick by the slightest attack. His morbidly delicate organization made him exquisitely susceptible of either pain or pleasure. He had suffered much from physical maladies and from domestic calamity; and his earlier works, especially his *Vanity Fair*, were tinged with a degree of cynicism which seemed to countenance the charge of his unfriendly critics, that he delighted in representing the baser side of human nature, and was skeptical as to the existence of real virtue in the world. His strength lay in portraying character rather than inventing incidents; and in Becky Sharp, Col. Newcome, Harry Foker, Laura Pendennis, and Paul de Florac, to say nothing of the picaroon, Barry Lyndon, he has left us a living gallery, certainly not surpassed by any modern novelist. In his later writings the dark shades no longer preponderate. The mellowing influence of years and sickness, and calmer as well as more extensive observation of life, had sunk the merciless satirist in the genial humorist and philosophic observer. He had still ample scorn for falsehood and vice, and satire for folly and pretense; but he had also smiles and tears, and tenderness and charity, that gave a moral beauty and interest to the last decade of his brilliant career as an author.

THAIS, an Athenian courtesan, famous for her wit and beauty, who was in Asia along with Alexander the great, and according to Cleitarchus—a doubtful authority—induced the Macedonian king, when excited with wine, to set fire to the palace of the Persian kings at Persepolis. After his death she lived with Ptolemy Lagi, by whom she became the mother of several children.

THALASSIDRO MA. See PETREL.

THALBERG, SIGISMUND, a very eminent pianist, b. at Geneva in 1812, received the greater part of his musical education at Vienna, where he was a pupil of Hummel. He made his first public appearance in 1827, and his *début* in Paris in 1835. After residing for a time in America he returned to Europe, and died April 27, 1871. In graceful and brilliant execution, and in manual dexterity on the piano, he had hardly a rival. His compositions are principally fantasias and variations.

THALEIA, or **THALIA** (Gr. the blooming one), one of the nine muses (q.v.), generally regarded as presiding over comedy. By Apollo, Thaleia became the mother of the Corybantes. See *illus.*, MYTHOLOGY, vol. X.

THALER, a coin in circulation in Germany, Austria, Holland, Belgium, Denmark, Sweden, and Norway. The new German *thaler* of silver is worth \$0.729, the specie

daler of Norway is equal to \$1.107, the *ten-thaler* (gold) of Denmark is worth \$7.861. The value varies in different parts of Germany; the Russian *thaler* is worth 71 cents. The word *thaler* is thought by some to be taken from the name of a mining town in Bohemia, called Joachimsthal (Joachim's dale), in which these pieces were coined, and that they were first known as *Joachimsthaler* and then for brevity *thaler*. German scholars derive the term *thaler* from *talent*, signifying a pound of gold. In the early part of the 16th c. the silver coins in use at Joachimsthal weighed 1 ounce. In Sweden the *rigsdaler riksmünt* is about 27 cents. In Denmark the *rigsbank daler* is about 54 cents. In Germany generally the *thaler* of account is from about 69 cents to 73 cents, American currency. In other countries the *Laufthaler* or leaf dollar is in use; the *Philippsthaler*, the Swedish copper dollar, and in Spain the *dalera*, the Spanish pillar dollar, which was taken as the basis of the United States coinage and money of account. In most European countries the mints have coined *thalers* (varying in value with the locality), hence called *rigsdaler* or *reichsthaler*, the dollar of the realm.

THALES, an early Greek philosopher, founder of the Ionic or physical school of philosophy, and one of the seven wise men (q.v.), was a native of Miletus, in Asia Minor, and flourished toward the close of the 7th c. B.C. Very little is known regarding his life. He is said to have recommended the Ionians, who were menaced by the Persians, to form a federation against their powerful enemy, and to select Teos as the capital. At a later period, we are told he induced the Milesians to withdraw from a union with Cræsus against Cyrus. He is also said to have predicted the eclipse of the sun which happened in the reign of Alyattes. His claim to the title of sage (as in the case of his compeers) was due to his practical wisdom rather than to his speculative achievements. Nevertheless, Thales has a name in the history of speculative philosophy. He is even regarded by some as the first Greek that speculated on the constitution of the universe. According to him, the original principal of all things is water, from which everything proceeds, and into which it is again resolved. It would appear also that in connection with this doctrine he had some idea of a soul or force in water productive of all the phenomena we see, but it is impossible to ascertain the extent of his belief in an immaterial power. Most probably, his philosophy was a form of pantheism, rather than of theism. None of Thales' speculations was committed to writing, and it is only from the notices of later Greeks, such as Herodotus, Aristotle, etc., that we can gather an idea of the character of his thinking.—See Ritter's *Geschichte der Ionischen Philosophie* (Berl. 1831), Lewes's *Biographical History of Philosophy*, and prof. Ch. A. Brandis, in Smith's *Dic. of Gr. and Rom. Biog.*, art. "Thales."

THALLIUM (symb. Tl, equiv. 203.6, spec. grav. 11.9) is a metal which derives its name from the Greek word *thallos*, green, because its existence was first recognized by an intense green line appearing in the spectrum of a flame in which thallium is volatilized. It was discovered by Mr. Crookes, the editor of the *Chemical News*, in 1861, in the seleniferous deposit of a lead chamber of a sulphuric acid factory in the Hartz mountains, where iron pyrites is employed for the production of the acid. In the following year, it was obtained in larger quantities from a similar source by M. Lamy, who exhibited magnificent specimens of it in solid bars at the last great exhibition in London. Thallium is slightly heavier than lead—a metal which it resembles in its physical properties. It is very soft, being readily cut with a knife, or drawn into wire; and its freshly-cut surface exhibits a brilliant metallic luster and grayish color, somewhat between those of silver and lead. In contact with the air, it tarnishes more rapidly than lead, and becomes coated with a thin layer of oxide, which preserves the rest of the metal. It fuses below a red heat, and is soluble in the ordinary mineral acids. With oxygen, it enters into two combinations—viz., *Thallium monoxide*, Tl_2O , which is a black powder, soluble in water. It is basic, and its salts with acids are called *thallious salts*; and *Thallium trioxide*, Tl_2O_3 , which is insoluble in water and the alkalies, may be obtained as a dark reddish powder, and forms *thallic salts* with acids.

There is a difference of opinion as to whether the salts of thallium are or are not powerful irritant poisons. Lamy (with the view of testing the statement of Paulet, that the salts are poisonous) dissolved 75 grains of the sulphate in milk; and he found that this quantity sufficed to destroy two hens, six ducks, two puppies, and a middle-sized bitch. In one experiment, a grain and a half proved fatal to a puppy. Mr. Crookes, on the other hand, although much exposed to the fumes of this metal, suffered no particular effects from them; and he swallowed a grain or two of the salts without injury. He found that the latter have a local action on the hair and skin, staining the former, and rendering the latter yellow and horny.—For further details regarding this metal, the reader may consult Mr. Crookes's memoirs in the *Philosophical Transactions* for 1862, and in the *Chemical News*, and Lamy's memoir in the *Annales de Chimie et de Physique* for 1863.

THALLOGENOUS PLANTS are those acotyledonous plants which exhibit the greatest simplicity of structure, consisting of a mere thallus (q.v.) with reproductive organs. Of this description are *algæ*, *characeæ*, *fungi*, and *lichens*. When apparent leaves exist in any of these, they do not exhibit the symmetry always found in true leaves; and although some of them have stems or stalks, which attain, as in some sea-weeds, both to a considerable age and to great strength, all is composed of cellular tissue without any proper woody fiber.—In the botanical system of Lindley, the thallogenous

plants form a class, under the name *thallogens*; and in that of Endlicher, a corresponding place is assigned to them under the name *thallophyta*.

THALLUS, in botany, a structure composed of cellular tissue, without woody fiber, which in some of the lower cryptogamic orders, as *algæ*, *fungi* and *lichens*, constitutes the whole plant, except the reproductive organs, which are situated in or upon it. The thallus assumes very various forms, sometimes crust-like, sometimes spread out like a leaf, simple, lobed, or branched; or, as in mushrooms, it becomes a stalk, cap, and gills.

THAMES, a river formed by the union, at Norwich, Conn., of the Yantic, Quinebaug, and Shetucket rivers. The course of the river is s., and it enters Long Island sound 3 m. below New London and 15 m. from the junction of the three rivers. The river, a picturesque tidal channel, is navigable for its full course, and its mouth forms New London harbor.

THAMES (Lat. *Tam-esis*; the root *tam* probably meaning broad, and *esis* or *isis*, being identical with *esk*, *ex*, *ouse*, etc., all from Cel. *uisg*, water), the most important river of Great Britain, and the longest in England, flows e.s.e. across the s. portion of the country. Its remotest springs—those of the upper waters of the Churn—rise on the s.e. slope of the Cotswold hills, 3 m. s. of Cheltenham, and 7 m. w. of the Severn at Gloucester. The springs unite about a m. from their sources, and form the Churn, which flows s.e. 20 m. to Cricklade, and there receives the Thames, which joins it from the w. after a course of 10 miles. The Thames, or Isis, then flows e.n.e. for about 35 m., when, curving s.e., it passes Oxford, and flows on to Reading, where, after receiving the Kennet from the w., it again changes its course; and with a generally eastward course, it passes Windsor, Eton, Richmond, London, Woolwich, and Gravesend, a few miles below which it expands into a wide estuary, and enters the North sea. The length of the Thames is estimated at 250 m., the area of its basin at upward of 6,000 sq. miles. Throughout the greater part of its course, it is of importance as forming the boundary-line between several of the southern counties. Passing Cricklade, it forms part of the northern boundary of Wilts, and below this point it separates the counties of Oxford, Buckingham, Middlesex, and Essex on the n. from those of Berks, Surrey, and Kent on the s., except certain outlying bits of some of these counties. Its chief affluents are the Colne, Leach, Windrush, Cherwell, Thame, Colne, Lea, and Roding, on the left; and the Kennet, Loddon, Darent, Mole, and Medway, on the right bank. At Vauxhall bridge, the width of the river is about 230 yards; at London bridge, 290 yards; at Woolwich, 490 yards; at Gravesend pier, 800 yards; 3 m. below Gravesend, 1290 yards; and at its mouth, between Whitstable and Foulness Point, about 8 m. below the Nore, it is 18 m. across. At the Nore Light, the commonly reputed mouth of the Thames, the breadth is 6 miles. The river is navigable for barges to Lechlade, upward of 200 m. above its mouth, and it is connected with the Thames and Severn, Oxford, Wilts and Berks, Grand Junction, and several other important canals, by means of which it maintains free communication with the w. and s. coasts, and with all parts of the interior of the country. Vessels of 800 tons can reach St. Katharine's docks, while those of 1400 tons can ascend to Blackwall, 6 m. below London bridge. The part of the river immediately below London bridge is called the *Pool*; and the part between the bridge and Blackwall is called the *Port*. Two embankments have been formed, one on the n. shore from Blackfriars bridge to Westminster, and one on the s. shore from Westminster bridge to Vauxhall. See LONDON.

THAMES, BATTLE OF THE, at the Moravian settlement on the Thames river, Ontario, Can., Oct. 5, 1813; between the American forces under Gen. William H. Harrison, and the British under Gen. Proctor, with 2000 Indian allies under Tecumseh. Tecumseh was killed during the battle. The charge of the cavalry under Col. Richard M. Johnson began and decided the battle, in which 600 British prisoners were taken, besides, stores, cannon, etc. See TECUMSEH, and HARRISON, WILLIAM HENRY.

THANE, or **THEGN** (A.-S. *thenien*, analogous to Ger. *dienen*, to serve), a title whose use in the early feudal ages has been the subject of much discussion. In England, in Saxon times, the king's thane was a "miles emeritus," who, on the cessation of his actual service about the king's person, received a benefice or grant of land. The term "miles," when used by Bede, is uniformly rendered "cyninges thegn" by his Saxon translator. In the 10th c., all who would, in the feudal era, have been known as tenants *in capite*, were thanes. After the conquest, thanes and barons are classed together; and in Henry I.'s time the terms seem to be used synonymously. The office or dignity appears to have been attached to particular estates; thane lands are frequently mentioned in Domesday. After the reign of Henry II., the term fell into disuse. The title thane was introduced at a later period into the northern parts of Scotland, where, however, it did not express the same rank and dignity as in England; the tenure not being military, but in fee-farm.—The Scottish thane seems to have been a hereditary tenant, paying the sum at which the land stood in the king's rental, and retaining his ancient authority strengthened and legalized. The title was in occasional use in Scotland down to the end of the 15th century. Hector Boece's notion of the Scottish thanes being all made earls, which has been adopted in Shakespeare's *Macbeth*, is devoid of historical foundation.

THANET, ISLE OF, forms the north-eastern corner of the county of Kent (q.v.), from the mainland of which it is cut off by the river Stour and its branches, and is bounded on the n. and e. by the sea. It is 10 m. in length, and from 4 to 8 m. broad; and contains 26,500 acres, of which 23,000 are arable, and 3,500 in marsh and pastures. The surface is high, but in the main, level; the soil is in general light and chalky; the island, however, is rich and fruitful—agriculture being successfully pursued. Besides the ordinary crops, canary and radish seeds are largely grown. Pop. '91, 57,600.

THANET, OCTAVE. See FRENCH, ALICE.

THANKSGIVING DAY is chiefly an American institution. After the first harvest of the New England colonists in 1621 Gov. Bradford made provision for their rejoicing specially together with praise and prayer. In 1623 a day of fasting and prayer in the midst of drought was changed into thanksgiving by the coming of rain during the prayers; gradually the custom prevailed of appointing thanksgiving annually after harvest. These appointments were by proclamation of the governors of the several New England states. During the revolution a day of national thanksgiving was annually recommended by congress. Of late years, the custom of appointing a Thanksgiving day by the governors of states, long confined to New England, has been adopted through the country, the President's proclamation, however, usually appearing first. See Love, *The Fast and Thanksgiving Days of New England* (N. Y., 1895).

THANN, a t. of Germany, in the province of Alsace-Lorraine, at the foot of a hill crowned by the ruins of the castle of Engelburg, 13 m. w.n.w. of Mulhouse. It contains a superb Gothic church, surmounted by a spire of delicate open work, upward of 300 feet high. Cotton cloths, chemicals, and machinery are manufactured. Pop. '95, 7537.

THASOS, the most northerly island in the Ægean sea, a few miles off the coast of Macedonia. Circumference about 40 miles; pop. about 12,400, scattered over a dozen villages. Thasos is mountainous, and, on the whole, barren. The description of it given by Archilochus is still applicable: "An ass's backbone overspread with wild wood." It exports some oil, honey, and timber. In ancient times the island was famous for its gold mines, which appear to have been worked from a very remote antiquity.

THATCHER, HENRY KNOX, 1806-80; b. Thomaston, Me., grandson of Gen. Henry Knox, entered the navy as midshipman, 1823; rose through successive grades to capt., 1861; commander, 1862. He commanded the frigate *Constellation* in the Mediterranean, 1862-63, the steam frigate *Colorado*, n. Atlantic blockade squadron, 1864-65. He distinguished himself in the attacks on Fort Fisher under Porter, 1864-65, and in the siege of Mobile under Farragut, co-operating with Gen. Canby in 1865, receiving the surrender of the confederate naval force in Mobile bay; appointed rear-admiral, 1866, for gallantry in this action; retired, 1868; residing at Winchester, Mass., and Nahant. He was at one time commandant of the Charlestown navy-yard, a member of the Bunker Hill Monument association, and pres. of the Massachusetts society of the Cincinnati, succeeding his grandfather in membership.

THAXTER, CELIA (LAUGHTON), poet, was born at Portsmouth, N. H., in 1836. Her father was the lighthouse keeper of the White Island light on the Isles of Shoals, and she drew much of the material of her prose and verse works from the sea. In 1851 she married Levi L. Thaxter. She wrote *Among the Isles of Shoals* (1873); *Poems* (1874); *Drift-wood* (1878); *The Cruise of the Mystery* (1886); *An Island Garden* (1894). She died in 1894.

THAYER, a co. in s.e. Nebraska, adjoining Kansas; drained by the Little Blue river and Big Sandy creek; traversed by the Chicago, Rock Island, and Pacific, and the Burlington Route railroads; 576 sq. m.; pop. '90, 12,738. Co. seat, Hebron.

THAYER, ABBOTT HENDERSON, an American artist, born in 1849. He studied in Paris under Gerôme and Lehmann, and received a medal at the Paris exposition of 1889. He was elected a member of the society of American artists in 1879. He has painted, notably, a "Virgin Enthroned" and a "Madonna," and many pictures of flowers.

THAYER, ARTHUR WILDER, American composer, b. in Dedham, Mass., Aug. 26, 1857. He studied singing under Charles R. Adams, harmony, counterpoint, and instrumentation under George W. Chadwick, and conducting under Karl Zerrahn. After conducting choral societies in Lowell, Salem, Worcester, Providence, and other towns, he was superintendent of music in the public schools of Dedham and Milton. He is now director of music at Eliot Church, Newton, and a member of the Howard Musical Association. His works are chiefly songs and part-songs, many of which were written for the Apollo Club of Boston. They include: *Rosalind's Madrigal*; *Bugle Song*; *Sea-Greeting*; *Muleteer's Song*; *The Quiet Moon upon the Clouds*; and *My Sweet Sweetying, Beware*.

THAYER, JOSEPH HENRY, D.D., b. Boston, 1828; educated at Harvard college and Andover theological seminary; for a short time pastor of a Congregational church in Salem, Mass., and an army chaplain. In 1864 he became associate professor of sacred literature in Andover theological seminary, and in 1884 in Harvard divinity school. A translation of Winer's *New Testament Grammar* and of Buttmann's *New Testament Grammar* are among his published works.

THAYER, SIMEON, 1737-1800; b. Mass.; served in the French and Indian war, 1756-57, and was taken prisoner at Fort William Henry. On the outbreaking of the revolution he received a capt.'s commission, and was with Arnold in the Quebec expedition, where he was made prisoner. After his release he did gallant service at Red Bank, Fort Mifflin, and the battle of Monmouth, where he was severely wounded. In 1781 he left the army. He wrote a *Journal of the Invasion of Canada in 1775*.

THAYER, SYLVANUS, 1785-1872; b. Mass.; educated at Dartmouth college and at West Point. He was appointed to the engineers, served through the war of 1812, and was chief engineer of Gen. Dearborn, Gen. Hampton, and Gen. Porter, successively. Visiting Europe on professional duty, he witnessed the movements of the allies before Paris, and studied the military systems of France and other countries. He was superintendent of the U. S. military academy, 1819-33, and raised it to a high standing. He afterwards supervised the construction of the defenses of Boston harbor. In 1857-58 he commanded the corps of engineers. He was retired in 1863 with the rank of col. He founded the Thayer School of Civil Engineering at Dartmouth college, and a free public library in his native town of Braintree.

THAYER, THOMAS BALDWIN, D.D., b. Boston, 1812; educated in Boston; pastor of a Universalist church, Lowell, Mass., 1833-45; and in Brooklyn, N. Y., 1845-51; returned to Lowell, 1851; settled in Boston, 1857-69. He was editor of the *Universalist Quarterly*; and published *Christianity against Infidelity*; *The Theology of Universalism*. He d. 1886.

THEA. See TEA.

THEATER, a place for public representations, chiefly of a dramatic or musical description. Theaters are of very ancient origin. They were found in every Greek city, both at home and in the colonies, and many very interesting specimens of the Greek theaters still exist in very good preservation. These were not built like modern theaters, with tiers of galleries rising one over the other, but were constructed with concentric rows of seats rising in regular succession one behind and above the other like the steps of stairs. These seats were frequently cut in the solid rock; and a place where the natural curve and slope of the ground rendered such excavation easy, was generally chosen. The seats, or audience department, were arranged in a semicircular form. In the center, at the lowest point, stood the orchestra; and the proscenium, or place for the dramatic representation, formed the chord of the semicircular auditorium. Behind this was the scena; closing in the building was a solid wall, generally ornamented with pillars, cornices, etc. There was no roof, but the audience was probably protected from the sun's rays by a curtain stretching across the theater. This form of theater was also that adopted by the Romans, who built or excavated large theaters in many of their important towns. The theaters of the Romans differed from their *amphitheaters* (q.v.), the former being semicircular, the latter oval, and with seats all round. Of the theaters still remaining, that of Orange, in the s. of France, is one of the finest, the auditorium being 340 ft. in diameter. During the middle ages, theaters were unnecessary, and were never built. The few dramatic performances then in use, which were chiefly of the nature of holy mysteries, were represented in the cathedrals. From the remains still existing, however, there would seem to have been large open-air theaters at an early age in this country. Of these Piran Round in Cornwall is the best example. It is circular, with raised platforms all round for spectators, after the manner of the Greek theaters. With the revival of classical literature in the 16th c., the classical drama was also reproduced, and naturally along with it the classical form of theater. The first specimens of what may be called modern theaters (although founded on the old Greek model, according to Vitruvius's description) were the Teatro Olympico, erected by Palladio in Vicenza; a similar one in Venice, also by Palladio; and another in Vicenza, by Serlio. In Italy and Spain, open court-yards, with galleries round them, were at first the scenes of dramatic performances. In France and England, where the climate did not so readily admit of open-air representations, the first plays performed were exhibited in tennis or racket courts, in which there were usually galleries at one end; and as this accommodation was found too limited, these were afterward carried along the sides also. But dramatic literature soon became so important that buildings had to be designed for the express purpose of its representation. Accordingly, in Paris, the theater of the Hôtel de Bourgogne was erected in the beginning of the 17th century. It was rebuilt, 1645, with tiers of boxes on a square plan. In 1639, the theatre of the Palais Royal was erected by Richelieu, and was long considered the best model. The present circular plan of the galleries, with pit sloping backward, seems to have been first introduced in Venice in 1639; and the horseshoe form of the boxes was first carried out by Fontana in the Tordinoni Theatre, at Rome, in 1675. The modern form of the auditorium was thus invented, and gradually improved and perfected, till in about a century similar theaters were erected all over Europe; the Scala Theater at Milan, the largest in Italy, and the great theater at Bordeaux, being built, the former in 1774, and the latter in 1777. The plan of the Scala Theatre at Milan shows the general disposition of all the parts of the modern theater on the largest scale. Modern theaters are all very similar in their general distribution. They are divided into two distinct departments—viz., the auditorium or audience department, and the stage or scenic department. In the former, the seats are invariably arranged on a sloping ground-floor or "pit;" and on several tiers or galleries, extending in a semicircular or

horse-shoe form round the house. On the ground-floor, the front rows of seats are generally set apart as "dress stalls," and the back part only is then called the "pit." In opera-houses, the stalls generally occupy the greater portion of the space, and the "pit" is reduced to a minimum. In dramatic theaters, the tiers of galleries have the floors arranged in stages, rising above one another in such a manner as to enable the spectators all to see over those before them to the front of the stage. In theaters for operatic representation, the galleries have the floors laid level, and are divided all round into private boxes. The top tier is, however, sometimes left partially open, and has the seats on stages. In the larger opera houses, there are usually retiring-rooms connected with each of the private boxes. There is also a "crush-room," or large saloon, in which the audience may promenade between the acts. In all French theaters and opera-houses, these saloons, or *foyers*, are very large, and elegantly fitted up. They are almost always over the entrance-hall. In some of the modern French theaters, there are two foyers, one over the other, for the different classes who occupy the dress circle and the upper galleries. The question has often been raised as to the best form for a theater, both for hearing and seeing. It is a most difficult question to decide theoretically as regards hearing, but it is quite clear that the old semicircular plan of the Greeks is as nearly as possible the best for seeing, as it places the seats all round at an equal distance from the center of the proscenium; and therefore we find, where seeing well is all-important, as, for instance, in a *lecture theater*, this old form is usually adopted. In an oblong house, on the other hand, the seats at the center of the galleries are much further removed than those at the sides from the center of the stage, and are thus at a disadvantage as regards hearing; while the side boxes are badly placed for commanding a view of the stage. The entrances and staircases of theaters are not generally so well arranged or so spacious as they should be. In French theaters, this is especially the case. In these, there is often only one narrow wooden stair on each side of the house, leading to all the galleries. Recent accidents by fire, and the risk the audience runs in case of want of proper exits, have drawn attention to this subject, and the legislature will probably determine that there must be a separate, wide, and easy stair to each gallery—as, indeed, there usually now is in theaters recently built in this country. For large galleries, these stairs should be at least six feet wide; and a strong iron hand-rail down each side of the stair would be found useful in case of a panic, to prevent a fatal crush. Besides the main passages for the use of the public, there ought to be private passages and doors leading to every part of the house, so that the manager may pass with ease to any point in the audience where his presence may be required.

The orchestra occupies the space immediately in front of the proscenium, and this space is arranged so as to be capable of being enlarged or contracted as occasion may require. The proscenium is a small portion of the stage which projects a few feet in front of the curtain, so as to enable the actors to stand well forward, that they may be distinctly heard by the audience. The part of the house on either side of the proscenium is that on which there is usually the greatest amount of ornament. The sides and ceiling of the proscenium form, as it were, the frame through which the picture represented on the stage is seen; and as on it every eye must rest, it is made more ornate than the rest of the auditorium. The ceiling, presenting as it does a large broad surface, and being well seen from many parts of the house, is also a place well adapted for ornament, and is generally made as handsome as possible. The same remark applies to the fronts of the dress circle and galleries. The stage extends backward from the proscenium, and ought to be of considerable depth, so as to admit of the scenic effects, dissolving scenes, etc., now so much run upon. The great length of the stage from front to back is one of the most striking differences between the modern and the ancient theater, and arises entirely from the introduction and development of movable scenery—an invention of the architect Baldassare Peruzzi, and first used in Rome before Leo X., in 1508. The floor of the stage is not laid level like the floor of a room, but is sloped upward from front to back, so as to elevate the performers and scenes at the back, and render them more easily seen. The inclination of the stage is generally about half an inch to every foot. The stage department of a theater not only requires to be very long, but also very lofty above, and deep below the stage, so as to allow the large frames on which the scenes are stretched to be raised or lowered in one piece. The stage itself is a most complicated piece of mechanism, a considerable part of it being made movable either in the form of *traps*, for raising or lowering actors, furniture, etc., or in long pieces, which slide off to each side from the center, to allow the scenes to rise or descend. There are also *bridges*, or platforms constructed for raising and lowering through similar openings, some of them the full width of the stage. The traps and bridges are almost all worked by means of balance-weights, and the slides by ropes and windlasses. Besides the large *frames* above described as containing pictures occupying the full opening of the stage, there are other scenes which are pushed from the sides to the center, each being only one-half the width of the opening. These are called *flats*, and usually slide in grooves above and below. The grooves are arranged in clusters at intervals, having clear spaces between, called the *entrances*, through which the actors pass on and off the stage. But in modern French theaters and in the opera-houses—such, for instance, as Covent Garden theater—these grooves are regarded as an incumbrance to the stage, and are entirely done away with. Their place is occupied by narrow openings or *sits* in the stage, below which are

blocks running on wheels, and containing sockets, into which poles are dropped from above, and to these the flats are attached. Another advantage of this system is, that the gas-wings and ladders may be made movable, and slip backward and forward in the same manner as the flats. When occasion requires, the whole stage can thus be entirely cleared. According to the old plan of fixed grooves, only the center of the stage can ever be cleared without unscrewing all the grooves, and the gas-wings must always remain in the same relative position. Besides the flats, there are also smaller scenes which move in the grooves. These are called *wings*, and are used to screen the entrance. Corresponding to the wings are similar narrow scenes dropped from above: these are called *borders*, and are used to hide the gas-battens. These and the scenes which are drawn up, the gas-battens, etc., are all worked by means of ropes from the *flies*, or galleries running along the sides of the stage at a high level. The ropes from these passing up into the barrel-loft (a space in the roof filled with large drums and barrels on which the ropes are coiled) and down again to the flies, form a complication which seems to the uninitiated observer an inextricable mass of confusion. While such is the usual arrangement connected with movable scenery, it is to be noted that latterly a very great change has been introduced into the higher class of theaters. This change consists in the dismissal of wings or sliding side portions of scenes with intervening gaps, and substituting for them large pieces of scenery resembling the sides and further end of a room—an arrangement every way more natural. In cases of this improved kind, the actors enter on the stage and depart by doors. In connection with the stage, it is usual to have a large space set apart for containing scenery, called the *scene-dock*. This is frequently placed at the back of the stage, and may, on occasion, be cleared out, to give extra depth to the scene. There are also numerous apartments required in connection with the stage for the working of the theater—such as manager's room; dressing-rooms for the actors and actresses; the "green-room," in which they assemble when dressed, and wait till they are called; "star-rooms," or dressing-rooms for the stars; the wardrobe, in which the costumes are kept; furniture stores, scene stores; "property"-makers room; and workshops for the carpenter, gas-man, etc. There must also be a good painting-room, which must necessarily be a large apartment, from the size of the pictures which have to be painted—each being the full size of the opening of the stage. The canvas for these scenes is stretched on frames, which move up and down by means of a winch with balance-weights; and thus the painter stands comfortably on the floor, and moves his picture up or down, so as to get at any part he wishes. An interesting point on the stage is the prompt corner, from which the prompter has command of all the lights of the house, and bells to warn every man of his duty at the proper moment. He has a large brass plate, in which a number of handles are fixed, with an index to each, marking the high, low, etc., of the lights; and as each system of lights has a separate main pipe from the prompt corner, each can be managed independently. The side of the house on which the prompter is seated is called the "prompt side," and the other side is called the "O. P." or *opposite* side.

The house, or auditorium department, is generally lighted by means of a large luster or sun-light in the center of the ceiling, and much of the effect of the building depends on how this is managed. There are also usually smaller lights round one tier of the boxes at least. The proscenium is lighted by a large luster on each side, and by the foot-lights, which run along the whole of the front of the stage. These are sometimes provided with glasses of different colors, called mediums, which are used for throwing a red, green, or white light on the stage, as may be required. The stage is lighted by rows of gas-burners up each side and across the top at every entrance. The side-lights are called *gas-wings*, or *ladders*; and the top ones, *gas-battens*. Each of these has a main from the prompt corner. They can be pushed in and out, or up and down, like the scenery. There is also provision at each entrance for fixing flexible hose and temporary lights, so as to produce a bright effect wherever required. The mediums for producing colored light in this case are blinds of colored cloth. Another means of producing brilliant effects of light is the lime-light, by which, together with lenses of colored glass, bright lights of any color can be thrown on the stage or scenery when required.

Theaters are usually either very cold or insufferably hot. This arises from want of proper means of heating, and insufficient ventilation. The center luster is the great cause of ventilation, the draught caused by its heat drawing off the foul air at the ceiling. The suction caused by this withdrawal of air is naturally supplied from the great body of air in the stage. The stage ought, therefore, to be moderately heated by means of hot-water pipes or otherwise, so as to prevent cold draughts. The passages and lobbies round the house should also be heated in the same way, so that any air drawn in to the house may be properly tempered. An attempt has been made in Paris, of late years, to obviate the great heat and draught caused by the center luster, by doing away with the luster, and making the ceiling partly of glass, with powerful lights and reflectors behind the glass in the roof. This mode of lighting is, however, of rather a subdued character for a theater, although very appropriate to such chambers as the house of commons, where it acts admirably. In Paris they have also tried to supply fresh air from the gardens outside by means of a large tube, from which numerous small tubes branch and distribute the fresh air all round the theater from the fronts of the boxes round the proscenium, etc. The idea is an excellent one, and is said to answer well practically.

There is a novel and agreeable class of theaters now in use in Germany, but of which there are no specimens in this country. It consists of a double auditory, one at each end of the stage. One of these auditories is arranged and lighted in the usual manner, and is called the winter theater. The other auditory is called the summer theater, and is so arranged that performances may be represented in daylight during the summer season. It is lighted by large windows in the outer wall, which corresponds in form to the interior curves of the galleries, and also by windows in the roof. The entrances are by means of staircases at each side, near the proscenium, and by wide corridors and balconies round the curve of the exterior wall. One of the most effective of these summer-theaters is the Victoria in Berlin, by Zitz.

The art of *dramatic representation* has undergone great changes. In ancient Greece, partly from the character of the subjects selected, and partly from the origin of the drama itself, costume and acting were conventional, artificial, and stereotyped. On this point, we quote the words of Witzschel, who has written a handbook for students on the Athenian stage. (Eng. transl. by Paul; ed. by T. K. Arnold, Lond. 1850): "There can be no doubt," says he, "that the somewhat fantastic costume which was handed down without any change from one generation of actors to another was closely connected with the religious character of their tragic performances. The peculiar fashion and brilliant colors of the tragic wardrobe belonged rather to the Dionysian solemnities than to the stage. That Æschylus, by whom the greater part of it was invented, kept steadily in view the original intention of tragedy is evident from the notices which we find in ancient writers of his theatrical dresses having been worn in other religious ceremonies and processions. It is only reasonable to suppose that he would have given to the tragic stage a wardrobe of a very different description had he not been influenced by the conviction, that theatrical performances were in some sort a religious ceremonial. Another proof of the feeling entertained on this subject may be found in the ridicule with which Aristophanes overwhelms Euripides for introducing his heroes, not only in pitiable situations but in dirty, ragged, and beggarly weeds, to the great disgust of all true-hearted Athenians, and the utter annihilation of tragic ideality. In the *Acharnenses*, the whole of the tragic poet's squalid wardrobe is held up to public derision.

"The tragic costume for male characters of the highest rank consisted of an embroidered tunic with sleeves, which, in the older personages reached to the feet (*chiton poderes*), and in the younger to the knees. Over this was thrown a green pall, or long mantle (Gr. *surma*, Lat. *palla*), which also reached to the feet, and was richly ornamented with a purple and gold border. Persons of high but not royal rank wore a shorter red mantle, embroidered with gold, which was partially covered by a richly-embroidered, high-fitting scarf. Soothsayers wore over the tunic a kind of a network, composed of woolen threads. A sort of waistcoat (*kolpōma*) was also worn over the tunic. This was the costume of powerful and warlike sovereigns, such as Atreus, Agamemnon, etc. Dionysus (Bacchus) appeared in a purple tunic, which hung negligently from an embroidered shoulder-knot, and a thin, transparent, saffron-colored upper robe, with a thyrsus in his hand. Even Hercules himself was not the athletic hero of the old mythology, with a lion's skin thrown loosely round his muscular limbs, but a solemn, theatrical personage, enveloped in a long mantle. The costume of a queen was a flowing purple robe, with a white scarf; and for mourning, a black robe, and blue or dark yellow shawl. Persons in distress, especially exiles, wore dirty-white, dark-gray, dingy-yellow, or bluish garments. . . . To increase their height, the tragic performers wore the cothurnus, a sort of buskin, with high soles and still higher heels, which compelled them to walk with a measured and sounding tread; and a top-knot of hair, or toupet (Gr. *ongkos*), suitable to the age and condition of the character represented. A corresponding breadth of figure was produced by means of padding and by a sort of glove. Thus equipped, the tragic hero seemed a giant as compared with ordinary mortals. Lastly, they had the mask, a part of the ancient theatrical costume which seems to us so strange and unnatural. For its meaning and origin we must go back to the Dionysian festival, at which the excited crowd were wont, in honor of the jolly god, to smear their faces with lees of wine; and at a later period, when dramatic interludes were attempted, with vermilion, or to cover their cheeks with rude masks of bark. In the course of time these primitive inventions were discarded, and their places supplied by linen masks, characteristically painted. For the sake of retaining this uncouth but distinctive appendage of the Dionysian festival, the Greeks were content to forego the delicate expression of feeling and eloquent play of features which are indispensable to a modern actor; but on the other hand, when we remember the enormous size of their theaters, which scarcely permitted the assembled thousands to hear what was said by the actors, still less to distinguish their features, we are forced to acknowledge that the practice of wearing masks was rather an advantage than an inconvenience." The above description is, in the main, applicable to the Roman as well as the Greek theaters. The only additional point which it is necessary to notice is that, among the ancients, the acting of plays was not (as it is now) a regular and daily, but only an occasional affair, at festival seasons and the like. With the fall of the western empire, the disappearance of classic paganism and classic tastes, and the triumph of the Christianised barbarians of the n. and e., theatrical performances ceased. But the liking for such things is not artificial; it is natural and irrepressible; and gradually, as the ancient culture resumed

something of its former sway, efforts were made, not indeed, to re-enact the majestic tragedy of Greece (for its language was scarcely known), or the pungent comedy of Rome, but to throw into dramatic form the "mysteries," "miracles," and "moralities," of the Christian religion. The rudeness of these mediæval plays may perhaps suggest to us what Greek performances were before the days of Thespis. In fact, they were introduced as a means of edifying, as much as of amusing, the ignorant laity, were customarily the works of monks, and were performed on festive occasions in the churches. It does not, however, appear that they were accompanied by any *scenico* representations. A raised wooden stage like that which forms the front of a traveling show, was all that the untutored taste of the times demanded. Nor are we to suppose for a moment that the slightest attention was paid to propriety of costume or speech. The personages rather than the actions, the ceremony rather than the dialogue, the moral rather than the matter, were the things looked to, and hence no subtle or artistic representation of life and character was possible. The development of the modern drama (q.v.) ultimately restored the art of the actor to its ancient dignity and importance; but it was long before those changes took place that gave theatrical performances their modern character. Good acting—that is to say, skillful impersonation of character and varied elocution—became quite common in England after the restoration, and was not unknown before it; but appropriate costume and scenery were scarcely thought of until the time of Talma (q.v.), toward the close of last century. Since then the best theaters have displayed a most creditable desire to reproduce, with something like verisimilitude, the outward "form and pressure," the garb, deportment, and air of the age represented.

The latest improvement to prevent delay between the scenes has been introduced in the Madison Square Theater in New York city, which has two stages, one above the other. During the performance of a scene the second stage floor is being prepared in the under-space, with all its scenery fixed, and when the curtain falls the first stage rises into the upper regions and the second floor goes up to take its place. These floors are accurately balanced by heavy counterpoise weights, so that the whole of these enormous masses are moved with comparatively little force.

In addition to the above-mentioned parts of the theatre, which are reserved for the mechanical working of the performance, much space is occupied by the "green-room" for the actors and rows of dressing-rooms. An immense deal of storage-room is also required, and some of the Parisian theatres have large magazines for this purpose in the suburbs. In many cases also the atelier for the scene painters is far removed from the theatre, and thus far better space and lighting for the work can be provided.

The painting of theatrical scenery has frequently been the work of artists of very high talent, such as Raphael in Rome, Watteau, Boucher, and Serrandoni in France, and Stanfield in England. Paintings of very high artistic merit and wonderfully decorative effect are now produced for theatrical purposes, especially in France, Germany, and England. In England, especially, great historical and antiquarian knowledge are brought to the aid of this branch of art. The landscapes, in particular, are sometimes works of great beauty, and very beautiful effects of lake scenery, with trees and mountains reflected in the water, are got by setting great sheets of plate glass over the stage floor, slightly inclined, so that a real reflection is thrown by the landscape painted on the scene behind. Another ingenious device, used by Wagner at Baireuth and also in England for magical scenes, was to form a thin and semi-transparent curtain of vapor, which was sent up by a perforated steam-pipe concealed in a groove in the stage.

The various methods of lighting used are an important item in the production of striking effects. The old system of a row of "foot-lights," with their unpleasant upward shadow, is now almost obsolete. Dip candles were used till 1720, when molded candles were introduced into French theatres. The next improvement was the lamp of M. Argand, with its circular wick. In 1822 gas was first used in a Parisian theatre, next came the oxyhydrogen lime-light, used for special effects, and now electric lighting is rapidly superseding all other kinds.

The old way of producing lightning was to blow lycopodium or powdered resin with a bellows through a flame, and this is still used in realistic effects of conflagrations. More effective lightning is now made by flashing the electric light behind a scene painted with clouds in which a zigzag aperture has been cut out and filled with a transparent substance. Thunder is made by shaking large sheets of iron, by rolling cannon balls above the ceiling of the auditorium, and by clapping together a series of planks strung together on two ropes. Wind is imitated by a machine with a cogged cylinder, which revolves against coarse cloth tightly stretched. The sound of rain is produced by shaking parched pease in a metal cylinder.

The orchestra is now usually arranged either below or above the proscenium, so that the musicians are not visible. The prompter is placed at one side, in the wings, so as to avoid the disfigurement of the hood-like box which formerly used to cut the front line of the stage into two halves. This is, however, less convenient for the actors.

Till the middle of the present century little trouble or expense was laid out on dresses and accessories. Certain conventional costumes, made of cheap stuff, were used for

each part, with but little regard to historical correctness. Armor and weapons were made of pasteboard covered with metal foil, and stage jewelry was made of small cup-like pieces of tin formed with many facets. Now, however, no trouble or expense is spared to get the costumes and various properties archæologically correct; real jewels and the richest stuffs are often used for the dresses, as well as real furniture of the most costly sort for the furnishing of the scenic rooms. As much as \$100,000 is sometimes spent before the play can be presented. All this splendor and realism is very hostile to the true interests of the drama; magnificent scenery and the costly accessories are expected by the audience, rather than good acting. In some scenes, such as the procession in the first act of Richard III., as recently represented in New York, the words and acting of the chief performers were almost lost in the general bustle and splendor of the scene. Frequently, too, the noise involved in setting up some elaborate scene behind the stage almost drowns the voices of the actors in front of the drop scene.

The employment of female actors is of French origin, and dates from the first half of the 17th c.; but they were not permitted (without molestation) to tread the English stage till 1661. Before this innovation, female parts were performed by youths; and though it ill consorts with *our* ideas of adequate representation to conceive the parts of Desdemona, Ophelia, Cordelia, etc., executed by those of another sex, it would appear that several actors obtained a wonderful success in this line.

The title of "his majesty's servants," which English actors once bore, originated in the fact that some of them were really members of the royal household. The king and particular nobles kept troops of actors for their own pleasure, whom they sometimes permitted to go about the country and perform. The first prince we read of that gave his "servants" such permission, was Richard, duke of Gloucester (afterward Richard III.). In Queen Elizabeth's time (1571), the earl of Leicester's "servants" were licensed to open the first *public* theatre in England, and it is owing to the circumstance of actors having originally formed part of the household of the king that a license from the lord chamberlain is still necessary to the opening of a theatre.

Of American places of amusement, that with the largest seating capacity is the Madison Square Garden, New York, which seats, 6011 people, or with its main floor 11,000 people. The Mechanics' Hall, Boston, seats, 5500; the Auditorium, Chicago, 4041; The Boston Theatre, 3017; the Carnegie Music Hall, New York, 3000; the Metropolitan Opera House, New York, 2842; the Academy of Music, New York, 2700; the Music Hall, Boston, 2588; the Academy of Music, Philadelphia, the St. Charles Theatre, New Orleans, and Whalen's New Grand Metropolitan Theatre, St. Louis, 2500 each; the Chestnut Street Theatre, Philadelphia, and the New Olympic Theatre, St. Louis, 2400 each; Kernan's Monumental Theatre, Baltimore, and the Chicago Opera House, 2300 each; the Star Theatre, New York, 2243; the Columbia Theatre, Chicago, the Standard Theatre, Chicago, the French Opera House, New Orleans, and Niblo's Garden, New York, 2200 each; the Grand Opera House, Detroit, Dickson's Grand Opera House, Indianapolis, and the Columbia Theatre, San Francisco, 2100 each; Ford's Grand Opera House, Baltimore, Kelly's Front Street Theatre, Baltimore, the Globe Theatre, Boston, the Academy of Music, New Orleans, the Grand Opera House, New York, the Grand Opera House, St. Louis, the Standard Theatre, St. Louis, the Grand Opera House, San Francisco, and the Oakland Theatre, San Francisco, 2000 each. See Donaldson, *The Theatre of the Greeks* (8th ed., 1875); Malone, *History of the Stage*, (1820); Collin, *Annals of the Stage* (1879); Donnet, *Théâtres de Paris* (1821); Salomons, *Constructi des Théâtres* (1871); Constant, *Principaux Théâtres Modernes* (1870); Pougin, *Dictionnaire du Théâtre* (1884); Geary, *Law of Theatres and Music Halls* (1885); Seilhamer, *History of the American Theater* (3 vols., 1891). See DRAMA.

THEATINES, one of the more modern religious brotherhoods of the Roman Catholic church, which played a very important part in the well-known internal movement for reformation which took place in central and southern Italy toward the middle of the 16th c., and which Ranke has described in his *History of the Popes*. The founders of this association were a party of friends: Cajetan di Thiene; John Peter Caraffa, at that time bishop of *Theate* (from which the congregation took the name *Theatine*); Paul Consiglieri; and Bonifazio di Colle. Cajetan and Caraffa, in concert with the two other friends named above, having resigned all their preferments, obtained a brief of Clement, dated June 25, 1524, formally constituting the new brotherhood, with the three usual vows, and with the privilege of electing their superior, who was to hold office for three years. One peculiarity of their vow of poverty deserves special notice: they were forbidden to possess property, and were to subsist entirely upon the alms of the faithful; and yet they were strictly forbidden to beg, or in any way to solicit charitable contributions. Their first convent was opened in Rome, and F. Caraffa was chosen as the first superior. He was succeeded in 1527 by Cajetan, and the congregation began to extend to the provinces. After a time, however, it was thought advisable to unite it with the somewhat analogous order of the Somaschans; but this union was not of long continuance; Caraffa, who was elected pope, under the name of Paul IV., having restored the original constitution in 1555. By degrees, the Theatines extended themselves, first over Italy, and afterward into Spain, Poland, and Germany, especially Bavaria. They did not find an entrance into France till the following c., when a house was founded in Paris under cardinal Mazarin in 1644. To their activity, devotedness, and zeal, Ranke

ascribes much of the success of that remarkable reaction against Protestantism which took place in the latter half of the 16th century. In later times, however, they do not appear to have played any notable part. Their most remarkable member in modern times has been the celebrated Sicilian, Father Ventura, author of the well-known work *Bellezze della Fede*, and familiar to Englishmen by the part which he took in the Italian revolution of 1849. At present, the Theatine order is confined to Italy and Sicily.

THÉÂTRE LIBRE (Fr., free theatre). The name of an enterprise due to the energy and enthusiasm of a young Parisian, André Antoine, who on March 30th, 1887, opened a small theatre at Montmartre, which was to be conducted on the following original plan: The season consists of eight representations given only once a month from October to June; a different piece is produced at each representation; no tickets are sold to the public, but the spectators consist of the subscribers to the venture, and such persons as may be invited by the author or by M. Antoine; and the whole conduct of the affair is strictly private. The design is to give young authors a chance to try their strength; and also for art's sake, to produce plays, which for any reason, political or moral, might be forbidden by the censorship if undertaken at the public theatre. The Théâtre Libre has, in its way, been very successful. By 1890, thirty authors have been represented on its stage. Among them such famous writers as Zola, de Goncourt, Ibsen, Tolstoi, and Tourguéneff. Twenty-three of the new pieces so produced, have subsequently been given at the public theatres. With a few exceptions, the actors at the Théâtre Libre have been amateurs who receive a very small remuneration.

The idea of the Théâtre Libre has been copied in the Freie Bühne of Berlin, and both in London and Boston a movement to establish a similar house was begun in 1891. See on the subject George Moore's *Impressions and Opinions* (1891).

THEBAINE. See **OPIMUM**

THEBES, the name of a celebrated Egyptian city, called by the Egyptians Taape, or Taouab; by the Hebrews, No-Amen; by the Greeks, Thebæ; and at a later period, Diospolis Magna. It lies in the broadest section of the valley of the Nile, in about lat. 26° n., and was formerly the capital of Southern or Upper Egypt. Its ruins, the most extensive in that country, comprise nine townships, the most remarkable of which are Medinat Habu, Gournah, Karnak, and Luxor. Its local and eponymous god was Amen-Ra, or Jupiter Ammon; and its foundation traditionally dated from the time of Menes, the founder of the monarchy, although no remains of so early a date have been discovered on the site. Recently, however, excavations have brought to light constructions of the 11th dynasty, who appear to have founded the original temple of the god. The Nile flows through the midst of the ancient city, and divides it into four principal quarters: Karnak and Luxor, which lie on the e. bank, and Gournah and Medinat Habu, on the w. bank of the river. The most flourishing period of the city was under the 18th, 19th, and 20th dynasties, or from about 1500 to 1000 B.C., when it had supplanted Memphis, the ancient capital of the Pharaohs. The more central situation of this city probably caused it to rise into importance, for it was secure against the northern enemies of Egypt; hence, under these Diospolitan dynasties, the worship of Amen-Ra arose in all its splendor; magnificent palaces and temples were built in its different quarters, to which additions were made by later monarchs, and even by the Ptolemies and Romans till the time of the Antonines, in the 2d c. A.D. Here, too, were the cemeteries of the Theban monarchs and the officers of their courts, colleges of priests, and the seat of royal government. It was enriched by the spoils of Asia and the tributes of Ethiopia, and its fame and reputation had reached the early Greeks, Homer describing it by the epithet of Hekatompylos, or City of a Hundred Gates, in allusion to its propylæa, for Thebes was never a fortified city. In the plenitude of its power it sent forth an army of 20,000 war-chariots; but the Bubastite and Tanite dynasties removed the capital again to Sais and Memphis, and Thebes declined in importance, although retaining much of its ancient grandeur. At the Persian conquest, Cambyses obtained a spoil of nearly £2,000,000 from the city, destroyed many of its noblest monuments, and injured its political pre-eminence. The foundation of Alexandria by Alexander the great, and other causes, still further injured the city; and although some repairs were made under the subsequent monarchs, its grandeur had departed. At the time of Strabo. Thebes was only a cluster of small villages. When that geographer visited the city its extent was about 9½ m. in length (according to Diodorus), its circuit was about 16 miles. Its temples, tombs, and ruins were visited by the Roman travelers; and Germanicus and Hadrian inspected the sculptures of the temples. At a later period, a considerable Christian population existed under the empire; but the inhabitants fled at the Arab invasion to Esneh; and Thebes is now inhabited only by a few Arab families of Fellahéen, who obtain a precarious livelihood by guiding travelers over the ruins, or rifling the tombs for antiquities. At Gournah is to be seen the Memnoneion, built by Ramesses II.; with a colossus of that monarch, weighing 887½ tons, the largest statue in Egypt, broken. This is supposed to be the palace of Osymandyas, described by Hecateus, and is of considerable extent. In this quarter are two palace-temples of Amenophis III., and the vocal Memnon, or celebrated colossus of that monarch, supposed by the ancients to emit a sound at sunrise. At Medinat Habu is a pile of build-

ings, commenced by Thothmes I., of the 18th dynasty, with courts and propylæa, built by Ramesses III. or Rhampsinitus, and sculptures representing his victories over the Philistines, the life in his harem, the riches of his treasury, and a calendar with inscriptions dated in the twelfth year of his reign. Here, 8,000 ft. to the n.w., are the cemeteries of sacred apes; and 3,000 ft. beyond, the valley of the tombs of the queens, consisting of 17 *syringes*, or sepulchers, supposed to be the tombs of the Pallacides of Amen, mentioned by Diodorus and Strabo. Near them are the Biban-el-Meluk, or tombs of the monarchs of the 19th and 20th dynasties, 16 in number, the most interesting of which are that of Sethos I., called Belzoni's, after its discoverer, and those of Ramesses III., and Siptah. At Gournah itself are the tombs of functionaries and others, and this latter site has enriched the museums of Europe with antiquities of various kinds. The palaces of the Luxor quarter were founded by Amenophis III. From hence was removed the obelisk of the Place de la Concorde in Paris. Still more magnificent than any of these is the temple of Karnak, the sanctuary of which, built by Osertesen I. of the 12th dynasty, was added to by the monarchs of the 18th dynasty. The most remarkable part of this wonderful mass of courts, propylæa, and obelisks, is the great hall, 170 ft. by 329 ft., built by Sethos I. and Ramesses II., having a central avenue of 12 massive columns, 60 ft. high, 12 ft. in diameter; and 122 other columns, 49 ft. 9 in. high, 27 ft. 6 in. in circumference; and 2 obelisks, 92 ft. high, and 8 ft. square. In this temple is also the so-called portico of the Bubastites, built by Shishak I., recording his expedition against Jerusalem, 971 B.C. The Ptolemies also restored this building.—Diodorus, i. 45; Strabo, xvi. p. 816; Wilkinson, *Topography of Thebes* (8vo. Lond. 1835); Champollion, *L'Égypte*, i. p. 199, and foll.; *Lettres*, pp. 63–173; Belzoni, p. 58.

THEBES, the principal city of Beotia, in ancient Greece, was situated in the southern part of the country, on the slopes of Mount Teumessus, and between two streams, the Dirce and the Ismenus. According to the prevalent tradition, Thebes was founded by a colony of Phenicians under Cadmus (q.v.), after whom the city was called Cadmeia—a name subsequently restricted to the citadel; but passing over the long series of picturesque and tragic myths that have given it its pre-historic fame (in which the central figure is Œdipus), we first catch a quasi-authentic glimpse of Theban history in the 8th c. B.C., when one Philolaus, a Corinthian, settled in the place, and drew up a code of laws for the inhabitants. It is not till near the end of the 6th c. B.C., however, that we reach a purely historical period—the earliest well-attested event being the dispute between Thebes and another Beotian city, Plateæ, which involved the former city in an unsuccessful war with Athens. Henceforth, the relations of Thebes and Athens were, except for brief intervals, marked by bitter enmity. During the Persian war Thebes shamefully sided with the Asiatic invader, and, in consequence, lost much of her power and prestige. Athens proposed to deprive her of her supremacy over the Beotian confederacy; but Sparta, always jealous, even to spitefulness, of her Attic rival, interfered, and positively forced the other Beotian cities to acknowledge anew their unworthy mistress. When the Peloponnesian war broke out, Thebes took part with Sparta, and at its close, was eager for the destruction of Athens; but soon after it became jealous of the overgrown power of its ally, and gave a friendly welcome and shelter to those Athenians whom the oppression of the Thirty Tyrants (q.v.) compelled to abandon their city. It was from Thebes that Thrasybulus and his co-patriots started on their famous expedition for the deliverance of Athens, accompanied by a body of Theban citizens. A keen and bitter antagonism now sprung up between Thebes and Sparta, which, after many vicissitudes, ended in a great military struggle (379–362 B.C.), in which the former city, under the heroic guidance of Epaminondas (q.v.), achieved a brilliant triumph, and for a time held the position of the foremost power in Greece. It was now the time for Athens to revive her ancient animosities; and for a while they had free play. At length the eloquence of Demosthenes induced both states to unite in opposition to the encroachments of Philip of Macedon; but it was too late; and in 338 B.C. the battle of Chæroneia crushed the liberties of Greece. After Philip's death the Thebans made a fierce but unsuccessful effort to regain their freedom. Their city was taken by Alexander, who levelled it to the ground, and sold the entire population—men, women, and children—into slavery. For 20 years it remained an utter desolation; but in 315 B.C. it was rebuilt by Cassander, who gathered into it all the Thebans he could find in Greece. It was again destroyed by the Romans, and did not recover till about the decline of the empire. During the 11th and 12th centuries it was the seat of a considerable population engaged in the manufacture of silk; but under the Turks it again declined, though it has still a modern representative, Thebes, or Thiva, with a pop. of '89, 3228. Scarcely a single relic of antiquity has survived the ravages of time.

THECLA, a virgin saint of the early church, whose existence may be considered historical, although all, or almost all, the details regarding her are legendary, being in great measure founded upon an apocryphal book, now lost, entitled *The Periods (circuits) of Paul and Thecla*, the unhistorical character of which is declared by Tertullian (*De Bapt.* ii. 17), and by St. Jerome in his catalogue of ecclesiastical writers. According to the legend, Thecla was a member of a noble family of Iconium in Lycaonia, where she was converted by the preaching of St. Paul, and having devoted herself to a life of virginity,

suffered a series of persecutions from her intended bridegroom, as well as from her parents. As to the manner of her death, nothing is certain. She is styled in the Greek martyrologies the *proto-martyress*, as Stephen is the *proto-martyr*; while in the Roman breviary she is said to have died at the age of 90 in Seleucia, where her tomb was anciently pointed out. The *Acts of Paul and Thecla* was among the books stigmatized as "apocryphal" by Pope Gelasius.

THEINER, AUGUSTIN, 1804-74; b. Breslau, studied at Breslau and Halle; assisted his brother Johann Anton in a work on the history of celibacy; wrote an essay on the papal decretals which found great favor; visited Rome, 1831, became a member of the oratory of St. Philip Neri, fully identified himself with the ultramontane party, was consultant of the holy office. In 1848 he published a work opposing the election of bishops and priests by laymen, and maintaining the temporal sovereignty of the popes; was appointed in 1851 keeper of the secret archives of the Vatican, and published compilations illustrating the ecclesiastical history of the different Christian nations. His greatest work was the continuation of the *Annales Ecclesiastici* of Baronius in 1856. Having in 1869 corresponded with Dr. Döllinger and Prof. Friedrich, and advocated the Old Catholic doctrine and position, he was debarred access to the archives, but his salary was continued, and he remained in the Vatican.

THEISM, the doctrine concerning God, differing from pantheism by the relation which it affirms between God and the world of things; and from deism by the relation which it acknowledges between God and man. The pantheist asserts that God and the world are one; while the theist believes that a personal God, the creator of the world, is independent of it. The deist admits that God is the creator of the world, but denies that he has given a written revelation to man. Consequently, if man could exclude from his mind all the light which comes from revelation, his way would be dark indeed. But as the divine light shines around him, whether or not he acknowledge the source of it, his deism may become almost theism.

THEISS, the largest affluent of the Danube, and the second river of Hungary, rises by two streams, the Black Theiss and the White Theiss, in the Carpathian mountains, on the borders of Galicia. It flows first s. through a mountain-pass; but after receiving the Viso, Iza, Tarancz, and Talabor, it changes its course to w. and s.w., flowing past Tokay to Szolnok, where it curves toward the s.; and after running parallel to the Danube for upward of 300 m. it joins that river about 5 m. below the town of Titel. The principal towns upon its banks are Szigeth, Tokay, Szolnok, Csongrád, and Szegedin. About one half of this last town was destroyed by an inundation of the Theiss in the spring of 1879. Its chief affluents are—the Vörsova, Bodrog, and Hernad, the Szamos, Körös, Maros, and Bega, the most of which are navigable. The Theiss is navigable at Szegeth for small vessels, at Nemeny for steamers, and at Szolnok for large vessels.

THELLUSSON ACT is an act of parliament, 39 and 40 Geo. III. c. 98, passed for the purpose of checking the disposition of testators to accumulate the income of their estates until it should form a large fortune. The late Mr. Thellusson had, by his will, directed his personal property to be invested in land, and the rents and profits of the land to be so purchased, and of his other real estate, to be accumulated during the lives of all his descendants who should be living at the time of his death, or born in a certain time thereafter; and then he limited the accumulated property in favor of certain of his descendants who might be then living at that distant time. The property was said to have consisted of landed estates worth £4,000 a year, besides personalty of about half a million; and it was estimated that the accumulated fund would amount to above 19 millions. The testator's object was to create enormous wealth for the purpose of founding three families to spring from his three sons. For three quarters of a century the questions arising out of this will have been discussed in various forms; but the legislature, soon after the testator's death, took the earliest opportunity of preventing in future testators accumulating the income in this way for more than 21 years, and the above act was passed for that purpose. In the courts the first attempt to upset the will of Mr. Thellusson was to make out that it was too uncertain to be carried into execution—next, that the accumulation was illegal—next, whether males claiming through females would be entitled to a share: all of which attempts to upset the will failed. Ultimately, however, the fund proved not to be so large as was anticipated, and was distributed among a greater number of claimants. The eldest son was created Baron Rendlesham in 1806. The litigation ended by a decree of the house of lords in 1858. The Thellusson act has been extended to Scotland.

THEME, in music, one of the divisions of a subject in the development of the sonata-form; the *cantus firmus* on which counterpoint is built; the subject of a fugue; and a simple tune on which variations are developed.

THEMIS (Gr., "what is established by old law"), in Greek mythology, was the daughter of Uranus and Gæ (heaven and earth), the wife of Zeus, and, by him, mother of the Horæ (hours) and Moeræ (fates), as also of Eunomia (equity), Dikē (justice) and Eirēnē

(peace). She was regarded as the personification of order and justice, or of whatever is established by "use and wont;" and as such was charged by Zeus to convoke the gods, and preside over them when assembled, being likewise represented as reigning in the assemblies of men. In modern art Themis is represented as having her eyes bandaged, and at the same time holding a pair of evenly-balanced scales in one hand, with a sword in the other.

THEMISTOCLES, the great Athenian general and statesman, was the son of an obscure citizen of Athens, and was born about 514 B.C. He was actuated by excessive ambition from a very early period, and began his public career by setting himself in opposition to the principal men of the state, and chiefly Aristides, "the just." It is uncertain whether he was at Marathon, but there is no doubt that the laurels gained there by Miltiades fired Themistocles's ambition. From the time (483) that he got his inconveniently upright rival, Aristides (q.v.), ostracised, he was regarded as the political leader in Athens, being made archon eponymus in 481. In order to recover for Athens the naval supremacy in Greece, and that she might be prepared to meet the expected Persian invasion, he persuaded the Athenians to devote the proceeds arising from the silver mines at Laurium to the construction of a fleet, sagaciously foreseeing that his country's only chance of overcoming her enemy was by sea. In the battles of Artemisium and Salamis (480), disastrous for the Persians, Themistocles, commander of the Athenian fleet, the largest in Greece, to avoid dissensions, was content to serve under Eurybiades the Spartan. On both these occasions it was only by the greatest tact, combined with threats and a judicious outlay of the bribes which he himself had received in profusion, that Themistocles could induce the other commanders to come to an engagement with the Persians. On the night previous to Salamis he sent a faithful slave to tell Xerxes that, unless he came up next day, the Greek fleet would be scattered, and he would miss the chance of an engagement; thus securing either victory to the Greeks or the favor of Xerxes to himself in case of defeat. See SALAMIS. In several other ways did the wily Themistocles contrive to provide for himself a safe retreat at the Persian court in case of disaster. The victory at Salamis raised his reputation to the highest point. Not neglecting his own personal aggrandizement, he sailed round among the Grecian islands, and on various pretexts extorted enormous sums from the inhabitants. Shortly after the Persian invasion, his fellow-citizens began to see through him, and he was accused of bribery and extortion. In 471 he was ostracised and retired to Argos; and finally, to escape being tried for treason, in which he was implicated by the correspondence of Pausanias, he betook himself, in 465, to the court of Artaxerxes, king of Persia; but before he would see the king himself, got permission to wait a year, during which he made himself master of the language and usages of Persia. At the end of this time he managed to raise himself so highly in the king's favor that, after the Persian fashion, the town of Magnesia was appointed to supply him with bread, Lampasæus with wine, and Myus with other provisions. He lived securely at Magnesia until his death in 449. Some authorities assert that he poisoned himself. A monument was erected to Themistocles in the market-place of Magnesia, and it is said that his bones were secretly taken to Attica, and burned there. Undoubtedly Themistocles was a man of very great sagacity and determination, had a quick and keen perception of difficulties both present and future, which his ready invention, backed by promptness of action, enabled him to meet and overcome. On the other hand, he appears to have been possessed of no moral principles, his greatest ambition apparently having been to make himself, by fair means or foul, the greatest man in Greece.

THÉNARD, LOUIS JACQUES, Baron, 1777-1857; b. Nogent-sur-Seine; studied chemistry with Vauquelin in Paris; demonstrator of chemistry in the polytechnique school of Paris, 1797-1837, subsequently professor of chemistry in the college of France and in the university of Paris. The title of baron was given him in 1824; member of the academy, 1833; made peer of France in the same year. He resigned his chair in the university, 1840. With M. Gay-Lussac he published *Recherches Physico-chimiques*. In 1813 he began the publication of *Traité de Chimie Elementaire, Theorique et Pratique*, translated into German and French. He has given more time and money toward developing the scientific institutions of France than any one since Cuvier.

THE NARD'S BLUE. See BLUE.

THEOBALD, LEWIS, was the son of an attorney at Sittingbourne in Kent, at which place he was b. toward the close of the 17th century. His father's business, for which he was educated, proved not much to his mind; and betaking himself to literature, he published, in 1714, a tragedy entitled *Electra*, which he followed up by a number of other dramas. As a poet, he had scant success, and is long since utterly forgotten; but as the favorite butt of Pope, he is immortalized in the *Dunciad* of that writer. Besides this unenviable distinction, "piddling Theobald," as Pope contemptuously termed him, is not without some fair claim to be honorably remembered as one of the most laborious and useful of the early editors and commentators on Shakespeare. In this capacity, dull as he undoubtedly was, he did good service to the poet, which has since been sufficiently recognized. The hatred of Pope he incurred by a pamphlet published in 1726, entitled *Shakespeare Restored, or Specimens of Blunders committed or unamended in Pope's Edition of this Poet*; and if he could not compete with his adversary in wit, he proved

himself a much more complete editor of Shakespeare by his edition in 7 vols. 8vo, published in 1733, which quite extinguished that of his rival. His knowledge of our earlier drama was extensive and minute; and to his judicious application of it, in elucidating the text of the great poet, we remain to this hour not a little indebted. He died in Sept., 1774.

THEOBROMINE, $C_7H_8N_4O_2$, is a crystallizable principle present in chocolate. It is extracted from the cacao-nuts (the seeds of *theobroma cacao*) in the same manner as caffeine or theine is extracted from the coffee, tea, etc., in which that substance occurs. It is less soluble in water than caffeine, but resembles that substance in forming crystallizable salts with some of the acids. By dissolving theobromine in a solution of ammonia, and adding nitrate of silver, a gelatinous precipitate is obtained, which, by boiling with a solution of ammonia, yields a crystalline mass of theobromide of silver, $C_7H_7AgN_4O_2$, in which 1 equivalent of hydrogen is replaced by 1 of silver. This compound, when treated with iodide of methyl, yields iodide of silver and caffeine, which latter may be extracted with alcohol. Hence we arrive at the remarkable conclusion, that caffeine, $C_8H_{10}N_4O_2$, must be regarded as methyl-theobromine, $C_7H_7(CH_3)N_4O_2$.

THEOCRACY, literally, "government by God," is the name given to that constitution of a state in which the Almighty is regarded as the sole sovereign, and the laws of the realm as divine commands rather than human ordinances. Under such a view, the priesthood necessarily become the promulgators and interpreters of the "divine commands," and act as the officers of the invisible Ruler. The most famous example of a theocracy is that established by Moses among the Hebrews.

THEOCRITUS, the creator and most celebrated composer of bucolic poetry, was the son of Praxagoras and Philinna, and b. at Syracuse. The date of his birth is unknown, but the period of his greatest literary activity was probably 272 B.C. About the close of the reign of Ptolemy Soter, he visited Alexandria, where he received instruction, and made his first successful essays in poetry. He came to be patronized by Ptolemy Philadelphus, who assisted his father, Ptolemy Soter, in the government of Egypt; and in honor of his patron, he composed, about 285 B.C., his 14th, 15th, and 17th idyls. He further formed the acquaintance of the poet Aratus, to whom he addressed his 6th idyl. He subsequently revisited Syracuse, where he continued to reside under Hiero II. From his 16th idyl, it may be concluded that he was dissatisfied with the political state of Sicily, and also with the insufficient rewards which his poems received from Hiero; and that, in consequence, he fixed his attention, during his declining years, rather on the life of the country than of the court, and on those scenes of rural nature which form the chief subject of his poetical remains. The idyls of Theocritus are principally representations, dramatic and mimetic in their character, of the every-day life of the Sicilian peasantry. They have been successfully imitated by Virgil, and have given origin at least to that so-called pastoral literature of mediæval and modern times, which is, however, totally deficient in the simplicity, fidelity, and therefore poetry of the Syracusan author. Theocritus knows nothing of the imaginary shepherds of a fictitious Arcadia; his dramatic simplicity and truth are in wide contrast to the affected sentiment, the unnatural innocence, and the artificial simplicity of that unreal world. Comedy and pathos enter freely into his representations of rural Sicilian life, and his idyls retain the charms of freshness and nature even to the present day. They are 30 in number, though all of them are not strictly bucolic, or even genuine. They are written in a mixed dialect, in which the softened Doric prevails; and together with a few lines from a lost poem called *Berenice*, and 22 epigrams in the Greek anthology, make up his remains, of which the best editions are those of Meineke and Paley; and the best translations in English, those of Dr. M. J. Chapman; Calverly (1869); and Andrew Lang (1880).

THEODICY (Gr. *Theos*, God, and *diké*, justice; Lat. *Theodicia*, the judgment of God), a name given to the exposition of the theory of Divine Providence, with a view especially to the vindication of the attributes, and particularly of the sanctity and justice of God in establishing the present order of things, in which evil, moral as well as physical, so largely appears to prevail. The name is of modern origin, dating from the close of the 17th c., or the beginning of the 18th c.; but the theory itself, as well as the mysterious problem which it meant to resolve, is as old as philosophy itself. See EVIL. The first to consider the question in its integrity was the celebrated Leibnitz (q.v.). His work entitled *Essais de Theodicée sur la Bonté de Dieu, la Liberté de l'Homme, et l'Origine du Mal*, was published in 1710. It rose at once to the very highest point of popularity, and was translated into almost every European language. The leading principle of Leibnitz's vindication of God's goodness is the well-known optimistic theory which has been explained elsewhere (see OPTIMISM); but he had been followed by several writers in different countries—as Balguy, Werdermann, Kindervater, Creutzer, Benedict Kapp, and many others. Of these writers, it may be said in general, that they have followed the same method, and have addressed themselves to the same view—viz., the reconciliation with the goodness, the sanctity, and the justice of the one God, the existence of those manifold evils, physical or material, as well as moral, which appear in the present order of things. This view, it will be seen, is strictly limited to one single problem. But in the discussions of the new philosophic systems, and especially that of Hegel, which have arisen in Germany, new difficulties regarding the Christian idea of God have arisen out

of the rationalistic notions of existence in general. To meet those difficulties, a new theodicy has become necessary, and it has begun to occupy the attention of philosophers, especially in France. Two works in particular addressed to this view of the subject may be noticed; the first is M. Maret's *Christian Theodicee, or Comparison of the Christian and the Rationalistic idea of God*, 1845; the second is that of the Jesuit philosopher, Père Gratry, who has devoted the first volume of his course of philosophy, *De la Connaissance de Dieu*, to this special subject. This work was published at Paris, 1853.

THEODOLITE (Gr. *theoô*, I see, *dolichos*, long), an instrument much employed in land-surveying for the measurement of angles horizontal and vertical is neither more nor less than an altitude and azimuth instrument, proportioned and constructed so as to be conveniently portable. Like all instruments in very general use, the variations in its construction are almost numberless; but its main characteristics continue unaltered in all forms. It consists essentially of two concentric circular plates of copper, brass, or other material (the upper plate, or *upper horizontal*, either being smaller, and let into the lower, or *lower horizontal*, or the rim of the lower raised round the outside of the upper), moving round a common axis, which, being double, admits of one plate moving independently of the other. Upon the upper horizontal rise two supports, bearing a cross bar, which is the axis of a *vertical circle* moving in a plane at right angles to the former. This latter circle either has a telescope fixed concentric with itself, or a semicircle is substituted for the circle, and the telescope is laid above, and parallel to its diameter. The circles, as their names denote, are employed in the measurement of horizontal and vertical angles. For these purposes the outer of the horizontal circles is graduated, and the inner carries the index-point and the verniers (q.v.); the vertical circle is also graduated, and the graduations are generally read off by an index-point and vernier firmly attached to the supports. The upper horizontal is furnished with two levels placed at right angles to each other, for purposes of adjustment, and has a compass-box let into it at its center. The stand consists of a circular plate supported on three legs, and connected with the lower horizontal by means of a ball-and-socket joint; the horizontal adjustment of the instrument being effected by means of three or four (the latter number is the better) upright screws placed at equal distances between the plates. The telescope is so fixed as to be reversible, and the adjustments are in great part similar to those of other telescopic instruments, but are too numerous and minute to be here detailed. Both horizontal plates being made, by means of the screws and levels, truly level, the telescope is pointed at one object, and the horizontal angles read off; it is then turned to another object, and the readings-off from the graduated circle again performed; and by the difference of the readings, the angular horizontal deviation is given; and when vertical angles are required, the readings are taken from the vertical circle in a similar manner.

THEODORA, Empress, 508-548; b. Cyprus; a dancer and courtesan at Constantinople, to whom Justinian was married in 525. He proclaimed her empress on his accession to the throne in 527, and she seems to have exerted considerable influence in public affairs. The legislation of Justinian for improvement of the stage was, no doubt, due to her. By that legislation any actor becoming a Christian could not be obliged to remain upon the stage if he had conscientious scruples against doing so.

THEODORE, King of Abyssinia. See **ABYSSINIA**.

THEODORE, of Mopsuestia, a well-known writer of the Syrian church, and especially notable in connection with the controversy of "The Three Chapters," was born of a wealthy and distinguished family at Antioch, in the first half of the 4th century. He was the school-fellow and friend of St. John Chrysostom, and his fellow-pupil under the philosopher and rhetorician Libanius; and he was induced by the earnest exhortation of Chrysostom, to join with him in embracing the monastic life. His theological and scriptural studies were made under Flavian of Antioch and Diodorus of Tarsus; and having received priest's orders, he resided for a time at Antioch, where his learning and eloquence won the highest applause; and afterward at Tarsus, under his old teacher Diodorus. About the year 390, or a little later, he was chosen bishop of Mopsuestia in Cilicia. In 394 he preached in the presence of the emperor Theodosius at Constantinople, on occasion of a synod held in that city. Of his further history little is known; but his literary activity must have been prodigious, if we can judge by the contemporary accounts, and by the number of the works which are ascribed to him, but of which only fragments now remain. The most important of these consisted of commentaries on almost all the books of Scripture, and various polemical writings. A supposed tendency to Pelagian and Nestorian errors was observable in Theodore, and was in part the occasion of the long controversy of the three chapters. This controversy, however, did not arise till long after the death of Theodore, which took place about 427. Considerable fragments of Theodore's commentaries have been published by cardinal Mai in his *Spicilegium Romanum*, and some of his works still exist in Syriac; but by far the greater proportion has been lost.

THEODORETUS (Gr. *Theodoretos*, God-bestowed), a celebrated church historian and theological writer, was born at Antioch about the year 393, and received his name from the circumstance of his being supposed to have been granted as the fruit of earnest prayer, to his parents, who had long been childless. He was educated from early childhood in a monastery, where, among his fellow pupils, were Nestorius and John of

Antioch, both afterwards celebrated in the controversy which takes its name from the former. He was admitted among the clergy of Antioch; and at a comparatively early age became bishop of Cyrus, a city of Syria. His zeal and eloquence were the theme of universal praise, and his success in bringing unbelievers and heretics to the church was almost unprecedented. In the controversies on the subject of Nestorius and his doctrines, which followed the condemnation pronounced by the council of Ephesus in 431, Theodoretus for a time took a warm and active interest. The party of Nestorius was with difficulty brought to an accommodation with Cyril of Alexandria, in virtue of which the condemnation of Nestorius by the council was acquiesced in by John, bishop of Antioch. For a time Theodoretus dissented from this condemnation of Nestorius; and he not only expressed these sentiments in a letter addressed to Nestorius himself, but also wrote formally against the celebrated anathemas of Cyril directed against Nestorianism. But he afterward saw the necessity of yielding, and concurred in the deposition of those bishops who still persisted in their rejection of the council of Ephesus. Nevertheless, he by no means fully accepted the views of Cyril; and when, on Cyril's death, the opposition to Nestorianism began to develop, under the turbulent partisanship of his successor in the see of Alexandria, Dioscorus, into the contrary error of Eutychianism. Theodoretus endeavored to induce Dioscorus to abandon his extreme opinions. Failing in the attempt, Theodoretus composed the work which has often figured in modern controversy, on account of the well-known passage as to the change of the eucharistic elements which it contains, entitled "*Eranistes or the Many-shaped*." This work was regarded by Dioscorus as a renewal of the Nestorian error, and he accused Theodoretus to Domnus, the new patriarch of Antioch, of that heresy. Theodoretus replied with great moderation; but Dioscorus persisted; and having engaged the imperial court on his side, succeeded in obtaining from the emperor Theodosius II. an order confining Theodoretus within the limits of his own diocese. Meanwhile, the Eutychian controversy reached its height, and Eutyches (q.v.) having been first condemned by Flavian, bishop of Constantinople, in a synod held in 448, was afterward absolved in the celebrated robber-council of Ephesus, under Dioscorus in 449. The latter council not only excluded Theodoretus from its sittings, but formally deposed him from his see; whereupon he was compelled to retire to the monastery at Antioch in which he had received his first education. All this, however, was reversed by the general council of Chalcedon, in 451. Theodoretus did not very long survive his restoration. He died about the year 457. His works fill four volumes folio, reprinted in 10 parts 8vo, by Schulze (Halle, 1768-74), and consist of commentaries on many books of the Old Testament and the whole of St. Paul's Epistles; a *History of the Church*, from 325 to 429 A.D., in five books; *Religious History*, being the lives of the so-called fathers of the desert, a series of most curious and interesting pictures of early ascetic life, etc., the *Eranistes*, a dialogue against Eutychianism; *A Concise History of Heresies*, together with orations and a large number of letters.

THEODORIC, surnamed **THE GREAT**, the founder of the Ostrogothic monarchy, which comprised Italy, Sicily, south-eastern Gaul, Rhetia, Noricum, Pannonia, and Dalmatia, was born on the banks of the Neusiedler See, to the s. of Vienna, in 454 A.D. His father, Theodemir, was one of the three brothers (the other two were Walamir and Widimir) who, on the death of Attila (453 A.D.), freed their nation from the yoke of the Huns, and being the representatives of the royal line of the Amali, exercised a united sovereignty over it; but the death of Walamir, and the departure to Italy and Gaul of Widimir with a part of the nation, left Theodoric's father sole ruler of the Ostrogoths who remained in Pannonia. Previous to these events, Theodoric had been given as a hostage to the eastern emperor, in accordance with whose directions he had been accustomed to all kinds of athletic and martial exercises, so that after his return (473) home, he was well qualified to fill the post of ruler of his ferocious and valiant kinsmen, which, by the death of his father, was left vacant in 474. In the previous year, the Ostrogoths had obtained parts of Mesia and Dacia as settlements from the emperor Zeno, and for years they gallantly defended the empire from foreign aggressors, other Gothic tribes included; but the impolitic faithlessness of Zeno produced in revenge the devastation of Thessaly and Macedonia, and subsequently (487) a raid directed on the capital itself. The emperor, to free himself from his troublesome ally, gave him permission to invade Italy, a suggestion gladly adopted by the warlike monarch, who started for Italy in 488; and after forcing his way through the Gepidæ and others who attempted to bar his progress, and gathering recruits on the way, arrived in the summer of 489 on the frontiers of Italy. Odoacer was both forewarned and forearmed; and a desperate conflict between the two powerful armies took place near Aquileia (August 28, 489), distinctly to the advantage of the Ostrogoths. A second and more disastrous defeat was inflicted on Odoacer near Verona (Sept. 27), after which he took refuge in Ravenna; but having again gathered a large force, he was totally routed a third time on the banks of the Adda (August, 490), again blockaded in Ravenna, while the whole of Italy was being subdued; and having at last surrendered, was treacherously murdered (March, 493). Theodoric now assumed the title of *king of Italy*, resisted the claim of suzerainty preferred by the eastern emperor; and with the exception of a victorious campaign against the Franks, to compel them to cease their assaults on the Visigothic dominions, the suppression of a rebellion in Spain against the authority of the

infant monarch, his own grandson Amalric (during whose minority Theodoric administered also the government of the Visigothic kingdom), and an expedition against the robber hordes of the Bulgarians, the whole of his long reign was devoted to the consolidation and development of his new kingdom. His followers only received one-third of the conquered country; the rest was legally secured to the then possessors, and by degrees his barbarous followers were placed upon a footing of harmony with their fellow-subjects. Theodoric made Ravenna his capital; occasionally, when his northern frontier was threatened, removing to Verona. He died in 526. Theodoric holds the very highest rank among monarchs. An uneducated barbarian, and master of a power which even the most formidable of his neighbors, the Franks, could not have long withstood, he showed no desire of conquest; cultivated the friendship and esteem of the surrounding nations; ruled all classes of his subjects with irresistible authority, but with corresponding justice and moderation; zealously promoted agriculture and commerce till Italy again took its old position as the most prosperous country in Europe; and, himself an Arian, exhibited a tolerance of all other sects, which the latter, when their turn for supremacy came, were very far from imitating. The foul blot on his character is the judicial murder of Boëthius (q.v.) and Symmachus, for a supposed connivance with the senator Albinus to restore the authority of the eastern emperor in Italy; but every fact that can be gathered respecting this event bears out the belief that it was the result of a burst of passion, intensified by his extreme, nay, almost morbid, jealousy of Byzantine interference in Italy. The one great error of his administration consisted in his wholly neglecting to assimilate his Ostrogothic subjects with the previous inhabitants, either by a common code of laws, or by common official preferment; for though, under his sway, the evil of this separation did not appear, yet, when the scepter fell to weaker hands, an antagonism necessarily arose between the ruling and the subject races, which was the chief cause of the successful restoration of Byzantine authority in Italy by Belisarius (q.v.) and Narses (q.v.). Theodoric left no son; but his third daughter, Amalaswintha, succeeded him as regent for her son Athalaric; the eldest, Theodiscusa, having become queen of the Visigoths, and the mother of Amalric; and the second, Ostrogotha, the wife of Sigismund, the last king of the Burgundians.

THEODOSIUS, the name of three later Roman emperors.—**THEODOSIUS I.**, surnamed **THE GREAT**, and **THE ELDER**, to distinguish him from his grandson, was of Spanish descent, and was born either at Italica (as Gibbon and those who wish to make him of kin with Trajan maintain), or more probably at Cauca, near Segovia, about 346 A.D. His father, also named Theodosius, was the great general of the Roman empire, who, after freeing South Britain from the savage Caledonians, who roamed over it at their pleasure, and annihilating the formidable rebellion of the Moor Firmus, which threatened to divorce the African provinces from the empire, was conspired against by his many malicious enemies at court, and summarily beheaded at Carthage in 376. Theodosius, who had accompanied his father in his British campaigns, and afterward, by routing the Sarmatians, saved Mesia from devastation, retired from active service after his father's murder, and occupied himself with the care of his patrimonial lands in Spain. But his many virtues and talents were not forgotten at court; and on the defeat and death of Valens (q.v.), his colleague, Gratianus (q.v.), feeling his inability to sustain alone the cares of empire, summoned Theodosius from his retirement, invested him with the imperial purple, and confided to him, Jan. 19, 379, the administration of Thrace, Dacia, Macedonia, Egypt, and the east, and especially the protection of the empire against the Goths. This last charge called for the full exercise of the new emperor's abilities, for the army at his command dared not face the Goths in the open field; and even when, after the death of their able leader, Fritigern, the Ostrogoths and Visigoths separated, each breaking up into several bands, Theodosius found it most prudent to sow jealousy and dissension among them by promises and bribes, and after a four years' so-called campaign, succeeded in pacifying the Visigoths, the Ostrogoths retreating toward Scythia. The latter returned in 386, their ranks swelled by Scythians, but were totally routed in attempting to pass the Danube, and the survivors were transported to Phrygia and Lydia. In 387, Theodosius undertook to restore to the throne of the western empire Valentinian II. (whose sister, Galla, he married), the brother of Gratian, who had been expelled by Maximus; and after a uniformly successful contest, the usurper was captured and put to death at Aquileia. In 392, the suspicious death of Valentinian, and the elevation of the puppet Eugenius by Arbogastes, the real ruler of the west, again summoned Theodosius to interfere; and after two years of preparation, his motley army of Byzantines, Goths, Alans, and Huns, aided by the treachery of some of Eugenius's generals, gained a complete victory over the Gauls and Germans, who chiefly constituted the army of the west; and the two portions of the Roman empire were again united under one ruler. The union, however, lasted only four months, owing to the death of Theodosius, Jan. 17, 395. Theodosius, though a professor of the orthodox Christian faith, was not baptized till 380, and his behavior after that period stamps him as one of the most cruel and vindictive persecutors who ever wore the purple. His arbitrary establishment of the Nicene faith over the whole empire, the deprivation of civil rights of all apostates from Christianity and of the Eunomians, the sentence of death on the

Manicheans and Quarto-decimans (q.v.), all prove this; though the want of evidence for the direct execution of these severe laws, somewhat modifies the unfavorable impression they produce, and inclines us to believe, that, like the massacre at Thessalonica, they were the result of a sudden access of savage passion, carefully fanned by his interested ecclesiastical advisers. His humiliation before St. Ambrose, bishop of Milan, for the massacre at Thessalonica, was regarded by the church as one of its greatest victories over the temporal power. See AMBROSE.—THEODOSIUS II., surnamed THE YOUNGER, the only son and successor of Arcadius (q.v.), was born 401 A.D., succeeded his father when eight years old, and occupied the throne of the east for 42 years. The chief events of his reign were the invasion of the empire by the Huns under Attila, a war with Persia, renewed efforts to extirpate paganism, and the compilation of the *Codex Theodosianus* (see CODE). The emperor himself was the feeblest of rulers, and was much better adapted for the cowl than for the scepter and sword.

THEOGNIS, an elegiac poet of Greece, about 544 B.C. Plato and Suidas say that he was a native of Megara in Sicily, others, and with probability, think he was born in Megara in Greece. In a conflict at Megara between the aristocracy and the democracy, the later prevailed, and Theognis, who belonged to the former, lost his landed property and was banished with his wife Argyris; they found refuge in Thebes. It is not known where he died. He left a work consisting of a series of moral sentences in elegiac verse, and containing many striking sentiments.

THEOGONY, the name given in ancient Greece to a class of poems recounting the genealogy of the gods. Musæus (q.v.) is said to have written the earliest theogony; but his work, as well as the theogonies of Orpheus (q.v.) and others, have perished; that of Hesiod (q.v.) being the only one that has come down to us.

THEOLOGY (Gr. *theologia*, lit., a speaking or writing about God) is a term employed to denote the theory of the divine nature and operation. It first occurs in Plato and Aristotle, who understand by it the doctrine of the Greek gods, and of their relation to the world. Homer, Hesiod, Orpheus, etc., are called *theologoi* (theologians), on account of the subject-matter of their verse. But their theology is at the same time called "mythic," to distinguish it from the "physical" theology of the philosophers, which, reversing the mythic order, concerned itself with speculative inquiries regarding the origin of the world and its relation to the gods. In the New Testament, the word theology does not occur, and the idea seems alien to the simplicity of the primitive Christian faith. The Greek Christians originally designated any deep philosophical apprehension of the truths of religion by the term *gnosis* (knowledge), which was opposed to *pistis* (faith), the simple irreflective trust of the majority of humble believers. First during the 3d and 4th centuries the word theology came into use, especially in connection with such of the fathers as defended the doctrine of the deity of the logos. In this sense, the evangelist John and Gregory of Nazianzen were termed *theologians*. During the same period, the word theology was applied to the doctrine of the Trinity. In the century following, its application was widened by Theodoret, who used it to denote the whole circle of theoretical instruction in religion; and finally, Abelard, through his *Theologia Christiana*, gave the word that comprehensive signification it still bears, as expressive not only of a theoretical but also a practical exposition of religious truth. The word divinity is sometimes used to denote the same thing as theology.

THEOPHILUS, one of the most important precursors of Dr. Faust, was, according to the legend, coadjutor-bishop at Adana, in Cilicia. After the death of his bishop, being unanimously chosen successor, he declined the proffered honor, but was shortly afterward, at the instigation of slanderers, deposed from his former office by the new bishop. He now had recourse to a Jew magician, who took him to a midnight meeting of devils, whose chief ordered him to deny Christ and Mary, and to give a bond making over his soul. The result was that next morning he was re-instated in his office and dignities by the bishop; and now, presuming on the support of his confederates, he began to assume a supercilious and domineering manner. But he was soon overtaken with remorse, and, through 40 days' fasting and prayers, prevailed on Mary to intercede with her son for him, and to get back the letter from the devil, which she laid upon the breast of the repentant sinner, as he lay asleep in the church. Theophilus then made a public confession of his crime, told of the goodness of the Virgin Mary, and died three days after. This legend, whose origin is traced back to an unknown Greek, of the name of Euty-chianus, was brought, during the 10th c., through an equally unknown Neapolitan priest, named Paulus, to the west, where it very quickly spread far and wide. Before the end of the century it was put into Latin verse by Roswitha, and still better, by the bishop of Rennes, who died in 1123 (printed in the *Acta Sanctorum*, Feb. 4, and in *Hildeberti Tironensis et Marbodi Opera*, published by Beaugendre, Par. 1708). Gauthier de Coinsy (died after 1236) turned it into a beautiful French poem (printed in *Œuvres de Rutebeuf*, published by Jubinal, 2 vols.); and the Rhenish compiler of the *Alte Passional* admitted it among his legends of Mary (*Marienlegenden*, published by Pfeiffer, Stuttg. 1846). A Dutch metrical version, in the 14th c., was published by Blommaert (*Theophilus*, Ghent, 1836). The first dramatic handling of the subject was in French by Rutebeuf, a distinguished troubadour of the 13th c. (*Œuvres*, published by Jubinal, 2 vols., Par. 1839); then repeatedly during the 14th and 15th c. in Low-German (*Roman-*

tische und andere Gedichte in altplattdeutscher Sprache, published by Bruns, Berl. and Stettin, 1798; *Theophilus, in Icelandic, Low-German, and other Tongues*, by Dasent, Lond. 1845). The legend of Theophilus is also not seldom to be found inserted in large works, and frequent allusions to it occur in Latin, German, Anglo-Saxon, Icelandic, Swedish, French, and even Spanish literature. It has even been pictorially represented in French churches. With the 16th c. it seems to have disappeared. However much the various versions differ from one another in the minor circumstances, the essential traits remain throughout unchanged; that Theophilus made a compact with the devil in order to recover lost property; that he attained his object, but at the same time nothing more (nothing whatever of magic art), and that Mary rescued the repentant sinner. Through this legend of Theophilus, the oldest known instance of a compact with the devil, there runs a lenient spirit (derived from paganism, and which the Roman Catholic church was able to sanction by interposing the Virgin Mary), which distinguishes it markedly and essentially from the stern Protestant shape of the devil's compact in the Faust-book, which, with vigorous consistency, requires the consignment of the contracting party to hell.

THEOPHRASTUS, the Greek moralist and naturalist, was born at Eresus in Lesbos, and studied philosophy at Athens, first under Plato, and subsequently under Aristotle. The latter took especial interest in him, and according to a rather incredible legend, altered his original name of Tyrtamus into that of Theophrastus (divine speaker), in compliment to the fluent and graceful speech of his pupil. To Theophrastus, moreover, he bequeathed the presidency of the lyceum, his library, and the original MSS. of his writings. Theophrastus proved a worthy successor of the Stagirite. Under his presidency the lyceum sustained its character, and attracted no fewer than 2,000 disciples, among whom was the comic poet Menander. The kings Philipppus, Cassander, and Ptolemy held him in high esteem; and such was the admiration of the people of Athens for him that, when he was arraigned for impiety and triumphantly acquitted, they would have killed his accuser had he not generously interceded. In compliance, however, with the law of Sophocles, which decreed the banishment of all philosophers from Athens, Theophrastus, in 305 B.C., left the city, until the enactment was repealed the very next year by Philo, also a disciple of Aristotle. From that date Theophrastus continued his lectures until his death in 287, at which time he had presided over the academy for 35 years. His birth being unknown, we are ignorant of his age at the time of his death, and conjectures variously give it from 85 to 107 years. On the eve of dissolution, he is said to have complained of the shortness of human life, which ended just when he was about to solve its enigmas. He was accompanied to the grave by the entire Athenian population. He bequeathed his library to Neleus of Scepsis. The great object of his philosophical labors was to develop the Aristotelian system, to explain the difficulties which obscured it, and to fill up the gaps which left it incomplete. Most of the works which he wrote with this object have perished; only the following remain: 1. *Characteres*, in 30 chapters, descriptive of vicious character; 2. *Of Sensuous Perception and its Objects*; 3. A fragment on *Metaphysics*; 4. *Of the History of Plants*, in 10 books, one of the earliest of extant treatises on botany; 5. *Of the Causes of Plants*, in 8 books, of which, however, only 6 remain; 6. *Of Stones*. The best complete edition of Theophrastus is that of Schneider; there are numerous editions of the *Characteres* separately.

THEOPHYLACT, b. Constantinople; was made archbishop of Bulgaria in 1078, and resided at Achrida. He wrote a work on *Education of Princes* for the benefit of his pupil, Constantinus Porphyrogenitus, the son of Michael VII. and the empress Maria. He wrote valuable commentaries on the 12 minor prophets, and on the greater part of the New Testament, compiled chiefly from the works of Chrysostom. He wrote also 75 epistles and several tracts. His works were printed in Greek and Latin at Venice, 4 vols. folio.

THEORY, a word expressing the scientific process of generalization under various aspects.

Theory is, in the first place, opposed to fact, or matter of fact, and signifies that a certain class of facts have been generalized and brought into a single comprehensive statement. It thus corresponds to a principle, general truth, or law of nature. That a half-inflated bladder hung before the fire is expanded till it bursts is a matter of fact; that bodies generally are expanded by heat is the theory or general principle, comprehending the whole class of facts. To give the theory of a fact in this sense of the word is to give its general law; this is also called its explanation, and sometimes its cause. See CAUSE.

Theory, in the next place, is opposed to hypothesis (q. v.). A fact may for a time be referred to a hypothetical or assumed principle; endeavors being meanwhile made to remove the hypothetical character by proving or disproving the principle. The vortices of Descartes was a hypothesis to account for planetary motions; while Newton's view, that gravity might be the cause of these motions, was in the first instance a hypothesis. The Cartesian doctrine was disproved and abandoned; the Newtonian was fully verified, and, ceasing to be a hypothesis, became a theory.

Lastly, theory is opposed to practice. The theory of a subject is the knowledge or explanation of it; the practice is making some use of it. Physiology is theory; physic.

or medicine, is practice. In practical matters there are two modes of procedure which are still further illustrative of the distinction now in hand. The knowledge possessed by a worker in any art may be empirical, experimental, rule-of-thumb—that is, it may be gathered by actual experience in the particular operation. The seaman's knowledge of the prognostics of weather, and the cook's art in boiling and roasting, are usually of this kind. On the other hand the worker's knowledge may be obtained from theory, in other words, from general principles or laws scientifically ascertained; as when the theory of the winds and the law of storms are employed to predict the weather; when the cook roasts and boils according to the known temperature for coagulating albumen; and when a physician prescribes a dietary grounded on a chemical analysis of the food and of the tissues to be maintained. Great caution is required in the employment of such theoretical knowledge in the arts and in practical affairs. It is not enough that the theories are fully established; we must also know all the conditions of the case, so as to allow for every agent operating to produce or to mar the effect. That a cannon-ball should describe a parabola, is a correct theoretical inference from gravity and the laws of motion; but the resistance of the air, a distinct agency, makes it untrue in fact, and therefore misguiding in practice. When this resistance is allowed for, the theory is complete, and its application will no longer disappoint the operator. See DEDUCTION.

THEOSOPHY (Gr. *theosophia*, divine wisdom), the name given to a so-called sacred science, which holds a place distinct as well from that of philosophy as from that of theology, even in questions where these latter sciences have the same object with it, namely, the nature and attributes of God. In investigating the divine nature and attributes, philosophy proceeds entirely by the dialectic method, employing as the basis of its investigation the ideas derived from natural reason; theology, still employing the same method, superadds to the principles of natural reason those derived from authority and revelation. Theosophy, on the contrary, professes to exclude all dialectical process, and to derive its knowledge of God from direct and immediate intuition and contemplation, or from the immediate communications of God himself. Theosophy, therefore, so far as regards the science of God, is but another name for mysticism (q.v.), although the latter name implies much more; and the direct and immediate knowledge or intuition of God, to which the Mystics laid claim, was, in fact, the foundation of that intimate union with God, and consequent abstraction from outer things, which they made the basis of their moral and ascetical system. The theosophic system dates from a very high antiquity; and within the Christian period we may number among theosophs, the Neo-Platonists, especially Plotinus, Iamblichus, and Proclus; the Hesychasts of the Greek church; all those of the mediæval Mystics who laid claim to any dogmatical theory; and in later times, the Paracelsists, Bodenstein and Thalhauser, Weizel, Jacob Böhme, and above all, Emmanuel Swedenborg. If we consider one particular view of the philosophic system of Schelling, he also may be assigned to this school. See OCCULTISM.

THERA, or SANTORIN, an island on the w. coast of Greece, the most celebrated of the Sporades, in the Grecian archipelago; 41 sq. m.; pop. '89, 22,000. According to Strabo it was 700 stadia n.e. from the Cretan coast, and 200 stadia in circumference. Its origin, given by mythology, is a clod of earth thrown from the ship *Argo*; another legend was that it was produced by submarine fires. Between this island and smaller islands of the group is the crater of an ancient volcano. By an earthquake, 237 B.C., the land now forming the little island of Therasia was torn off, giving it the shape of a horse-shoe. The formation of the coast makes an excellent harbor, which, however, has no bottom reachable by anchors, and vessels tie up to the shore. In 1866-70, a new volcano broke out, with a cone which attained the height of 325 feet. The portion which in ancient times was covered with lava, ashes, and pumice-stone, is now a cultivable surface, producing barley, wine, and cotton, which does not require planting every year. It contains an extensive ledge of fine marble which has been undisturbed by volcano or earthquake. The principal industry is shipbuilding, and the inhabitants are Greeks.

THERAMENES, d. B.C. 404; b. Greece. In 410 he was at the battle of Cyzicus and in 408 at the siege of Chalcedon and the capture of Byzantium. He was one of the generals at Arginusæ in 406, and succeeded in saving the lives of the 6 generals condemned for not rescuing the drowning crews. He went on an embassy to Lacedæmon during the siege of Athens by Lysander, and finally, after passing three months with the latter, made peace in behalf of the Athenians. He had an understanding with the exiles of the Athenian oligarchy, and was one of the 30 tyrants. He was put to death by the partisans of Critias, whose measures he had opposed.

THERAPEUTÆ, a pious "Jewish" sect, mentioned in a book ascribed to Philo, as living chiefly on the lake Mareotis, near Alexandria, but as having also numerous colonies in other parts of the world. They are described as in many respects like the Essenes (q.v.). Like them, they lived unmarried in a kind of monastery, were very moderate with regard to food and dress, the latter consisting in a white garment; prayed at sunrise, their face turned to the sun; studied much in the Scriptures—which they explained allegorically—and in other "ancient books," and were principally opposed to slavery. The chief differences between these two "sects," as they are described to us, consisted in the Therapeutæ simply living a life of contemplation, while the Essenes fol-

lowed many occupations, such as agriculture, arts, etc.; the latter lived together, while the Therapeutæ lived separately in their cells; the Essenes not only took an interest in other human beings, but actively assisted them; while the Therapeutæ, who also, before they entered the brotherhood, divided their property among their relatives, contrary to the "common treasure" of the Essenes, kept in utter ignorance of the outer world. Again, the Therapeutæ knew none of the divisions which marked the degrees of initiation among the Essenes, but they held the temple at Jerusalem in much higher veneration than the latter; the Therapeutæ brought up boys to the brotherhood, while the Essenes only recruited themselves from grown-up people. One of the chief characteristics of the Therapeutæ was also the religious meals they used to hold in common on every seventh Sabbath; the Essenes having two such sacred meals daily. Many and striking are also the analogies offered by their mode of life and their doctrines to those of the Pythagoreans. Neither partook, e.g., of animal food or wine, and both admitted women to their assemblies, which were mostly concluded with hymns; and they both held the number seven sacred. Many theories have been broached in regard to this mysterious sect. One of the most plausible notions is the one—latterly much discussed—of the whole book *De Vita Contemplativa*, which treats of this sect, being falsely attributed to Philo. It is rather believed to be the work of an early Christian, intended to idealize the life of Christian monasticism and asceticism of the first centuries. See **ESSENES**.

THERAPEUTICS (Gr. *therapeuo*, I heal) is that division of the science of medicine which treats of the various actions of remedies upon the diseased animal system, or the means by which nature may be aided in her return to health.

THERESA, SAINT. See **TERESA**.

THERESIOPEL, more commonly called **MARIA-THERESIOPEL** (Hung. *Szabadka*), an important town in the *Bácska*, the richest corn district of Hungary, 24 m. w.s.w. of Szegedin, near the Palitsch lake. It contains numerous important buildings, as the churches, gymnasium, and the great barracks. Manufactures of leather and shoes, linen-weaving, dyeing, the production of wine, tobacco, and fruits, together with the rearing of cattle and horses, are the chief branches of industry. Pop. '90, 72,737.

THERIACA (Gr. *ther*, a-wild or a venomous animal), a medicine in the form of an electuary, supposed to be an antidote to the poison of venomous animals. It was invented by Andromachus of Crete, physician to the emperor Nero, and was described in a poem, preserved in Galen's work, *De Antidotis*. This theriac was a mixture of about 70 ingredients, some of them quite inert, and others antagonistic to one another. Yet it continued in repute until recent times, and it is not long since in Venice, Holland, France, and other places, the druggists had to prepare the compound with certain solemnities in the presence of the magistrates. The term theriac was applied to various compounds of a similar nature, and *theriac* and *theriacal* became synonymous with medicinal. The English word *treacle* is a corruption of *theriacal*, and originally meant an electuary, or compound syrupy medicine (e.g., Venice treacle=the theriac of Andromachus); and it was applied to molasses from the similarity in appearance.

THERMIDOR, i.e., the "hot month," formed, in the calendar of the first French republic, the 11th month, and lasted from July 19 to Aug. 18. The 9th Thermidor of the Republican year 2 (July 27, 1794) is historically memorable as the date of Robespierre's fall, and the termination of the Reign of Terror. The name Thermidorians was given to all those who took part in this fortunate *coup d'état*, but more particularly to those who were desirous of restoring the monarchy.—See Duval's *Souvenirs Thermidoriens* (2 vols., Par. 1844.)

THERMO-BAROMETER. A name applied by Bellini, a physician and anatomist, born in Florence, Italy, in 1643, to a syphon-barometer having its two wide legs united by a narrow tube, so that it could be used either in its ordinary position as a barometer, or in the reversed position as a thermometer. In the construction of the instrument there was a wide sealed leg of the barometer which served as a bulb of the thermometer. The word is also applied to a thermometer which indicates the atmospheric pressure at the boiling point of water. The instruments used for this purpose were first applied by Wollaston. They consisted of small metallic vessels for boiling water, fitted with delicate thermometers, graduated from 80 degrees to 100 degrees in such a way that even the one hundredth part of a degree might be estimated, thus making it possible to ascertain the height of a place to within 10 feet by means of the boiling point.

THERMO-DYNAMICS, or the **DYNAMICAL THEORY OF HEAT**, though literally merely the science of the relations of heat and work, is now very generally employed to denote the whole science of **ENERGY**. See **FORCE**. We propose in this place to give a general sketch of this grand modern generalization, supplementary to what will be found in the article just referred to; but, for the sake of continuity, we must repeat a little of what was there given, though in a somewhat different form.

Energy is strictly defined as the power of doing work (q.v.), and is of one or other of two kinds—*potential* or *kinetic*. A raised weight, a wound-up spring, gunpowder, and the food of animals, are instances of stores of potential energy. A missile in motion, wind, heat, and electric currents are instances of kinetic energy. Sound, light, and other forms of wave-motion (see **WAVE**), are all instances of mixed potential and kinetic energy.

The modern theory of energy contemplates its

CONSERVATION,
TRANSFORMATION, and
DISSIPATION.

The CONSERVATION OF ENERGY is the statement of the experimental fact, that energy is, like matter (q.v.), indestructible and uncreatable by any process at the command of man.

The TRANSFORMATION OF ENERGY is the statement of the experimental fact, that any one form of energy may in general be transformed wholly or partially into any other form. This used to be known as the CORRELATION OF FORCES. But it is subject to the condition derived from the first fact, that the portion transformed retains its amount unchanged. It is also subject to the law of DISSIPATION, or degradation, which is a statement of the experimental fact, that energy generally tends at every transformation to at least a partial transformation into heat; and that, once in that form, it tends to a state of uniform distribution, in which no further transformation is possible.

The original energy of the universe, therefore, though still of the same amount as at creation, being in a state of ceaseless transformation, has been in great part frittered down into heat, and will at length take wholly that final form.

The history of the grand discoveries which are briefly summarized in these few lines, has been much discussed of late—especially in the *Philosophical Magazine*—and is now pretty clearly ascertained.

Newton took the first great step. In a scholium to his third law of motion (q.v.), he lays down in a few clear words the conservation of energy as the embodiment of the experimental results known in his day with reference to forces and visible motions. Part of this statement of Newton's was afterward reinvented under the name of conservation of vis-viva; but all that Newton really wanted to enable him to complete the conservation of energy was an experimental knowledge of the nature of heat, electricity, etc. That heat is motion of some kind, not matter, and that the laws of its communication are the same as those of the communication of visible motion, was experimentally proved at the very end of last century by Davy. Rumford had almost completed a proof a year or two before; but he had also made a very fair attempt to determine the "mechanical equivalent" of heat—i.e., the quantity of heat which is equivalent to a given amount of mechanical work. That there is such an equivalent is at once evident by looking at Davy's discovery in the light of Newton's scholium already referred to. But though the dynamical theory of heat was thus really founded in 1799, it was not generally received. The first to recall attention to it was Séguin, nephew of the celebrated Montgolfier (from whom he states that he derived his views), who, in 1839, distinctly enunciated the equivalence of heat and mechanical work, and sought to prove by experiment that heat disappears, or is put out of existence, in the production of work from a steam-engine.

In 1842 Mayer published a short note, in which he enunciated the conservation of energy as a metaphysical deduction from the maxim, *Causa æquat effectum*. He made no experiments to prove this general statement, but he made a calculation of the mechanical equivalent of heat from the specific heats of air—assuming that when heat is produced by compression, its amount is the equivalent of the work spent in compressing. His result was erroneous, because his data were imperfect. But it appears that his assumption, quite unwarranted as it was, is really very nearly true for air.

In 1843 Colding, led also by some metaphysical speculations, propounded the doctrine, but endeavoured to base it upon actual experiments. Finally Joule, also in 1843, published an experimental determination of the mechanical equivalent of heat (770 foot pounds as the work required to heat a pound of water one degree Fahr.), which is within half per cent of the most trustworthy results since obtained. Joule had been, since 1840 at least, making quantitative determinations of equivalence between various forms of energy; and was led to propound the general law of conservation of energy by the only legitimate process—viz., experiment, as contrasted with metaphysical assertions of what ought to be. The complete foundation of the science on a proper basis is thus due to him; though, as we have seen, portions of it were established thoroughly by Newton and by Davy.

Before we consider what are the principal features of the theory as now developed, it is necessary to refer to the admirable investigations of Fourier and Carnot, which, though in some respects defective, must be considered as real advances. Fourier's great work, *Théorie de la Chaleur*, is devoted to the laws of conduction and radiation, i.e., to the dissipation, of heat, and is one of the most remarkable mathematical works ever written. Carnot's work, *Sur la Puissance Motrice du Feu*, is the first in which any attempt is made to explain the production of work from heat. It is unfortunately marred by his assumption that heat is a material substance, though it is only fair to say that he expresses grave doubts as to the truth of this hypothesis.

(We borrow our notice of Carnot from a paper by sir W. Thompson (q.v.) in the *Transactions of the Royal Society of Edinburgh*, 1849.)

He begins his investigation by premising the following correct principle, sadly neglected by many subsequent writers: "If a body, after having experienced a certain

number of transformations, be brought identically to its primitive physical state as to density, temperature, and molecular constitution, it must contain the same quantity of heat as that which it initially possessed." Hence he concludes that when heat produces work, it is in consequence of its being *let down* from a hot body to a cold one, as from the boiler to the condenser, of a steam-engine. His investigation, though based on an erroneous hypothesis, is extremely ingenious, and forms the foundation of the modern theory. We give a sketch of it, preparatory to our account of the present state of the theory, and for this purpose we choose a somewhat hypothetical case, as simpler than the most common practical one. This the case of a piston working air-tight in a cylinder closed at the bottom.

Suppose we have two bodies, A and B, whose temperatures, S and T, are maintained uniform, A being the warmer body, and suppose we have a stand, C, which is a non-conductor of heat. Let the sides of the cylinder and the piston be also non-conductors, but let the bottom of the cylinder be a perfect conductor; and let the cylinder contain a little water, nearly touching the piston when pushed down. Set the cylinder on A; then the water will at once acquire the temperature S, and steam at the same temperature will be formed, so that a certain pressure must be exerted to prevent the piston from rising. Let us take this condition as our starting-point for the cycle of operations. 1. Allow the piston to rise gradually; work is done by the pressure of the steam, which goes on increasing in quantity as the piston rises, so as always to be at the same temperature and pressure. And *heat is abstracted from A*, namely, the latent heat of the steam formed during the operation. 2. Place the cylinder on C, and allow the steam to raise the piston further. More work is done, more steam is formed, but the temperature sinks on account of the latent heat required for the formation of the new steam. Allow this process to go on till the temperature falls to T, the temperature of the body B. 3. Now, place the cylinder on B; there is of course no transfer of heat; because two bodies are said to have the same temperature when, if they be put in contact, neither parts with heat to the other. But if we now press down the piston, we do work upon the contents of the cylinder, steam is liquefied, and the latent heat developed is at once absorbed by B. Carry on this process till the amount of heat given to B is exactly equal to that taken from A in the first operation, and place the cylinder on the non-conductor C. The temperature of the contents is now T, and the amount of caloric in them is precisely the same as before the first operation. 4. Press down the piston further, till it occupies the same position as before the first operation; additional work is done on the contents of the cylinder, a further amount of steam is liquified, and the temperature rises.

Moreover, it rises to S exactly, by the fundamental axiom, because the volume occupied by the water and steam is the same as before the first operation, and the quantity of caloric they contain is also the same—as much having been abstracted in the third operation as was communicated in the first—while in the second and fourth operations the contents of the cylinder neither gain nor lose caloric, as they are surrounded by non-conductors.

Now, during the first two operations, work was done by the steam on the piston; during the last two, work was done against the steam; on the whole, the work done by the steam exceeds that done upon it, since evidently the temperature of the contents, for any position of the piston in its ascent, was greater than for the same position in the descent, except at the initial and final positions, where it is the same. Hence the pressure also was greater at each stage in the ascent than at the corresponding stage in the descent; from which the theorem is evident.

Hence, on the whole, a certain amount of work has been communicated by the motion of the piston to external bodies; and the contents of the cylinder having been exactly restored to their primitive condition, we are entitled to regard this work as due to the caloric employed in the process. This, we see, was taken from A, and wholly transferred to B. It thus appears that *caloric does work by being let down from a higher to a lower temperature*. And the reader may easily see that if we knew the laws which connect the pressure of saturated steam, and the amount of caloric it contains, with its volume and temperature, it would be possible to apply a rigorous calculation to the various processes of the cycle above explained, and to express by formula the amount of work gained on the whole in the series of operations, in terms of the temperatures (S and T) of the boiler and condenser of a steam-engine, and the whole amount of caloric which passes from one to the other.

Though the above process is exceedingly ingenious and important, it is to a considerable extent vitiated by the assumption of the materiality of heat which is made throughout. To show this, it is only necessary to consider the second operation, where *work is supposed to be done* by the contents of the cylinder expanding *without loss or gain of caloric*, a supposition which our present knowledge of the nature of heat shows to be incorrect. But it is quite easy, as seems to have been first remarked by J. Thomson in 1849, to put Carnot's statement in a form which is rigorously correct, whatever be the nature of heat. J. Thomson says: "We should not say, in the third operation, 'Compress till the same amount of heat is given out as was taken in during the first.' But we should say, 'Compress till we have let out so much heat that the further compression (during the fourth stage) to the original volume may give back the original temperature.'" It is but bare justice, however, to acknowledge that Carnot himself was by no means satis-

fied with the caloric hypothesis, and that he insinuates, as we have already seen, more than a mere suspicion of its correctness.

If we carefully examine the above cycle of operations, we easily see that they are *reversible*, i.e., that the transference of the given amount of caloric back again from B to A, by performing the same operations in the opposite order, requires that we expend on the piston, on the whole, as much work as was gained during the direct operations. This most important idea is due to Carnot, and from it he deduces his test of a *perfect* engine, or one which yields from the transference of a given quantity of caloric from one body to another (each being at a given temperature) the greatest possible amount of work. And the test is simply that *the cycle of operations must be reversible*.

To prove it, we need only consider that, if a heat-engine, M, could be made to give more work by transferring a given amount of caloric from A to B, than a reversible engine, N, does, we may set M and N to work in combination, M driven by the transfer of heat, and in turn driving N, which is employed to restore the heat to the source. The compound system would thus in each cycle produce an amount of work equal to the excess of that done by M over that expended on N, without on the whole any transference of heat; which is of course absurd.

The application of the true theory of heat to these propositions was made in 1849, 1850, and 1851 respectively, by Rankine, Clausius, and sir W. Thomson. Rankine employed a hypothesis as to the nature of the motion of which heat consists, from which he deduced a great many valuable results. Clausius supplied the defects of Carnot's beautiful reasoning; accommodating it to the dynamical theory by a very simple change, and evolving a great number of important consequences. But by far the simplest, though at the same time the most profound, writings on this subject, are those of sir W. Thomson, to be found in the *Transactions of the Royal Society of Edinburgh*; and these must be consulted by any reader who desires to have a clear statement and proof of thermo-dynamical laws, not complicated by unnecessary hypotheses or formulæ, and yet perfectly general in its application. See also Tait's *Thermo-Dynamics* (2d ed. 1877).

In its new form, thermo-dynamics is based on the two following laws:

Law I. (Davy and Joule.) *When equal quantities of mechanical effect are produced by any means whatever from purely thermal sources, or lost in purely thermal effects, equal quantities of heat are put out of existence, or are generated.*

Law II. (Carnot and Clausius.) *If an engine be such that, when it is worked backward, the physical and mechanical agencies in every part of its motions are all reversed, it produces as much mechanical effect as can be produced by any thermo-dynamic engine, with the same temperatures of source and refrigerator, from a given quantity of heat.*

The proof of this second law differs from that of Carnot (already given as regards reversible engines) by being no longer based on the supposition of the materiality of heat, but on the following axiom, in some of its many possible forms: It is impossible, by means of inanimate material agency, to derive mechanical effect from any portion of matter by cooling it below the temperature of the coldest of the surrounding objects. It will be easily seen that the pair of engines (one reversible) before mentioned would, if worked in combination, form a perpetual motion; and, besides, would constantly transfer heat from a colder to a warmer body.

One of the immediate and most important deductions from these principles is—that only a fraction of the heat employed in any engine is converted into useful work (the remainder being irrecoverably lost). This fraction was shown by Thomson to be capable of expression as

$$\frac{S-T}{S};$$

where S and T are the temperatures of the source and condenser, *measured from the absolute zero* of temperature. See HEAT. Thus, an air-engine, in which a far greater range of temperature can be safely used than in a steam-engine, employs effectively a much larger portion of the heat supplied to it; and there is no doubt that air-engines would supersede steam-engines, if we could get a material capable of enduring the great heat required.

THERMO-ELECTRICITY treats of the currents that arise from heating the junction of two heterogeneous conductors. Such currents can be obtained in many ways, but we shall here simply indicate the more important.

Thermal Currents with one Metal.—Take a copper wire, cut it in two, and fix each half in one of the binding screws of a galvanometer. Heat one of the free ends to redness, and press it against the other, and a current will be generated, passing at the junction from the hot to the cold end, as shown by the deflecting needle. In almost all cases where portions of the same metal at different temperatures are pressed together a current is produced, the direction of which depends on the metal, and even on the structure of the same metal.

Currents are also obtained when two portions of the same metal or piece of metal have different structures, and the point where the two structures meet is heated. If, for instance, one piece of wire be hard-drawn and the other part annealed, when the seat of change from the one to the other is heated, a current is produced. Or if the whole be annealed, and one part of it be hammered, the hammering makes the other part harder, and the current, when the junction is heated, passes from the soft to the

hard part. The direction of the current differs with different metals in these circumstances. Even the difference of structure introduced by the twisting of a portion of a wire causes a current to flow when the wire is heated in the vicinity of the twist. Thus, when a knot is tied on a platinum wire, or when part of it is coiled into a spiral, a current passes always toward the knot or coil when the flame of a spirit-lamp is directed on a portion of the wire near the knot or spiral. The twisting, in this case, acts as hardening or hammering would do. By running the flame of a spirit lamp along a metal, it frequently happens, more especially if it be of a crystalline structure, that currents are produced at certain points. These points are supposed to indicate a change in structure. If a bar of fused antimony have its ends connected with a galvanometer, and examined in this way, *neutral points* are generally found. The flame of a lamp generates a current near these points, always passing toward the point, and changing in direction with the change of the side on which the flame is applied. Bismuth shows neutral points, but the current always goes from the cold to the hot part across the neutral point. In bars of those metals which are crystallized regularly and slowly, no neutral points are found.

Thermal Currents with two Metals.—A current is always obtained when the point of junction of any two metals is heated. The two metals which show this property in the greatest degree are bismuth and antimony. When a bar of antimony, A (fig. 1), is soldered to a bar of bismuth, B, and their free extremities are connected with a galvanometer, G, on the junction being heated, a current passes from the bismuth to the antimony, as shown in the figure. When S is chilled by applying ice, or otherwise, a current is also produced, but in the opposite direction. Such a combination constitutes a thermo-electric pair. Applying the same mode of explanation to this pair that we apply to the galvanic pair (see GALVANISM), bismuth is positive within and negative without the pair, antimony negative within and positive without the pair. Bismuth thus forms the negative pole, but positive element; antimony the positive pole, but negative element of the pair. The metals may be classed in thermo-electric just as in electro-chemical order. The following table gives them in this order, the direction of the arrow showing how the current goes within the pair. The order and numbers in this

table, which are for temperatures between 40° and 100° Fahr., are those given by Dr. Matthiessen. For other temperatures, the table would be different for several of the metals.

It will be seen, that metals like bismuth and antimony, which have a crystalline structure, are best suited for a thermo-electric pair. Tourmaline, when heated, shows an opposite electricity at each end. If it had a low conducting power like the metals just named, we might expect from it a thermo-electric current instead of mere polarity. It is probable that the crystalline structure, however, accounts for the appearance of electricity in both cases.

Thermo-electric Pile or Battery.—One bismuth-antimony pair is of very little power. To increase this, several pairs are associated together, and the same tension-arrangement is adopted as in a galvanic battery. The heat in this case must be applied only to one row of soldered faces. The current depends on the difference of temperature of the two sides. When a strong current is required, the one series must be kept in ice, or in a freezing mixture, while the other is exposed to heat radiating from a red-hot plate of iron. As in the galvanic pair, the electro-motive force is proportionate to the number of pairs; the size of the bars, like the size of the galvanic plates, merely aiding to diminish the resistance. The electro-motive force of a thermo-electric battery is small; according to Dr. Matthiessen, that of 25 bismuth-tellurium pairs equals one cell of Daniell's battery, when the one series is kept at 32° Fahr. and the other at 212° Fahr. In consequence of the low electro-motive force of the thermo-electric battery, the galvanometer to be used with it must introduce as little resistance as is consistent with the best effect on the needle. Hence special galvanometers are used, in which the coil wire is short (200 turns) and thick ($\frac{1}{8}$ inch); these are called thermo-galvanometers.

When a great number of pairs are formed into a battery, they may be conveniently arranged as in fig. 2, which shows one of 30 pairs. The odd faces, 1, 3, 5, etc., are exposed on the one side, and the even faces, 2, 4, 6, etc., on the other. The terminal bars are connected with the binding screws *n*, *p*. The interstices of the bars are filled with insulating matter (gypsum) to keep them separate, and the frame in which the whole is placed is of non-conducting matter. Such a pile in conjunction with a thermo-galvanometer (see GALVANISM) forms the most delicate thermometer for radiant heat, and is generally called a *thermo-multiplier*. When placed

FIG. 2.

in a room, the temperature of which is equable all round, no current is produced: but if heat be radiated more on one side than another, a current ensues. If the hand, for instance, be brought near on the one side, a current indicates its radiant power; or if a piece of ice be brought near, a current is also shown, but moving in the opposite way.

Thermal Effects produced by the Galvanic Current.—As heat or cold produces a current at the junction of two dissimilar conductors, we should expect that if a galvanic current be made to pass through the junction, heat or cold would follow, and such is found to be the fact. When a current from a voltaic cell passes through a system of three rods of bismuth, antimony, and bismuth, at the junction where the current passes from bismuth to antimony, cold is produced; and at the other, from antimony to bismuth, heat. If, for instance, water be placed in a hollow at either junction, cooled to 32° Fahr, it will become frozen when the current passes from the bismuth to the antimony. When the junction of these two metals is put into the bulb of an air thermometer, so that a current can be sent through it in either way, the air expands when the current goes from antimony to bismuth, but contracts when it goes in the opposite way. See THERMO-ELECTRICITY, where the theory of energy is applied to the explanation of the various phenomena.

Seebeck was the discoverer (1821) of thermo-electricity; Nobili invented the thermo-electric pile (1834); Peltier (1834) first observed the thermal effects of galvanic currents at the junction of heterogeneous conductors. See ELECTRIC HEATING.

THERMO-ELECTRICITY AND THERMO-MAGNETISM. If the ends of an iron wire be attached by twisting or soldering to the extremities of the copper wire of a galvanometer, and one of these junctions be heated, the galvanometer indicates the passage of a current in the circuit in a direction from copper to iron through the heated junction. The first application of the theory of energy to this phenomenon is of course as follows: Since heating the junction produces the energy of the current, part of the heat must be expended in this process; though it is of course entirely recovered as heat in the circuit, if the current be not employed to do external work. The existence of the current from copper to iron is thus associated with the cooling of the junction; and it had been experimentally shown by Peltier, that if an electric current be passed through a circuit of iron and copper, originally at the same temperature throughout, it produced cold when passing from copper to iron, and heat when passing from iron to copper. If the two junctions be maintained each at a constant temperature, a constant current passes from the warmer to the colder junction through the iron wire; and by the conservation of energy, the heat developed in the circuit (together with the equivalent of the external work done, if the current be employed to drive an electro-magnetic engine) is equal to the excess of the heat absorbed at the warmer junction over that given out at the colder, precisely as in the case of a heat-engine. So far the process presents no difficulties. But it was discovered by Cumming in 1823, that not only is the strength of the current *not* generally proportional to the difference of temperatures of the junctions, but that if the difference be sufficiently great, the current may, in many cases, pass in the opposite direction. Thus, in the copper-iron circuit, at the temperature 300° C. of the hot junction, the current passes through it from iron to copper. Thomson (Bakerian lecture—*Phil. Trans.* 1855—"On the Electrodynamic Properties of Metals") applied the principle of energy to this case, and derived from it the conclusion, that one of three things must happen, the most unexpected of which was found by experiment to be the actual one—*viz.*, the startling result, that *a current passing in an iron bar or wire from a hot to a cold part produces a cooling, but in copper a heating effect.* This very remarkable discovery, which, taken in connection with that of Peltier, gives the key to the whole subject of thermo-electricity, has been made the subject of a valuable experimental investigation by Le Roux (*Annales de Chimie*, 1867).

The theory of such phenomena (and of others far more complex, involving, for instance, crystalline arrangement), in complete accordance with the conservation of energy, has been given by Thomson (*Trans. Royal Soc. Edin.* 1854); but it would be inconsistent with the character of this work to enter into any details on so abstruse a subject. A similar remark must be made regarding his application of the principle to the subject of thermo-magnetism, or the relation of the magnetizability of various substances to their temperature; one or two of his results may, however, be mentioned. Thus, iron at a moderate or low red-heat experiences a heating effect when allowed to approach a magnet, and a cooling effect when slowly drawn away from it; while in cobalt, at ordinary temperatures, exactly the opposite effects are produced. Similar effects are in general produced when a doubly-refracting crystal is turned in the neighborhood of a magnet.

THERMOMETER (Gr. literally, *heat measurer*), a term which, in spite of its derivation, is usually restricted to instruments which measure temperature (see HEAT) by the *expansion* of bodies. Like that of the telescope and microscope, and many other valuable pieces of philosophical apparatus, its early history is very obscure. There are various claimants who seek to share at least a part in the credit of its invention; and they agree pretty well in referring it to somewhere in the beginning of the 17th century. We shall not waste space in endeavoring to settle such matters of history, but proceed at once to

a description of the forms of the instrument now most commonly used; after which we shall say a few words about the actual value of their indications, and finish by a rapid sketch of a few other instruments also adapted for the measurement of temperature, but not usually known by the name of thermometer.

Let us commence with the ordinary spirit-thermometer, as it is called; where the indications are given by the expansion of a quantity of alcohol which fills entirely a glass bulb, and partially a narrow tube attached to it.

To construct such an instrument, a capillary tube is selected, of as uniform a bore as possible. The easiest method of testing its uniformity is to introduce a column of mercury, about an inch long, into the tube, and gradually move it along by inclining the tube, carefully measuring the length of the column in each of its successive positions. It is obvious that the column will be longer the smaller is the mean section of the portion of the tube occupied at any time by the drop of mercury. If considerable differences of length are found, the tube is rejected at once. The best tubes are those which, if showing any change, taper very slowly but nearly uniformly from one extremity to the other; a defect which can easily be allowed for in the subsequent graduation of the instrument. A bulb is blown on one end of the selected tube; large, if the instrument is meant to be very delicate; small, if a common instrument is to be made, or one which will work through a great range of temperature. The bulb is heated to expand the contained air, and then the open end of the tube is plunged into alcohol, usually tinged with coloring matter, for greater visibility. As the bulb cools, the atmospheric pressure on the alcohol in the vessel forces some of it into the stem, and perhaps a little into the bulb. The tube being then inverted, a few dextrous taps suffice to shake the greater part of the alcohol into the bulb. The lamp is again applied, with caution, until the alcohol boils, and the rapidly escaping vapor drives the air almost entirely from the tube, whose open end is immediately plunged again into the colored spirit. Unless the stem be nearly 40 ft. in length—and thermometers have been made by Forbes (q.v.) of a length approaching to this for the measurement of underground temperature—the alcohol fills the whole of the ball and stem as soon as the glass has cooled. The bulb is again cautiously heated, so that, by the expansion of the spirit, such a portion may be expelled, that, when the whole has again cooled, the level of the liquid in the tube may stand near some point previously determined on with reference to the particular employment for which the instrument is destined. Finally, the lamp being again applied to the tube, near the upper surface of the liquid, that portion of the spirit is again made to boil; and while the vapor keeps the free end of the tube clear of air, that end is hermetically sealed; and the glass-blower's part of the work is done. A somewhat similar, but more difficult process has to be gone through, if other liquids, such as ether, sulphuric acid, mercury, etc., are employed to fill the bulb; each of these liquids having its own special use in certain philosophical inquiries, as we shall presently see. It only remains that the instrument be *graduated*, so that some definite information may be given by its indications.

In the older thermometers, the scale was arbitrary, so that no comparable readings could be taken by means of different instruments. In the finest modern instruments, also, the scale is usually quite arbitrary, being, in fact, engraved on the tube during the process of calibration above described. But then, by careful observation, certain definite temperatures are measured in terms of this arbitrary scale, so that the value of a degree and the position of some definite zero-point are determined for it, and the result engraved on the tube. These numbers enable us, by an easy calculation, to reduce the observed reading of the fine instrument to its equivalent in some of the standard scales.

At present, we assume, what is very nearly true for mercury at least, that equal increments of bulk correspond to equal increments of temperature. All, then, that is necessary is to fix two definite temperatures, and assign their positions on our scale. Water being one of the most common bodies in nature, and being everywhere easily obtainable in a state of great purity, is usually employed; and its *freezing* and *boiling* points are taken as the definite points. The temperature of freezing water or of melting ice is almost absolutely fixed, for (see HEAT) pressure alters it only very slightly. It is otherwise with the boiling-point of pure water, for this is considerably raised by increase of pressure; so much so, in fact, that if the barometer be not attended to, an error of several degrees is possible. Hence we must define the particular pressure, usually 30 in., at which the boiling-point is to be determined. The thermometer, constructed (so far) as above described is to have its bulb, and nearly the whole of the portion of the stem which contains liquid, immersed in pounded ice, from which the melted portion is freely trickling; and when the level of the spirit has become stationary, its position, the *freezing-point*, is marked on the tube. Similarly, the barometer standing at 30 in., the bulb is inclosed in the steam immediately above the surface of water freely boiling. We thus obtain the *boiling-point*. It only remains that we decide by what numbers these points shall be indicated, because (on account of the nearly uniform expansion of mercury) then the remaining divisions can be at once filled in by dividing the interval between them into equal parts, or, if necessary, allowing for a slight taper in the tube. The only scales which require mention are those of Fahrenheit, Réaumur, and Celsius. Of these, the first is commonly used in Britain, the second in Germany, and the third in France: but this last, under the name of the *centigrade* scale, is almost exclusively used

by scientific men of all nations. The relations of these scales will be easily understood by means of the following figure:

| | | | | | |
|-------|---|----|----|-----|-----|
| Fahr. | 0 | 32 | 77 | 122 | 212 |
| | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| Réau. | 0 | 20 | 40 | 80 | |
| | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| Cent. | 0 | 25 | 50 | 100 | |

In the Fahrenheit scale, the freezing-point is 32°, and the boiling-point 212°, so that the space between these is divided into 212 — 32, or 180, equal parts or degrees. In the others, the freezing-point is the zero, but the boiling-point is 80° and 100° respectively. It is of course perfectly easy to reduce from one of these scales to another. Thus—What is the centigrade reading for 77° Fahr. (See the dotted line in the figure)? The numbers in Fahrenheit's scale are all too great by 32, because 32°, and not 0°, stands for the freezing-point. Subtract this from 77, and we have 45. Hence the required number of centigrade degrees must bear the same ratio to the 100 from freezing to boiling in that scale that the 45 bears to the 180° between the same limits in Fahrenheit's. The requisite number is therefore

$\frac{45}{180} 100 = 25^\circ \text{ C.}$ In words—*To convert Fahrenheit to centigrade, subtract 32, and multiply by $\frac{100}{180}$, or $\frac{5}{9}$.* Vice versâ—*To pass from centigrade to Fahrenheit, multiply, by $\frac{9}{5}$, and*

add 32. Thus the Fahrenheit value of 50 C. is $\frac{9}{5} 50 + 32 = 122$, as in the figure. Of course the similar processes with Réaumur's scale present no difficulty.

It is supposed that Fahrenheit fixed his zero at the point of greatest cold that he had observed, possibly in Iceland, more probably by means of a freezing mixture, such as snow and salt, or sal-ammoniac. It is much to be desired that the centigrade scale alone were employed.

A mercurial thermometer ceases to be of use for temperatures only a little above the freezing point of mercury; but it has a wide range upward, as mercury does not boil till about 600° C. On the other hand, a spirit-thermometer, though of little use beyond about 50° or 60° C., as alcohol boils at 70° C., is useful for any degree of cold yet produced, as alcohol has never yet been frozen. When extreme sensitiveness is required, ether being considerably more expansible than alcohol, is sometimes employed; as by Thomson in detecting the effect of pressure on the freezing-point of water. Water, again, would be about the very worst substance with which a thermometer could be filled; for not to speak of its expanding in the act of freezing, and therefore necessarily bursting the instrument, if it were ever allowed to reach the freezing-point, its scale would read partly backward and partly forward; for as ice-cold water is gradually heated up to 4° C., it contracts, and begins to expand again after that limit has been passed.

To make thermometers self-recording, various schemes have been proposed, of which we shall notice only one or two. Those most commonly used indicate only *maximum* and *minimum* temperature during each 24 hours; or during the interval which has elapsed since they were last set. The usual arrangement consists of two thermometers, a mercurial and a spirit one, fixed horizontally to the same frame, with their bulbs at opposite ends of the frame. Above the mercury is a small piece of steel or ivory, and in the spirit a small and light float of glass or enamel. Capillary forces prevent the steel from entering the mercury, and the enamel from leaving the spirit. As the mercury expands, it pushes the steel before it, and when it again contracts, it leaves it behind, the end nearest the mercury thus remaining at the highest or maximum indication which that thermometer has given. In the spirit-thermometer, the liquid, as it expands, freely passes the enamel, and leaves it undisturbed; but it can never contract so as to leave it dry. It therefore pulls the enamel back when it contracts, and thus the extremity furthest from the bulb marks the lowest point which the spirit has reached, or the minimum temperature. To set this instrument, incline it so that the steel falls back to the surface of the mercury—the enamel at the same time comes to the surface of the spirit.

The best mode of registration is undoubtedly the photographic. For this purpose, a mercurial thermometer is placed vertically before a narrow slit, in such a way that no light can pass through the slit save above the level of the mercury in the tube. A gas flame is kept burning at some distance in front of the slit, the bulb of the thermometer being protected from its radiation; and behind the slit a sheet of prepared photographic paper is exposed to the narrow line of light which passes above the mercury. This paper is fixed on a cylinder with a vertical axis, which is made to revolve uniformly by clockwork. Lines are drawn by the clockwork on the paper, giving the position of the slit at each hour of the 24, or the gas-flame is mechanically reduced or eclipsed at intervals of an hour; so that the record, when photographically developed, gives the tempera-

ture for every minute of the day and night; the portion of the paper which has been exposed to the light is blackened.

Among ordinary meteorological instruments the *wet-bulb* thermometer is deserving of notice. It is simply an ordinary thermometer, with the bulb covered with paper or cotton-wool, kept constantly moist by the capillary action of a few fibers connecting it with a small vessel of water. If the air be *saturated* with moisture (see DEW, EVAPORATION), there will be no evaporation, and the wet-bulb thermometer will give the same indication as the dry-bulb. But the drier and the warmer the air is the faster does the water evaporate, and (the latent heat of evaporation being mainly taken from the moist bulb) the lower does the mercury sink in the moist-bulb instrument. The difference between the readings of the two instruments, compared with the actual temperature, as shown by the dry-bulb, thus leads to a determination of the hygrometric state of the air.

So far, we have spoken of the instruments now in common use. But the *air-thermometer* was probably the oldest form; and possesses a scientific superiority over those just described. Theoretical and experimental investigations, connected with the modern dynamical theory of heat (see FORCE, HEAT), show that equal increments of heat produce almost exactly equal changes of bulk in a nearly perfect gas, such as air, if the pressure to which it is exposed be constant. Hence, temperature, as measured by an air-thermometer, gives a true indication of the quantity of energy present in the form of heat. As the comparison of an air-thermometer with a mercurial one shows that, for temperatures not greater than 300° C., or 572° Fahr., the indications of the two agree very closely, the ordinary mercurial thermometer practically possesses within these limits the same advantage.

As the pressure of a gas depends on the amount of heat it contains, the *absolute zero* of temperature, or the temperature of a body wholly deprived of heat, may be determined by finding the temperature at which a perfect gas would cease to exert pressure. For ordinary temperatures, it is found (see HEAT) that air increases in bulk by .3665, and hydrogen by .3668 of its bulk, when heated under constant pressure from 0° to 100° C. Again, by Boyle's law, if the air be compressed again, at constant temperature 100° C., to the bulk it had at 0° C., its pressure is increased by .3665 of its former amount. Thus, p_0 being the pressure at temperature 0° C., p that at t° C., we have, when the volume is kept constant,

$$p_t = p_0 (1 + .003665t).$$

If we assume this to hold for all temperatures, p_t vanishes when

$$1 + .003665t = 0;$$

$$\text{or } t^{\circ} = -274^{\circ} \text{ C. very nearly.}$$

That is to say, at 274° C., under the freezing-point of water, a perfect gas ceases to exert pressure on its containing vessel—i.e., is deprived of that thermal energy on which pressure depends.

The air-thermometers in common use are affected by the pressure, as well as the temperature of the atmosphere. To avoid this inconvenience, Leslie and Rumford in the present century revived the *differential thermometer* of Sturmius. In this instrument, in one of its common forms, a bulb is blown at *each* end of the tube (which is bent into a U-form), and the liquid in the stem is used merely as an index, both balls being full of air. The length of the column of fluid is usually adjusted so that it can just fill one of the vertical arms and the horizontal portion of the tube; and the quantities of air in the two balls are so adjusted that the column will take this position *when the two balls are at the same temperature*. If the one ball be heated more than the other the liquid index will take a new position, and this is read off by a scale applied to either of the vertical arms. The graduation of this instrument may be effected by calculation, but it is usually done experimentally. Leslie made good use of it in his investigations on heat; and, with various adjuncts, such as coloring the glass of one ball while that of the other was left white; silvering or gilding one of the balls; covering one of them with moist silk or linen, etc., this instrument became in his hands a *photometer*, an *æthrioscope*, a *hygrometer*, etc. See *illus.*, PHYSICS, vol. XI.

To thermometers which depend for their action on the expansion of solids, the name PYROMETER (q.v.) is frequently given; but that of Bréguet, as delicate as a good ordinary mercurial thermometer, is not alluded to in that article. The principle of this very beautiful instrument may easily be explained thus. In bending a slip of wood, the fibers on the convex side are necessarily more extended than those toward the concave side. Conversely, if the fibers on one side of a slip of wood were to expand more than those on the other, the slip would bend. Bréguet solders together two thin strips of gold and platinum, or platinum and silver; for portability and concentration bends the compound strip into a helix, fixes its upper end, and attaches a horizontal index to the lower end. The least change of temperature in the surrounding air changes the length of one side of the compound slip more than the other, and the helix twists or untwists through an angle very nearly proportional to the change of temperature.

For measuring radiant heat, the most delicate instrument is the thermo-multiplier. See THERMO-ELECTRICITY.

THERMOSCOPE. An indicator of temperature. There are various kinds : (a) the *intrinsic thermoscope*, which shows any temperature whatever throughout the range of the instrument, whatever it may be, the temperature indicated being intrinsically determined by the constitution of the instrument ; (b) the *discontinuous intrinsic thermoscope*, which shows whether the temperature of the body to which it is applied is higher or lower than a given temperature depending on the intrinsic quality of the instrument ; (c) the *continuous intrinsic thermoscope*. The accuracy, whether discontinuous, or continuous, depends upon permanence of quality of the material, and of the mechanical constitution of the instrument, according to which the recognized features shall always be very accurately the same for the same temperature.

THERMOPYLÆ (literally, "the hot gates"), a famous pass leading from Thessaly into Locris, and the only road by which an invading army can penetrate from northern into southern Greece. It lies s. of the present course of the river Spercheius, between Mt. Œta and what was anciently an impassable morass bordering on the Maliac gulf. In the pass are several hot springs, from which Thermopylæ probably received the first part of its name. Thermopylæ has won an eternal celebrity as the scene of the heroic death of Leonidas (q. v.) and his 300 Spartans in their attempt to stem the tide of Persian invasion (480 B. C.). Again, in 279 B. C., Brennus, at the head of a Gallic host, succeeded, through the same treachery that had secured a victory to Xerxes in forcing the united Greeks to withdraw from the pass.

THEROIGNE DE MIRECOURT, 1762-1817, b. Luxemburg, France. Her true name was Anne Joséphe Terwagne. In 1789 she left the convent where she was receiving her education, went to Paris, and became a prostitute. She figured in the revolution as a leader of the virulent female mob. In 1791 she was seized by the allies in Holland and imprisoned in Vienna. On her return to Paris, 1793, her popularity was at first increased; but while trying to defend Brissot, her lover, she was seized, stripped, and whipped by a mob of maddened women. She became insane from this treatment, and the rest of her life was spent in *La Salpêtrière*.

THERSI TÊS, son of Agrius, whom Homer, in the *Iliad*, makes the ugliest and most impudent talker among the Greeks before Troy. His name in antiquity was a synonym for dastardy and malevolent impudence. The later poets say that he was slain by Achilles for calumniating him.

THESAU RUS. See DICTIONARY.

THESEUS, one of the most celebrated personages of the Greek heroic age. The legend of his career is differently told, but he is usually said to have been the son of Ægeus, king of Athens, by Æthra, daughter of Pittheus, king of Troezen. He was brought up at the court of his maternal grandfather, and, on reaching manhood, proceeded to his father's residence at Athens. On his way thither he performed several famous exploits, such as the destruction of Periphetes, Sinis, Phæa, the Krommyonian sow, Skiron, Kerkyon, and the fell robber Procrustes. See PROCRUSTES. After his arrival Medea sought to poison him, but her plot failed. Ægeus recognized his son, and Medea and the sons of Pallas were banished. The next feats of Theseus were the capture of the Marathonian bull, and the deliverance of Athens from its dreadful tribute of youths and maidens to the Cretan Minotaur (q. v.), in which he was assisted by the Cretan princess, Ariadne (q. v.). On his return to Athens his father Ægeus destroyed himself, and Theseus succeeded to the throne. In his new capacity of ruler, he displayed no less wisdom than he had formerly shown heroism. To him the legend ascribes the consolidation of the 12 petty commonwealths of Attica into one state, an event that certainly did occur at some period of Attic history, which was commemorated by the festival of the *Synækia*. Theseus also reorganized the Athenaic festival, and re-named it the Pan-Athenaic, founded the Isthmian games, and many other institutions ; but soon after the craving for his old stirring life returned, and having laid down his authority, he set out along with Heracles in quest of new adventures. They fought the Amazons, and Theseus carried off their queen, Antiope or Hippolyte, by whom he had a son. After the death of Antiope, he married Phædra. The legend makes him take part in the Argonautic expedition by a ludicrous anachronism, join in the Calydonian hunt, help Peirithous and the Lapithæ against the Centaurs, and assist in the attempt to rescue Persephone from the lower world (which led to a long imprisonment there, from which he was delivered by Heracles). Returning to Athens, he found that the minds of the people had been prejudiced against him during his absence, and as he could not re-establish his authority, he withdrew to Skyros, where he was treacherously destroyed by king Lycomedes. What grain of historical fact may lie in the myth of Theseus, it is hard to say. One of the most brilliant figures of the heroic age, reminding us, by his valor, wisdom, and generous love of the fair sex, of a knight of chivalry, we are loath to yield him up as a victim to the ravenous maw of criticism; yet all that can be said for his historic reality is, that so finished and admirable a prince is more likely to have been a legendary tradition of some real hero of primeval times, than a mere creature of poetic imagination.

THE'SIS, a Greek term, strictly signifies a "placing" or "setting"—e. g., Pindar's *epéon thesis* (Ode iii. 14)—the "arrangement of words" in verse; but subsequently was

employed by the philosophers (Aristotle, etc.), to denote an intellectual position that had to be maintained. This is the sense in which the word was understood by the scholastics of the middle ages.

THESMOPHORIA, a famous festival anciently celebrated in different parts of Greece, but especially in Attica, in honor of Demeter, as the *thesmophoros* or "law-giving" goddess, inasmuch as, by the introduction of agriculture, she gave the first impulse to civil society, and more especially to the honorable bond of marriage. The Thesmophoria lasted three days, from the 11th of the month Pyanepsion (October). Only married women could take part in the ceremonies. After certain preliminary purifications (among which abstinence from sexual intercourse was prominent), the women inaugurated the solemnity by marching in procession from Athens to Eleusis, where the night was spent in celebrating the mysteries of the goddess. The next day, called *nesteia*, or the "day of fasting," was spent in mourning. The women sat for a while on the ground around the statue of Demeter, and ate nothing but cakes made of sesame and honey. They next proceeded barefooted to the Thesmophorion or temple of Demeter, where they deposited their mystical offerings to the goddess. On the third day, called *kalligeneia* in honor of Demeter as the "mother of beautiful offspring," fasting was exchanged for merriment, jollity, and raillery.

THES PIS. See DRAMA.

THESSALONIANS, FIRST EPISTLE TO THE, one of the earliest epistles of St. Paul—perhaps the very earliest—was probably written at Corinth about the close of the year 52 A.D., and seems to have been occasioned by the "good tidings" which Timothy brought him of the "faith and charity" displayed by his Macedonian converts. It may be divided into two portions, a *narrative*, and a *hortatory*; the former embracing the first three chapters, and terminating with a prayer for the Thessalonians, the latter the remaining two. From the narrative portion we derive much important and deeply interesting information regarding the "church of the Thessalonians;" but perhaps its great value consists in the picture it presents to us of the apostle himself—"bold in God," yet "gentle, even as a nurse cherisheth her children;" scorning to use "flattering words," or to "seek glory" from an assertion of his apostolic dignity; nay, in the excess of a noble pride, "laboring night and day because he would not be chargeable unto any." The epistle is conspicuous for the absence of the ordinary doctrinal element; even the word "justification," it has been remarked, does not once occur: on the other hand, it is penetrated with a deep conviction of the nearness of the second coming of Christ, and with an undefined fear lest, in spite of all his labors, the "tempter" (probably, in this case, the Hellenistic Jews of Thessalonica) should seduce the Thessalonian Christians from the "faith." Schrader (*Apostel Paulus*) was the first to impugn the genuineness of the epistle. He was followed in the same line by Baur; but their opinions have met with little favor among scholars of any party.—See Lünemann in Meyer's *Commentary*; Jowett's (2d ed. 1859) and Ellicott's (3d ed. 1866) *Commentaries*.

THESSALONIANS, SECOND EPISTLE TO THE, was likewise written at Corinth, and in all probability not long after the first. It is generally thought to have been occasioned by the misapprehension of the apostle's meaning on the subject of the coming of Christ to judgment, to which the previous letter had given rise, although Hug and others considered the expression "be not troubled. . . by letter, *as from us*" (chap. ii. 2), as indicating that somebody had forged an epistle in Paul's name; and it is scarcely possible to interpret the passage at the close of the letter, "the salutation of Paul with mine own hand, which is the token in every epistle: so I write" (chap. iii. 17), otherwise than as a precaution against forgery. From its contents we gather that adversaries of the apostle had been at work among his Macedonian converts, and that they had not scrupled to misrepresent his teaching, particularly on the great topic above mentioned. Who they were we cannot be sure, but it is probable that they were Jews or Judaizing Christians. They must have obtained a considerable measure of success in their nefarious enterprise, for we are distinctly aware of a sharper and more imperious tone in the language of Paul. He now teaches more precisely that Christ could not come until the antagonistic forces in human or diabolic society had made themselves more prominent, and done their worst. The genuineness of this epistle is as certain as that of the first. See the commentaries previously mentioned.

THESSALONICA. See SALONICA.

THESSALY, the largest division of ancient Greece, lay to the s. of Macedonia and the e. of Epirus, being separated from the latter by mount Pindus, and from the former by the Cambunian mountains, the Ægean sea bounding it on the e., and the Maliac gulf and mount Æta on the south. Thessaly proper is a vast plain shut in on every side by mountains; on the n. and w. by those already named, on the s. by mount Othrys, and on the e. by mounts Pelion and Ossa, the only opening being the Vale of Tempe in the n.e., between Ossa and Olympus. The plain of Thessaly is said at one time to have been a vast lake, the waters of which found an outlet by the Vale of Tempe. This plain is drained chiefly by the river Peneius (now *Salambria*) and its tributaries, and is the most fertile in all Greece, producing in ancient times abundance of corn and cattle, and a breed of horses considered the finest in Greece.

History.—Thessaly was originally called *Æolia*, indicating that the country was at one time inhabited by *Æolians*, who, however, were either expelled (proceeding s., and taking up their residence in *Bœotia*, etc.) or reduced to slavery by immigrants from the more rugged region of *Epirus*, about 1000 B.C. As in *Laconia*, the inhabitants of Thessaly appear to have been divided into three classes—1. The *Epirote* conquerors, who became rich landed proprietors; 2. Those descendants of the original inhabitants, who, although dependent on the nobles, yet possessed a few privileges; and 3. The *Penestæ*, or those of the original inhabitants who had been reduced to serfdom, and who cultivated the lands of their conquerors, corresponding to the *helots*, although, on the whole, their condition was better. These latter frequently rebelled against their masters, who were very frequently at war among themselves. Each of the four districts into which Thessaly proper was divided was regulated by a council of its own, but they were occasionally united under a *tagus* or president, whose power and time of office appear to have been indefinite. The government, from an early time, appears to have been oligarchal in the separate cities—of which *Pharsalus*, *Larissa*, *Heracleum*, and *Pherræ* were the chief—the principal power being in the hands of the two great families of the *Aleuads* and *Scopads*, famous for their hospitality and encouragement of poets and artists. Thessaly, however, never played any important part in Grecian history, and it was only after the end of the *Peloponnesian* war that it exercised any influence on the affairs of Greece. About that time (400 B.C.), *Lycophron*, overthrowing the government of the nobles, became tyrant of *Pherræ*, and endeavored to make himself master of all Thessaly. What he failed to accomplish, his successor, *Jason*, succeeded in doing, causing himself to be elected *tagus* of all Thessaly about 374 B.C.; his assassination in 370 B.C. preventing him from attempting to become master of all Greece as he intended. The rule of *Jason's* successors became so unbearable, that, in 353 B.C., the old families called in the aid of *Philip* of *Macedon*, who compelled the “*tagus*” to abdicate, and in 344 subjected the country to *Macedonia*. Thessaly remained subject to the *Macedonian* kings till the victory by *T. Flaminius*, at *Cynoscephalæ*, in 197 B.C., restored it to the protection of *Rome*. Under the emperors, Thessaly was united with *Macedonia*, but after *Constantine* it was a separate province. In 1204 A.D., with other portions of the eastern empire, it came under the dominion of the *Venetians*, and in 1355 was taken by the *Turks*. The restoration to Greece of Thessaly s. of the *Salambria* was recommended by the *Berlin* congress in 1878, and accomplished in 1881. In 1897 Thessaly was the principal seat of the *Turko-Grecian* war, the *Turks* forcing the *Milouna* and *Raveni* passes, in the *Olympian* range on the frontier, finally occupying *Larissa* April 25. See GREECE.

THETFORD, a municipal and parliamentary borough and market t. of Norfolk, on the Little Ouse, 79 m. n.e. of London by the Great Eastern. Pop. '91, 4247.

THETIS, daughter of *Nereus* and *Doris*, was married against her will by the gods to *Peleus*, by whom she became the mother of *Achilles*. She dwelt in the depths of the sea with her father, and had, like *Proteus*, the power of changing her shape. Her hand is said to have been sought by *Poseidon* and *Zeus*, who gave up the pursuit on *Themis* declaring that the son of *Thetis* would be greater than his father.

THIAN-SHAN, or **TIEN-SHAN**, or **CELESTIAL MOUNTAINS**, a great mountain system, consisting of several ridges, mostly parallel, in central Asia, are situated to the s. and e. of lake *Issyk-kul*, in lat. about 42° north. They are said to extend in an e.n.e. direction from the vicinity of *Samarkand*, to long. about 96° e.—a distance of 1500 miles. This range was never visited by any European till *P. Semenov*, commissioned by the imperial Russian geographical society, explored a part of it in 1858. It is one of the four great ranges, trending in a general direction from w. to e., which traverse central Asia—and these respectively are the *Altai-Sayan*, or *Altai*an mountains, in lat. about 50° n.; the *Thian-shan* mountains, lat. about 42° n.; the *Kuen-lun* system, lat. about 36° n.; and the *Himalaya* mountains (q.v.). In long. 76° to 79° e., the *Thian-shan* mountains are divided into two great, nearly parallel ridges, and inclose between them a deep valley, about 15 m. in average breadth, through which the river *Narin*—the chief head-water of the *Sir-daria*—flows in a w.s.w. direction. East of these ranges, the mountains are known as the *Tengri-tagh*; and of this subdivision the chief peak is the *Tengri-Khan* (i.e., specter-prince), in lat. 42° 23' n., long. 79° 40' e., and which rises to the height of 24,000 feet. East from the *Tengri-tagh*, the *Thian-shan* mountains continue in a double chain, and at an average height of 11,330 feet. The south-westernmost branches of the T. (the *Alai* and *Trans-Alai*), running toward the *Pamir*, contain among others the “*Kaufmann*” peak, over 25,000 feet high, one of the highest in the T. system. The eastern section has the most stupendous snow fields, snow peaks, and glaciers, such as the *Petrov* glacier, over 12 miles in length, or the *Seraf-schan* glacier, which is 15.

THIBAUDIN, **JEAN**, French general, was born at *Moulins-Engilbert* (*Nièvre*) Nov. 13, 1822, and received his education at the Military School of *Saint Cyr*. His first active service was in *Africa*. He then went through the *Italian* campaign. When the *Franco-Prussian* war broke out (1870), he served as *Lieutenant Colonel*, under *General Frossard*, and fought in the battles of *Forbach* and *Gravelotte*, but was taken prisoner at the capitulation of *Metz*, Oct. 27, 1870. Escaping from his captors, he made his way to the French army, and took command of a regiment under an assumed name. After the conclusion of peace he was made a *Colonel*, and in 1882 became a *General*. He succeeded *Billot* as *Minister of War*, in 1883, and was known at once as a pronounced

Radical, hostile to the princes of Orléans. On the visit of Alfonso XII. of Spain, to Paris, in September, 1883, Thibaudin was thought to be compromised by the hostile demonstrations which took place, and was dismissed from the ministry, Oct. 5th. In 1885 he resumed his duties as a member of the Committee on Infantry, but was removed in 1887.

THIBAUT, or **THEOBALD I.**, King of Navarre, and Count of Champagne, 1201-53; b. France; brought up at the court of Philip Augustus. He was in love with Blanche of Castile, queen of Louis VIII., though 14 years her junior, and when Louis died, in 1226, it was suspected that he had been poisoned by Thibault. The latter at first allied himself with the league of nobles against Blanche, regent during the minority of her son, but was soon won over by her. On the death of his grandfather, Sancho the Wise of Navarre, in 1234, he inherited that kingdom. He went to Palestine in 1239, but was badly defeated at Gaza. He afterward took part in the persecution of the Albigenses. He was a friend of literature, and was a *trouvère* of no mean order.

THIBET, **TIB'ET** or **TUBET**, is the European name of a country in central Asia, bounded on the n. by Mongolia, on the e. by China, and on the s. and w. by Hindustan. The native name is Bod or Bodyul, the land of Bod. It covers an area of from 600,000 to 700,000 sq.m., with the north-eastern part of which we are still almost totally unacquainted. The pop. is estimated at 6,000,000.

Surface.—From an elevated tract at the western extremity of Thibet, where the Hindu-Kush and Pamir highlands meet, the mountain-system of the Kuenlun runs e., and the greater chain of the Himalaya s.e., inclosing in the angle between them the Thibetan table-land, which extends eastward to the frontier of China. Although Thibet is described as a table-land by geographers, its surface is traversed by mountain-chains, which, near its western and eastern frontiers, interlace and ramify in a complicated manner. On the southern border the height of the plateau through which the Sanpue runs, from a point near its source to H'lassa, was in 1866 carefully ascertained by barometrical observation. Along the great route from H'lassa to Gartok, in the basin of the Indus, for a distance of 800 m., the average elevation was found to be 13,500 feet. Several stages of the journey along the route were above 16,000 ft.; only one sank to 11,000. To the n. and e. of this elevated tract, the plains of Thibet are supposed to descend to much lower elevations; but accurate observations are still wanting. The Himalaya, 20 summits of which are higher than the loftiest of the Andes, stand out from the plateau, and are only connected with it by ridges of lesser elevation. They project from the highlands like buttresses which rise higher than the walls they support. In general the descent from Thibet on the s. is by three gradations, the first of which is very abrupt. The mountain-roads by which Thibet is entered from India, pass through deep ravines cut by the streams in the mountains, and present the wildest and grandest scenes described by travelers.

The mountains which rise from the table-land divide Thibet into several natural regions. The Karakorum range, which runs parallel to the Himalaya, forms with them a great valley, drained on the w. by the tributaries of the Indus, and on the e. by the Sanpu. To the whole basin of the Indus n. of the Himalaya, the name of little Thibet is sometimes given; but more generally the upper basin is known as Ngari, the middle basin as Ladakh (q.v.), or middle Thibet; and the lower as Bultistan, or lower Thibet. The countries drained by the Sanpu are described as Thibet proper, which is in turn divided into Dsang, the district of the upper Sanpu, and Wei, surrounding H'lassa, the district of the lower Sanpu. Further e. the tract drained by the tributaries of the Yang-tze-kiang, in which are Lithang and Bathang, is known as Kham. North of the basin of the Sanpu lies another region, a great elevated desert, called Khor on the w., and Katchi on the e.; and at the north-eastern extremity of Thibet is a hilly tract, in which the Hoang-ho takes its rise, and in the center of which is situated the lake Ko-ko-nor. The provisional name given to the tract is the country of the Ko-ko-nor.

Geology.—The geology of Thibet is little known except on the s. and western frontier. The highest part of the Himalaya consists of granites and crystalline strata, and in the neighborhood of the lake Manasarowar, of volcanic rocks. On the table-land, the strata belong to the most recent tertiary epoch (the Pleistocene). They lie horizontally as they were deposited, and seem to have been lifted up in one unbroken cake to their present prodigious elevation. Thibet abounds with gold, borax, salt, silver, copper, and tin, but the jealousy of the natives and the absence of fuel renders its mineral wealth unavailable. Some gold, however, has been worked.

Climate.—Thibet lies between the latitude of Naples and Cairo, and might be supposed to enjoy a similar climate. But its great elevation renders it excessively cold during the winter, when its climate resembles that of the arctic regions more than that of countries in the zone to which it belongs. The mountains and the great plains which lie between Thibet and the sea rob the winds of their moisture, and hence another peculiarity of the climate is its excessive dryness. Timber never rots, but it breaks from brittleness; flesh exposed to the wind does not become putrid, but dries, and can be reduced to a powder. The air loses its conducting power; and persons dressed in sheepskins give out long electric sparks when they approach conducting substances. During the winter, the winds are excessively high, and the weather-beaten rocks break into a dust, which mixes

with the loose alluvial soil, and with it is blown about in blinding clouds. The limit of perpetual snow is from 16,000 to 18,000 feet high on the Thibetan side of the Himalaya, while on the Indian or southern side it is in some places only 13,000—a fact attributed to the dryness and purity of the air above the table-land. The Tibetan glaciers, particularly in the mountain region of the w., are of enormous extent. Pastures and low bushes make their appearance at 18,544 ft.—2,800 ft. higher than Mont Blanc, and 1279 ft. above the snow-line on the Andes near Quito. Below this level extends a country of bare and scanty pastures. Owing to the great dryness of the air, trees (the cedar and birch) are only met with in a few scattered spots on the hills. In the great plains, the pursuits of the inhabitants are chiefly those of the pastoral tribes of the steppes of Central Asia. In the valleys, however, the soil is more productive; and fruit-trees, the vine, and the European grains are cultivated. The conditions of the climate render irrigation necessary, and the construction and maintenance of terraces along the slopes. This has given rise to a kind of agriculture characteristic of Thibet, which demands skill and continuous labor, and which has called into existence an intelligent, strong, and hardy population. Among the productions of Thibet are barley, buckwheat, grapes, and all the European fruits.

Industry.—The Thibetans have made considerable progress in the industrial arts. They are ingenious jewelers, and manufacture extensively fabrics of wool and goat's hair, Buddhist idols, etc. In spite of the inaccessible nature of the country, and the absence of good roads and bridges, the rivers being crossed by inflated skins, a great trade is carried on with the neighboring lowlands. That with China is conducted chiefly at Sinning, but partly at H'lassa, by caravans, the goods being conveyed on the backs of llamas, mules, and horses. The raw produce of Thibet is exchanged for tea, or Chinese manufactures, and European cutlery. A great trade is also carried on with Nepaul and Bhotan, from which, in exchange for the produce of Thibet, broadcloths and Indian manufactures are imported. From Turkestan the trade is no less important.

Language and Religion.—The language of the Thibetans, spoken also in Nepaul, and by the inhabitants of Bhotan, belongs to the monosyllabic or Chinese class. See PHONOLOGY. Thibetan is singularly free from dialects, from which it is concluded it spread rapidly in recent times. It has a copious literature, chiefly religious. The religion of the Thibetans is a kind of Buddhism. See LAMAISM. At the extreme w. in Bulistan, however, Mohammedanism prevails, which, having spread from Cashmere and Persia, and not from Turkestan, is Shiite.

Government.—Almost the whole of Thibet proper is now tributary to China. The government is to some extent, however, in the hands of a Buddhist hierarchy, the name of the chief priest being the Dalai-lama, and the second the Bogdo-lama. These spiritual and temporal princes rule in different parts of the country. There are Chinese soldiers in all the chief towns, and the Chinese generals have the entire control of the army, and the direction of the most important temporal affairs. Commerce is in the hands of the government, and is closely watched, there being Chinese garrisons at the entrance to all the chief passes.

There are several important towns in Thibet, of which Lassa (q.v.) is the chief.

History.—The early history of Thibet is legendary. The first king, who flourished 113 B.C., was exposed in a copper box, and afterward found swimming in the Ganges. As early as the beginning of the 5th c. after Christ, a Buddhist missionary from Cashmere is said to have penetrated into Thibet, and to have obtained a footing for the doctrines of Buddha. In 821, Thibet was compelled to pay tribute to China. Early in the 10th c., king Dharma adopted Mohammedanism; but he was killed in 925, and Buddhism was re-established. In the beginning of the 11th c., Thibet was split into several states, and its power declined. In the 12th and 13th centuries, the Chinese began to conquer the eastern parts of Thibet, which, however, did not become tributary to Peking till 1720, when they were placed under their present government. Western Thibet has been more exposed to the inroads of the Turkish tribes than of the Chinese. The former were, however, expelled from it by Aurungzebe in the 17th c., and then it was that Mohammedanism was introduced. In the early part of this century, western Thibet was annexed to the Sikh empire of Runjeet Singh. It now forms part of the territory of the Maharajah of Cashmere.

Until a comparatively recent period, Thibet was only known from the accounts given by Marco Polo and the Jesuit missionaries, travelers respectively of the 13th and 17th centuries. It was, however, visited in 1774 by George Bogle, and in 1780 by Samuel Turner, both sent by Warren Hastings on missions to the Dalai-lama. In this century it has been partially explored by Manning (1811), capt. Strachey (1846), the French Jesuits Huc and Gabet, the brothers Schlagintweit (1855-56). On May 15, 1866, it was stated to the geographical society of London that a regular survey of lower Thibet and Ladak had been completed by the Indian government. While the work was proceeding, maj. Montgomerie, the officer in charge, conceived a plan of carrying out the survey in the neighboring districts of Thibet, closed by the jealousy of the Chinese officials against Europeans. He had Hindus of education, or pundits, instructed specially to take scientific observations, and sent them, disguised as merchants, to explore Thibet beyond the Chinese frontier. The pundits traveled over and carefully surveyed that part of the country lying n. of the Himalaya, and between the frontier of Cashmere

and Illassa. They visited the great gold-fields of Thibet, which were found to extend 1000 m. s.e. of Ilchi, the mart from which the produce of the diggings is exported; and they furnished accurate and copious information about districts which, as yet, no European has been allowed to enter. One of these pundits, a semi-Thibetan, who was dispatched in 1871, succeeded in exploring 320 m. of unknown territory, discovering and marching round the great lake Tengri-nor in the n., which is 50 m. long. The journey of the pundit Nana Singh, in 1874 and 1875, is one of the most important in geographical results that have been made in the present century. Passing from Leh to Illassa, he traversed for the first time the vast lacustrine plateau of Thibet, and thence made his way into Assam. While these explorations have been made in the west of Thibet, attempts have been made to penetrate the south-eastern corner of the table-land.—See col. Montgomerie's *Reports of Trans-Himalayan Explorations; Tibet in the Last Century*, by Clements Markham (1876); Sir William Temple in the *Proceedings of the Geog. Soc.* (1882); William Rockhill, *The Land of the Lamas* (New York, 1891), and *Diary of a Journey through Mongolia and Tibet in 1891 and 1892* (Washington, 1894); and works of various travelers in the publications of the Royal Geographical Society.

THICK-KNEE, *Oedienemus*, a genus of birds of the family *charadriade*, most nearly allied to the plovers, although, from their comparatively large size, they have often been ranked with bustards. They differ from the true plovers in having both mandibles inflated toward the tip, and not merely the upper mandible. There are about half a dozen species. Only one occurs in Britain, the common THICK-KNEE (*O. crepitans*), also known as the thick-kneed plover, thick-kneed bustard, great plover, Norfolk plover, and stone curlew.

THIELT, a t. of Belgium, in the province of w. Flanders, 16 m. s.e. of Bruges. It is a well-built town, containing several interesting edifices and institutions. An important linen market takes place here annually, and the principal manufactures are linen, woolen, and cotton goods, lace, and gloves. Pop. '94, 9998.

THIERRY, JACQUES NICHOLAS AUGUSTIN, an eminent French historian, was born at Blois, May 10, 1795. He received his education in the normal school of his native town, and became a teacher in a provincial school. In 1814 he resigned this charge, came to Paris, and published his first work, entitled *De la Réorganisation de la Société Européenne*. In this treatise he considers the practicability of having one government for the whole of Europe, preserving at the same time the nationality of each people. Adopting the views of St. Simon, Thierry became the assistant of that philosopher, in which capacity he worked for three years. In 1817 he joined Comte and Dunoyer as editors of the *Censeur Européen*, in which he wrote many articles, literary, political, and historical. In 1820 he became engaged on the *Courrier Français*, in which he published his *Dix Lettres sur l'Histoire de France*. He now began to addict himself almost exclusively to historical writing. Having given up the *Courrier*, he published his masterpiece, *L'Histoire de la Conquête d'Angleterre par les Normands* in 1825, and his *Lettres sur l'Histoire* (1827), works which had great success; but his success was dearly bought, as the necessary labor seems to have ruined the eyesight of the author. Becoming quite blind in 1830, he went in that year to Hyères for the benefit of his health. Here he met Julie de Quérangal, an authoress of considerable repute, whom he married in the following year. He seems to have been able partially to resume work about this time, and in 1835 he published his *Dix ans d'Etudes Historiques*, the introduction to which is one of the most eloquent of his works. In 1840 appeared his *Récits des Temps Mérovingiens*, which work gained the great Gobert prize. The preface gives an interesting and eloquent account of the history of his own literary labors. His last publication was the *Essai sur l'Histoire de la Formation et de Progrès du Tiers Etat*, in 1853. The author died May 22, 1856, his wife having predeceased him in 1844. During his life Thierry enjoyed the success and popularity due to his industry and talents. His careful research has thrown much light on the early ages of which he has written, and dispelled much popular error regarding them.

THIERS, a manufacturing t. in France, in the dep. of Puy-de-Dôme. It stands in a pleasant valley on the right bank of the Durole, 23 m. e.n.e. of Clermont. Its manufactures of cutlery, paper, and playing-cards gave to the town a certain importance in the 17th century. Pop. '91, 11,993.

THIERS, LOUIS ADOLPHE, French historian and statesman, was b. April 16, 1797, at Marseilles. His father is variously reported to have been a locksmith, a decayed cloth-merchant, or an advocate at the parliament of Marseilles; his mother belonged to an old commercial family which had fallen into poverty. He was placed by his mother's relatives in the lyceum, where he achieved many victories over his young competitors. In 1815 he was sent to Aix to pursue the study of the law. Here he formed his friendship with M. Mignet the historian, in company with whom, as soon as he had taken his degree as advocate, he set off to Paris to seek his fortune. He lived for a time in obscurity and indigence, but, obtaining an introduction to Lafitte, he was enrolled among the contributors to the *Constitutionnel*, then the leading liberal organ. He became distinguished for the vigor and hardihood of his articles, and as in France the occupation of a journalist was at that time and for many years afterward regarded with an estimation proportioned to its influence over society, the young political writer was admitted into the most brilliant circles of the opposition. In the crowded saloons of Lafitte, Casimir Perier, the comte de Flahault, the baron Louis (the great financier of the

era), and of M. de Talleyrand, he enjoyed an intercourse with actors in the grand revolutionary drama, which was eminently useful to him in the great undertaking which he had long meditated. *L'Histoire de la Révolution Française* (1823-7) placed the briefless advocate and young political writer in the highest ranks of literary celebrity. Three editions were soon called for, and the profits upon the sale, and the gift of a share in the *Constitutionnel*, conferred upon him by an admirer, raised him to comparative affluence. Leaving his garret in the alley of Montesquieu he emerged into fame, and became one of the most prominent men of France in the two paramount fields of literature and politics. In Jan., 1830, he established a new paper of more democratic principles, the *National*. Assisted by Armand Carrel and some of the ablest men of the liberal party, Thiers in this journal waged unrelenting war against the Polignac administration, which at length, stung beyond endurance, took the desperate measure of issuing the ordinances of July. The revolution of 1830 was the result. Thiers now devoted himself to a public career, and was appointed secretary-general to the minister of finance and elected deputy for the town of Aix. His first appearance in the chamber of deputies gave no promise of his subsequent distinction. His diminutive person, his small face, encumbered with a pair of huge spectacles, and his whole exterior presenting something of the ludicrous, the new deputy, full of the impassioned eloquence of the revolutionary orators, attempted to impart the thrilling emotions recorded of Mirabeau. The attempt provoked derision, but soon subsiding into the oratory natural to him—simple, easy, vigorous, rapid, anecdotic—he became one of the most formidable of parliamentary champions. From 1832, when the Soult cabinet was constructed, he continued a minister, with one short interval, until 1836. He was by turns minister of the interior, minister of commerce and public works, and minister for foreign affairs under various chiefs—Soult, Gérard, Mortier, and Broglie. In Feb., 1836, he was nominated president of the council and foreign minister by Louis Philippe. He only held this office until Aug., 1836, when he passed into opposition. In 1840 he was again called by the king to the premiership. He refused lord Palmerston's invitation to enter into an alliance with England, Austria, and Prussia for the preservation of the integrity of the Ottoman empire, from some lingering sympathy with the principles which dictated the first Napoleon's invasion of Egypt and Syria, and a desire to accomplish by diplomatic relations with Mehemet Ali that which Bonaparte had sought to effect by force of arms—a controlling power on the part of France in Syrian and Egyptian affairs. Lord Palmerston entered into the treaty without France, Acre was taken by the English fleet, and Mehemet Ali was driven out of Syria. The popular irritation in France fostered by Thiers was excessive, and nothing but the peaceful character of Louis Philippe prevented the French nation from rushing into a war of defiance to all the powers of Europe. Thiers alarmed the continent by his threats of setting aside the treaties of 1815 and extending the French frontier to the Rhine. It was computed that he spent not less than \$40,000,000 in military and naval demonstrations. The effect of the ill blood thus generated was felt shortly afterward in the seizure of the Society islands, and in the remonstrances which the British government saw reason to address to that of France respecting the ill treatment of Mr. Pritchard, their consul at Tahiti. Louis Philippe dismissed his bellicose prime minister, and Europe again tasted the sweets of repose. He employed his leisure in historical pursuits. His *Histoire du Consulat et de l'Empire*, begun in 1845 and completed in 1860, is one of the greatest historical works of the age. At the revolution of 1848 he accepted the republic, but was banished after the *coup d'état* of 1851 (see LOUIS NAPOLEON). After a short residence in Switzerland he was permitted to return to Paris, where he published a continuation of his *History*. He re-entered the chamber in 1863, having been elected deputy for the department of the Seine by the liberal opposition. In his speeches Thiers constantly taunted the empire with the loss of foreign *prestige*; and these taunts are not to be left out of record when the disastrous war of 1870 is to be rightly accounted for. When that conflict became inevitable, he predicted the certain defeat to France it would lead to. The early disasters of the war brought him into a particularly prominent position. It was Thiers who suggested the laying waste of the country around Paris. He declined to become a member of the government of national defense, formed on the downfall of the empire; but voluntarily undertook diplomatic journeys to England, Russia, Austria, and Italy, on behalf of France—a self-imposed mission in which he was unsuccessful, but by which he acquired the unfeigned gratitude of his countrymen. According to the suggestions of these four neutral powers, Thiers opened negotiations for peace with the king of Prussia at Versailles, which, however, were for the time unavailing. After the capitulation of Paris Thiers was elected to the national assembly by the vote of a third of the French nation, and was chosen by the assembly to be head of the provisional government. Owing to his good sense the French accepted the terms of peace offered by Prussia. In 1871, after having crushed the commune and restored order, he ceased to be "chief of the executive power" of France to become "president of the French republic;" and this office he held till May, 1873, when, failing in his effort to make the republic permanent by definitive legislation, he made way for Marshal MacMahon. His death (Sept. 5, 1877) was a severe blow to the republicans of France, whose leaders had latterly come to regard Thiers, though a "conservative republican," as head of the whole republican party. Thiers had been a member of the *Académie Française* since 1836.

THIMBLE. This word is considered to be a derivative of *thumb*, and is generally used for the cap or cover, or often a simple ring, which is placed on the finger for protection from the needle while sewing. It is usually made of metal and has many small indentations to receive the head of the needle. In mechanics, it is any thimble-shaped appendage or fixture: as a tubular ring or lining, fixed or movable, placed in a hole; or a strut through which a bolt or pin passes; or a tubular cone for expanding a flue, called in England a *ferule*. As a nautical term, it signifies an iron ring encircled by a groove to receive the rope which is spliced about it, used to keep the eye of the rope from injury.

THINGVALLA. A lake in the southwestern part of Iceland between the towns of Reikiavik and Skalholt. It is about 19 miles long (n.w. to s.e.) contains several islands, and is remarkable for its picturesqueness. Its southern portion contracts into a river which flows into the Gulf of Thorlaks and thus serves as an outlet for the lake. Thingvellir on its northern shore is a village of considerable historical interest from the fact that the central moot, the Althing, a council of delegates from every inhabited quarter of Iceland, met there in the open air from 920-1800.

THIONVILLE, a fortified t. of Alsace, in the German province of Alsace-Lorraine, on the Moselle river, 20 m. n. of Metz, situated on a broad plain; population (1890), 8923. It is fortified by a wall, built under the old-school system, which ranked it as a 3d class fortress. After the French were defeated at Forbach, and retreated to Metz, this fortress greatly troubled the Prussians then laying siege to Metz. Three unsuccessful attempts to take Thionville were made by the Prussians in August, September, and October. After the fall of Metz a greater force could be spared, and the place was bombarded from early morning of Nov. 22d to the evening of the 24th, 1870, by 85 guns, when it surrendered. The fortifications were little injured by the attack, although many buildings in the place were demolished. The German name is Diedenhofen.

THIRD, the name popularly given to a musical interval, or rather to two different musical intervals, which are distinguished as the *major* and *minor* third. The major third is the interval between a note and its mediant, as between C and E; its ratio is 4 to 5, and it comprises four semitones. The minor third has for ratio 5 to 6, as from A to C, and comprises but three semitones.

THIRD HOUSE. See LOBBY.

THIRLWALL, CONNOP, D.D., 1797-1875; b. England; educated at Cambridge; became a fellow and tutor; admitted to the bar at Lincoln's Inn, 1825; relinquishing law, was ordained, 1828; rector of Kirby-under-Dale, Yorkshire; made bishop of St. David's, 1840. He published, with Charles Hare, a translation of the first two volumes of Niebuhr's *History of Rome*; and in 1835 wrote for Lardner's *Cabinet Cyclopædia* the first vol. of *History of Greece*, completed in 8 vols. He was for several years examiner of the university of London, visitor of St. David's college, Lampeter, and an associate editor of the Cambridge *Philological Museum*. He published sermons, charges, letters, and addresses, entitled *Literary and Theological Remains*.

THIRSK, a parliamentary borough in the n. riding of Yorkshire, on both banks of the Codbeck, an affluent of the Swale, 23 m. n.w. of York. It contains an old, large and handsome Gothic church, and carries on manufactures of leather and saddlery. Pop. '81, of borough, 6306; '91, 6584.

THIRST is a well-known sensation, resulting from a peculiar state of the mucous membrane of the digestive canal, but especially of the mucous membrane and the fauces, usually caused by an insufficient supply of liquid. In cases of extreme thirst, there is a peculiar sense of clamminess in the mouth and pharynx; which, with the other disagreeable feelings, is almost immediately relieved by the introduction of liquid into the stomach, where it is absorbed by the veins. That the thirst is relieved by the absorption of the fluid, and not by its action as it passes over the mucous membrane, which seems to suffer most, is proved by the facts—(1) that injection of liquids into the stomach through a tube (in cases of wounded œsophagus), and (2) the injection of thin fluids, as water, into the blood, remove the sensation of thirst. An excessive thirst is often an important morbid symptom. It may arise from two very opposite conditions—one a condition of excitement, and the other of depression. Whenever the blood is in a state requiring dilution, and is too stimulating, as in fevers and inflammation, there is thirst; and, again, in cases of excessive secretion and exhaustion; as for example in cholera and in the two forms of diabetes, there is great thirst, which sometimes also attends the lowest stages of prostration in malignant diseases. When there is a great loss of the watery portion of the blood by profuse perspiration, caused not by disease, but by hard bodily exercise in a hot atmosphere, as in the case of coal-whippers, mowers, and reapers, etc., there is always great thirst, and from two to four gallons of beer or cider a day may, in these cases, be taken with impunity, if not with advantage. Cold tea, without milk or sugar, is the most satisfying drink under these circumstances. Independently of disease, great thirst may be induced by the use of salted meat or fish, highly-peppered curries, and other stimulating dishes, the ingestion of malt liquors

drugged with salt and more pernicious matters, or of gin strengthened by sulphuric acid, etc. In all these cases the symptoms point to the natural remedy.

THIRTEEN. See SUPERSTITIONS.

THIRTY TYRANTS, at Athens, were a body of rulers invested with sovereign power after the close of the Peloponnesian war. They were all native Athenians, but members of the aristocratic party, and chosen by the Spartan conquerors, who, knowing the animosity existing between the democracy and oligarchy of Athens, hoped to rule the city through the agency of the latter. Their government was a positive "reign of terror," marked by the most infamous cruelties. Even Mitford, with all his hatred of democracy, speaks of the "shamelessness of crime" as surpassing all that had previously occurred in Grecian history. It lasted only one year, when it was overthrown by the return of the Athenian exiles under Thrasybulus.

THIRTY TYRANTS of the Roman Empire, is the collective title given to a set of military usurpers who sprung up in different parts of the empire during the 15 years (253-68 A. D.) occupied by the reigns of Valerian and Gallienus, and amid the wretched confusions of the time, endeavored to establish themselves as independent princes. The name is borrowed from the Thirty Tyrants at Athens, but, in reality, historians can only reckon nineteen—Cyriades, Macrianus, Balista, Odenathus, and Zenobia, *in the east*; Postumus, Lollianus, Victorinus and his mother Victoria, Marius, and Tetricus, *in the west*; Ingenuus, Regillianus, and Aureolus, in Illyricum and the countries about the Danube; Saturninus, in Pontus; Trebellianus, in Isauria; Piso, in Thessaly; Valens, in Achaia; Æmilianus, in Egypt; and Celsus, in Africa.

THIRTY YEARS' WAR was not properly one war, but rather an uninterrupted succession of wars (1618-48) in Germany, in which Austria, the most of the Catholic princes of Germany, and Spain, were engaged on one side throughout, but against different antagonists. This long-continued strife had its origin in the quarrels between the Catholics and Protestants of Germany, and the attempts of the former, who were the more powerful body, to deprive the latter of what liberty of worship they had obtained. The severe measures taken by the emperor, the head of the Catholic party, against the Protestant religion, led also to strictures on their civil rights; and it was to protect their political as well as their religious liberties that the Protestants formed a union, May 4, 1608, with Frederick IV., the elector palatine, at its head. The rival union of the Catholic powers, under the leadership of the duke of Bavaria, followed July 11, 1609. In Bohemia, the immense preponderance in numbers (two out of three) and influence of the Protestants had forced from their Austrian king an edict of toleration (July 11, 1609), which was at first faithfully observed; but during the reign of Matthias, sundry violations of it were made with impunity; and as the influence of Ferdinand of Styria (see FERDINAND II.), his successor, began to be felt in more flagrant partiality to the Catholics, the kingdom became a scene of wild excitement; three of the Catholic party were thrown from the window of the Bohemian council-chamber at Prague, and ultimately Ferdinand was deposed, and Frederick V., the elector palatine, chosen in his stead (1619); and count Thurn, at the head of an insurgent army, repeatedly routed the imperial troops, and actually besieged the emperor in Vienna. The Catholic princes, though as apprehensive as their opponents of the encroaching policy of Austria, crowded to the emperor's aid; and while the Protestant union and James I. of Great Britain held aloof from Frederick, whose sole allies were Bohemians (under Thurn), Moravians, Hungarians, and a Piedmontese contingent of 3,000 (under count Mansfeld), a well-appointed army of 30,000, under duke Maximilian, advanced to support the Austrians, and totally routed Frederick's motley array at Weissenberg (Nov. 8, 1620), near Prague, afterward reducing the upper, while an army of Spaniards under Spinola ravaged the lower palatinate, and the Saxons (in alliance with the emperor), occupied Lusatia. The Bohemians were now subjected to the most frightful tyranny and persecution; a similar policy, though of a more moderate character, was adopted toward the people of the palatinate—the Protestant union standing aloof, and subsequently dissolving, through sheer terror. But the indomitable pertinacity and excellent leadership of count Mansfeld and Christian of Brunswick, two famous partisan leaders, who ravaged the territories of the Catholic league, and the forced cession to Bethlem Gabor of large portions of Hungary and Transylvania, did much to equalize the success of the antagonistic parties.

Here the war might have ended; but the fearful tyranny of Ferdinand over all the Protestants in his dominions (Hungary excepted), drove them to despair, and the war advanced to its second phase. Christian IV. of Denmark, smarting under some injuries inflicted on him by the emperor, and aided by a British subsidy, came to the aid of his German co-religionists in 1624, and being joined by Mansfeld and Christian of Brunswick, advanced into Lower Saxony, while the emperor, hampered by the political jealousy of the Catholic league, was unable to oppose him. But when, by the aid of Wallenstein (q. v.), a powerful and effective army had been obtained, and the leaguers under Tilly, in co-operation with it, had marched northward, the rout of the Danes by Tilly at Lutter (Aug. 17, 1626), and of Mansfeld by Wallenstein at Dessau (April 1, 11, and 25, 1626), again prostrated the Protestants' hopes in the dust; yet a gleam of comfort was obtained from the victorious raid of Mansfeld through Silesia, Moravia, and

Hungary, though his scheme for an insurrection in Hungary failed, and his death soon after, at Zara, freed the emperor from a formidable and irreconcilable enemy. The combined imperialists and leaguers meantime had overrun North Germany and continental Denmark, and ultimately compelled king Christian to conclude the humiliating peace of Lübeck (May 12, 1629). This second great success seems to have turned Ferdinand's head, for not content with a still more rigorous treatment of the Protestants, and the promulgation of the *restitution edict*, which seriously offended even the Catholics, he stirred up Poland against Sweden, and insulted Gustavus Adolphus, both personally and in the persons of his ambassadors—insolent impertinences which he soon saw bitter reasons to regret. The Catholic league now forced him to reduce his army, and supplant Wallenstein by Tilly; while France was inciting Gustavus to the willing task of aiding the Protestants in Germany.

The war entered its third phase by the landing of the Swedes at Usedom (June, 1630), and their conquest of Pomerania and Mecklenburg. Gustavus, by the exercise of a little wholesome pressure, induced the elector of Brandenburg to aid him; and though unable to save Magdeburg (q.v.), he marched to join the Saxons, completely routed Tilly at Breitenfeld (Sept. 17, 1631); victoriously traversed the Main and Rhine valleys; again routed Tilly on the Lech (April 5, 1632), and entered Munich. By the judicious strategy of Wallenstein he was, however, compelled to return to Saxony, where he gained the great victory of Lützen (q.v.); but his death, depriving the Protestants of the only man who could force the confederate powers to preserve unity of action, was a severe blow to their cause; though the genius and indefatigable zeal of his chancellor, Oxenstierna, and the brilliant talents of the Swedish generals, preserved the advantages they had gained, till the crushing defeat of Bernard of Weimar at Nordlingen (Sept. 6, 1634) again restored to the emperor a preponderating influence in Germany. Saxony now made peace at Prague (May 30, 1635), obtaining such satisfactory terms for the Lutherans that the treaty was within three months adhered to by all the German princes of that sect, and the Calvinists were left to their fate.

Final success now appeared to demand only one more strenuous effort on the part of Austria; but Oxenstierna, resolved to preserve to Sweden her German acquisitions, propitiated Richelieu (q.v.) by resigning to him the direction of the war; and the conflict advanced into its final and most extended phase. The emperor, allied for offense and defense with the Lutherans, was now also assailed through his ally, Spain, who was attacked on her own frontier, in the Netherlands, and in Italy; Bernard of Weimar fighting independently, with the view of obtaining Alsace for himself, opposed the leaguers, while the Swedes, under Baner, held North Germany, and by frequent flying marches into Silesia and Bohemia, distracted their opponents, and prevented them, after their successes over duke Bernard, from proceeding with the invasion of France. The great victory of Baner over the Austrians and Saxons at Wittstock (Oct. 4, 1636), restored to Sweden the victor's wreath she had lost two years before; and from this time, especially under Torstensohn (q.v.) and Königsmark, the Swedes were always successful, adding a second victory of Breitenfeld (Nov. 2, 1642), one at Yankowitz (Feb. 14, 1645), and numberless ones of less note, to their already long list of successes, carrying devastation and ruin into the hereditary territories, even to the gates of Vienna, defeating the best generals of the empire, till, from a profound feeling of inability to check them, the Austrians hardly dared appear to the north of the Danube. On the Rhine the leaguers at first had great success—the Weimar troops, now in French pay, were almost exterminated at Duttlingen (Nov. 24, 1643); but after the Spanish power had been thoroughly broken in the Netherlands by Condé, the French were re-enforced on the Rhine; and under Condé and Turenne (q.v.) rolled back the leaguers through the palatinate and Bavaria, and revenged at Nordlingen (Aug. 3, 1645) the former defeat of the Swedes. The emperor was now deserted by all his allies except the duke of Bavaria, whose territories were already mostly in the hands of Turenne and Wrangel; and a combined invasion of Austria from the w. and n. was on the point of being executed, when, after seven years of diplomatic shuffling, with an eye to the changing fortunes of the contest, the peace of Westphalia (q.v.) put an end to this terrible struggle.

THISTLE, *Carduus*, a genus of plants of the natural order *compositæ*, sub-order *cynarocephalæ*, with spinous leaves, imbricated involucre, and heads of flowers, consisting of tubular hermaphrodite florets alone, very rarely diœcious, stamens free, pappus deciduous, the receptacle having chaffy bristles. The flowers are sometimes large, generally purple, rarely white or yellowish. Recent botanists have divided this genus into two genera—the true thistle (*carduus*), in which the pappus is composed of simple hairs, and the plume thistle (*cirsium* or *cnicus*), in which the pappus is feathery.—The species of both genera are numerous, and are found in most of the temperate and cold parts of the northern hemisphere, annual, biennial, and perennial herbaceous plants of considerable size.—The MILK THISTLE (*carduus marianus*), a biennial, native of Britain, and other parts of Europe, attains a height of 4 to 6 ft., and is remarkable for the milky veins of its large waved leaves. The bractæ of the involucre are subfoliaceous and recurved. The young leaves are sometimes used as a spring salad. Blanched leaves are used in winter salads. They are also used as a boiled vegetable, along with the

young stalks, after these have been peeled and soaked in water to extract part of their bitterness. The root is used as salsafy. In former times, the plant was frequently cultivated.—The creeping plume thistle (*cirsium arvense*, or *cnicus arvensis*), a species about 1 to 3 ft. high, with creeping roots, pinnatifid leaves and numerous diœcious flowers, is a very troublesome weed in fields, very common in Britain, and now too common, not only in Europe, where it is indigenous, but in America and other countries to which it has found its way. *Cirsium lanceolatum* and *C. palustre*, both common British plants, are also regarded as troublesome weeds. The former has larger flowers than any of the other species common in Britain. *Cirsium oleraceum* is a native of the n. of Europe, but not of Britain, distinguished by its yellowish flowers, which are surrounded with large yellowish involueral bractæ. The young leaves are used as a culinary esculent.—The BLESSED THISTLE (*carduus benedictus* of the pharmacopœias, *cnicus benedictus* or *cirsium benedictum* of modern botanists) is a native of the Levant and of Persia, resembling in appearance a *centaurea*; with yellow flowers enveloped in leaves, and abounding in a gossamer-like down. The whole plant has a very bitter and disagreeable taste, and besides a bitter extractive, contains much sulphate and muriate of potash and sulphate of lime. It is a powerful laxative- tonic medicine, and a strong decoction of it readily induces vomiting.—The COTTON THISTLE (*onopordon*) is a distinct genus, known by its receptacles being destitute of bristles, and coarsely and deeply honey-combed. The common cotton thistle (*O. acanthium*), a native of Europe, and found in England, but rarely wild in Scotland, if, indeed, it is a true native of that country, is, nevertheless, very generally called by gardeners and others the SCOTCH THISTLE. The national emblem of Scotland is not, in all probability, any one species of thistle in particular, as botanically distinguished; though the stemless thistle (*cnicus aculeis*, or *cirsium acule*) is in many districts of Scotland so designated. According to the common tradition, the Danes (or Norsemen?) came upon the Scots unperceived in the dead of night; and halting while their spies were trying to discover the undefended points of their opponents' camp, one of the spies chanced to tread upon a thistle of this species, and the loud imprecation which the sudden pain evoked aroused the unsuspecting Scots, who at once attacked the invaders, gained a complete victory, and dubbed the plant which had been the means of their success the Scotch thistle. The cotton thistle has large elliptic leaves, and a broadly winged stem. The young fleshy root and the stem, while still tender, are in many places boiled and eaten. The expressed juice of the plant was formerly reckoned good for cancerous sores and cutaneous eruptions.—Plants of the genus *silybum*, distinguished by its monadelphous stamens, and of the genus *echinops*, which has a very different manner of growth, and belongs to a very different section of the *compositæ*, are often to be seen in flower-gardens, where they are known as thistles. The name is also, generally with some addition, very often bestowed upon many plants which have little resemblance to any of these, except in their spinous character. *Centaurea calcitrapa* is commonly known as the STAR THISTLE (see CENTAUREA).—The CARLINE THISTLE (*carlina vulgaris*) is pretty common in dry hilly pastures in some parts of Britain.

THISTLE, ORDER OF THE, called also the order of St. Andrew. See ANDREW, ST. The following is a more complete account of its institution than is given in the article referred to. The order is of no very ancient date. The earliest-known mention of the thistle as the national badge of Scotland is in the inventory of the effects of James III., who probably adopted it as an appropriate illustration of the royal motto, *In defense*. Thistles occur on the coins of James IV., Mary, James V., and James VI.; and on those of James VI. they are for the first time accompanied by the motto, *Nemo me impune lacesset*. A collar of thistles appears on the gold bonnet-pieces of James V. of 1539; and the royal ensigns, as depicted in sir David Lindsay's armorial register of 1542, are surrounded by a collar formed entirely of gold thistles, with an oval badge attached. This collar, however, was a mere device until the institution, or, as it is generally but inaccurately called, the revival of the Order of the Thistle by James VII. (II. of England), which took place on May 29, 1687. Statutes were issued, and eight knights nominated by James; but the patent for the institution of the order never passed the great seal. After falling entirely into abeyance during the reign of William and Mary, the order was revived by Queen Anne, Dec. 31, 1703.

THLINKETS, a tribe of Indians (called Kolosh by the Russians), the chief native population of Alaska (q.v.). They inhabit the coast and islands from the intersection of the 141st meridian to the s. boundary. They lead a nomad life in the summer, laying up provisions for the winter months, winter being the only period when they occupy fixed dwellings. They derive their principal nourishment from the fish, mollusks, and algæ of the sea, preserving the latter in boxes, with herrings' spawn. They also hunt the larger marine animals, such as the seal, otter, and porpoise, and carry on a considerable trade with white settlers in fish and furs. The T. in 1880 numbered 6773. To these are usually added 788 Hyda, closely related to the T., who reside on Prince of Wales Island.

THOBURN, JAMES M., D.D., b. Ohio, 1836; grad. at Alleghany coll.; admitted on trial to Pittsburg conference, 1858; went to India as missionary, 1859; presiding elder of Calcutta district (Bengal conference), 1873-88; editor of *The Witness* 6 years; repre-

sented the India conference in gen. conference, 1876; South India conference, 1880, and the Bengal conference, 1888. Elected missionary bishop for India and Mayklasia, 1888. He has written *My Missionary Apprenticeship* and *Missionary Addresses before Theological Schools*.

THO LEN, an island in the Netherlands, province of Zealand, bounded on the s. by the Easter Scheldt, contains about 30,000 acres of rich land, and is defended from floods by strong dykes, the borders of which are planted with trees. Pop. '89, 2932.

THOLUCK, FRIEDR. AUG. GOTTREU, a German Protestant theologian; b. Breslau, March 30, 1799; educated at the univ. there and at Berlin; devoted himself to oriental studies, and pub. *Suffismus sive Theosophia Persarum Pantheistica* (Berl. 1821). His sympathy with Christianity was negative, but influenced by Neander and by baron von Kottwitz, of Silesia, he changed radically, and in 1823 pub. his *Wahre Weihe des Zeuifers* (True Consecration of the Skeptic; 7th ed. published at Hamb. 1851, under the title of *The Doctrine of Sin and the Propitiator*, and translated into English, French, Danish, Swedish, and Dutch). Next year he published his *Auslegung des Briefs an die Römer* (Exposition of the Epistle to the Romans; Berl. 1824; 4th ed. 1842; also translated into English and other languages). About the same time he was appointed extraordinary professor of theology at Berlin, and in 1825 he paid a visit to England. On his return in 1826 he succeeded Knapp as ordinary professor of theology at Halle, where, with the exception of a brief official sojourn at Rome, he remained until his death. Tholuck's position at Halle was far from pleasant at first, for the majority of the theological faculty, among whom was Gesenius, were very decided rationalists, and did all in their power to make the new professor miserable, but the latter, though not a man of very powerful intellect, was filled with a quiet, earnest, resolute faith, and he continued his evangelical labors in spite of all opposition, until they were crowned with success. The university of Halle is at present, mainly owing to Tholuck, as thoroughly Christian, though not, perhaps, so strictly orthodox, as it was in the days of Francke. His kindness (and that of his wife) toward students, especially poor students, was proverbial, and contributed not a little to his fame abroad. In 1843 he was chosen a member of the consistory of Magdeburg, where he became superior councilor in 1867. Besides the works already mentioned, we may specify among his exegetical writings his *Praktischer Commentar zu den Psalmen* (Practical Commentary on the Psalms; Hamb. 1843); *Commentar zum Evangelium Johannis* (Commentary on the Gospel of John; 6th ed. Hamb. 1844); *Commentar zum Briefe an die Hebräer* (Commentary on the Epistle to the Hebrews; 3d ed. Hamb. 1850); *Philosophisch-theologische Auslegung der Bergpredigt* (Philosophico-theological Exposition of the Sermon on the Mount; 3d ed. Hamb. 1845). Of his dogmatic writings, the principal are contained in the *Literarischer Anzeiger für Christliche Theologie und Wissenschaft*, a journal now discontinued; and in his *Glaubwürdigkeit der Evang. Geschichte* (Credibility of the Gospel History; Hamb. 1837); a treatise directed against Strauss's *Leben Jesu*. Among his contributions to the history of theology are to be reckoned his *Vermischte Schriften grösstentheils apologetischen Inhalts* (2 vols. Hamb. 1839); *Der Geist der Luth. Theologen Wittenbergs im 17. Jahr* (The Spirit of the Lutheran Theologians of Wittenberg in the 17th Century; Hamb. 1852); *Das Academische Leben des 17. Jahrh.* (The Academic Life of the 17th Century; Halle, 1853-54); and his *Geschichte des Rationalismus* (History of Rationalism), of which several parts—notably a *Vorgeschichte des Rationalismus*—have already appeared, but which is still unfinished. Besides these may be mentioned several volumes of sermons. Tholuck died at Halle, June 9, 1877.

THOMAS, a co. in s.w. Georgia, adjoining Florida, drained by the Ocklockonee river, and its branches; traversed by the Plant System railroad; about 784 sq. m.; pop. '90, 26,154. Co. seat, Thomasville.

THOMAS, a co. in n.w. Kansas, drained by the n. and s. forks of Sappa creek, by the head-waters of the Saline river, and the n. and s. forks of Saline river; about 1080 sq. m.; pop. '90, 5538. Co. seat, Colby.

THOMAS, or **DIDYMUS**, one of the twelve apostles, both of whose names signify "a twin." One of the records concerning him in John's gospel has led to his being unduly condemned as a doubter. It speaks only of his asking evidence, such as the other disciples had had, on which to rest his faith. There are various traditions concerning his labors and martyrdom, as the earlier say, in Persia and as the later, on the Malabar Indian coast. Several Roman Catholic theologians assert that traces of his presence in America are found from Paraguay to Mexico, in which last country Spanish priests pretend that the Aztec divinity Quetzalcoatl was the apostle Thomas, who introduced those features of the Aztec religion which resemble Christian and Jewish rites.

THOMAS, CHARLES LOUIS AMBROISE, composer, b. in Metz, Aug. 5, 1811. He studied at the Paris Conservatoire under Zimmermann and Kalkbrenner on the piano forte, and under Douren, Barbereau, and Lesueur in counterpoint, harmony, and composition, winning the Grand Prix de Rome in 1832. After studying three years in Italy, he returned to Paris, and devoted himself to dramatic composition. He succeeded Auber as director of the Conservatoire in 1871. In 1851 he became a member of the Académie Française, and entered the Légion d'Honneur in 1845. Thomas was one of the most noted composers of the modern French school, and stood second to Gounod, whom he resembled in style. His chief success lay in opéra comique, the

best of his works being *Mignon*, Paris, 1866. His compositions include: *Le panier fleuri*, 1839; *Le Caid*, 1849; *Le songe d'une nuit d'été*, 1850; *Psyché*, 1857; *Hamlet*, 1868; *Françoise de Rimini*, 1882; ballets; cantatas; requiems; chamber-music; and choruses for male voices, which are much esteemed. He died Feb. 12, 1896.

THOMAS AQUINAS. See AQUINAS, THOMAS.

THOMAS, EDITH MATILDA, American author, born at Chatham, O., in 1854, and educated at the Normal Institute, Geneva, O. She has contributed prose and verse to periodicals, and published the volumes of poetry, *A New Year's Masque*; *Lyrics and other Poems*; *The Inverted Torch* (1890); *A Winter Swallow* (1897).

THOMAS, GEORGE HENRY, 1816-70, b. Va.; was of mixed Welsh and French descent; entered the U. S. military academy at West Point in 1836, and graduated in 1840. He was employed in garrison duty for a brief period, and was then for two years in active service in the Florida war, and brevetted 1st lieut. for gallantry. In 1845 he was in Texas; was present at the outbreak of hostilities with Mexico; and distinguished himself at Monterey and Buena Vista, being brevetted capt. and maj. for gallant conduct. After the close of the Mexican war he served a year in Florida; three years as cavalry and artillery instructor at West Point; and then as maj. 2d cavalry, for five years in Texas. Thomas's associations had all been southern; his family and friends at home were Virginians; A. S. Johnston was col. of his regiment, Robert E. Lee lieut. col., and W. J. Hardee senior maj.; while other officers were Van Dorn, Kirby Smith, Fitz Hugh Lee, and Hood. But he adhered to the Union cause; was lieut. col. and afterward col. of the 2d cavalry; commanded a brigade in the first Shenandoah campaign, a division in the battle of Mill Spring—when he first began to awaken national attention, and was in command of the right wing of the army of the Tennessee during the siege of Corinth, where he was in full command during a great part of June, 1862. He had the center of the army of the Cumberland, and did good work at Murfreesboro; commanded the 14th army corps in the campaign of middle Tennessee in the summer of 1863; and at the ill-starred battle of Chickamauga Thomas stood firm, and resisted the concentrated attack of a victorious enemy; gaining justly the title of "the rock of Chickamauga." He commanded the army of the Cumberland at Missionary Ridge, and in the campaign of 1864, up to the capture of Atlanta. His indomitable nerve and firmness enabled him to hold his ground at Nashville, where he was envied by Hood's army; and despite urgent pressure, to remain inactive until he was ready for the final blow. When that happened, which was on Dec. 15, '64, he flung his army upon Hood with a determination and power which were irresistible; and the defeat of the confederates bore testimony to the coolness which accomplished one of the most splendid victories of the war. Gen. Grant, who had even designed assuming his command on account of the delay, was the first to acknowledge the unerring judgment of Gen. Thomas. He was at once appointed a maj.-gen. in the regular army; congress tendered him a vote of thanks; the legislature of Tennessee voted him a gold medal; and the American people recognized his ability and his success with unstinted praise. In 1865-66 Gen. Thomas commanded the military division of the Tennessee, and the department of Tennessee the following year. He was afterward transferred to the 3d military district; and to the department of the Cumberland in 1867-69. From May 15, '69 until his death, which occurred Mar. 28, 1870, he was in command of the military division of the Pacific, with headquarters at San Francisco, where he died. His remains are buried at Troy, N. Y., and there is in Washington a monument to his memory.

THOMAS, ISAIAH, LL.D., 1749-1831; b. Boston; after an apprenticeship of 11 years began business as a printer at Newburyport, 1767. His career is noteworthy as that of a patriot, publisher, and a friend of science and literature. Having removed to Boston, he published the *Massachusetts Spy*, 1770, and continued it afterward at Worcester. He boldly denounced the oppression of the colonies by the British government, and took part in the skirmish at Lexington. He opened a bookstore at Boston, and in days when communication with distant places was so limited, established branches of his business in several parts of the United States. He printed a folio edition of the Bible, 1791, and afterward many editions of smaller size. For many years he was one of the principal printers and publishers of school books for the whole country. In 1810 he published a *History of Printing in America* (2 vols., 8vo).

THOMAS, JESSE BURGESS, D.D., b. Edwardsville, Ill., 1832; son of Judge T., of the supreme court of Ill. He graduated at Kenyon coll., O., 1850; studied law, and was admitted to the bar, 1855. He afterwards entered Rochester theol. sem., but was compelled to leave through ill health, and, 1862, entered the Baptist ministry at Waukegan, Ill. His subsequent locations were in Brooklyn, San Francisco, and Chicago; and, 1874, he was recalled to Brooklyn, where he was connected with the First Baptist church until 1877. He is a forcible preacher, and is also known as an author and lecturer.

THOMAS, JOHN, 1725-76; b. Mass.; became eminent as a physician, and was a member of Shirley's medical staff in 1747. He was made a col. of the provincial forces in 1759, led a regiment at Crown Point the next year, and was at the capture of Montreal. He was one of the "sons of liberty," and a member of the provisional congress. He was appointed maj.-gen. in 1776, and during the siege of Boston was at the head of

a brigade on the Roxbury side. On the night of Mar. 4, 1776, with a force of 3,000 men, he occupied Dorchester heights, and threw up intrenchments. This movement forced the evacuation of the town by the British, Mar. 17. He afterward commanded the army in Canada, but was forced to retreat on account of the smallness of his force, and the ravages of the small-pox, of which he soon died.

THOMAS, JOSEPH, LL.D., b. N. Y., 1811; educated at Yale college, and became a physician. He spent the years 1857-58 in India, engaged in the study of the oriental languages, and afterwards studied in Egypt. He was prof. of Latin and Greek at Haverford college, Penn. In association with Thomas Baldwin he published in 1845 *A Pronouncing Gazetteer*, which went through several editions and has been several times revised; and in 1854, *A New and Complete Gazetteer of the United States*. Among his other works are, *Travels in Egypt and Palestine* (1853); *A Comprehensive Medical Dictionary* (1864), and a *Universal Pronouncing Dictionary of Biography and Mythology* (1871). *Webster's Unabridged Dictionary* is supplied with his "pronouncing vocabularies" of proper names, in which department his work has high authority. D. 1891.

THOMAS, THEODORE, b. Germany, 1835; received his musical education from his father, and played the violin at public concerts when only six years of age. He came with his parents to America in 1845, and was a member of the orchestra of the Italian opera in New York. He played first violin in the first American concert tour of Jenny Lind. In 1861 he began the formation of his famous orchestra, and in 1864 gave his first symphony concerts in New York. In 1866 he instituted his summer-night festivals. In 1869 he conceived the idea of traveling during the time unoccupied in New York, and for nine years he made an annual round of the principal American cities, which enabled other places to enjoy the services of his unrivaled orchestra. In 1878 he accepted the position of director of the college of music at Cincinnati, but disagreements arose, and in the spring of 1880 he resigned his position to return to New York. From 1878 to 1890 he was the conductor of the Brooklyn philharmonic society, and in 1890 he went to Chicago. He visited N. Y. city with his orchestra in 1895 and 1897.

THOMAS, THEODORE GAILLARD, b. S. C., 1832; took his medical degree at the South Carolina medical college. In 1863 he was chosen prof. of obstetrics and gynecology at the College of Physicians and Surgeons in New York city, and acted as visiting surgeon at the city hospitals. He has written many papers for medical periodicals, and is the author of a standard treatise on the diseases of women, which has been translated into French and German. As a medical lecturer he is admirably clear and instructive.

THOMASIVS, CHRISTIAN, a German philosopher and jurist, was born at Leipsic, Jan. 1, 1655; studied at Frankfort-on-the-Oder (1675-79), and, returning to his native town, commenced to lecture on law in a style perfectly free from the pedantry of the schools. In 1687, to the astonishment of his Latin-speaking colleagues, he adopted the German language as the vehicle of his expositions, published his programme for the following year in the same tongue, and commenced a monthly journal under the very German title of *Freimüthige, Lustige und Ernsthafte, jedoch Vernunft- und Gesetzmässige Gedanken oder Monatsgespräche über Allerhand, Vornehmlich aber neue Bücher* (Honest, Merry, Sincere, yet Rational and Moderate Thoughts, or Monthly Talk concerning all Sorts of Books, but especially New Ones). This work, however, excited so much opposition that he was forced to leave Leipsic, and went first to Berlin, and afterward (1690) to Halle, where, under the patronage of the Brandenburg court, his lectures were the means of establishing a university, since famous. In this university Thomasius became professor of jurisprudence, and here he died, Sept. 23, 1728. The great aim of Thomasius was to harmonize and blend science and life; hence his contempt for hair-splitting subtleties of which nothing could be made; his preference for the use of German rather than Latin in his academic lectures; his disinclination to all philosophical terminology, his depreciation of the school-men, etc. But more particularly he was among the first who insisted on dissociating natural right from morality, and, in connection therewith, honorably signalized himself as a courageous opponent of trial for witchcraft and punishment by torture. The characteristic features of his mode of thought are contained in his *Vernünftige und Christliche aber nicht Scheinheilige Gedanken und Erinnerungen über Allerhand Auserlesene, Gemischte, Philosophische und Juristische Händel* (Rational and Christian, but not pretend-ly Pious Thoughts and Recollections concerning sundry Choice, Mixed, Philosophical, and Juristic Transactions, 3 vols. Halle, 1723-26); and in his *Geschichte der Weisheit und Thorheit* (History of Wisdom and Folly).—See Luden, *Christian Thomasius nach seinen Schicksalen und Schriften* (Berl. 1805).

THOMAS, ST., the island. See SAINT THOMAS.

THOMAS THE RHYMER, a name given to the earliest poet of Scotland. The history of his life and writings is involved in much obscurity; but it is generally believed that Thomas Learmount of Ercildoune was the person whose poems and prophecies were extensively known among the people of Scotland at an early period. The rhymer derived his territorial appellation from the village of Ercildoune, in the county of Berwick, situated on the river Leader, about 2 m. above its junction with the Tweed. The time of his birth is unknown; but he appears to have reached the height of his reputation in 1283, when he is said to have predicted the death of Alexander III., king of Scotland. This singular prophecy is recorded in the *Scotichronicon* of Fordun in 1430, who relates

that one day the rhymer, when visiting at the castle of Dunbar, was interrogated by the earl of March, in a jocular manner, if to-morrow should produce any remarkable event. The rhymer is reported to have expressed himself to the effect: "Alas for to-morrow, a day of calamity and misery! Before the twelfth hour shall be heard a blast so vehement that it shall exceed all those which have yet been heard in Scotland—a blast which shall strike the nations with amazement, shall confound those who hear it, shall humble what is lofty, and what is unbending shall level with the ground." On the following day the earl, who had been unable to discover any unusual appearance in the weather, when seating himself at table observed the hand of the dial to point to the hour of noon; while, at the same moment, a messenger appeared bringing the mournful tidings of the accidental death of Alexander at Kingorn. This is supposed to have been before 1299.

From this and other prophecies the rhymer became popularly known as "true Thomas," and was believed to have derived his skill from his intercourse with the queen of fairyland. The legend bears that he was carried off at an early age to fairyland, where he acquired all the knowledge which made him so famous. After seven years' residence there he was permitted to return to the earth to enlighten and astonish his countrymen by his prophetic powers, still remaining bound to return to his royal mistress when she should intimate her pleasure. Accordingly, while the rhymer was making merry with his friends in his tower at Ercildoune, a person came running in, and told, with marks of fear and astonishment, that a hart and hind had left the neighboring forest, and were composedly and slowly parading the street of the village. The rhymer instantly rose, left his habitation, and followed the animals to the forests, whence he was never seen to return. The Eildon tree, where he delivered his prophecies, no longer exists; but its site is marked by a large stone called the Eildon tree stone. A neighboring rivulet takes the name of the Bogle (or goblin) burn from the rhymer's supernatural visitants.

The earliest edition of the prophecies of the rhymer was published in Edinburgh, by Waldegrave, in 1603. See also, *The Romance and Prophecies of Thomas of Ercildoune*, by J. A. H. Murray, LL.D. (1876).

THOMASTON, a town and village in Litchfield co., Conn.; on the Naugatuck river, and the New York, New Haven, and Hartford railroad; 10 miles n. of Waterbury. They contain a high school, Laura Andrews public library, national and savings banks, electric lights, and extensive manufactories of clocks, watches, cyclometers, cutlery, brass goods, clock bells, and enamel goods. Pop. '90, 3278.

THOMASTON, a town and village in Knox co., Me.; on the Georges river and the Maine Central railroad; 4 miles w. of Rockland. They contain the state prison, high school, electric light and street railroad plants, national and savings banks, ladies' and prison libraries, and extensive lime works and shipbuilding plants. Pop. '90, 3009.

THOMASVILLE, city and co. seat of Thomas co., Ga.; on the Plant system of railroads; 32 miles n.e. of Tallahassee, Fla. It is 50 miles from the Gulf of Mexico, has an altitude of 350 feet above sea-level, and contains the South Georgia college (co-educational), Young female college, the Connecticut industrial school for colored pupils, gas and electric light plants, waterworks supplied from artesian wells, national and state banks, and several large hotels. The city is a noted winter health resort for northern invalids. Pop. '90, 5514.

THOMPSON, a town in Windham co., Conn.; on the Quinebaug river, and the New England railroad; 26 miles n.e. of Norwich. It was incorporated in 1785, contains several villages, and has electric lights, good water-power, cotton and woolen mills, and many handsome residences on the surrounding hills. Pop. '90, 5580.

THOMPSON, AUGUSTUS CHARLES, D.D., b. Conn., 1812; educated at Yale college, East Windsor theological seminary, and the university of Berlin; became pastor of the Eliot Congregational church, Roxbury, Mass., 1842. He visited India with Dr. Anderson, 1855-56. His publications are: *Songs in the Night*; *The Lambs Fed*; *The Young Martyrs*; *Last Hours, or Words and Acts of the Dying*; *The Better Land*; *The Poor Widow*; *Gathered Lilies, or Little Children in Heaven*; *Feeding the Lambs*; *Morning Hours in Patmos*; *Lyra Cælestis*; *Christus Consolator*; *The Mercy Seat*.

THOMPSON; BENJAMIN. See RUMFORD, Count.

THOMPSON, CEPHAS GIOVANNI, b. Middleboro', Mass., 1809; inherited love of art from his father, a portrait painter; went to reside in Plymouth at the age of 18, and began to paint portraits. He entered the studio of D. C. Johnson in Boston, and had access to the Boston Athenæum. He subsequently removed to Providence, R. I.; resided in New York, 1837-47; in New Bedford, Mass.; in Italy, 1852-60; making one of a circle of young American artists and sculptors since known to fame. Returning to New York he continued work, dying in 1888. Among his best-known works are copies of the Staffa "Madonna" of Raphael, and "Beatrice Cenci;" among his own conceptions are the "Angel of Truth," "Liberation of St. Peter," "The Mother's Prayer," "Chastity," etc. His brother Jerome, 1814-86, was a landscape painter.

THOMPSON, DANIEL PIERCE, 1793-1868; b. Mass.; graduated at Middlebury college, 1820; became a private tutor in Virginia; studied law and was admitted to the bar of that state. He returned to Vermont, 1824, practiced in Montpelier, and held several legal offices. In 1853 he became secretary of the state. He wrote seven or eight novels,

of which *The Green Mountain Boys* (1840), and *The Rangers* (1850), were very popular. He also wrote a history of Montpelier (1860); and *Laus of Vermont* (1835).

THOMPSON, DENMAN, actor, was born in Girard, Erie co., Penn., in 1833. His parents were both natives of New Hampshire, whither they removed in 1847, and where Denman attended school until 1850, when he went to Boston, to earn his own living. He soon joined a circus company, with which he remained some time, and subsequently engaged in many other ventures of a similar nature, with varied success until 1875, when he won a deservedly wide reputation by creating the character of Joshua Whitcomb in the play of that name. In 1886 he produced *The Old Homestead* at the Boston theatre, in which his previous success was emphasized and confirmed. This play had a continuous run of four years 1887-91 and was often reproduced after that time.

THOMPSON, SIR EDWARD MAUNDE, F.S.A., curator and editor, Hon. LL.D. from St. Andrews college, Scotland, was b. May 4, 1840, in Jamaica, W. I., and was educated at Rugby, Eng. In May, 1861, he was appointed assistant in the British Museum; in 1878 became keeper of the MSS. in the Museum. He was Sandars reader in Bibliography at Cambridge (1895-96), and was knighted in 1895. He has edited: *Chronicon Anglie*, 1328-1388, in the Rolls Series (1874); *Letters of Humphrey Prideaux* for the Camden Society (1875); *Chronicon Ade de Usk*, 1377-1404 for the Royal Society of Literature (1876); *Correspondence of the Family of Hatton*, for the Camden Society (1878); *Diary of Richard Cocks in Japan*, 1615-1622, for the Hakluyt Society (1883); and, jointly with Professor Jebb, the facsimile of the "Laurentian Sophocles" for the Hellenic Society (1885). He is also joint editor of the publications of the London Paleographical Society.

THOMPSON, ELIZABETH, b. England, about 1850; studied art, and in 1874 exhibited at the Royal academy, London, a painting called "The Roll-Call," the most successful picture of the year. This was afterwards purchased by the queen. She married maj-gen. sir W. F. Butler in 1877. With the exception of a "Vintage Sketch in Tuscany," her other works are from military subjects, the "Battle of Balaklava" being the most important. She has exhibited also "Floreat Etona" (1882); "Evicted" (1890); "The Camel Corps" (1891); "The Dawn of Waterloo" (1895).

THOMPSON, GEORGE, 1804-78; b. and d. England. He first became known in connection with the anti-slavery agitation in the British colonies and was largely instrumental in procuring the freedom of the slaves and the abolition of the apprenticeship system. Subsequently he had joined the Anti-Corn Law league, and also took an active part in forming the British India assoc., which procured better government for the people of India. He was associated with Garrison, Whittier, and others in the anti-slavery movement in the U. S. A visit which he paid to this country, 1834, led to the formation of upward of 150 anti-slavery societies. Obligated to flee from this country on account of threats against his life, he returned during the civil war, and was given a public reception by the house of representatives. He belonged to the National Parliamentary Reform assoc. of England, and was elected M. P., 1847.

THOMPSON, Sir HENRY, surgeon, b. in Framlingham, Suffolk, England, in 1820, was educated at University college, London, Eng., and was appointed assistant surgeon of the University College hospital, London, in 1856; surgeon of the same in 1863; its professor of clinical surgery in 1866, and consulting surgeon in 1874. In 1884 he was professor of surgery and pathology in the royal college of surgeons, London. His essays on *The Pathology and Treatment of Stricture of the Urethra*, and *The Healthy and Morbid Anatomy of the Prostate Gland*, together with his *Clinical Lectures*, and his *Practical Lithotomy and Lithotomy*, have gone through numerous English editions and have been translated into the chief European languages. In 1864 he became surgeon extraordinary to Leopold I., King of the Belgians, and in 1866, to his successor, Leopold II. He has received various honors abroad, and in 1867 was knighted at home. He has written for current English magazines upon various subjects, and is understood to have been the author of two novels published under the pseudonym of "Pen Oliver." He has studied painting, and frequently exhibited pictures at the Royal Academy (London), the Salon (Paris), and elsewhere. He first brought the question of cremating dead human bodies before the English public, and in 1874 started the Cremation Society of London.

THOMPSON, HUGH MILLER, D.D., b. Londonderry, Ireland, 1830, graduated at Nashotah House, Wis.; was ordained priest in the Prot. Epis. church, 1856; had charge of many parishes and missions in the west and south; was prof. of ecclesiastical history at Nashotah House, and founded the sem. of Kemper Hall at Kenosha, Wis., where he also held a pastorate. He was for a while editor of the *American Churchman*, and at his entering upon the rectorship of Christ church, New York, 1872, he took editorial charge of the *Church Journal and Gospel Messenger*. He was consecrated asst. bp. of Miss., 1883. He is the author of *Unity and Its Restoration*, *Sin and Penalty*, *Is Romanism the Best Religion for the Republic?* etc.

THOMPSON, HUGH SMITH, b. Charleston, S. Car., 1836; educated at the South Carolina military acad.; was prof. in that institution, 1858-65; principal Columbia acad., 1865-80, and state supt. of education, 1871-82. He was elected gov. of S. Car., 1882, Dec.; re-elected, 1884, Dec.

THOMPSON, JACOB, b. N. C., 1810; graduate of the university of North Carolina, 1831; studied law; admitted to the bar, 1834; a Miss. pioneer; settled in the Chickasaw country; member of congress, 1839-51 chairman of the committee on Indian affairs. A zealous defender of his state and a strong partisan, he worked indefatigably for the interests of the Democratic party; was appointed secretary of the interior, 1857; holding the office 4 years; resigning for reasons connected with the re-enforcement of fort Sumter. He was one of the commissioners from the state of Miss. to North Carolina to urge the adoption of an ordinance of secession; gov. of Miss., 1862-64. In the civil war he was inspector-gen., department of the Mississippi, and aid to Beauregard. D. 1885.

THOMPSON, JOHN R., 1823-73; b. Conn.; graduated at the university of Virginia, 1843; studied law, and in 1845 was admitted to the bar. He is best known as the editor of the *Southern Literary Messenger*, which he controlled, 1847-61. Near the end of the war he went to England and wrote articles in defense of the cause of the confederacy in *Blackwood's Magazine*, the *Cornhill*, and other periodicals. He afterward resided in New York, and was a contributor to the *Evening Post*.

THOMPSON, JOSEPH PARRISH, D.D., LL.D., 1819-79; b. Philadelphia; graduated at Yale college 1838; studied theology at Andover and New Haven; ordained pastor of Chapel street Congregational church, New Haven, 1840; minister of Broadway Tabernacle church (Cong.), New York, 1845-71. He was one of the originators of the *New Englander* and the *Independent*, and associate editor of the latter. He visited Europe and the east, 1852-54. From 1872 until his death he resided in Berlin. His publications, besides sermons, addresses, and pamphlets, are: *Memoir of Timothy Dwight*; *Lectures to Young Men*; *Hints to Employers*; *Memoir of David Hale*; *Foster on Missions*, with a preliminary essay; *Stray Meditations*; *The Believer's Refuge*; *The Invaluable Possession*; *Egypt, Past and Present*; *The Early Witnesses*; *Memoir of Rev. David T. Stoddard*; *The Christian Graces*; *The College as a Religious Institution*; *Love and Penalty*; *Bryant Gray*; *Christianity and Emancipation*; *The Holy Comforter*; *Man in Genesis and Geology*; *Theology of Christ from His Own Words*; *Home Worship*; *Church and State in the United States*; lectures given in Berlin; *Life of Christ*; *Lectures on The Centennial of American Independence*, at Berlin, Dresden, Florence, Paris, and London; *The Workman, His False Friends and His True Friends*. Dr. Thompson devoted much time to oriental studies, especially Egyptology, the fruits of which have appeared in the *North American Review*, *Bibliotheca Sacra*, *Journal of the American Geographical and Statistical Society*, *Smith's Dictionary of Biblical Geography and Antiquities*; *Kitto's Cyclopædia of Biblical Literature*. Few men in literary and professional life have shown such industry, with uniformity of power in widely varying departments.

THOMPSON, LAUNT, b. Ireland, 1833; came to the U. S. when a boy; studied drawing and modeling in the studios; and in 1858 opened a studio in New York. Among his best-known works are the statues of Sedgwick, of Winfield Scott, and of Napoleon, the soldiers' monument at Pittsfield, Mass., and a statue of Abraham Pierson, first pres. of Yale, now in the college grounds, busts of Edwin Booth, Bryant, General Dix, Stephen H. Tyng, Charles Y. Elliott, and S. F. B. Morse. He died in 1894.

THOMPSON, MAURICE, author and journalist, born at Fairfield, Ind., Sept. 9, 1844. His early life was spent largely in Kentucky and Georgia, and during the civil war he served in the confederate army. At the close of the war he returned to Indiana, settling at Crawfordsville, where he engaged alternately in the practice of law, and in civil engineering, and from 1885 to 1889 was state geologist. In 1890 he entered journalism, joining the editorial staff of the *New York Independent*. His numerous publications include *Hoosier Mosaics* (1875); *The Witchery of Archery* (1878); *A Tallahassee Girl* (1882); *Songs of Fair Weather* (1883); *Byways and Bird Notes* (1885); *Sylvan Secrets* (1887); *The Story of Louisiana* (1888); and *A Fortnight of Folly* (1888).

THOMPSON, RICHARD WIGGINTON, b. Va., 1809; engaged in mercantile pursuits at Louisville, Ky.; studied law, and was admitted to the bar, 1834, in which year he was elected to the Ind. legislature; was re-elected, 1835, and elected to the state senate, 1836. He was sent as a whig to congress, 1841; re-elected, 1847. He practiced law at Terre Haute, Ind., still maintaining an active interest in politics. He was appointed sec. of the navy by Pres. Hayes, 1877.

THOMPSON, ROBERT ELLIS, born in Ireland in 1844, educated at the university of Pennsylvania, became a Presbyterian clergyman in 1882, and professor in the university of Pennsylvania 1870-92, and in 1894 became president of the Central high school of Philadelphia. He has published and edited many books on religious, educational, and economical subjects.

THOMPSON, THOMAS PERRONET, 1783-1869; b. England; graduated at Queen's college, 1802; served three years in the navy and then joined the army. He took part in the Buenos Ayres campaign, 1807; and in 1808 was made governor of Sierra Leone. His recall to England, 1810, was said to be due to the influence of the slave-traders, against whose traffic he had taken active measures. He was with the British army in the Peninsular and French campaigns of 1813 and 1814, and in the Indian Pindaree campaign. He was afterwards engaged in negotiations for the suppression of the slave trade by treaty. In 1824 he was one of the founders of the *Westminster Review*, and contributed many papers on a wide range of topics. He was a member of parliament, 1835-57.

THOMPSON, WADDY, 1708-1868; b. S. C.; son of Judge Waddy; graduate of South Carolina college, 1814; admitted to the bar, 1819; member of the S. C. legislature, 1826-30. He was at one time solicitor for the w. circuit; brig.-gen. of state militia; member of congress, 1835-41. He was chairman of the committee on military affairs, 1840; minister to Mexico, 1842, when his diplomatic services accomplished the release of 200 Texan prisoners. Subsequently he became a cotton planter in Florida, but resided in South Carolina. He published *Recollections of Mexico* (1846).

THOMPSON, WILLIAM, 1725-81; b. Ireland; settled in Pennsylvania, and was a capt. in the militia of that state in the French war, 1759-60. He led a regiment of Pennsylvania riflemen to Cambridge, in 1775, and skirmished with the British at Lechmere point soon after his arrival. Made a brig.-gen. in 1776, he was Lee's successor at New York, and soon afterward joined the army in Canada. Captured at Three Rivers, where he led the attacking force, he remained a prisoner on parole at Philadelphia till 1778.

THOMPSON, WORDSWORTH, historical and *genre* painter, born at Baltimore, Md., May 26, 1840, after studying under Charles Gleyre Lambinet and Passini, he exhibited his first picture "Moorlands of Au Fargi" at the Paris Salon of 1865. A picture called "Desolation" in 1873 brought about his election to the National Academy. Mr. Thompson found his subjects in Spain, Algiers, and Morocco, as well as in this country, but he will be best remembered as the painter of American historical themes, such as "Annapolis in 1776," and "A Review at Philadelphia in 1777." He died at Summit, N. J., Aug. 28, 1896.

THOMPSON, ZADOC, 1796-1856, b. Vt.; educated at the university of Vermont. He took orders in the Episcopal church, and was appointed professor in the Vermont Episcopal institute. He was state geologist, 1845-48, and professor of chemistry and natural history in the university of Vermont, 1851-53. He was a commissioner to the universal exposition in 1851, and was appointed state naturalist in 1853. Among his works are a *Gazetteer of Vermont* (1824); *The History of Vermont, Natural, Civil, and Statistical* (1841-43); and *Geography and Geology of Vermont* (1848).

THOMPSONVILLE, a village in Enfield town, Hartford co., Conn., on the Connecticut river, and the New York, New Haven, and Hartford railroad; 18 miles n. of Hartford. It contains the Enfield high school, and is principally engaged in the manufacture of carpets. Pop. '90, 4673.

THOMS, WILLIAM JOHN, b. Westminster, England, 1803; contributor to the *Foreign Quarterly Review*, and other periodicals, while clerk in the secretary's office of the Chelsea hospital; fellow of the society of antiquarians, 1838, and of similar societies in Edinburgh and Copenhagen; 1838-73, sec. of the Camden society. He was the founder and editor of *Notes and Queries*, retired 1872. He published a *Collection of Early Prose Romances* (1828); *Lays and Legends of Various Nations* (1834); *Three Notelets on Shakespeare* (1865); *Human Longevity* (1873). He d. 1885.

THOMPSON, ANTHONY TODD, 1778-1849; b. Edinburgh; educated at the university of Edinburgh, where he took the degree of M.D. 1799; began practice in London in 1800. He held the professorships of *materia medica* and medical jurisprudence in the London university, 1832-49, and was editor of the *Medical Depository*. He was the author of the *London Dispensatory* (1811), and wrote and edited many medical treatises and papers. His wife, KATHARINE BYERLEY THOMSON, 1800-62, wrote several novels and, jointly with her son, John Cockburn Thomson, published under the names of Grace and Philip Wharton several volumes of memoirs and biographical incidents, such as *Life and Times of George Villiers, Duke of Buckingham*; *Memoirs of Sir Walter Raleigh*, etc.

THOMSON, CHARLES, LL.D.; 1729-1824; b. Ireland; emigrated to America in 1740; was educated in Maryland, and entered business in Philadelphia, where he enjoyed the intimacy of Franklin. He was sec. of the continental congress, 1774-88, and of the U. S. house of representatives, 1788-89. He wrote on Indian affairs, and a *Synopsis of the Four Evangelists* (1815).

THOMSON, Sir CHARLES WYVILLE, 1830-82, a noted biologist, b. at Bonsyde, Scotland, educated at the university of Edinburgh, and in 1850 became lecturer on natural history in the university of Aberdeen. Successively he was professor of natural history at the universities of Cork, Belfast, and Edinburgh. He was one of the directors of the deep-sea dredging expeditions of the "Lightning" (1868) and of the "Porcupine" (1869), and director of the "Challenger" exhibition of 1872 to 1876. He wrote *Depths of the Sea* (1873).

THOMPSON, EDWARD, D.D., LL.D.; 1810-70; b. England; came to America, 1819; studied medicine in Philadelphia and Cincinnati; began practice at Wooster, Ohio, 1829; joined the Methodist conference, 1833, and was a minister at Norwalk, Sandusky, Cincinnati, Wooster, Detroit; president of Norwalk seminary, 1837-44; professor of mental and moral philosophy in university of Michigan, 1843; elected president of Ohio Wesleyan university, 1846; elected bishop, 1864, and soon afterward visited the Methodist missions in Germany, Bulgaria, India, and China, and organized the India mission into an annual conference. He published *Moral and Religious Essays: Biographical and Incidental Sketches; Educational Essays* (1856); *Letters from Europe* (1856); *Letters from India, China, and Turkey* (1870).

THOMSON, JAMES, author of *The Seasons*, was born on Sept. 11, 1700, at Ednam, in Roxburghshire, of which parish his father was minister. He was put to school at Jedburgh, and afterward sent to complete his education at Edinburgh. His intention was to enter the church, and he went through a full course of study with that object in view. His views, however, changed. From a very early age, he had been wont to express himself in verse; and in 1725 he betook himself to London to seek fame and fortune as a poet. Almost his sole capital for the enterprise seems to have been his manuscript poem of *Winter*. This, with some little delay and difficulty, he disposed of to a publisher for three guineas; and as its success was not instant, his outlook was by no means brilliant. Gradually, however, the merits of the poem were recognized; successive editions were called for; friends and patrons were not wanting to the young author, and in no long time Thomson found himself as good as a made man and poet. The *Winter* was followed in 1727 by the poem *Summer*; *Spring* was published the year after; and *Autumn*, completing *The Seasons*, appeared in 1730, with a re-issue of the previous portions. In 1729, Thomson produced the tragedy of *Sophonisba*; but though great expectations were formed of it, its success on the stage was but indifferent. During 1730-33, Thomson was abroad in Paris and elsewhere with the son of Sir Charles Talbot, the chancellor; and on his return, at the death of his pupil, the comfortable place was bestowed upon him of secretary of the briefs. This he held till it lapsed, on the death of the chancellor in 1737, which left him once more in considerable straits, which were, however, a little alleviated by a pension of £100 a year given him by the prince of Wales. His tragedy of *Agamemnon*, produced in 1738, was in Johnson's phrase, "only endured, but not favored;" and his poem on *Liberty*, by himself considered his greatest work, was little relished by the public. His *Tancred and Sigismunda*, produced in 1745, was the only one of his tragedies which had any success, and its success was not of a signal kind. About this time, the accession to power of his friend Mr. Lyttleton secured him the office of surveyor-general of the Leeward islands, which, however, he did not long live to enjoy. He died of a neglected cold in Aug., 1748, and was buried in the church of Richmond, without an inscription; but a monument was afterward erected to his memory in Westminster abbey. In the spring before his death he had published his finest poem, *The Castle of Indolence*. This piece which is written in the Spenserian stanza, has all the descriptive power and opulence of imagination which distinguish his more popular *Seasons*, while in tone and diction it is much more chastened and harmonious. Of his other works, with the exception of the song of *Rule Britannia*, nothing but the names is now remembered. As a man, Thomson was singularly amiable, and his careless, indolent generosity of disposition seems to have endeared him to all who knew him.

THOMSON, SAMUEL, 1769-1843; was the author of a *Materia Medica and Family Physician, New Guide to Health*, and *Life and Medical Discoveries, written by himself* (Boston, 1825), and originated the "Thomsonian," or botanic system of medical practice.

THOMSON, THOMAS, 1768-1852; b. Ayrshire, Scotland; educated at the university of Glasgow, called to the bar in 1793; deputy-clerk-registrar of Scotland, 1806; principal clerk of sessions, 1828-52. In 1832 he was elected president of the Ballantyne Club. He was one of the founders of the *Edinburgh Review*, and occasionally a substitute for Jeffreys as editor. He superintended the publication of numerous works on historical, legal, biographical, and other subjects; among them Chambers's and Thomson's biographical dictionary of eminent Scots, 1855. Sir Walter Scott, who acknowledged himself his debtor, asserted that he understood more of old books, old laws, and old history than any other man in Scotland.

THOMSON, THOMAS, 1773-1852, b. Scotland; educated at St. Andrew's and Edinburgh. In 1796 he began to contribute to the *Encyclopædia Britannica* a series of articles on chemical subjects, afterward published a *System of Chemistry*, 4 vols., 1802. In 1817 he was appointed lecturer on Chemistry, and in 1818 prof. at the university of Glasgow. He was among the first to explain Dalton's atomic theory and to recommend the employment of chemical symbols. Among his works are *Elements of Chemistry* (1810); *Travels in Sweden* (1813); *History of Chemistry* (1830-31); *Outlines of Mineralogy and Geology* (1836); and *Brewing and Distillation* (1849).

THOMSON, WILLIAM, D.D., b. England, 1819; educated at Oxford, of which he was tutor, fellow and provost; ordained, 1842; select preacher at Oxford, 1846; Bampton lecturer, 1853; rector of All Souls, Marylebone, 1855; preacher of Lincoln's Inn, 1853; bishop of Gloucester and Bristol, 1861; archbishop of York, 1863. He was a member of several learned societies, president of the Palestine exploration fund, one of the lords of the privy council, governor of the Charter-house and of King's college. Dr. T. published *The Atoning Work of Christ*; *Outline of the Necessary Laws of Thought*; *Life in the Light of God's Word*; *Limits of Philosophical Inquiry*. He died in 1890.

THOMSON, Sir WILLIAM, one of the few very great living mathematicians and natural philosophers, was b. in June, 1824. His father was prof. of mathematics in the university of Glasgow. Thomson graduated in 1845, as second wrangler and first Smith's Prizeman at Cambridge, where he was shortly afterward elected to a fellowship in St. Peter's college; and became prof. of natural philosophy in the university of Glasgow in 1846. This appointment he still holds. While still an undergraduate, he published several valuable papers. He was for some time editor of the *Cambridge Mathematical Journal*, and some of his most brilliant discoveries have appeared in its pages. He has

also contributed to the *Comptes Rendus*, the transactions and proceedings of the royal societies of London and Edinburgh, and various other journals. All his numerous writings have the stamp of originality in a marked degree. In the mathematical theories of elasticity, vortex-motion, heat, electricity, and magnetism, he has made remarkable discoveries; among which we need merely mention the dissipation of energy, the beautiful idea of electric images, and the complete solution of the problem of telegraphing through a submarine cable. Popularly, he is best known by his association with the Atlantic cable, a gigantic idea, which, but for his investigations, might, perhaps, not have been realized or even attempted. On its successful completion, in 1866, he was knighted. He has invented several excellent and useful instruments for various electrical purposes—such as electrometers and galvanometers; instruments for the determination of electric units in absolute measure, etc. He is a remarkable instance of the combination of the very highest powers of reasoning with the practical skill of the mathematician and engineer. In conjunction with Prof. Tait, he published in 1867 the first volume of a *Treatise on Natural Philosophy*. In 1892 he was made a peer, with the title of Lord Kelvin. He visited the U. S. in 1897.

His elder brother, JAMES, prof. of civil engineering in Glasgow, has made various improvements in the construction of turbines and other engines (see WATER-POWER); but is best known by his splendid discovery that the freezing-point of water is lowered by pressure; and the glacier-theory he has founded upon it. See HEAT, ICE, REGELATION.

THOMSON, WILLIAM M., D.D., graduated at Miami university, 1826; went as a missionary of the American board to Syria and Palestine. He published *The Land and the Book*; *Biblical Illustrations, drawn from the Manners and Customs, the Scenes and the Scenery of the Holy Land*; *The Land of Promise*; and *Travels in Modern Palestine*.

THOMSON EFFECT. If a wire is heated at one spot the heat will extend to equal distances on each side. If a current is passed this equality will be distributed, and the heat will extend further on one side, and not so far on the other.

THOMSONIAN SYSTEM. See THOMSON, SAMUEL.

THOR, the god of thunder, was the son of Odin and Earth (Yörd); his wife was Sif (= sib, friendship, love, and thus of the same import with Freyja). His palace, supported on 540 pillars, was called Thrudwanger; here he received the warriors that had fallen in battle. Thunder was caused by the rolling of his chariot, which was drawn by he-goats. He was in the vigor of youth, had a red beard, and was the strongest of all gods and men; the gods even called in his assistance when they were in straits. He was, in particular, a terror to the giants (q.v.), with whom he was perpetually at strife, and whom he struck down with his hammer Mjolnir (i.e., the smasher or mauler), which had the property of returning to his hand after being hurled; it had been made by cunning dwarfs. The sign of the hammer was among the heathen Teutons analogous to that of the cross among Christians. In the contest at the twilight of the gods, Thor slew the serpent of Midgard, but fell at the same time poisoned by the venom exhaled from its mouth. The name of Thor was widespread. The Saxons worshiped him as Thunar (high-German, *Donar*). Torden, the wrathful deity dreaded by the Lapps, who in his rage hurled down huge blocks from rocks, tore up trees, destroyed cattle and men, is evidently the Scandinavian Thor. The Gallic god Tarannis—in an old inscription Tanarus—mentioned by Lucan, appears also to be identical, especially as *torunn* in the Celtic languages still signifies thunder. The attribute of thunder is intimately associated with the Latin Jupiter and the Greek Zeus (see also INDRA). Of all the Asa-gods, Thor had unquestionably the most worshipers. In Upsala, according to Adam of Bremen, he occupied the place of honor in the temple between Odin and Frikke. In Norway, Thor was the national god, and here, as in Iceland, temples were almost exclusively erected to him. Offerings were made to him, particularly in times of pestilence. On the ground of the superior respect enjoyed by Thor, and of his being called "old Thor," some place him in opposition to Odin, and consider him historically as an older divinity, only partly supplanted by the Odin doctrine. As rude force is the predominating element in Thor, the humorous element of the Scandinavian belief attaches to him. Thus, the giants often blinded him by magic, and made fun of him; yet he always shows his extraordinary strength in these cases, and in the long-run his opponents are invariably overcome by the hammer. Thursday is so called from Thor; and the name survives in numerous names of places.

THORACIC DUCT, a canal equal in diameter to a goose-quill, proceeding from the *receptaculum chyli* (into which the contents of the lacteals are collected, and which is situated in the front of the body of the second lumbar vertebra), ascends along the front of the vertebral column, between the aorta and ascending vena cava, as high as the fourth dorsal vertebra; it then inclines to the left, and passing behind the arch of the aorta, ascends as high as the seventh cervical vertebra, when it bends forward and downward, and terminates at the point of union of the subclavian and internal jugular veins of the left side, where it is provided with a pair of semilunar valves, which prevent the admission of venous blood into it. It is also provided with other valves on its upward course. This duct is not liable to any special diseases; but if its function of conveying chyle from its source into the general circulation be interfered with, as, for example, by the pressure of a tumor, the due nutrition of the system must be checked.

THORAX. See CHEST.

THORBURN, GRANT, 1773-1863; b. Scotland; a nail-maker who emigrated to New York for political reasons in 1794, and became a seedsman. Over the pseudonym "Lawrie Todd" he was a frequent contributor to periodical literature. Among his works are, *Forty Years' Residence in America* (1834); and *Fifty Years' Reminiscences of New York* (1845). John Galt's novel, *Lawrie Todd*, gives some account of him.

THOREAU, HENRY DAVID, 1817-62; b. Mass.; graduated, 1837, at Harvard; and for three years was engaged in school-teaching. He had considerable mechanical skill, and worked for his bare living at carpentering, surveying, etc., on a system of his own, which opposed devoting more time to such employment than was necessary for the procuring of the necessaries of life. This was, in his case, to enable him to pass as much of his life as was possible in study and contemplation; and he devoted most of his time to investigating nature, and reasoning out metaphysical theories and problems. He was an admirer of Homer, early English literature, and Orientalia. His observations of natural phenomena and animal life made him at last an authority on these subjects, though not in the character of a scientist. He was a minute observer of details, and had a most vivid appreciation of facts and incidents in the line of his studies. He never married; was somewhat eccentric in his habits and opinions; a vegetarian by preference; and humane to that degree that he never used a gun to aid him in obtaining specimens of natural history. He contributed infrequently to the *Dial* and other periodicals. In 1849 he produced his first published work, *A Week on the Concord and Merrimac Rivers*. This was a detailed account of a boat-voyage; and was succeeded in 1854 by his *Walden, or Life in the Woods*; mainly devoted to studies of insect, bird, and animal life. Others of his works are *Excursions in Field and Forest* (1863); *The Maine Woods* (1864); *Cape Cod* (1865), etc.

THORIUM, or **THORIUM** (sym. Th, equivalent new system, 231.8), is a rare metal, much resembling aluminum, but taking fire considerably below a red heat, and burning with great brilliancy. *Thorina*, or *thoria*, is supposed to be the dioxide, ThO₂, and is remarkable for its high specific gravity, 9.2. Thorium was discovered in 1829 by Berzelius in an earth to which he had given the name *thorina*, and which occurs in a rare black Norwegian mineral termed *thorite*. None of the compounds of this metal are of any practical importance.

THORN. See CRATÆGUS, HAWTHORN, and SPINE.

THORN (Pol. *Torún*), a strongly-fortified t. of Prussia, in the s. of the province of West Prussia, on the right bank of the Vistula, 31 m. e.s.e. of Bromberg by railway. The town was founded in 1232, was a member of the Hanseatic league, and contains many houses—as the town-hall—remarkable for their beautiful gables and interiors. It is the birthplace of Copernicus, whose monument is to be seen in the *Johannis-Kirche*, and a bronze statue to whom was erected in the market-place in 1853. An active trade in corn and timber is carried on. Pop. '95, 30,306.

THORN, CONFERENCE OF, one of those efforts to explain away the differences between the several bodies of Christians, with a view to religious reunion, of which the 17th c. furnishes more than one example. The originator of this movement was the king of Poland, Ladislaus IV., who proposed his project for the consideration of a synod of the bishops of his kingdom held at Warsaw in 1643, and letters were addressed in consequence to all the several religious bodies in Poland, inviting them to send delegates to an assembly to be held at Thorn, for the purpose of the mutual explanation of their doctrines, with a view to the removal of all differences of belief. The conference met in Oct., 1645, and was opened in a spirit of moderation; but it soon lapsed into disputation and controversy, and at length broke up without any result, Nov. 21, 1645. The official account of the proceedings of the conference are printed in Calvi's *Historia Syncretistica*.—See also Schröckh's *Kirchengeschichte seit der Reformation*, iv. p. 509.

THORN-APPLE, *Datura*, a genus of plants of the natural order *solanaceæ*, having a tubular 5-cleft calyx, a large funnel-shaped 5-lobed flower, a 2-laminated stigma, and an imperfectly 4-celled, prickly, or unarmed capsule. The species of this genus are annual herbaceous plants, rarely shrubs or trees; and are in general very narcotic, and productive of excitement or delirium. The common THORN-APPLE, or STRAMONIUM (*D. stramonium*), is an annual plant, with smooth stem and leaves, white flowers, and erect prickly capsules, a native of the East Indies, brought by the gypsies to Europe, where it is now very generally to be met with, as also in Asia, the n. of Africa, and North America. It is by some stated to be the plant from which the poisonous "dri" of the gypsies is obtained. It contains a peculiar narcotic alkaloid, *D. daturine*, and is one of the most powerful narcotic acrid poisons; but its leaves and seeds are employed, although rarely, in medicine. The leaves have an extremely nauseous overpowering smell, and a loathsome bitter taste; the seeds, which are of a dark-brown color, are still more poisonous. A variety with pale violet flowers and purplish violet stem is frequently cultivated in gardens as an ornamental plant. Still more narcotic is the soft-haired thorn-apple (*D. metel*), a native of the s. of Asia and of Africa. Robbers in India employ it in order to stupefy those whom they would rob, or rather to throw them into the condition of a waking dream. From its seeds, along with opium, hemp, and certain spices, a strong

intoxicating substance is prepared, which the Mohammedans of India use in order to produce in themselves an indescribable joyfulness and extremely pleasurable feeling for a short time; but the use of it destroys the constitution. *D. tatula*, another Indian species, has similar properties, and is very energetic; as is also *D. sanguinea*, the FLORIPONDIO of Peru, which is used by the Indians to prepare a very powerful narcotic drink, which stupefies when very diluted, and when strong, brings on maniacal excitement.—The beautiful *D. fastuosa* has flowers externally of a violet color, and white within, and is cultivated as an ornamental plant, especially a variety with what are called double flowers, which consist rather of two corollas, one within the other.—*D. arborea*, a native of Peru and Colombia, has begun to be also very generally cultivated in flower-gardens in Europe. It has very splendid pendulous white flowers, 9 to 12 in long, which diffuse a sweet smell in the evening and at night. See illus., FLOWERS, vol. VI.

THORNDIKE, ISRAEL, 1757–1832; b. Mass.; received a common education, and in 1776 was made capt. of the *Warren*, a privateer. He assisted in framing the Federal constitution, became a resident of Boston in 1810, and purchased and gave to Harvard university in 1818, the library of Prof. Ebling of Hamburg.

THORNTON, SIR EDWARD, b. England, 1817; educated for the diplomatic service, which he entered by appointment as attaché to the embassy at Turin in 1842. He filled the same position in Mexico (paid) in 1845, and was made secretary to the legation in that capital in 1851. During 1848 he did much to forward the conclusion of the important treaty of Guadalupe Hidalgo. In 1852 he was secretary of legation to Buenos Ayres; chargé d'affaires to Uruguay, 1854; minister to the Argentine republic in 1859; envoy to Brazil in 1865; an envoy to the United States in 1867–82. He was minister plenipotentiary to the emperor of Russia (1881), and ambassador at Constantinople (1884). He was a member of the commission on the Alabama claims in 1871; knighted Aug. 9, 1870.

THORNTON, JOHN WINGATE, b. Maine, 1818; graduated at the Harvard law school, 1840. Mr. Thornton has written a number of historical and biographical pamphlets and books, such as the lives of John Eliot, and John Bowles, *First Records of American Colonization*, etc. He was the founder of the New England historical and genealogical society. He d. 1878.

THORNTON, MATTHEW, b. 1714–1803; b. Ireland, came to America in 1717, was educated at Worcester, Mass., and served as surgeon under William Pepperell in the capture of Louisburg, 1745. He settled as a physician in Londonderry, N. H., and was chosen president of the governmental convention in 1775. He became a delegate to the Continental congress, 1776, and signed the declaration of independence. He was afterward chief justice of Hillborough co., N. H., and later judge of the supreme court.

THORNWELL, JAMES HENLEY, D.D., LL.D., 1812–62; b. S. C.; graduated South Carolina college, Columbia, 1831; studied and taught; pastor of a Presbyterian church, Lancaster, S. C., 1835; professor of logic and belles-lettres in South Carolina college, 1838; pastor of Presbyterian church, Columbia, 1840; chaplain and professor of sacred literature and the evidences of Christianity in the college, 1841; pastor of Globe st. church, Charleston, 1851; president of South Carolina college, 1852; professor of didactic and polemic theology in the theological seminary, Columbia, 1856, and also pastor of the First Presbyterian church. He published *Arguments of Romanists Discussed and Refuted*; *Discourses on Truth*; *On the Rights and Duties of Masters*; *The State of the Country*. He published many controversial articles in the *Southern Presbyterian Review*, and defended slavery and secession. His complete works have been published by the Rev. J. D. Adger. In the southern states he was esteemed as one of the greatest of preachers and theologians.

THORNYCROFT, JOHN ISAAC, English builder of torpedo boats, and eldest son of Thomas and Mary Thornycroft, b. at Rome, Italy, Feb. 1, 1843, was trained in mechanics at an early age, by his father, who constructed a locomotive upon which his children rode around his studio. The cylinders of that locomotive were afterwards employed by the son in the making of a model steamer, which embodied some of the most important elements of the torpedo boat. Later he built a small steam launch, *The Nautilus*, the first upon the river Thames that developed sufficient speed to keep up with racing crews. He designed the *The Ariel*, a fast steamboat, in 1863. That was succeeded by *The Miranda*, which may be considered the progenitor of all torpedo boats now in use. *The Gitana*, built after *The Miranda*, came still nearer, however, to perfection, especially in its closed stokeholes, and the fan by which air was passed through the fire upon the vessel. Continuing his theoretical and practical studies of naval engineering at various English ship-yards, he finally settled at Chiswick, Middlesex County, England, as a maker of torpedo boats, in which specialty he stands in the front rank of all competitors.

THORNYCROFT, MARY (FRANCIS), b. Norfolk, England, 1814; the daughter of John Francis, the sculptor. While still a child she began to acquire the art of modeling, and her first attempts at sculpture were "Penelope" and "Ulysses and his Dog." Her first work of real value was the "Flower Girl." Others of her best works were "Sappho," "A Sleeping Child," and the "Skipping Girl," the best exhibited in the Paris exhibition

of 1855. By queen Victoria, Mrs. Thornycroft was commissioned in 1843 to execute a statue of the princess Alice, and this proved so satisfactory that she was chosen also to model the princess royal, the prince of Wales, and prince Alfred. Her son, William Hamo, is a sculptor of note, and her two daughters are artists. She died in 1895.

THORNYCROFT, WILLIAM HAMO, sculptor, A.R.A., b. in London, Eng., March 9, 1850, son of Thomas and Mary Thornycroft. He was brought up in a remote part of Cheshire, and educated at Macclesfield grammar school, and at University College school, London. He began to work in his father's studio at the age of seventeen, and in 1869 he was a student in the schools of the London Royal Academy. He exhibited at the London Academy for the first time in 1871. The same year he studied in Italy. In 1875 he received the biennial gold medal of the Royal Academy for the group "A Warrior bearing a Wounded Youth from the Field of Battle." His "Artemis" was executed in marble for the Duke of Westminster, and was a pronounced success. He was elected A.R.A. in January, 1881, in which year he produced his statue "Teucer," and R.A. in 1888. His more important works since that time have been the statue of "The Mower," 1884; "Memorial to the Poet Gray" at Pembroke college, Cambridge, Eng., and the statue of "The Sower," 1886. In 1885 he executed a bust of Samuel Taylor Coleridge for Westminster Abbey.

THOROLD, ANTHONY WILSON, D.D., b. Hougham, England, 1825; graduated at Queen's coll., Oxford, 1847; was rector of St. Giles-in-the-Fields, London, 1857-68; member of the Schools Inquiry commission, 1864; minister of Curzon chapel, Mayfair, 1868; and was elected on the first school board for London, 1870; became vicar of St. Pancras, Middlesex, and rural dean, 1869; canon residentiary of York, examining chaplain to the abb., and provincial chaplain to the abb. of Canterbury, 1874. He was consecrated bp. of Rochester, 1877. He is the author of *The Presence of Christ and The Yoke of Christ in the Duties and Circumstances of Life*. He died in 1895.

THOROUGH BASS. See FIGURED BASS.

THOROUGHWORT. See BONESET.

THORWALDSEN, BERTEL, one of the greatest of modern sculptors, was born, it is supposed, at Copenhagen, on Nov. 19, 1770. Neither the place nor the day of his birth, however, can be fixed with absolute certainty; and he himself, when casually questioned as to the last, replied with a certain *brusque* felicity: "I don't know; but I arrived at Rome on March 8, 1797;" dating his birth, as it were, from the commencement of his career as an artist. He was the son of a poor ship-carpenter, and his first essays in art were made in the carving of figure-heads in the yard where his father worked. His education was otherwise neglected, so that through life he could but indifferently write or spell; but the genius for art was born with him, and in 1793 he gained the first gold medal for design at the academy of Copenhagen; and along with it the privilege of three years' residence abroad for the purpose of study. Accordingly, in 1796 he sailed for Rome, arriving there as stated above. After long obscure and patient labor, his talent became conspicuous. From the celebrated Canova, in particular, he had early and generous recognition; and shortly, by the model for his great work, "Jason," he secured general admiration. No purchaser could, however, be found for it till, in 1803, just as in hopeless disgust the artist was about to return to Copenhagen, he received from the well-known Thomas Hope an order for its production in marble at a price which might be called munificent. From this time forward, prosperity and fame flowed upon him in full tide. In 1819 he returned to Denmark, taking the overland route, and everywhere on his journey special honor was paid him. His reception in Copenhagen was triumphal, and apartments were assigned him in the palace of Charlottenburg. He remained at home but a year, and at the end of it returned to Rome, where he continued to prosecute his art assiduously, up to 1838, when he left it, intending to pass his remaining years in his native country. Its climate, however, proved no longer suitable to him, and the year 1841 found him once more at Rome. In 1844, having revisited Copenhagen, he died suddenly there in the theater, of disease of the heart, Mar. 24. All the works remaining in his possession he bequeathed to his country, to be preserved in a museum bearing his name, for the maintenance of which he also left the bulk of his fortune, reserving a sufficient provision for Mme. Poulsen, his natural daughter. This magnificent and unique collection is now one of the chief glories of the metropolis of his native country. By his countrymen, he is naturally held in special honor; and their proud verdict, which ranks him the greatest of sculptors since Michael Angelo, is elsewhere more generally acquiesced in than is often the case in such instances of national enthusiasm. Anything like a catalogue of his chief works need not be here attempted. He addicted himself by preference to classical and mythological subjects; but his great works in the cathedral of Copenhagen, "Christ and the twelve Apostles," "St. John preaching in the Wilderness," and the "Procession to Golgotha," sufficiently prove that he was determined to this preference by no incapacity to appreciate and grandly fulfill the demands of the Christian ideal. Of the many busts from his hand of eminent contemporaries, those of Byron and the great Danish poet Oehlenschläger are perhaps the most notable. The life of Thorwaldsen has been written by Hans Christian Andersen, by J. M. Thiele, and by Eugene Plon. English readers may consult a careful abridgment of M. Thiele's work, by the Rev. M. R. Barnard, published in 1855 by Messrs. Chapman & Hall, London; and a translation of M. Plon's *Life* (1874). See illus., SCULPTURE, vol. XIII.

THOTH, also called **TAUT** or **THEUTH**, the Egyptian *Hermes* or *Mercury*, the mythical inventor of the arts and sciences, music and astronomy, and especially of speech and hieroglyphs or letters over which he was supposed to preside. His name, indeed, meant "speech," or "word," and he personified the divine logos, or intellectual power.

THOU, **JACQUES AUGUSTE DE**, or, as his name is frequently written, *Jacobus Augustus Thuanus*, son of *Christophe de Thou*, first president of the *parlement* de Paris, was born in that city, Oct. 8, 1553. He was originally designed for the church, but when old enough to judge for himself, he gave up all thoughts of an ecclesiastical career. In spite of the difficulty presented by a sickly constitution, he pursued both literary and scientific studies with vigor and success. Taking a liking for the writings of *Cujacius*, he took up his residence at Valence in Dauphiné where he attended the lectures of the celebrated jurist. At Valence, he made the acquaintance of *Scaliger*, with whom he maintained an unbroken friendship for the rest of his life. In 1578 he accepted, with reluctance, the office of ecclesiastical counselor of the *parlement* of Paris. A firm adherent of royalty, in 1588 he was made counselor of state to *Henry III.*; and during the rest of the reign of that king, he took a leading part in all public affairs. On the accession of *Henry IV.*, he was made keeper of the royal library. In 1591 he began his great work, the *Historia mei Temporis*, which principally occupied him during the remainder of his life. He took an important part in the arrangement of the edict of Nantes; but with this exception, he seems to have given but little attention to public affairs during the reign of *Henry IV.*; and the death of that monarch, in 1610 may be said completely to have ended his political existence. From 1604, when the first 18 books of the history appeared, the author held the position of first historian of his age. Eighty books appeared during his life; and the remainder, forming in all 138 books, were published in 1620, after the author's death, which took place May 7, 1617.

THOUSAND ISLES, **THE**, probably the greatest collection of small islands in the world; numbering about 1800; situated in an expansion of the *St. Lawrence* river, between Ontario, Can., and Jefferson and *St. Lawrence* counties, N. Y. They have become a favorite resort for summer tourists and residents, on account of their picturesque beauty.

THRACE, anciently the name of an extensive country bounded on the n. by the Danube, on the e. by the Euxine, on the s. by the *Ægean* and Macedonia, and on the w. by Macedonia and Illyria. In prehistorical times, however, the name appears to have denoted the whole of eastern Europe n. of Greece, including both Macedonia and Scythia; so, at least, one is disposed to understand the fable, that *Oceanus* had four daughters—Asia, Libya, Europa, and Thracia. It is, on the whole, very mountainous—whence, perhaps, its name *Thrace*, from *tracheia*, rugged (?)—the principal range being *Hæmus* (mod. *Balkan*, q.v.), from which three lesser chains branch off in a southeasterly direction, the loftiest being *Rhodope*, the summits of which reach an elevation of more than 8,000 feet. The three most important rivers of Thrace are the *Strymon* (mod. *Struma*), which, during the Greek period, formed the boundary between it and Macedonia; the *Nestus* (mod. *Carasu*); and the *Hebrus* (mod. *Maritza*, q.v.), the largest—all of which flow southward from *Hæmus* into the *Ægean* sea. Roughly speaking, ancient Thrace, before the rise of the Macedonian power, comprised the territory now divided by the Turks into the provinces of *Rumili* and *Bulgaria*; but subsequently the Romans made the range of *Hæmus* the northern limit of Thrace, and gave the region between *Hæmus* and the Danube the name of *Moesia* (mod. *Bulgaria*). The climate was considered by the Greeks very severe—even that of *Ænos*, on the shores of the *Ægean*, being described by *Athenæus* as "eight months of cold and four months of winter;" but it is believed that the ancient accounts are much exaggerated, or are only applied to Thrace poetically as the north, though it is not to be denied that, in the mountainous districts, the frost was often intense—as is still the case. The country was marshy, undrained, and overspread with dense damp forests (of fir, oak, chestnut, etc.), which must have considerably lowered the temperature; but large portions, especially in the s. and e., "such as the great plain of *Adrianople* and the land toward the lower course of the rivers *Nestus* and *Hebrus*," were very fertile. The chief products were corn, millet, wine, and hemp. Cattle, sheep, horses, and swine were reared in great numbers. The region between the *Nestus* and the *Strymon* appears to have been infested by lions. *Herodotus* states that they attacked the baggage-camels of *Xerxes* on his march; but if this was anciently the case these formidable animals have long since disappeared. Gold and silver mines were numerous and productive in the same locality, and the acquisition of these was the principal motive for *Philip* of Macedonia's aggressions.

The question has been much discussed, to what race the Thracians belonged, and it cannot be said that it has as yet been satisfactorily settled. It is certain, however, that two different peoples went by this name in early times. It is repeatedly asserted by those writers who treat of the confused medley of tradition and myth which fills up the prehistorical annals of Greece, that a race of "Thracians" inhabited part of the Hellenic peninsula, and had even at one time extended themselves as far as Attica. To these prehistoric Thracians belonged, says *Strabo*, the muses, and the cultivators of ancient music, *Orpheus*, *Musæus*, *Thamyris*, and *Eumolpus*; and the grand argument against confounding them with the Thracians of history is the impossibility of a race so notoriously barbarous as the latter in language and manners, having sprung from the authors of Hellenic literature and art (see *Müller's Hist. of Greek Lit.* p. 26, et seq.). But

whether the prehistoric Thracians were properly Hellenes, or "Pelasgians"—whatever that may mean—is indeterminable.

Passing now to the historic Thracians, whom we find settled in the regions n. and e. of Macedonia, we are again at fault. Of their manners and customs, of their character, and of their later history, we indeed know something; but of their origin and ethnological relations, we cannot be said to know anything. They were not Greeks, for they spoke a language which the latter called barbarous; but if (as Strabo asserts) the Getæ and Daci were branches of the Thracian family, and spoke the same tongue, we may conjecture that, ethnologically, the term "Thracian" denotes a mixed Illyrico-Scythian race; though it is quite impossible, from want of evidence, to substantiate the conjecture. Herodotus, Xenophon, and Strabo are our chief authorities regarding the habits and practices of the people. From them we learn that they bought their wives, and sold their children. Polygamy was general, and when a husband died, his favorite spouse was slain over his grave. Before marriage the Thracian women enjoyed the utmost liberty; after it they were guarded with Turkish rigor. War and robbery were the only honorable occupations of the men. They lived to steal, either from each other or from neighboring peoples. When not fighting or plundering they spent their days in savage idleness, or in quarreling over their cups. Courageous, or rather ferocious, after the fashion of barbarous peoples, they yet lacked the steady valor and endurance of disciplined troops; at all times, their warfare displayed more fierceness and impetuosity than fortitude. Their treachery was probably no greater than that of other barbarians.

The history of Thrace may be sketched in a few words. The Greeks first became acquainted with the inhabitants when they began to plant colonies on the coasts. Of these the principal were Byzantium (675 B.C.), Selymbria, Abdera (560 B.C.), Mesembria, Dicæa, Maronea, Ænus, Cardia, Sestus, Amphipolis, etc.; but their want of union—the fatal weakness of Hellenic civilization—hindered them from acquiring that measure of power to which they might have otherwise aspired, and enabled the Thracian chiefs of the interior to preserve their independence. In 513 B.C., Darius, king of Persia, marched through Thrace on his way to punish the European Scythians, and on his return left Megabazus, with 80,000 men, to subdue the country. In this he partially succeeded, but new disturbances and complications arose between the Persians and Greeks, which resulted (480 B.C.) in the famous expedition of Xerxes, the details of which do not belong to Thracian history. We have only to mention that a consequence of the expulsion of the Persians from Europe was the resumption of liberty and the revival of prosperity among the Greek colonies in Thrace. Shortly before the Peloponnesian war, a native Thracian state—the Odrysian—had attained to great power and eminence under a ruler named Sitalces, who joined the Athenian alliance, but could not, in spite of his resources, prevent the triumph of Sparta in the north as well as in the south. The rise of the Macedonian kingdom, under Philip II. (359 B.C.), destroyed the independence of great part of Thrace. All the region between the Strymon and Nestus was incorporated with Macedonia, and Macedonian garrisons were established further east. Under the government of Lysimachus the subjugation of Thrace became complete. On the fall of the Macedonian kingdom (168 B.C.) it passed into the hands of the Romans, and subsequently shared the vicissitudes of the Roman empire. In 334 A.D. a colony of Sarmatians was planted in Thrace by Constantine, and in 376 another of Goths by permission of Valens. In 395 it was overrun by Alaric, and in 447 by Attila. In 1353 Amurath obtained possession of all its fortresses, except Constantinople, and it has ever since remained subject to Turkey. But see BALKAN PENINSULA; BULGARIA.

THRALE, MRS. See PIOZZI, MRS.

THRASHER, a name given in the United States to several species of thrushes. They have generally a rather long decurved bill, not notched near the tip; short concave wings, although in some the wings are longer than the tail. In others the wings are decidedly shorter. Color, brown or ash above, usually spotted on the breast. Their names are sage thrasher, or mountain mocker, *oreoscoptes montanus*; brown thrasher, *harporhynchus rufus*; Cape St. Lucas thrasher, *H. cinereus*; gray curve-bill thrasher, *H. curvirostris*; California thrasher, *H. redivivus*; and red-vented thrasher, *H. crissalis*.

THRASIMENE, LAKE. See TRASIMENUS LACUS.

THRASYBULUS, d. B.C. 390; b. Athens, commanded an Athenian galley at Samos in 411. Attaching himself to the opponents of the oligarchy of 400, he was made gen., and secured the recall of Alcibiades. He won the battle of Cynossema, and in 407, in command of a fleet of 30 vessels compelled the submission of the revolted cities in Thrace. Banished by the 30 tyrants, he took possession, with the aid of a Theban force, of the fortress of Phyle. Occupying the Piræus with 1000 men, he fought the 30, and their successors the 10, and in 403 re-established the democracy. In 395 he commanded a force sent to relieve Thebes against the Spartans. In 390, with a fleet of 40 ships, he protected the Rhodians against Telentias. He was killed near Aspendus, in Cilicia, by the inhabitants, in revenge for some outrage committed by some of his men.

THREAD is an exceedingly small twine made by doubling and twisting several thicknesses of yarn so as to produce a strong and well-rounded line for sewing with, either of cotton, flax, or silk.

THREAD-WORMS. This term is applied by some zoologists to the whole order *nematoda*—a word derived from the Greek, and signifying a thread-like form. Most

writers, however, restrict it to the *oxyuride*, which, in the early part of this work, have been included in the *ascarides* (see *ASCARIS*), but have been arranged in a separate family by Cobbold, who divides them into 10 genera. Only one species, *oxyuris vermicularis* (formerly known as *ascaris vermicularis*), the small thread-worm, infests man, and is the commonest of the intestinal parasites. See illus., *WORMS*, vol. XV.

THREATS, in a legal sense, are that kind of intimidation which has for its object to influence a person in abandoning or surrendering some legal right, or what is equivalent, paying money, to prevent some injury being done to him. When the threats are made by more than two persons the offense usually assumes the form of conspiracy (q. v.). In other cases the usual form of the offense is the sending of a threatening letter—i. e. a letter either anonymous or otherwise—demanding money from the party addressed; otherwise, that he will be murdered, or his house will be burned, or he will be charged with some infamous crime. Whoever sends, or indirectly or directly, with knowledge of the contents, causes to be received, any letter or writing demanding, with menaces, or without any reasonable or probable cause, any property, chattel, money, valuable security, or other valuable thing, is held guilty of felony.

The common law very properly takes notice of the fact that a threat may be used to serve the purpose of a lawbreaker as effectually in many instances as an assault or other act of real violence. Accordingly, it is said that threats to intimidate officers of the peace in the exercise of their public functions constitute a misdemeanor; so "extortion" is held to include the obtaining of property by threats equally with such obtaining by violence. The sending of threatening letters is also indictable in the U. S. It is further said that where a person is induced by threats to commit a crime, the threats and apprehension constitute duress, and excuse him.

THREE KINGS, FEAST OF THE, a famous mediæval festival, identical with Epiphany (q. v.) or twelfth night, and designed to commemorate the visit of the three magi or wise men of the east (transformed by the mingled ignorance and reverence of the middle ages into great kings) to the infant Savior. But the name is more particularly given to a kind of dramatic or spectacular representation of the incidents recorded in the 2d chapter of Matthew—as, the appearance of the wise men in splendid pomp at the court of Herod, the miraculous star, the manger at Bethlehem, the solemn and costly worship of the Babe—which was long very popular. In 1336 a peculiarly gorgeous representation was got up at Milan by the preaching friars.

THREE RIVERS, city and co. seat of St. Maurice co., Quebec, Canada; at the junction of the St. Lawrence and St. Maurice rivers, and on the Grand Trunk and the Canadian Pacific railroads; midway between Montreal and Quebec. It was founded in 1634 by direction of Champlain; is within a short distance from the famous falls of Shawenegan; and has several convents and schools, saw mills, iron foundries and machine shops, shoe factory, branch banks, and several hotels. The principal industries are those connected with the lumber trade. It is one of the oldest cities in the province. Pop. '01, 8334.

THRESHER. See *FOX SHARK*.

THRESHING is the separating of the grain or seeds of plants from the straw or haulm, a process which has been accomplished in different ages and countries by means less or more effective. The first method known to have been practiced was the beating out of the grain from the ears with a stick. An improvement on this method was the practice of the ancient Egyptians and Israelites to spread out the loosened sheaves of grain on a circular piece of hard ground 50 to 100 ft. in diameter, and to drive oxen backward and forward over it, so as to tread the grain out; but as this mode was found to damage a portion of the grain, it was partially superseded in later times by the threshing-sledge (Egypt. *noreg*, cf. Heb. *moreg*), a heavy frame mounted on three rollers, which was dragged over the heaps of sheaves. The use of the stick was, however, retained for threshing the lighter kinds of grain. Similar methods of threshing were employed by the Greeks and Romans, the stick (*fustis*, *baculum*, *pertica*), the treading by men or horses, and the threshing-sledge (*tribulum*) being found in common use among them; but their threshing-sledge, which is still to be seen in operation in Greece, Asia Minor, Georgia, and Syria, differed from the eastern one by having pieces of iron or sharp flints fastened to the lower side, in place of rollers. The primitive implement in northern Europe was the stick, and an improved modification of it, the *flail*, has not yet been completely superseded. The flail consists of two sticks loosely fastened together at one end by stout thongs (*caplins*), one stick (the *hand-staff*) is used as a handle by the workman, and by a circular swing round his head he brings down the other stick (the *swipe*) horizontally on the heads of the loosened sheaves spread out on the barn-floor. In the hands of a good workman this implement is found to perform its work pretty effectively, although slowly.

Various attempts were made to supersede the flail by a machine, but with little success, till 1787, when Andrew Meikle, an ingenious Scotch mechanic, produced a threshing-mill so perfect, that even after having run the gauntlet of nearly a century of improvers, it is essentially the machine of its original inventor. In Meikle's mill the

mode of operation is as follows: The sheaves are loosened and spread out one by one on the feeding-board, with the ears toward the machine; they are then pushed forward till caught between two revolving fluted rollers of cast-iron; and as soon as one sheaf disappears between the rollers, another is presented to them. Behind the rollers is a rapidly revolving *drum* or cylinder, having four *beaters* or spars of wood armed with iron placed along its surface parallel to its axle; and these beaters striking the heads as they are protruded from between the rollers, detach the seeds and husks. Grain and straw then pass together over the cylinder, the former falling through wire-work, while the straw is carried forward by circular rakes, and, being by them thoroughly tossed and separated from the grain and chaff, is then ejected. The grain which has fallen through the wire-work is received into a winnowing-machine, where it is cleansed from chaff, etc., and is then either discharged upon the barn-floor, or, as is the case with the most improved machines, is raised by a series of buckets fixed on an endless web, and again winnowed, to separate the perfect grains from the light and small seeds. Barley is, previous to the second winnowing, subjected to the process of "hummingel," by which the awns are removed; but the rest of the process is the same as above.

Since Meikle's invention, the improvements attempted on his mill have been chiefly confined to modifications of the drum; such as diminishing the distance between the drum and its cover; increasing the number of the beaters, and accelerating the speed of the drum.

The portable threshing-machine, now so generally employed in England and America, has not the two grooved rollers, the loosened sheaf being at once submitted to the action of the threshing-machinery; the drum, which is a *high-speed drum*, is provided with six beaters, and its cover is capable of being set at any required distance from it by means of screws. A modification of this machine has the drum wide enough to allow of the straw being fed in sideways; the cover incloses the machine for about three-fifths of its circumference; and the straw, after separation from the grain, is delivered by the rakes almost unbroken, and in a condition fit for being at once put up in *bolts*, or bundles, whence this species of drum is called a *bolting-drum*. In another form, the drum is armed with rows of spikes projecting outward for about 2½ in., which revolve between similar rows of spikes on the interior of the cover; this kind threshes effectually, but breaks and chops the straw much more than the other forms of drum.

The attention of inventors and manufacturers of threshing-machines has not only been turned of late to the question of securing increased speed, but also of providing against the risk of accidents to those employed about the mills. The feeding of those high-speed drums which were getting so common was attended with considerable danger. Within the last few years, however, mills have been constructed, and are working well, with patent self-feeding apparatus. Considerable protection to life seems to have thus been afforded. The self-feeding apparatus consists of a covered hopper containing a shaking-board on which the sheaves are thrown sideways. Through this board, iron spikes curved like a fork or rake move forward and seize the unthreshed grain. A second row of spikes regulates to a nicety the quantity of stuff reaching the drum at a time; and while the shaking-board is falling to let the grain come in contact with the drum, the first row of spikes progresses to catch a fresh supply. Some of the English threshing-machines fitted up in this way within the last few years thresh from 8 to 10 quarters of grain per hour, and perform their work in every respect satisfactorily.

The driving-power is wind, water, horse-power, or steam; the first of which is so very uncertain and unequal in its operation that it has nowadays been mostly superseded by the others. Water-power (q.v.) is always desirable, and when it can be had in sufficient quantity or regularity, it is much to be preferred in point of economy, its mode of application to threshing being either by the ordinary machinery of the water-wheel or by *Barker's mill* (q.v.). Horse-power was the agent in most common use in the earlier days of threshing-mills, the horses being yoked to beams attached to a vertical revolving shaft which communicated motion by means of beveled gear to the threshing-machine. But it was found that this kind of work was very trying for the horses, and interfered considerably with the other work of the farm; and accordingly steam-power, as being more economical, has extensively superseded horse-labor, engines of 4 to 10 horse-power being generally employed. Portable threshing-mills and engines are very generally employed in America, and to some extent in England, being thought by many to be more economical, from their saving the labor of transporting the crop from the stack to the barn; and from their adaptability to the requirements of a farmer who may rent more than one holding in a district. On the other hand, however, some prefer the fixed machine on account of cheapness and diminished liability to derangement.

THRIFT *Armeria*, a genus of plants of the natural order *plumbagineæ*, having the flowers collected into a rounded head, a funnel-shaped dry and membranous calyx, five petals united at the base, five distinct styles, and five stamens attached to the base of the petals. By many botanists it has been regarded as a subdivision of the genus *statice*, from which it is distinguished chiefly by having the flowers in heads.—The common thrift (*A. maritima* or *vulgaris*) is a plant which grows in turf-like tufts, with linear leaves, scapes a few inches high, and beautiful rose-colored flowers, an ornament of the sea-coasts of Britain and of Europe generally, and also frequently found on high moun-

tains. It is often planted in gardens as an edging, for which is very suitable, being of a fresh green all the year, and exhibiting its fine flowers in profusion in July and August, but it requires to be renewed every two or three years, the smallest rootless sets growing, however, with great readiness in the moist weather of spring. The flowers are an active and useful diuretic. From two drams to an ounce of the flowers, freshly gathered and quickly dried, should be gently boiled, and the patient allowed to drink as much of the decoction as he pleases. Some aromatic, as anise or cinnamon, is added.

THRING, Rev. EDWARD, educator and headmaster of Uppingham School in Wales, Eng., b. Nov. 20, 1821, was at Eton, and King's College, Cambridge, Eng. Filling the curacy at Stubbings, Cockham Dean, Eng., and spending six months at Rome, Italy, he came to his life-work as Headmaster of Uppingham School, County of Rutland, Eng., Sept. 10, 1853. It was then simply a school-house and a school-room with twenty-five boarding pupils. He had a scheme for giving to each boy, clever or stupid, his own proper and individual training, and for having at hand all the needful machinery for this purpose. In 1887, the school consisted of a chapel, new school-room, old school-room, class-rooms, eleven boarding-houses, a swimming-bath, carpentry, forge and metal workshops, gardens, sanatorium, and a preparatory school, with a staff of thirty-three masters, and the matron of the sanatorium. He died in 1887.

THRIPS, a genus of small insects of the order *hemiptera*, suborder *homoptera*, allied to *aphis* (q.v.), and included in the family *aphidii* of some entomologists. The species are numerous and widely distributed. They are very active, and some of them very troublesome, by the injury which they do to cultivated plants, upon the juices of which they live. When disturbed, although they use their wings, their motion resembles leaping rather than flying. The wings are much fringed. See illus., BEETLES, ETC., vol. II., fig. 21.

THROAT, AFFECTIONS OF THE. Common inflammatory sore throat has been already described in the article QUINSY; and other important throat diseases, aphtæ or thrush, and diphtheria, have also been discussed in special articles. The *malignant sore throat* of the older nosologists is now recognized as a modification of scarlatina. Another important variety of sore throat occurs as one of the forms of secondary syphilis. *Bronchocele* or *goitre*, which, to a certain degree, is an affection of the throat, is specially described under the latter name.

The disease popularly known as *clergyman's sore throat*, or *dysphonia clericorum*, and which is recognized in medicine under the name of *follicular inflammation of the pharynx*, first shows itself by huskiness of the voice, with more or less coughing, hawking, and expectorating, from an uneasy sensation in the throat; there is, moreover, a constant inclination to swallow. On examining the back of the throat, its mucous membrane is seen covered with granulation, caused by an accumulation of secretion in the follicles, which sometimes burst and discharge their contents, which are of an elastic consistent nature. This discharge is occasionally followed by ulceration. The disease commonly arises from too prolonged or powerful exercise of the voice by persons in whom the mucous membrane of the throat is in a relaxed condition. Perfect rest from public speaking, preaching, acting, etc., is of more importance than anything else in the way of treatment, and a residence during the winter and spring in a mild and equable climate is expedient. Torquay, Ventnor, Nice, Mentone, Algiers, and Egypt, afford a choice of suitable residences. Tonics, such as iron, quinia, and strychnia (in small doses not exceeding $\frac{1}{10}$ of a grain, three times a day), should be tried; but the local application of a strong solution of nitrate of silver (from 20 to 80 grains in one ounce of distilled water), applied by a probang to the affected mucous membrane, is usually of far more service than internal remedies. The best work on this subject is that of Dr. Horace Green, an American physician.

Passing over several throat affections of minor importance, we proceed to the consideration of wounds in the throat. These wounds are comparatively seldom the result of accident; they are more often made with a murderous intent, and most frequently they are made with the view of committing suicide.

The first duty of the surgeon, in treating a case of cut throat, is to arrest the flow of blood. Ligatures should be applied to the wounded arteries, and steady pressure with the finger (beneath which a small pad of lint is placed) to the wounded veins, such as the external jugular. If the internal jugular is wounded, fatal hemorrhage will very rapidly ensue, unless the wound is immediately plugged with small pieces of sponge, or pressure with the finger is maintained as long as necessary. With a knowledge of these means of checking hemorrhage by pressure, an intelligent non-professional person may be the means of saving life. When the bleeding has completely ceased, but not till then, means may be taken for bringing together the edges of the wound. In most cases, sutures, or even adhesive plaster, are inexpedient and even dangerous, and it is best to keep the parts in simple apposition.

THROCKMORTON, a co. in n.w. Texas, drained by the Brazos river and its branches about 900 sq. m.; pop. '90, 902, chiefly of American birth. The surface is uneven. The soil is adapted to grazing. Co. seat, Throckmorton.

THROCKMORTON, Sir NICHOLAS, 1513-71, held household positions with the duke of Richmond and Henry VIII. He served at Boulogne and with Somerset in the Scottish wars, was knighted and returned to parliament from Northampton. He took the

side of Mary against lady Jane Grey, though himself a Protestant. In 1554 he was charged with complicity in Wyatt's rebellion and was acquitted, but detained in the Tower for a year. After his release he lived in France until the accession of Elizabeth, under whom he became chief butler of England and chamberlain of the exchequer. From 1559 to 1563 he was Cecil's ambassador to France. In the proposed marriage between Mary, queen of Scots, and the duke of Norfolk, he opposed the wishes of Elizabeth and lost her favor.

THROMBOSIS (derived from the Greek *thrombos*, a clot of blood) is a term originally suggested by Virchow, and was generally employed to designate an affection of the blood-vessel, (either veins or arteries) which essentially consists in a coagulation of blood (forming a true clot) at a certain fixed spot. Under certain morbid conditions, the blood has a tendency to coagulate in its vessels during life, on the least provocation. Thus, slight pressure on the side of the vein will sometimes induce this coagulation, while in other cases it is due to inflammation of the tissues which surround a vein, or laceration of a vein (as when the placenta is expelled from the uterus). A clot thus formed in a vessel increases and extends from one to another, till it reaches and finally fills a large vessel. Clots of this kind occurring in veins have been noticed from the times of Ambrose Paré and Petit, who seem to have been the first to apply the term *thrombus* to them.

TRONDHJEM, or TRONDHJEM (Ger. *Drontheim*), the ancient Nidaros, and former capital of Norway, is situated in the Fjord of Thronthjem at the mouth of the little river Nid, 240 m. n. of Christiania; pop. '93, 28,792. Thronthjem, which consists of the old town, founded in 997, and the suburbs of Blakland and Ilen, is built on the picturesque slopes of the Nid Elv, and has regular and broad streets. The fortified island of Munkholm and the fortress of Christiansteen defend the capacious harbor, which is never closed by frost on the seaward side. Among the public buildings the most noteworthy are the Kongens-Gaard, or old palace, and St. Olaf's church, the remains of the old cathedral, now partially restored, built in the 12th century, by archbishop Oeysteen, who erected this noble Gothic pile on the site of the two early Christian churches which had been founded by Harald Haardrade and Olaf II. The fine western extremity of the nave was not completed till 1248. The body of the murdered St. Olaf was preserved within a costly shrine in the chancel of Christ church, which ranked as the metropolitan church of Norway, where the kings of Norway have been crowned since the time of Magnus V. (1164). Trondhjem is the seat of government for the province and of a bishopric, and has a public exchange, the principal national bank, a public library, museum, various literary and scientific institutions, an institution for the deaf and dumb, an insane asylum, etc. The chief articles of trade are fish, tar, deal, and copper, which is obtained from the neighboring mines of Røros. Salted cod and herrings, which are found in large quantities at the entrance of Thronthjem Fjord, are important articles of export. Besides its shipping and coasting trade Thronthjem is the center of considerable manufacturing activity, and has good sugar-refineries, distilleries, etc. The environs of Thronthjem are picturesque, and its position is one of considerable attraction, notwithstanding the high northern latitude (63° 25'); while the numerous historical events with which it is associated render it one of the most interesting towns in the Scandinavian kingdoms. The preponderance of wooden houses has somewhat diminished of late years, and the local authorities are endeavoring to enforce the use of stone for building purposes, in consequence of the frequent occurrence of great fires.

THRONE (Gr. *thronos*), the chair of royalty, an ornamented seat raised above the level of the floor, on which it stands, often covered with a canopy, and intended for the use of a sovereign or other potentate. From an early period the Asiatic monarchs are represented as enthroned; the same usage of a dignified chair set apart for the sovereigns was adopted in Greece, where also it was customary to represent all the greater gods as enthroned. In the middle ages and modern times, the throne has been in all monarchical countries the chair occupied by the sovereign on state occasions. The name of throne was also given, in the early centuries of the Christian church, to the raised seat in the middle of the tribune behind the altar, where the bishop sat surrounded by his clergy. The throne is now a common metaphorical expression for sovereign power and dignity.

THROSTLE. See SPINNING.

THROW, the term applied in mining to the amount of dislocation (q.v.) in a vertical direction, produced by a fault in the strata.

THRUSH, *Turdus* or *Merula*, a genus of birds of the family *merulidæ* or *turdidæ*, having a bill of moderate size, straight, the upper mandible convex, its point compressed, notched, and slightly curved downward, the gape furnished with a few hairs; the nostrils near the base of the bill, oval, partly closed by a naked membrane; the first feather of the wing very short, the third and fourth longest; the tarsus longer than the middle toe, the outer toe connected with the middle toe at the base. The species are numerous and widely distributed, some of them inhabiting temperate and even cold countries, and some found only in tropical regions. Some of them are birds of passage, as the fieldfare and redwing. Some are gregarious, particularly in winter, as the species

just named; others live solitary or in pairs. The common British species are the blackbird (q.v.), fieldfare (q.v.), redwing (q.v.), ring ouzel (q.v.), song thrush, and missel thrush.—The SONG THRUSH, or THROSTLE (*T. musicus* or *M. musica*), the mavis of the Scotch, is smaller than the blackbird, its whole length being not quite nine inches. Its plumage is brown, of various finely-mingled shades; the throat, sides of the neck, breast, and flanks yellowish, spotted with dark brown; the belly nearly white, with a few spots of dark brown; a dark brown streak, with a lighter brown streak over it, passing from the bill to the eye. It is found in all parts of Europe, but deserts some of the northern parts in winter, being thus partially a bird of passage. It remains all the year in Britain. It feeds on insects, worms, slugs, snails, berries, and seeds. It often makes its nest in the center of a thick bush or shrub, and sometimes in an open shed. The eggs are usually four or five in number. The male takes part in the work of incubation, and is very attentive in feeding his mate while so occupied. The throistle is well known as one of the sweetest songsters of the groves. In captivity, it has been taught simple airs.—The MISSEL THRUSH (*T. viscivorus* or *M. viscivora*) is about 11 in. in entire length, and is the largest and strongest European species of the genus. The plumage is very similar to that of the song thrush. The tail is slightly forked, which is not the case in that species. The spots on the belly are more numerous and black. The song is loud and clear, but not equal to that of the song thrush or of the blackbird. The bird delights in pouring forth its song from the very top of a tall tree. It also very often sings before or during wind and rain, whence it has received the name of stormcock. Its nest is generally fixed in the fork of a tree. It is found in almost all parts of Britain where there are woods. Its range extends through great part of Asia; it is found in India.—The WOOD THRUSH (*T. mustelinus* or *M. mustelina*) is abundant in North America in summer, as far n. as Hudson's Bay, retiring to tropical and subtropical regions in winter. It is rather smaller than the song thrush and very similar to it. It is of a very shy and retiring disposition. It has a clear but very simple song, which is to be heard in the depths of the forest, far from the haunts of men. Several other species are found in North America. India has some. A common West India species (*T.* or *M. leucogenys*) is familiarly known by the name of hopping Dick, and is a general favorite from its bold lively manners, and its sweet song. All the species are in esteem for the table, and the song thrush is much sought for this use in Italy in the season of ripe grapes, when it becomes very fat. Gardeners in Britain well know how troublesome thrushes are where numerous, from their avidity for cherries and small fruit.

THRUSH, known also as *infantile sore mouth*, is essentially a disease of early infancy, although it may occur at any age. Its characteristic symptom is the presence of small roundish white specks or patches on the lining membrane of the cavity of the mouth and throat, on the surface of the tongue, the angles of the lips, etc. These patches, which are termed *aphthæ*, look like minute drops of tallow or fragments of curd, and are formed by elevated portions of epithelium covering a drop of serous fluid; and as the dead epithelium falls off, a raw surface, or a dirty ash-colored spot, is left exposed. In thrush, crops of these little patches commonly succeed one another. These spots render the mouth hot and tender, in consequence of which the act of sucking is accompanied by difficulty and pain. In association with these local symptoms are indications of general constitutional disturbance, such as feverishness, drowsiness, sickness, flatulence, colicky pains, diarrhoea, etc. The stools are green and slimy, and not unfrequently acrid, as may be inferred from redness of the anus being a common symptom. The vomited matters are also green, and have a strongly acid smell, as also has the breath. The complaint sometimes seems to be the result of improper diet, if the child is being brought up by hand, or of unwholesome milk from a diseased or intemperate nurse; of bad ventilation, etc.; but in some cases the cause of the disease is not evident. The disorder usually lasts eight or ten days, and is only attended with danger when the local affection runs into a low form of gangrenous ulceration. As undue acidity of the stomach seems to be an almost general symptom, the diet should be carefully regulated, and mild *antacids* prescribed. Dr. (Sir Thomas) Watson specially recommends a mixture of 2 parts of dried carbonate of soda and 1 of gray powder (mercury with chalk), of which from three to five grains may be given thrice daily. As a local application to the patches honey of borax may be applied with a camel-hair pencil; or a pinch of a mixture of powdered borax and loaf-sugar (1 to 8 or 10) may be placed occasionally on the tongue, and the infant allowed to spread it over the mouth.

THRUSH, or TRUSH, in the horse, consists in inflammation and ulceration of the sensitive surfaces within the frog, giving rise to a fetid discharge, constituting unsoundness, and usually causing lameness. Want of cleanliness is the chief cause. Daily, when the horse returns to his stable, the foot should be washed out with soap and water, carefully dried, and the fissures filled with mineral tar. If amendment does not speedily ensue, a dressing of calomel should be substituted for the tar several times a week. Ragged or loose portions of the frog may be removed by the knife or scissors.

THUCYDIDES, the great historian of the Peloponnesian war, born of the demus Halimus, most probably in 471 B.C., is said to have been the son of Olorus and Hegesipyle, and connected with the family of Cimon. It is stated—on authority equally conjectural, however—that he was instructed in oratory by Antiphon, and in philosophy by

Anaxagoras. Certain it is that, Athenian as he was, of good family, and resident in the most cultivated community in Greece, he must have enjoyed a most liberal education. He was further possessed, either by inheritance or by acquisition through marriage, of gold mines in that part of Thrace lying opposite the island of Thasos. He left a son called Timotheus, and perhaps also a daughter, who is said by some scholars to have written the eighth book of his history. We know from himself that he was one of the sufferers from the terrible plague of Athens, and also one of the few who recovered. We have no direct evidence as to his having displayed in public the oratorical talent which he reveals in his history; but it is certain that he held military command, and that he had under him an Athenian squadron of seven ships at Thasos, 424 B.C., when Eucles, who commanded in Amphipolis, solicited his assistance against Brasidas. The expected arrival of a superior force induced Brasidas to offer Amphipolis favorable terms, which were accepted. Thucydides arrived on the evening of the same day on which Amphipolis had surrendered; and though he prevented Eion, at the mouth of the Strymon, from falling into the enemy's hands, still his failure to save Amphipolis caused him to be sent into exile, probably to avoid the severer punishment which his enemy Cleon, then so popular with the Athenians, was designing for him. Where his exile was spent, is not known. Probably he lived a good deal in the Peloponnesus, if not also in Sicily, as has been inferred from his minute descriptions of Syracuse and its neighborhood. According to his own account, he lived in exile twenty years, and probably returned to Athens about the time when Thrasybulus liberated it, in the beginning of 403. Ancient authorities are all agreed that his end was a violent one, though whether it occurred at Athens or in Thrace, we have no means of ascertaining. The year of his death is generally fixed at 401. Uncertainty also prevails as to the time when he wrote his history. He is supposed, from hints supplied by himself, to have kept a register of the events of the war, from its outbreak to its close. His great work, chronologically divided into winters and summers—each summer and winter making a year—was subsequently rearranged, probably by Alexandrine critics, into the books and chapters as we now have it; and of these books the eighth (and last) is supposed either to have not been written by him, or to have not received the same careful revision which he bestowed on the previous seven. There is hardly a literary production of which posterity has entertained a more uniformly favorable estimate than the history of Thucydides. This high distinction he owes to his undeviating fidelity and impartiality as a narrator; to the masterly brevity of his style, in which he is content to give in a few simple yet vivid expressions the facts which it must have often taken him weeks or even months to collect, sift, and decide upon; to the sagacity of his political and moral observations, in which he shows the keenest insight into the springs of human action, and the mental nature of man; and to the unrivaled descriptive power exemplified in his account of the plague of Athens, and of the Athenian expedition to Sicily. Often, indeed, does the modern student of Greek history share the wish of Grote, that the great writer had been a little more communicative on collateral topics, and that some of his sentences had been expanded into paragraphs, and some of his paragraphs into chapters. But this want cannot have been felt by the contemporaries of Thucydides; while the fate of other ancient historians warns us that had his work, like theirs, been looser in texture, or less severely perfect, it would not have survived, as it has done, the wearing influence of time, or remained, in its own language, the *ktēma es aiei*—the “possession forever”—it has proved to the world. The best editions are those of Poppo (11 vols. Lps. 1821-40), of Krüger (2 vols. Berl. 1846-47), and—at least for historical illustration—of Arnold (3 vols. Oxford, 1830-35). The best English translation is by Richard Crawley (1874); that of the Rev. Thomas Dale is also good.

THUG (from the Hindustani *thaga*, deceive; hence, literally, a deceiver, a cheat) is the name of a religious fraternity in India, which, professedly in honor of the goddess Kālī, the wife of Ś'iva, is addicted to the commital of murders, and chiefly lives upon the plunder obtained from its victims. The name of Thugs is that by which this fraternity is generally known among Europeans in the more northern parts of India. In some provinces to the southward they are called *Phansigars*, or “stranglers” (from the Hindustani *phansi*, a “noose”). In the Tamil language their name is *Ari Tulukar*, or “noosers;” in the Canarese, *Tanti Kalleru*, or “thieves who use a cat-gut noose;” and in Telugu, *Varla Vandla*, or “people who use the noose.” In the s. of India they used to live under the protection of the native chieftains, who, on the consideration of a settled contribution, and probably also of a share in the result of their depredations, connived at their practices, which, to the uninitiated, were generally concealed under the guise of an honest industry, especially that of the culture of land.

The proceedings of the Thugs are generally these: Banding together in gangs of from 10 to 50, but sometimes also of a much greater number, they assume the appearance of ordinary traders, traveling, if enabled to do so by their wealth, on horseback, with tents, and all the comforts of opulent merchants; but if this be not possible, also in more humble characters. Each gang has its *jemadar*, or leader; its *guru*, or teacher; its *sothas*, or entrappers; its *bhuttotes*, or stranglers; and its *bughaees*, or grave-diggers. On arriving at towns and villages, they pretend to meet by accident, and to have no previous acquaintance with one another. Some of the gang are then employed as emis-

saries to collect information; and when learning that any persons of property are about to undertake a journey, they endeavor to insinuate themselves into their confidence, and usually propose to them, under the plea of safety, or for the sake of society, to travel in their company; or else they follow them, waiting for the proper opportunity of carrying out their murderous work. The latter is generally perpetrated by throwing round the neck of the victim a rope or cloth, which one of the gang holds at one end, while the other end is seized by an accomplice; and while the two Thugs draw the noose tight, and press the head of their victim forward, a third seizes him by the leg, thus causing him to fall to the ground. The fatal injury is then easily inflicted. Travelers staying in the same choultry, or public resting-place, are sometimes murdered in the night. In attacking a traveler on horseback, generally one of the gang goes in front of the horse, while another keeps himself in the rear; a third, walking by his side, when finding him off his guard, suddenly seizes him by the arm, and drags him to the ground: the sufferer is then strangled in the usual manner. Three Thugs are therefore generally required to murder one man; two, at the least, are thought necessary; for to strangle a man single-handed is a rare occurrence, and a feat of this kind is esteemed by the fraternity a most honorable distinction, which goes far to ennoble, in the eyes of his fellows, the Thug who has accomplished it, and even his family, for many generations. After the murder is perpetrated the body of the victim is generally mutilated, in order, it seems, to expedite its decomposition, and thus to guard against discovery. For the same reason, care is taken to inter the body at a spot where it is not likely to be found; and thus it could happen that entire parties of travelers were destroyed, and not a vestige of them was discoverable. The indiscriminate slaughter in which the Thugs seem to indulge, is to a certain extent restrained by superstition; thus, it is deemed unlucky to kill certain classes and castes; and, as a rule, the female sex is exempt altogether.

The mode of dividing the plunder is probably various. According to one account, "a portion of it is usually appropriated to defraying the expenses of religious ceremonies; and sometimes a part was also allotted for the benefit of widows and families of deceased members of the gang. The residue of the booty being divided into several parts, was generally shared as follows: To the leader, two shares; to the men actually concerned in perpetrating the murder, and to the person who cut the dead body, each one share and a half; and to the remainder of the gang, each one share."

The practice of Thugs is not restricted to adventures on land. The rivers of India also are infested by bands of these robbers, who have similar habits to those of the land Thugs. They generally go in considerable parties—the one assuming the dress of travelers of respectability, the others acting as boatmen. When going up the river, they always pretend to be men going on pilgrimage to Benares, Allahabad, or some other sacred place; when going down, they pretend to be on their way home from such places. The travelers intended for their victims are inveigled on the high-roads, and murdered inside the boat, while some of the gang above sing and play. At a signal given by these that all is clear, the bodies of the murdered men are thrown into the river.

The patron goddess of the Thugs is *Devī* or *Kālī*, the wife of the god *S'iva*, and the deity of destruction. In her name they exercise their profession, and to her they ascribe its origin. Formerly, they believe, *Kālī* co-operated with the Thugs, and assisted them in the disposing of the bodies of their victims by devouring them. But through an indiscretion of one of the fraternity, who, out of curiosity, pried into the proceedings of the goddess, she became displeased, and condemned them in future to bury their victims. But though she now refused her future assistance, she presented her worshippers with one of her teeth for a pickaxe, a rib for a knife, and the hem of her lower garment for a noose. Whether on the faith of this legend or otherwise, it is certain that the pickaxe is the instrument which, by all the Thugs, is held in the highest estimation. Its fabrication is superintended with the greatest care, and it is consecrated to its duties under many and minutely regulated ceremonies; and after it has thus been prepared, it is only intrusted to a Thug selected for this dignity on account of his shrewdness, caution, and sobriety. The place where, and the manner in which, it is then deposited are likewise the subject of the strictest rules; and it is submitted to special purifications after each time that it has been used for the preparation of a grave. The pickaxe is, in short, looked upon with the highest reverence by a Thug; it is the symbol of his faith, and the chief object of his superstitions. That these superstitions are gross and numerous may be easily anticipated. The belief in omens, especially, plays a great part in a Thug's career. All his movements are regulated by it, and the learning of the Thugs consists in a thorough acquaintance with them.

To a neglect of the warnings given by omens, or to an imperfect acquaintance with them, the Thugs invariably ascribe a failure of their undertakings, if it happens. When preparing for an expedition the auspices are always solemnly taken; and only if favorable it is carried out. Among the bad omens they count the meeting the corpse of any one belonging to the village, the meeting an oil-vendor, a carpenter, a potter, a dancing-master, a lame or blind man, a fakcer with a brown waistband, or a Hindu devotee with long traced hair. To sneeze is a bad thing at setting out on an expedition; to meet a woman with an empty pitcher, or an ass braying from the front, a pair of jackals crossing the road in front of the gang, to see a wolf cross the path from left to right. On the other hand, it is a lucky omen to meet a woman with a pitcher full of water, or a preg-

nant woman, or to hear an ass braying on the left while halting at a stage, or to see a single jackal passing from right to left, or an antelope from left to right. Superstitions like these—and it is not necessary to give more instances of them—sufficiently show that the Thugs consider their murderous practices as countenanced and regulated by higher powers; and it is for the same reason that after every murder they perform a special solemnity called *tapunî*. It is celebrated in honor of the terrific Kâli, and its principal feature consists in addressing a prayer to the goddess, and in making the practical stranglers, those who formed part of the expedition, and committed the murders, partake of *gaur*, or consecrated sugar, the effect of which is believed to be irresistible. Other ceremonies are, of course, likewise performed on the occasion; but it is from the eating of the gaur that the strength and prosperity of the Thug are supposed necessarily to be derived. Another feast observed by the Thugs throughout India is called *Kurhæ Kârna* or *Kote*. It likewise takes place in honor of Kâli, and the requisites for its celebration are goats, rice, ghee (butter), spices, and spirits. The superstitions of the Thugs are all of Hindu origin; but they are adopted also by the Mohammedans, who, while stout adherents to the tenets of the Koran, yet pay divine honors to the Hindu goddess of destruction. This inconsistency they sometimes reconcile by identifying Kâli, whose other name is also Bhavânî, with Fatima, the daughter of Mohammed, and wife of Ali, and by saying that Fatima invented the use of the noose to strangle the great demon Rukutbeejdana.

At various periods steps were taken by the native and English governments to suppress Thuggee—the practice of the Thugs—but it is only since 1831 that energetic measures were adopted by the British authorities to counteract the evil; and though it has not yet altogether disappeared, it may be safely assumed that it is fast dying out.—For a fuller account of the Thugs the reader is referred to the *Illustrations of the History and Practices of the Thugs* (by E. Thornton, Lond., 1837)—whence the foregoing outline is taken; to the authentic reports of special cases contained in the same work; and to Col. Meadows Taylor's *Confessions of a Thug* (1840).

THUJA. See ARBOR VITÆ.

THULE, the name generally given by the ancients to the most northerly part of Europe known to them, and in the description of which fancy played a conspicuous part. According to Pliny, it was an island in the northern ocean, discovered by the navigator Pytheas, who reached it after six days' sail from the Orcades. The name Thule appears to be merely a classic form of the Gothic *Tiel* or *Tiule* "remotest land" (comp. Gr. *telos*, a goal); and most modern geographers identify Thule with Iceland. Some, however, prefer to seek for it in that part of Norway called *Thile* or *Thilemark*, or in Jutland, the extremity of which is known as *Thy* or *Thyland*. Ptolemy considers that Mainland, the principal member of the Shetland group, has the best claim to being regarded as the Thule of Pytheas.

THUMB IKINS, or THUMBSCREW, an instrument of torture for compressing the thumb, largely made use of by the Inquisition in Spain, and also occasionally used in England when examination by torture was practiced there. The last instance of its application in Britain was in the case of principal Carstairs, on whom this mode of torture was inflicted for an hour and half at Holyrood by the Scottish privy council, with the view of obtaining from him confession of the secrets of the Argyll and Monmouth parties, but without effect in producing any disclosures.

THUN, a picturesque and ancient t. of Switzerland, in the canton of Bern, 17 m. s.s.e. of the city of that name. It stands on the Aar, 1 m. from the lake of Thun, out of which the river rushes past the town in a stream of crystal clearness. The old castle of the 12th c. with its corner towers, and the venerable church, are the chief buildings. Thun is the starting-place for those who visit the Bernese Oberland, and is consequently visited by crowds every season. Pop. '88, 5505.

THUN, LAKE OF, in the canton of Bern, Switzerland, between the t. of Interlaken on the e., and that of Thun on the n.w.; is 11 m. long, 2 m. broad, about 1800 ft. above sea-level. Its greatest depth is 1130 ft. The scenery is very attractive. Steamers ply on the lake, and the railway from Thun to Interlaken skirts the s. shore.

THUNBERG, CARL PETER, 1743–1828; b. Sweden; studied with Linnæus at Upsal; sailed with a Dutch ship as surgeon, 1771–73, cruising at the cape of Good Hope; lived 6 years in Java and Japan, returning in 1779 to Sweden, where he was appointed successor to Linnæus in 1781 as professor of botany at the university of Upsal.

THUNDER. See LIGHTNING.

THUNDERBOLT, in heraldry, a bearing borrowed from classical mythology, which may be described as a twisted bar in pale inflamed at each end, surmounting two jagged darts in saltire between two wings displayed with streams of fire.

THURGAU (i. e., valley of the Thur), a frontier canton in the n.e. of Switzerland, bounded on the n.e. by the lake of Constance, and on the w. and s. by the cantons of Zurich and St. Gall. Area, 384 sq. m.; pop. '88, 105,121. The surface, unlike that of the other cantons of the country, is undulating or hilly, but nowhere mountainous, the chief height being the Hörnli in the extreme s., 3690 feet. The principal river is the

Thur, from which the canton derives its name, and from which, flowing w.n.w. through a broad valley, joins the Rhine in the canton of Zürich. The soil is fertile in the ordinary crops, and remarkably so in fruits—large tracts of open country being laid out in orchards, as well as vineyards. Three-fourths of the inhabitants are Protestants. Capital, Frauenfeld.

THURIFER (Lat. *thur*, incense, and *fer.*, to carry), the ministering attendant in the Roman Catholic church, at solemn mass, vespers, and other solemn ceremonies, whose duty it is to carry the *thurible*, or incense vessel, and either to minister incense (q.v.) himself, or to present the thurible to be used for that purpose by the officiating priest. The office of thurifer is one of those which belong to the so-called "Minor Order" of *acolyte*. See ORDERS, HOLY. The thurible now in use, consists of a metallic vessel for holding burning charcoal, commonly of silver or silver-plated, but occasionally also of gold, with a movable cap, and suspended from four chains, so as to be capable of being freely waved about in the air for the readier dispersion of the smoke of the incense, which is thrown upon the live charcoal. See illus., CEREMONIES, vol. III.

THÜ RINGER-WALD (Forest of Thuringia) is a considerable mountain-range of central Germany, which extends from the junction of the rivers Werra and Horsa, near Eisenach (q.v.), in a s.e. direction to the n. of Bavaria, where it joins the Frankenwald, a ramification of the Fichtel-Gebirge. Its total length is about 60 m., and its highest summits (Gross-Beerberg, Schneekopf, Inselsberg, and Finsterberg) range from a height of close on 3000 ft. to about 3200 feet. The range is composed mostly of granite, porphyry, and argillaceous schists, abounding in metallic veins, among which iron ore is most conspicuous, though copper, nickel, and cobalt are also found, and auriferous sands occur in some of the rivers which have their source here. The Thüringer-wald is parceled out among the states of Weimar, Meiningen, Coburg-Gotha, Prussia, Schwarzburg, Reuss, and Bavaria.

THURINGIA (Ger. *Thüringen*), the name still borne by that part of upper Saxony which is generally bounded by the Werra, the Saale, and the Harz mountains, though it has no longer any distinct terminal significance. The country was so-called from the people Thuringii (probably the descendants of the Hermunduri), who were found inhabiting it in the 5th century.

THURLES, a market-t. and seat of a poor-law union in the county of Tipperary, province of Munster, Ireland. It is a place of great antiquity, and is celebrated not only in the bardic history, but also as the scene of a great battle with the Danes. It is situated on the river Suir, 52° 42' n. lat., 7° 47' w. long., 86 m. s.w. from Dublin, with which city, as well as with Cork, it is connected with the Great Southern and Western railway. Pop. of township '81, 4,850, with few exceptions Roman Catholics. Thurles being the seat of the Roman Catholic archbishop has two convents of nuns, a monastery of Christian brothers, and a college for ecclesiastical and general education, numerously attended.

THURLOW, EDWARD, Baron, an English lawyer, was born in 1732, at Little Bracon-Ash, in Norfolk. His father, a clergyman, sent him to school at Canterbury, where he obtained a sound knowledge of the Latin and Greek classics. Thence he proceeded to Cambridge, but in his zeal, it is said, to affect the character of an idle clever boy, he committed breaches of discipline which compelled him to leave the university. He became a student of the Inner Temple, and was called to the bar in 1754. He was a fellow-pupil, in a solicitor's office, with the poet Cowper, and still affected idleness, although, in reality, he worked hard to make himself a good lawyer. His lofty stature, strongly marked features, dark eyes, bushy eyebrows, and look of self-possession and wisdom, led, it appears, every one with whom he came in contact to attribute to him qualifications he really did not possess. His gifts, however, were those most likely to insure early success at the bar. An accidental meeting, at a coffee-house, with the Scotch solicitors in the great Douglas case, led to his employment in it as junior counsel, and to his acquaintance with the members of the Douglas family. It was one of them, the duchess of Queensberry, who, by her influence with lord Bute, obtained for him, in 1761, the rank of king's counsel. After this period, he acquired a still higher reputation by his speech in the Douglas case—the greatest effort of his life. In 1768, he was returned from Tamworth, and became a zealous supporter of lord North. When, in 1771, he was appointed solicitor-general, he attracted the especial notice of George III. by the zeal he displayed in supporting the American policy of the government. In 1778, he was made lord chancellor; and such was his influence with the king, that he was allowed, contrary to all precedent, to retain the office under the Rockingham administration. He caused great embarrassment by opposing all the measures brought in by that government. Under the coalition ministry, he was compelled to retire; but he was restored as chancellor on Mr. Pitt coming to power. For a time he supported the government; but relying again on the support of the king, he once more began to give trouble, and ventured to oppose the measures his colleagues brought forward. Pitt then intimated that he or Thurlow must retire, and the king, without any hesitation, consented to his removal (1792). Thurlow

sank into comparative obscurity. He amused himself in reading the Latin and Greek classics with his nephews, and spent much of his time in visiting and receiving visits. He died at Brighton on Sept. 12, 1806. Lord Campbell finds nothing recorded of him to justify the great reputation for ability he had among his contemporaries, but it must be recollected that it was his conversation which was admired.

THURMAN, ALLEN G., p. Va., 1813; removed to Ohio while still a child, and received there an ordinary school education, but was well grounded in the French language by a Paris professor who lived in his family. He fitted himself for the bar, and was admitted in 1835 to practice; represented Ohio in the 29th congress; was judge of the supreme court of that state in 1851, and in 1854 chief justice. In 1869 he was elected to the U. S. senate to fill the unexpired term of Benj. F. Wade; and was re-elected in 1874. He retired from the senate March 3, 1881, after 12 years' continuous service, with a high reputation for statesmanship and integrity. His views on finance were toward the expansion of the circulating medium, but in general politics he was profoundly democratic. He was a prominent candidate for the democratic nomination for president, and in 1888 was an unsuccessful candidate for vice-president. He died Dec. 12, 1895.

THURSBY, EMMA, b. Brooklyn, N. Y., 1857. She studied under Julius Myer and Errani, and sang in the Plymouth Church choir, Brooklyn, 1870. She went to Italy to study, 1873, and returned to complete her musical education under Errani and Mme. Ruderstorf. She made a successful tour of the U. S. and Canada, 1875; was warmly received in England and France, 1878-9, and was engaged by Maurice Strakosch as prima donna of his company, 1880. She has had great success in Europe, and holds high rank as a concert-singer. Her voice is a clear and flexible soprano.

THURSDAY (Swed. *Thorsdag*, Ger. *Donnerstag*), the fifth day of the week, is so called from Donar or Thor (q.v.), who, as god of the air, had much in common with the Roman Jupiter, to whom the same day was dedicated (Lat. *Jovis dies*, Fr. *Jeudi*).

THURSO, a seaport and market town on the n. coast of Caithness, Scotland, 18 m. n.n.w. of Wick. It exports flag-stones. Pop. '91, 3930.

THURSTON, a co. in n.e. Nebraska; 398 sq. m.; pop. '90, 3176. Co. seat, Pender.

THURSTON, a co. situated in s.w. Washington; bounded n.e. by the Nisqually river; drained by the Des Chutes river; crossed by the Northern Pacific and other railroads; about 768 sq. m.; pop. '90, 9675. Co. seat, Olympia.

THURSTON, ROBERT HENRY, b. R. I., 1839; educated at Brown university. In 1861 he was appointed to the engineers in the navy. He served through the civil war, and in 1866 became assistant prof. of natural philosophy and lecturer on physics and chemistry at the U. S. naval academy. After making a study in England of the iron manufactures, he was called in 1871 to the chair of mechanical engineering at the Stevens institute of technology, Hoboken, N. J. In 1873 he went to Vienna as a member of the U. S. scientific commission. He was on the international jury of the exhibition, and published a report on *Machinery and Manufactures*. In 1875 he served on the U. S. commission on the causes of boiler explosions. Among his inventions are the magnesium-ribbon lamp, and an improved steam-engine governor. In 1885 he was made director of the Sibley college of mechanical engineering of Cornell university. He was a member of the U. S. commission on the construction of safes and bank vaults in 1891. He has published *History of the Steam Engine* (1878); *Materials of Engineering* (1882-6); *Manual of the Steam Engine* (1890); *Manual of Steam Boilers* (1890); *Engine and Boiler Trials* (1890); and has translated Carnot's *Réflexions sur la Puissance motrice du Feu*.

THWARTS, in a boat, are the cross-benches on which the rowers sit.

THYATIRA. See AK-HISSAR.

THYLACINE, *Thylacinus*, a genus of carnivorous marsupial quadrupeds, nearly allied to opossums and dasyures. The muzzle is elongated, and somewhat dog-like. The tail is long and tapering. Only one species is known (*T. cynocephalus* or *Harrisi*), a native of the mountainous parts of Van Diemen's Land, where it inhabits the wildest glens, but issues from them to prey on the sheep of the colonists, by whom it is commonly called the wolf, or tiger-wolf, and is destroyed by all possible means. See illus., MARSUPIALIA, vol IX.

THYME, *Thymus*, a genus of humble half-shrubby plants, of the natural order *labiate*, having a two-lipped calyx, and four diverging stamens. GARDEN T. (*T. vulgaris*) is 6-10 in. high, with narrow, almost linear leaves, and whitish or reddish flowers, which grow in separate whorls, six in a whorl. It is common upon dry hills in the s. of Europe, and is very commonly cultivated in gardens, on account of its fragrance.—WILD T. (*T. serpyllum*) has a procumbent stem with many branches, 2-3 ft. long, oval leaves and purplish flowers, arranged in whorls, which are united in a head. It is abundant on hills and mountains in Britain, and in all parts of Europe; and the n. of Asia. It is less fragrant than garden thyme, but both species contain an aromatic essential oil. The flowering branches (*herba thymi* and *herba serpylli*) are used in medicine as a powerful stimulant, and those of garden thyme are also used in cookery for flavoring. The LEMON T., or lemon-scented thyme of our gardens, is regarded as a variety of *T. ser-*

pyllum. It is generally of still lower growth than the common garden thyme.—No species of thyme is indigenous in America.

THYMELEA CÆÆ, a natural order of exogenous plants, of which the mezereon and spurge laurel (see **DAPHNE**) are familiar examples. This order consists chiefly of shrubs, like the spleen, suprarenal capsules, and thyroid gland, are placed among the ductless glands. It is a temporary organ, and is commonly stated to attain its greatest development in relation to the rest of the body during the latter part of fetal life. "But this," says Dr. Carpenter, "is a mistake, for the greatest activity in the growth of this organ manifests itself in the human infant soon after birth; and it is then, too, that its functional energy seems the highest. This rapid state of growth, however, soon subsides into one of less activity, which merely serves to keep up its proportion to the rest of the body; but its increase is continued till the age of puberty is attained."—*Principles of Human Physiology*, 6th ed. p. 143. After remaining stationary for some years, it gradually assumes, in well-nourished persons, the characters of a mass of fat. On examining the gland when its growth is most active, it is found to consist of two lateral lobes placed in contact along the middle line, extending from the lower border of the thyroid gland to the cartilage of the fourth rib, and covered by the sternum and by the margins of the muscles passing upward from the top of that bone. The gland is of a pinkish gray color, soft and lobulated on its surfaces; and by careful manipulation it may be shown to consist of an assemblage of hollow glandular lobules, united together by connective tissue, all their cavities communicating with a central reservoir or main canal, from which there is no outlet. This arrangement is well seen in the gland of a calf. The thymus is about 2 in. in length, one and a half in breadth, and 4 lines thick, and at birth it weighs about half an ounce; its chemical constituents are water, albumen, gelatine, sugar(?), fats, leucine, sarkine, xanthine, and formic, acetic, succinic, and lactic acids, besides the ordinary inorganic salts—the number of the ingredients, many of them of rare occurrence elsewhere in the body, indicating that important chemical changes take place in their structure. Its exact uses are unknown, but, like the other ductless or vascular glands, it doubtless plays some important part in the preparation and maintenance of the blood. The albuminous nature of the juice of this gland, and the finely granular appearance it presents, indicate that a material is here being prepared which is to be rendered subservient to nutrition; and various facts which have been noticed in regard to its changes of bulk, (especially its rapid diminution in over-driven lambs, and its subsequent gradual redistention during rest, if plenty of food is given) strongly confirm these views.

THYMIC ASTHMA. See **THYMUS GLAND**.

THYMUS GLAND, or simply the thymus (Gr. *thymos*, sweet thyme, because the gland was compared to the flower of this plant by Galen), one of those structures which, like the spleen, suprarenal capsules, and thyroid gland, are placed among the ductless glands. It is a temporary organ, and is commonly stated to attain its greatest development in relation to the rest of the body during the latter part of fetal life. "But this," says Dr. Carpenter, "is a mistake, for the greatest activity in the growth of this organ manifests itself in the human infant soon after birth; and it is then, too, that its functional energy seems the highest. This rapid state of growth, however, soon subsides into one of less activity, which merely serves to keep up its proportion to the rest of the body; but its increase is continued till the age of puberty is attained."—*Principles of Human Physiology*, 6th ed. p. 143. After remaining stationary for some years, it gradually assumes, in well-nourished persons, the characters of a mass of fat. On examining the gland when its growth is most active, it is found to consist of two lateral lobes placed in contact along the middle line, extending from the lower border of the thyroid gland to the cartilage of the fourth rib, and covered by the sternum and by the margins of the muscles passing upward from the top of that bone. The gland is of a pinkish gray color, soft and lobulated on its surfaces; and by careful manipulation it may be shown to consist of an assemblage of hollow glandular lobules, united together by connective tissue, all their cavities communicating with a central reservoir or main canal, from which there is no outlet. This arrangement is well seen in the gland of a calf. The thymus is about 2 in. in length, one and a half in breadth, and 4 lines thick, and at birth it weighs about half an ounce; its chemical constituents are water, albumen, gelatine, sugar(?), fats, leucine, sarkine, xanthine, and formic, acetic, succinic, and lactic acids, besides the ordinary inorganic salts—the number of the ingredients, many of them of rare occurrence elsewhere in the body, indicating that important chemical changes take place in their structure. Its exact uses are unknown, but, like the other ductless or vascular glands, it doubtless plays some important part in the preparation and maintenance of the blood. The albuminous nature of the juice of this gland, and the finely granular appearance it presents, indicate that a material is here being prepared which is to be rendered subservient to nutrition; and various facts which have been noticed in regard to its changes of bulk, (especially its rapid diminution in over-driven lambs, and its subsequent gradual redistention during rest, if plenty of food is given) strongly confirm these views.

The anatomy, physiology, and development of this gland have occupied the attention of three of the most celebrated writers of the present century: see sir Astley Cooper's beautiful monograph, *On the Anatomy of the Thymus Gland*, (1832); Mr. Simon's *Physiological Essay on the Thymus Gland*, (1843); and Prof. Goodsir's memoir "On the Development of the Thymus Gland," in the *Philosophical Transactions* for 1844.

The only disease of this structure requiring notice is hypertrophy—a condition which was supposed occasionally to induce suddenly fatal dyspnoea (breathlessness) in children. There are, however, sound reasons for believing that there is no essential connection between the glandular enlargement and the suffocative paroxysms; because (1) the affection termed *thymic asthma* may occur with an abnormally small thymus; and (2) when a thymus, enlarged by malignant disease (encephaloid, for example) does occasion dyspnoea, it is not sudden and paroxysmal, but constant in its nature. The disease is known under various other names, as *laryngismus stridulus*, *spasmodic croup*, and *child-croaking*. This *bastard croup*, as Dr. Watson calls it, is far more common than true croup, and is very liable to be confounded with it. "In their most obvious symptoms, the two affections are much alike. The broad and essential difference between them is the absence in the spurious disorder of inflammation and of fever, and consequently of any concrete or other effusion from the mucous membrane of the air-passages. The child is seized all of a sudden, roused perhaps from its sleep, or checked in the act of sucking, by a catch, or interruption of its breathing, more or less complete. It strives and struggles to inspire, but is apparently unable to do so; at length the effort is successful, and the breath is drawn in with a shrill whistling or crowing sound, like that which characterizes the inspirations of croup, or of whooping-cough, and depending, no doubt, upon the same cause—a nar-

rowing (in this complaint, temporary) of the fissure of the glottis."—*Lectures on the Principles and Practice of Physic*, 4th ed. vol. i. p. 866. The more complete the closure of the chink of the glottis is, the more intense will be the symptoms. In severe cases the countenance becomes livid, the eyes fixed, and there is an entire suspension of the respiratory functions for a while. The child makes vehement struggles to recover its breath, and at varied intervals, from a few seconds up to a minute or longer, air is admitted through the glottis, now partially open, and this rush of air produces the characteristic sound. A fit of coughing or crying then often supervenes, and the attack terminates with some exhaustion. If, however, the glottis does not partially open, the child will die suffocated (or in popular language, *in a fit*) at the end of two, or at most three minutes, falling back pallid and exhausted in its nurse's arms. In association with these symptoms is often a contracted state of the flexor muscles of the thumb, fingers, toes, wrist, and ankle, giving to the foot an appearance like that of a club-foot. It has been observed by Dr. Ley, who has written a volume on this disorder, and other observers, that there is a frequent connection between child-growing and certain other affections, as (1) tumefaction of the glands in the neck and chest, and entanglement of the pneumogastric nerve or its branches among these glands; (2) painful dentition, which is apt to produce glandular swellings of the neck; and (3) excoriations behind the ears, and inflamed and irritable scalp, which also occasion enlargement of the glands. The nerves passing from the enlarged gland to the nervous center convey the sensation of irritation; and the inferior laryngeal nerve, which supplies nearly all the muscles of the larynx, acts on the efferent or motor nerve, and excites spasmodic contraction of the muscles closing the aperture of the glottis. Hence the phenomena are those of reflex action.

During the paroxysm, the warm bath may be tried if it can be got ready at once. The application of hot fomentations to the throat by means of a large sponge, is often very serviceable, and is usually more accessible than the bath. The muscles sometimes relax when cold water is freely sprinkled over the chest and face, and these simultaneous applications of hot and cold water are by no means incompatible. The subsequent general treatment must depend upon the exciting cause, on the painful dentition, the eruption of the head, etc. The state of the bowels and of the skin must always be carefully regulated, and change of air is always advisable. Phosphate of lime, in doses of from 5 to 10 gr. 3 times a day, administered in chalk mixture, has been strongly recommended by Dr. W. Budd in this disease, and is well deserving of a trial.

THYROID BODY or GLAND (Gr. *thyreos*, a shield, and *eidos*, like), one of the ductless or vascular glands, lying at the upper part of the trachea, and consisting of two lateral lobes, placed one on each side of this canal, and connected together by a narrow transverse portion at the lower third, called the isthmus. It is of a brownish red color, and its normal weight is about an ounce, but it occasionally becomes enormously enlarged, constituting the disease called bronchocele or goiter. Each lobe is somewhat conical, and is about two inches long and three-quarters of an inch broad. The thyroid body differs from the other vascular glands in structure, for it "consists of an aggregation of closed vesicles, which seem to be furnished with a true liminary membrane, and therefore to be real gland vesicles embedded in a stroma of connective tissue, and not communicating with any common reservoir. These bodies vary in diameter in the human subject from $\frac{1}{100}$ to $\frac{1}{8}$ of an inch; and they contain an albuminoid plasma, which is either faintly granular or of a somewhat oily aspect, amid which are seen a number of corpuscles, the greater part of them in the condition of nuclei, while some have advanced to that of cells."—Carpenter's *Principles of Human Physiology*, 6th ed., p. 143. The thyroid body is abundantly supplied with blood by the superior and inferior thyroid arteries, which continue subdividing till they ultimately form a very minute capillary plexus upon the liminary membrane of the vesicles. This body, like the thymus and suprarenal capsules, is relatively larger in the fetus and during infancy than in after-life.

From the investigations of Mr. Simon (see his memoir on the "Comparative Anatomy of the Thyroid," in the *Philosophical Transactions* for 1884), it appears that a thyroid is present in all mammals, birds, reptiles, and amphibians, and that he has discovered it in many fishes. Its presence in some of the fishes in which Mr. Simon observed it, has, however, been called in question by Dr. Handfield Jones, (see his article "Thyroid Gland" in the *Cyclopædia of Anatomy and Physiology*).

Mr. Simon has propounded a theory regarding the function of this gland which is certainly ingenious, and probably correct. Basing his theory on the circumstance, that the thyroid arteries arise in close proximity to the cerebral, he considers that the thyroid gland acts as a diverticulum to the cerebral circulation, exercising at the same time its secreting function in an alternating manner with the brain.

Little need be said here regarding the diseases of this organ, as the most important of them, bronchocele or goiter, has been already described under the latter title.

THYRSUS, in botany, a panicle (q.v.), in which the flower-stalks are short, and the flowers are thus close together, so that the panicle is dense. It is a very common form of inflorescence. The use of the term is, however, somewhat vague.

THYSANURA, an order of wingless insects of small size, and which undergo no metamorphoses. They are furnished with peculiar organs, either along their sides or at the extremity of the abdomen, which, as well as the legs, are used for locomotion. The

whole order is comprised in two families—*podurida*, or spring-tails (see *PODURA*), and *leptismida*. The *leptismida* have an elongated body, covered with small shining silvery scales. The abdomen is furnished on each side with a series of movable appendages; it has also at its extremity a compressed appendage of two pieces, and three jointed bristles, which are used in leaping. The *leptismida* inhabit dark and moist places, as behind window-shutters, beneath planks, etc.; many of them often in the interior of houses.

TI, *Cordyline ti*, formerly *dracena terminalis*, a plant of the natural order *liliaceae*, and nearly allied to the dragon tree. See *DRAGON'S BLOOD*. It is found in the s.e. of Asia, the eastern archipelago, the Sandwich islands, and many other island groups of the Pacific ocean. It attains a height of 10 or 12 ft., sometimes more, with a tree-like form, lanceolate leaves of a reddish hue, and branching panicles. The fruit is a three-celled and three-seeded berry. The leaves afford food for cattle. They also form durable thatch for houses. Their fibers are sometimes made into cloth. It is most valuable, however, for its root, which is very large, and when raw, is hard, fibrous, and almost insipid; but becomes soft and sweet when baked—is very nutritious, and much used as an article of food. Good sugar is also made by evaporating its juice; the fermented juice is used as an intoxicating beverage, and a kind of ardent spirit is distilled from it.

TIAHUANUCO, an elevation of land over 12,000 ft. high in Bolivia, 38 m. n.w. of La Paz, on lake Titicaca, supposed to have been an island in the lake at some remote period, and containing some remarkable ruins, formed of beautifully carved blocks of stone, of gigantic size, many of them joined together with bronze, and giving no clue to their age, though evidently antedating the incas. One theory makes it a place of worship of an ante-historic race, and not an inhabited place.

TIA RA, the triple crown of the pope, which is considered to be symbolical of his temporal, as the keys are of his spiritual authority. It is composed of a high cap of gold cloth, encircled by three coronets, with a mound and cross of gold on the top. From the cap hang two pendants, embroidered and fringed at the ends, and *semée* of crosses of gold. The original papal crown consisted of the cap alone, and was first used by pope Damasus II., 1048 A.D. The cap was surrounded with a high coronet by Boniface VIII. in 1295; the second coronet was added in 1335 by Benedict XII.; and the third by John XXIII. in 1411.

TIBER, the chief river of central Italy, and the most famous in the peninsula, rises from two springs in a wood of beech trees in a dell of the Tuscan Apennines (province Arezzo), about 6 m. n. of the village of Pieve-San-Stefana, and in lat. about 43° 45' north. Its course until it reaches Perugia is s.e.; thence, as far as Rome, it pursues, along an irregular zigzag line, a southern direction; but when it enters the plain of the Campagna, it curves to the s.s.w., and enters the Mediterranean by two branches, which inclose the Isola Sacra. The entire course of the river is about 260 miles. The most celebrated towns on or near its banks are Perugia, Todi, Orvieto, Rome, and Ostia; and its chief affluents are the Nera (anc. *Nar*), and Teverone or Aniene (anc. *Anio*) from the left, and the Chiana from the right. In the upper portion of its course, from its source to the city of Orvieto, it is rapid and turbid, and of difficult navigation. It is regularly navigable for boats of 50 tons to the confluence of the Nera, 100 m. from its mouth, and small steamers ascend to within 7 m. of that point. Wine, corn, charcoal, wood, and other produce from the interior are conveyed by the Tiber to Rome. Within the walls of Rome (q.v.), the width of the river is 300 ft., and the depth from 12 to 18 feet. Of its two mouths, the northern, the Fiumicino, is the channel of commerce; the southern, the Fiumara, is useless for commercial purposes, owing to the accumulation of sand at its mouth. The Tiber is supplied mostly by turbid mountain torrents, whence its liability to sudden overflows of its banks; even the oldest Roman myth, that of Romulus, being inseparably associated with an inundation. Its waters, too, are still discolored with yellow mud, as when Virgil described it—

Vorticibus rapidis et multa flavus arena.

TIBERIAS. See GALILEE.

TIBERIAS, SEA OF. See GENNESARET.

TIBERIUS, (TIBERIUS CLAUDIUS NERO CÆSAR,) the second emperor of Rome, was the son of Tiberius Claudius Nero, one of the active partisans of Pompey and Antony in the war of the second triumvirate, and of Livia, a descendant of Appius Claudius Cæcus, and was born Nov. 16, 42 B.C. The triumvir, Octavianus Cæsar (afterward the emperor Augustus) having become enamored of Livia, the complaisant husband divorced her, and, though then pregnant with Drusus, she was immediately espoused by Octavianus (38 B.C.). Tiberius being now one of the imperial household, received a careful education, was allowed by Augustus the same public honors as were paid to his nephew and grandsons, and as well as his brother Drusus, was employed in active service at the head of the legions on the outposts of the empire. Tiberius was at this time in favor with the emperor and the Roman people, chiefly because his retired mode of life and subordinate position restrained his evil propensities; and his praises as a military leader were loudly sounded, though the character of his opponents was not such as called for the display of very great warlike ability. At the command of Augustus, he unwillingly divorced his wife, Vipsania Agrippina, to marry the emperor's daughter Julia (11 B.C.); but disgusted

at her open profligacy, he gladly accepted a command on the German frontier, and afterward (6 B.C.) retired to Rhodes, where he lived for seven years, returning after Julia's banishment to Pandataria. The death of two of Augustus's three grandsons paved the way for the adoption of Tiberius, and of the third grandson, Agrippa Postumus, by the emperor, and for the appointment of Tiberius as heir to the throne, Agrippa being, apart from his youth, wholly unfitted for the exercise of uncontrolled authority. Accordingly, Tiberius ascended the throne (14 A.D.), and by his manly and graceful demeanor, prudence, and moderation, gave promise of a happy reign. His mild and benignant sway at first was doubtless due in part to the necessity of outbidding his popular nephew Germanicus (who was of Octavian blood by his mother's side) for public favor; but after his kinsman's death (19 A.D.), and the removal of all who were likely to put forth claims to the throne, Tiberius's true character became better known. He had always shown himself reserved, jealous, timid, and irresolute, though not cowardly, and almost devoid of sympathy and affection; and with the scepter firmly in his grasp, the development of these qualities produced the most suspicious and cruel of tyrants. During the life of his mother, however, Tiberius, who held her somewhat in dread, took little share in the government, but led a retired life, attempting to ape the virtues he had not. The chief events of this part of his reign were the increase in number and amount of the taxes, the removal of all power from the people and the senate, and the institution of prosecutions for *læsa majestas*, the latter being nothing else but a convenient mode of removing all who incurred the displeasure of the emperor. But after Livia's death (29 A.D.), he resigned the whole real authority into the hands of Ælius Sejanus, a Roman knight and a commander of the prætorian guards, and gave himself up to the unrestrained indulgence of his sensual appetites. The empire did not suffer by the change, for Sejanus was a man of great ability and resolution, and well knew how to maintain his ascendancy over the emperor by pouring into his suspicious ear tales of conspiracy, and then allaying the imperial fears, and satisfying his own private enmities by the condemnation for *læsa majestas* of eminent Roman citizens. In 26 A.D., Tiberius retired to the island of Capri, there to wallow in his brutish enjoyments with more freedom, leaving Sejanus, whom he made his coadjutor in government, and equal in position, at the head of the government; and from this period till the discovery of the ambitious aspirations of Sejanus, and his downfall (31 A.D.), the Roman annals are crowded with proscriptions at Rome, and infamous excesses at Capri. Sejanus's successor, Macro, had all his vices, and few or none of his talents, and so the state of affairs was even worse than before, the senate exhibiting a rare degree of sycophancy, by indorsing with the most accommodating promptitude every order, however tyrannical, of the emperor or his confidant. It may seem strange that this frightful misgovernment by an aged debauchee and his ignoble favorite should have been so quietly submitted to by the Romans, but in reality their tyranny was confined exclusively to those of rank, the common people being treated with forbearance and occasional liberality, as there was nothing to fear from them. Tiberius's powerful constitution was at last completely destroyed by his excesses, and falling sick at Astura, he traveled to Misenum, where, in the villa of Lucullus, he ended his infamous life, Mar. 16, 37 A.D., his death being hastened a few days either by poison or suffocation.

TIBET. See THIBET.

TIBIA (Latin, "shin-bone"). In *anatomy*, the larger of the two bones forming the fore-leg, and the one to which the fibula is attached. In *music*, the Tibia was the commonest musical instrument of the Greeks and Romans, and was a pipe or flute, originally made of bone, but later of a reed growth, with the opening at the top, protected by a natural knot, with a tongue beneath, partially detached by a longitudinal slit. It was used at festivals, sacrifices, dances, as an accompaniment to the rowing of the trireme, sometimes also to the march of troops to battle. The *tibia dextra* was held in the right hand, *bass*, the *tibia sinistra* in the left, *treble*; *tibiae pares*, both treble or both bass, and the *impares*, one of each.

TIBULLUS, ALBIUS, the Roman elegiac poet, was born of equestrian family, probably 54 B.C., and died young, not long after Virgil, about 18 B.C. We know nothing of his youth or education. From his equestrian ancestors he inherited an estate at Pedum, between Tibur and Præneste, which, like the estates of Virgil and Horace, had been either wholly or partially confiscated in the civil wars. Tibullus, however, recovered part of his property, and spent upon it the best part of his short life. He was patronized by Messala, whom, in 31, he accompanied into Aquitania, to suppress a serious revolt which had broken out in that province. He was present at the battle of Atax, which gave the final blow to the insurgents; and he celebrates in a fine strain of poetry, the honorable part he bore in the campaign. Next year, Messala was sent to the East and again Tibullus accompanied him; but having been obliged from illness to stop at Coreyra, he returned to Rome. At this point, the public life of Tibullus ceases; and henceforth he devoted himself to the study and composition of poetry. His *Elegies*, divided into four books, are mainly addressed to his mistresses, Delia, Nemesis, and Glycera, whose inconstancy or coldness he bewails in tender and exquisitely finished verses. The third book, however, is now believed to be the work, not of Tibullus but of another and inferior poet; while the hexameter poem on Messala, with which the fourth book opens, is from inter-

nal evidence, supposed to be also by another and inferior hand. Only the first book was published during the poet's lifetime, which, brief as it was, yet passed peacefully away amid all the blessings of pecuniary competence, patronage of the great, health, and fame. The character of Tibullus was singularly pure, amiable, and winning. During life, he had the honor of being addressed in an ode and epistle by Horace; after death, of being bewailed in an elegy of matchless beauty by Ovid. The best edition of his poems is L. Müller's (1882). They were translated into English by Grainger (1752) and Cranstoun (1872).

TIBUR. See **TIVOLI**.

TIC DOULOUREUX. See **NEURALGIA**.

TICHBORNE TRIAL, a celebrated conspiracy case in the legal records of England, in which an impostor, who assumed the identity of an heir to claim his estate, was found guilty and sentenced to fourteen years' penal servitude. Roger Charles Tichborne was born in 1829, and after his education in France and at the Roman Catholic college of Stonyhurst, he entered the English army in 1849. In 1852 he offered to marry his cousin Kate, the daughter of his uncle, sir Edward Tichborne; but failing to obtain the consent of her parents, resigned his commission, sailed for Valparaiso, and in 1854 left Rio de Janeiro on board the ship *Bella* which was lost at sea. Sir Edward Tichborne died in 1853, and was succeeded by his brother James. The latter died in 1862, and as his eldest son Roger was supposed to be lost on the *Bella*, he was succeeded by his second son Alfred, who lived only till 1866. A posthumous son was born three months after the death of Alfred, and was accepted as the heir to the Tichborne estates. In 1865 Lady Tichborne, widow of Sir James, advertised in English and Australian newspapers for her son Roger, whom she believed to be living. In 1867 a butcher of Wagga Wagga, Australia, where he was known as Thomas Castro, sailed for Paris, and was accepted by lady Tichborne as her son Roger; although nearly every other member of the family considered him an impostor. He found, however, many adherents, and traveled about England to secure witnesses and obtain information concerning incidents in the life of Roger Tichborne. In 1867 he filed a bill in chancery to restrain the trustees of the estates from setting up certain outstanding terms as an answer to any action he might bring to recover the property. The trial was delayed for nearly four years by various causes, especially by sending commissions to Australia and South America. Lady Tichborne died in 1868, but there were so many persons who believed in the claimant that he was able to borrow large sums of money to pay the expenses of the trial, which was commenced in 1871. It continued for 103 days when the jury declared themselves satisfied that the claimant was not Roger Charles Tichborne, and he was nonsuited. He was then imprisoned to be tried for perjury, but was released on bail. His trial for perjury was begun in the court of Queen's Bench in 1873, and lasted 188 days, till Feb. 28, 1874, when he was found guilty and sentenced to fourteen years' penal servitude. The career of the claimant was traced from the time he left England to the time of the trial, and it was clearly shown that his real name was Arthur Orion, a native of London, who emigrated to Australia where he assumed the name of Thomas Castro. He was entirely ignorant of incidents in the life of Roger Tichborne during his residence in France, and knew no French, which Roger spoke more fluently than English. His handwriting was entirely different, and he was very illiterate, while Roger had been well educated. It was also proved that he did not resemble Roger in his physical appearance. In consequence of the trials the trustees were obliged to mortgage the Tichborne estate. See *Charge of the Lord Chief Justice in the Case of the Queen v. Castro* (London, 1875). T. was released, Oct., 1884.

TICHVIN', a t. of Great Russia, in the government of Novgorod, 168 m. e.s.e. of St. Petersburg, on the Tichvinka, which, together with the canal of the same name, connects the Volga with the Baltic. It contains four churches, 2 convents, and 2 banks. The inhabitants are chiefly employed in the transit-trade by land and water. Pop. '93, 6650.

TICINO, a river of Switzerland and the n. of Italy, rises on the southern slopes of Mt. St. Gothard, and flows s. through lake Maggiore, and s.s.e. through the n. of Italy to its junction with the Po, about four m. below Pavia. Entire length about 150 m.

TICINO, the most southern canton of Switzerland, bounded on the w. and s. by Italy, and on the e. by Italy and the canton of Grisons. Area, 1088 sq. m.; pop. '94, 127,940. Its surface, forming a portion of the southern slope of the Alps, comprises lofty mountains in the north. The northern boundary between Ticino and the cantons of Uri and Grisons is a range of the Lepontine Alps, rising in Mt. St. Gothard (q. v.) to the height of about 12,000 feet. There is considerable dairy farming and cattle breeding; there is some agriculture, and grapes, figs, olives, almonds and melons are raised. Offsets from the Lepontine and Rhetian Alps occupy the greater part of the canton. In the south the country falls away into flats, and the scenery becomes Italian in character. The principal river is the Ticino (q. v.).

TICK, the popular name of a great number of *acarides* (see **ACARUS**), forming a section called *suctoria*, having the mouth in the form of a sucker, with no apparent mandibles. They live by sucking the juices of plants and animals. Some of them are

aquatic. The harvest-bug (q.v.) is a well-known example of the suctorial *acarides*. It belongs to a family called *leptidae*. The name *Ticino* is more particularly given to the family *iodidae*. They abound in almost all parts of the world, but chiefly in warm countries, in which they are very troublesome pests. Many of them live in woods, attached to branches, but are ready to attach themselves to animals, which sometimes suffer greatly from their numbers, their blood-sucking powers, and the inflammation which they cause. The *tampan* (q.v.) is a very troublesome tick of s. Africa. The carapata of Brazil is scarcely less annoying. It infests dry bushy places, clusters of many hundreds being found clinging to very slender twigs, and they instantly transfer themselves to any horse, ox, or other quadruped which comes in contact with them, burying their serrated suckers in its skin, so that they cannot be withdrawn without considerable force. If not taken off, they go on increasing in size, till they become as large as a horse-bean, or even larger. Whole herds of cattle sometimes perish from the exhaustion which they cause. Wet weather, however, soon kills them, and an animal made to swim across a river, is almost freed from them at once. Travelers in the interior of Brazil are sometimes obliged to pick hundreds off their own bodies before retiring to rest for the night.—The Dog Tick (*Ixodes plumbeus*) is common in Britain, abounding on ferns in fir plantations, etc., in many places in autumn, and attaching itself to dogs, oxen, and other animals, sometimes even to man. It is in form and size like a grain of linseed, oval, shining, reddish, with a pale margin. The body swells to the size of a small horse-bean after the tick has attached itself to an animal, and the wound is attended with much inflammation and pain. Tortoises have ticks peculiar to them, which adhere to their neck, and by the thickness of their leathery coat, are preserved from being crushed when the head is retracted. See *illus.*, INSECTS, vol. VIII.

TICKELL, THOMAS, 1686-1740, b. England; educated at Oxford, where he was appointed fellow in 1710. He attracted the attention of Addison by some lines praising the latter's *Rosamond*; and Addison, becoming sec. of state in 1717, made him under-secretary. He was sec. to the lord justices of Ireland from 1725 till his death. He published *Prospect of Peace* (1713); *The Royal Progress* (1714); and a poetical version of the 1st book of the *Iliad* (1715). His best known poem is *Colin and Lucy*. Goldsmith calls his *Elegy on Addison* "one of the finest odes in our language."

TICKET OF LEAVE is a term which is properly applied only in regard to convicts in the Australian colonies. A kind of permit was given to them after a certain period of their sentences, if they could be trusted at large. It required the convict who held it to remain within a particular district. The term was afterward popularly applied to the kind of document called technically an "order of license," which sets a convict at large in the British empire before the expiry of his sentence. The occasion of its being first used was when, after the year 1840, the colonies, one after another, refused to receive convicts. If those sentenced to transportation were kept in prison in this country for the whole period of sentence, its severity would be greatly increased; and hence, by way of compensation to the convicts not taken abroad, part of their sentence was remitted. On the form of the sentence being recently changed from transportation to penal servitude, the partial remission was made systematic, as an inducement to good conduct and industry. Under the existing act of 1864, the period of remission which may thus be gained, is for males about a fourth, and for females about a third, of the whole sentence. The method of adjusting the period is by debiting the convict with so many marks, representing the amount of industry that must be accomplished to gain the largest period of remission; and according to the proportion of these gained is the amount of remission or order of license or ticket of leave. See **CONVICT**; **PRISONS**.

TICKING, a strong cloth, used chiefly for making beds, mattresses, and paillasses. Formerly, it was always manufactured of linen, but cotton is now largely used for this purpose. A very general character of ticking is that it is woven in stripes of two colors, blue and white.

TICKNOR, FRANCIS ORRERY, physician and poet, was born in Baldwin Co., Georgia, in 1822. He studied medicine in Philadelphia and New York, and went to Columbus, Ga., to practice, where he died in 1874. He wrote many poems, especially during the civil war, which were published after his death by Paul H. Hayne. Among these may be noticed "Little Giffen" and "The Virginians of the Valley."

TICKNOR, GEORGE, an American scholar and author, born in Boston, August 1, 1791; educated at Dartmouth College; admitted to the bar in 1813, but devoted himself to literature. From 1815 he spent four years in Europe, residing at Göttingen, Rome, Madrid, Paris, Edinburgh, and London, where he made the acquaintance of the most distinguished men of letters. Returning to America, he became professor of French and Spanish languages and literature in Harvard university. In 1835, resigning his professorship, he went with his family to Europe, where he remained three years, collecting materials for his *History of Spanish Literature* (New York, 1849, 3 vols. 8vo), an exhaustive and admirable work, which has been translated into Spanish and German. Mr. Ticknor also edited *The Remains of Nathaniel Appleton Haven*, and wrote a *Life of Lafayette*, first published in 1824 in the *North American Review*. He published in 1864 a biography of his friend, W. H. Prescott, the historian. Mr. Ticknor died in 1871. See *Life, Letters, and Journals of George Ticknor* (Boston, 1876).

TICONDEROGA, a town and village in Essex co., N. Y.; on lake Champlain and the Delaware and Hudson and the Rutland railroads; 90 m. n. of Albany. The falls of the outlet of lake George, 150 ft. in $1\frac{1}{2}$ m., afford constant water-power for manufactories of paper, pulp, graphite, air engines, blank books, paint, machinery, and other articles. The promontory was fortified by the French in 1755. In 1757 Montcalm assembled here a force of 9000 men, with which he took the English fort, William Henry, on lake George. In 1758 General Abercrombie with 15,000 men attempted to storm the French fort, then called Carrillon, but was repulsed with a loss of 2000. In 1759 it was invested by General Amherst, and the French dismantled and abandoned both this fort and Crown Point, which were then enlarged and strengthened by the English at a cost of \$2,000,000. Being weakly garrisoned after the cession of Canada to Great Britain, it was, in 1775, surprised and captured by Ethan Allen. In 1777 it was recaptured by General Burgoyne, by erecting a battery on an unprotected height which commanded it; but after the surrender of Burgoyne, it was dismantled and abandoned. It was again occupied by the British troops in 1780, and at the close of the war became a picturesque ruin. Pop. '90, town, 3980; village, 2267.

TIDAL WAVES are on record as early as B.C. 4th c. Such waves are generally attributed to some violent convulsion of the earth, inasmuch as they are nearly always preceded by an earthquake. Perhaps the most noted is that of Lisbon, which occurred in 1755; immediately after the earthquake a wave 60 ft. high came in from the sea. For its extent and height, the wave that succeeded the earthquake at Arica, on the w. coast of South America, in 1868, was one of the most remarkable. The sea at first receded, then came back in a great wave estimated to be more than 40 ft. high. It landed one of the U. S. war ships high up on the shore. It reached South California, 5000 m. distant, in a few hours, extended to Yokohama, Japan, and to the shores of Australia. Large waves have also been noticed upon the great lakes.

TIDE-MILL. See WATER-POWER.

TIDES. It was known, at least as early as the time of Cæsar, though probably long before, that the time of high-water, and also the height of the tide, are in some way connected with the age of the moon. And even in the present state of science, what is called the *establishment* of a port, or the time of high-water at new or full moon (that is, the interval between the moon's crossing the meridian and the full tide), which is practically the most important part of the whole question, cannot be predicted by theory, but must be obtained by observation. The first attempt to explain the phenomena of the tides was made by Newton; and, considering the little that has, since his time, been effected, his approximate solution must be pronounced highly creditable, although in many respects unsatisfactory. D. Bernouilli and others have since slightly improved Newton's method; and a complete solution of the problem has been attempted by Laplace. The principles involved in this solution are undoubtedly correct, and the result, so far as it goes, leaves little to be desired. But it does not go far, for two reasons: we know very little as to the depth of the sea; and, even had we that knowledge, the excessive difficulties of the mathematical processes required in taking account of it, and of the forms of continents and islands, would make this method inapplicable.

Newton's approximate method consists in the study of the problem as a *statical* one, and this we will presently describe. Laplace, on the other hand, treats the problem as one of *fluid motion*. Airy and others have, more recently, attempted, with success, to simplify Laplace's process. Curiously enough, however, the results of all these theories are very much alike; and, while some of the results agree well with observation, others seem irreconcilable with it. We cannot explain Laplace's method without employing high analysis, quite unsuited to this work; so we must be content to describe the faulty theory. In the Newtonian or *equilibrium* theory, we consider the earth to be spherical, and covered with a layer of water, which would, of course, if left to itself, be uniformly deep over the whole surface. The attraction of the moon (per unit of mass) on the water immediately below her, is greater than her attraction on the solid earth (per unit of mass), and tends, therefore, to raise the water at that part of the surface. At the point of the surface directly opposite to the moon, the water-layer is further from the moon than the bulk of the earth, and, consequently, the moon attracts the water (per unit of mass) *less* than it attracts the earth. The tendency is, as it were, to pull the earth away from the water, so that here also the water is raised, though not *quite* so much as on the other side, as the moon's attraction diminishes with distance. The effect of the moon's action on the previously uniform layer of water is thus to elongate it both ways in the direction of the line joining the centers of the earth and moon. On account of the very small amount of this elongation, it is found by mathematical processes, which we cannot give here, that the form of the surface will become very nearly a prolate spheroid (a solid formed by the revolution of an ellipse about its *longer* axis).

[Before proceeding further with our explanation, it is necessary to say a few words with reference to a mistake often fallen into by those whose knowledge of mechanics is scanty; and at times paraded with a show of learning by a class of men who doubt such plain matters of fact as the moon's rotation, the oblateness of the earth, the inertia of matter, and what not. Such people say that, since, if the moon and earth were rigidly fixed to each other, the water would rise only on the side next the moon, this must be the case in nature also. This is the same mistake as those commit (see PERTURBATIONS)

who allow that at new moon the sun virtually diminishes the moon's gravitation toward the earth, but refuse to allow that the same is true at full moon.]

We have next to consider that the moon revolves about the earth, and that the earth also revolves about its axis. Thus, the equilibrium figure has never time to form; but an imperfect form of it travels round the earth in the time of a lunar day (24 hours 54 minutes). If the moon be on the equator, it is obvious that similar portions of the water-spheroid will reach any one spot on the earth at intervals of half a lunar day (12 hours 27 minutes). If the moon's declination be considerable, such will not be the case—a place, for instance, whose latitude is equal to the moon's declination, will be reached by one pole of the wave-spheroid when the moon is on the meridian; but in 12 hours 27 minutes, the other pole of the spheroid will not pass over the place, but at a meridian distance of twice the latitude of the place, or twice the moon's declination. Thus, when the moon's declination is sensible, the two tides of each day are not generally equal in height, except for places on the earth's equator. This gives rise to what is called the *diurnal* tide, which is, as it were, superposed upon the ordinary, or *semi-diurnal*, tide, and ought to be more sensible as the latitude is greater. Owing to fluid friction, and other causes, we should expect that the axis of the tidal spheroid would lag a little behind the moon, and this is found to be the case.

So far, we have a general explanation of the occurrence of tides twice a day, and of their dependence on the moon. But we started with two assumptions which are not consistent with fact, viz., that the earth is spherical and uniformly covered with water, and that the moon is the only tide-producing body. The corrections to be made in consequence of the inaccuracy of these assumptions must now be explained. We commence with the latter. The sun, although at an immense distance compared with that of the moon, has such an enormous mass, that his tide-producing influence is comparable with that of the moon. In fact, it is easy to see that, as Newton showed, the tide-producing power of an attracting mass is directly as the mass, and inversely as the *cube* of its distance. That it is directly as the mass, is obvious. To prove the other assertion, let R be the earth's radius, D the distance of the attracting body from the earth's center, then the attraction per unit of mass on the earth is to that per unit of mass on the water nearest the attracting body as

$$\frac{1}{D^2} \text{ to } \frac{1}{(D-R)^2},$$

according to the law of gravitation. The difference between these quantities is proportional to the tide-producing force. But

$$\frac{1}{(D-R)^2} = \frac{1}{D^2(1-\frac{R}{D})^2} = \frac{1}{D^2}(1 + \frac{2R}{D} + \text{etc}) = \frac{1}{D^2} + \frac{2R}{D^3} + \text{etc.}$$

the remaining terms being omitted, since D is always much greater than R . The difference is therefore approximately

$$\frac{2R}{D^3},$$

as stated above.

Now the mass of the sun is to that of the moon as 355,000 to 0.0125, and the sun's distance is about 400 times that of the moon. Hence the tide-producing power of the sun is to that of the moon as

$$\begin{aligned} &355,000 \text{ to } .0125 \times 400^3 \\ &\text{or } 355 \text{ to } 800. \end{aligned}$$

By calculations, which we cannot give here, it has been shown that the difference of length of the axes of the wave-spheroid produced by the moon alone is about 58 inches; so that in that due to the sun it will be about 25.7 inches.

In consequence of the extremely small amount of these effects on the sea-level, we are entitled to simply add or superpose the separate effects of the sun and moon, in order to obtain their joint effect. And now we have at once the explanation of what are called *spring* and *neap* tides. At new and at full moon, the wave-spheroids due to the sun and moon have their axes almost coincident, so that we have a tide which is to the lunar alone as $800 + 355$ to 800, or as 13 to 9 nearly; while, when the moon is in her first or last quarter, the axes are nearly at right angles, and the compound tide is to the lunar tide alone as $800 - 355$ to 800, or as 5 to 9 nearly. Thus the height of the spring-tide is to that of the neap-tide in the ratio of about 13:5.

Another curious phenomenon, which we can now easily account for, is the "priming" and "lagging" of the tides, or the *acceleration* and *retardation* of the time of high-water. If the tides were due to the sun or moon alone, they would recur at equal intervals of time; and, in fact, this is the case with the lunar and solar tides separately. But what we observe is the compound tide, and this will obviously have its maximum *between* two consecutive maxima of the lunar and solar tides; but nearer to the lunar tide as it is the greater. Thus, if about new moon the sun passes the meridian *before* the moon, the tide is accelerated; if *after*, it is retarded. And the same is true about full moon, only

that in this case our statement refers to passages of the sun and moon on opposite sides of the meridian. This retardation or acceleration has for its greatest value a period of rather less than an hour; and the respective maxima occur about $4\frac{1}{2}$ days before and after the spring-tides.

But we meet with far more serious difficulties when we come to consider the actual distribution of water over the earth's surface; and it is here that future improvements must be looked for.

But even so inadequate an attempt at a solution as is the equilibrium theory, gives us the means of explaining a great many curious observed phenomena. It shows, for instance, how exceedingly small we should expect to find the tides in an inland sea such as the Mediterranean; for there, even when the moon is most favorably situated, the utmost difference of level would be (by calculations which we cannot give here) only about an inch or two; and of this part would be the rise in one portion of the sea, the rest the fall in others. The popular explanation of this phenomenon is very simple. We have but to notice that, according to the equilibrium theory, the form of the water is a spheroid of definite dimensions, its axes differing from each other by 58 inches. But a small portion of such a spheroid (of the dimensions of the Mediterranean, for instance) can hardly be distinguished from a sphere; so that the form of the surface of a limited mass of water will be but slightly altered by the attractions of the sun and moon.

It is obvious from what we have just said, that the rise of the water in tidal rivers, estuaries, and deep bays, where it sometimes amounts (even in calm weather) to more than 100 ft., cannot possibly be due to the moon's action upon the water of the mere river or bay, but must be almost entirely produced by the tidal wave in the ocean; and, in fact, this part of the problem presents comparatively little difficulty. Once grant the fact of the tidal disturbance of sea-level at the mouth of a river, and the calculation of the motion of the consequent wave in the river-channel is within the power of mathematics. It is by means of investigations made from this point of view, and by others concerning the effect of the moon on long canals, that Laplace's method has been improved. For the details of the process, see Airy on "Tides and Waves," in the *Encyc. Metrop.* All we can do here is to point out a few of the immediate consequences of the periodic rise and fall of the sea-level as regards the motion of the water of a tidal river. Here the tide always runs *up* the river, even when, as in the case of the Severn, this is the opposite direction to that in which the moon appears to move. In the open sea at the mouth of the river, the interval from high to low-water is almost exactly equal to that from low to high-water, each being about $6\frac{1}{2}$ hours nearly. But the further we go up the river, the greater becomes the disparity between these periods, high-water following low-water at shorter and shorter intervals, while the intervals during which the tide falls are correspondingly increased. In some cases, as at certain points in the Seine and Severn, the interval from low to high-water is so short that the tide-wave rushes suddenly up, and spreading over the flat sands at the side of the channel, forms a dangerous surf called a *bore* (q.v.).

Connected with these peculiarities, there is also a singular effect produced on the direction of the current in a tidal river. In the open ocean, the water merely rises and falls, there being no perceptible tidal current. Sailors are in the habit of associating the cessation of currents, or "slack" water, with the occurrence of high and low water. This is the case in bays, but not in rivers, and it gives rise to some curious errors regarding the time of high-water in rivers. Thus it is sometimes said that it is high-water in the center of the Thames' channel long after it is high-water at the shore—an obvious absurdity. The truth is, the current does not cease simultaneously at the shore and in the mid-channel. At the mouth of a tidal river, the water runs upward for hours after high-water, and downward after low; and the same is true, in a less degree, at places higher up the stream.

When considerable alterations of breadth or depth occur in the channel of a river, we find corresponding alterations in the amount of rise of the tide. Thus, according to Airy, at the entrance of the Bristol channel, the whole rise at spring-tides is about 18 ft.; at Swansea, 30 ft.; and at Chepstow, 50 feet. In the bay of Fundy, the tide is said to rise nearly 120 feet. Again, the same port may be reached by tide-waves coming from the ocean by different channels; and here we have to compound the two disturbances just as we did with the separate lunar and solar tides. In the German ocean, we have a very good example; but the most remarkable is the tide at Batsham, in Tonquin. At this port, two tide-waves meet, coming respectively from the Indian and China seas; these bring, simultaneously, opposite but nearly equal changes in the water level, and the effect is, that there is almost no perceptible tide.

Whewell, Lubbock, and others have lately added much to our knowledge of the *facts* of the tides: and have constructed what are believed to be tolerably accurate charts of *cotidal lines*—that is, lines representing the positions of the crest of the tide-wave at hourly intervals as it sweeps round the earth. A great deal, however, remains to be done in this direction, before we can hope to elicit from observation such hints as may enable us to improve the mathematical theory of the subject.

The frictional resistance to the motion of the tide-wave of course produces heat. This heat is a transformation of part of the earth's energy (see *FORCE*) of rotation; and thus it

appears that the tides are gradually lengthening the day. We may see easily that this would go on, were the moon the only tide-producing body, so long as the earth rotates about her axis in less time than a lunar month. For if the length of the (sidereal) day were that of a lunar month, the earth would always turn the same face to the moon; and the tide-spheroid would have a *fixed* position on the earth, and there would be no loss of energy by friction. Simple as this deduction is, though it seems to be roughly guessed at by Kant, it was not formally enunciated till about thirty-five years ago. Mayer was the first to publish anything on the subject, but it seems to have been previously noticed by others. One of the most curious deductions from it is the recent speculation which assigns, as the cause of the moon's turning always the same face to the earth, the friction of the enormous tides which must have been produced by the earth in her mass when it was in a molten state, on the surface at least, if not throughout.

For tidal evolution and the theory, based on Dr. G. H. Darwin's calculations, that in early geologic times the size of the tides was vastly greater than at present (owing to the greater nearness of the moon), see *Nature*, vols. xxv., xxvi.

TIE, in music, an arch drawn over two notes on the same degree, uniting them so that they are played or sung as one single note of the same value. Thus, for the two C's

written in the example , one is played of the value of a minim and

quaver combined. The tie is often used in syncopated passages to connect the last note of one measure with the first of the succeeding one, when the former note, which would otherwise be unaccented, acquires the emphasis of the latter :

See SYNCOPATION.

TIE-BEAM. See ROOF.

TIECK, CHRISTIAN FRIEDRICH, 1776-1851; b. Berlin; studied sculpture under Schadow in Germany, and David in France; was employed at Weimar, 1801-5, and afterward in Italy; became a professor of the Berlin academy, 1820, and was engaged with Schenkel and Rauch in improving the art. He executed at Carrara many busts in the Wallhalla for the crown prince Louis of Bavaria; at Weimar those of Goethe and other poets; a statue of Neckar for Mme. de Staël; of his brother at Dresden, and decorations of the royal theater at Berlin, and other public buildings.

TIECK, LUDWIG, a brilliant and prolific German novelist and poet, was born at Berlin, May 31, 1773, and studied at the universities of Halle, Göttingen, and Erlangen. He made his first appearance as an author in the *Straussfeder* (Ostrich-feather) magazine, conducted by Musäus (q.v.) and J. G. Müller, for which he wrote a series of little tales, of which the best was *Die beiden Merkwürdigsten Tage aus Siegmann's Leben* (The Two most Remarkable Days in Seigmann's Life). But the originality of his genius first displayed itself in his romances of *Abdallah* (Berl. 1796) and *William Lovell* (3 vols., Berl. 1795). These were followed by his *Peter Lebrecht, eine Geschichte ohne Abenteuerlichkeiten* (Peter Lebrecht, a History without Adventures, 2 vols., Berl. 1795-96), and *Peter Lebrecht's Volksmärchen* (3 vols., Berl. 1797), which were equally remarkable for richness of fancy, artless simplicity, and an overflowing humor. In some of these *Märchen*, as, for example, his "Bluebeard," "Puss-in-Boots" (*Der gestiefelte Kater*), and "The Life and Death of Little Red Riding-hood" (*Leben und Tod des kleinen Röthkappchen*), he combated with satiric humor, perhaps, too, with somewhat of youthful arrogance, the "enlightened" notions on which the literature of the 18th c. prided itself—showing very distinctly his strong tendencies toward the deeper poetic spirit of the middle ages. The same polemic was maintained in his comedy, *Die verkehrte Welt* (The Topsy-turvy World, 1799). To this period also belong his *Herzensergüssungen eines kunstliebenden Klosterbruders* (Heart-effusions of an art-loving Monk, Berl. 1799), *Franz Sternbald's Wanderungen*, an art-novel (2 vols., Berl. 1798), and *Phantasien über die Kunst* (Fancies on Art, Hamb. 1799), all of which are full of a noble enthusiasm for art, but pervaded at the same time by a dreamy mystical religiosity, which is no longer admirable. These works brought Tieck into close relationship with A. W. von Schlegel and others, and led to the establishment of the literary sect or coterie known as the "Romantic school," whose influence on the later literature of Germany and France has been very great, and not always very good. Tieck now married the daughter of a Hamburg clergyman who had been a friend of Lessing; and in 1799 went to Jena, where he added Steffens to the list of his friends. Here he published his famous *Romantische Dichtungen* (2 vols., 1799-1800). His translation of *Don Quixote* (4 vols., Berl. 1799-1801, 3d ed., 1831) far surpassed all previous attempts. In 1802 he joined A. W. von Schlegel in the *Musen-Almanach*; and in 1804 published his longest romance, *Kaiser Octavianus*. Tieck's health now began to fail him, and in 1805 he visited Italy. On his return to Germany, he settled, after some changes, at Ziebingen in 1811, where he formed a friendship with the philosopher Solger, who exercised a great influence over his mind. Henceforth we find less of the dreamy

and formless mysticism of his earlier years, and more of the artistic element. The change becomes visible in his *Phantasm* (3 vols., Berl. 1812-17), and in his *Ulrich's von Lichtenstein Frauendienst* (Tüb. 1812). In 1817, along with a friend, Burgsdorf, he paid a visit to England, where he collected fresh materials for his Shakespeare. From 1819 to 1840 he resided at Dresden; but on the accession to the throne of Friedrich Wilhelm IV. of Prussia, he was invited to Berlin, whither he proceeded, and where he resided for the rest of his life. His death occurred April 28, 1853. Other important works of Tieck's, besides those already mentioned, are his *Novellenkranz* (Berl. 1831-35; complete in 12 vols., Berl. 1853), in which there is hardly a trace of the credulous romanticism of his earlier years, but abundance of lively and subtle talk on the literature and life of the present; *Dramaturgische Blätter* (2 vols., Bresl. 1826), republished in his *Kritische Schriften* (4 vols., Leip. 1848-52); *Shakespeare's Vorschule* (2 vols., Leip. 1823-29); and his splendid continuation of Schlegel's translation of our great poet. Tieck revised a collected but incomplete edition of his works in 20 vols. (Berl. 1828-46).—See Köpke's *Life of Tieck* (1855); Steiner, *Ludwig Tieck und die Volkbücher* (1893).

TIEDemann, Dietrich, 1748-1803; b. Germany; educated at the university of Göttingen. He was teacher of ancient languages at Cassel 1776-86, when he was called to the chair of philosophy at Marburg. His most important work is his *Geist der Speculativen Philosophie* (1791-96), containing the history of philosophy from the time of Thales. His other works, such as *Untersuchungen über den Menschen* (1777-98); and *Idealistische Briefe* (1798), contain interesting researches in psychology.

TIEL, the seat of an arrondissement in the Netherlands, province of Gelderland, is picturesquely situated on the right bank of the Waal. In the 5th c. it was called Tellum or Thiela. The fortifications have been demolished, and formed into beautiful walks. Pop. '89, 9896. Principal buildings are the town-house, court house, chamber of trade, and the great Reformed church of St. Martin.

TIENTSIN, a large and important city and river-port of China, in the province of Chihli, on the right bank of the Pei-ho, 35 miles from the mouth of that river by land, and 70 miles by the windings of the stream. It is the port of the city of Peking, from which it is distant 80 miles south-east. The streets are unpaved, and the houses, principally built of mud or dried bricks, have a mean appearance, though the central parts of the town are filled with well-built houses. Next to Peking it is the most important city of Chihli. The river is generally frozen over from about Dec. 15 to March 15, and the business, at other times carried on by means of boats and junks, is taken up by sledges, which swarm on the river. Pop. abt. 950,000.

TIEPOLO, GIOVANNI BATTISTA (also called **TIEPOLETTO**), an Italian painter, born at San Piero di Castello, near Venice, March 5, 1696. He studied under Lazzarini, and modeled his style chiefly upon that of Veronese, especially in his numerous wall and ceiling frescos. His most important works are the mural decorations in the archiepiscopal castle at Würzburg (the work of three years, comprising *Olympus and the four quarters of the globe*, and the *Life of Frederick Barbarossa*), the history of Anthony and Cleopatra at the Palazzo Labia in Venice, scenes from the Old Testament in the archiepiscopal palace at Udine, and frescos in the royal palace at Madrid. He died in Spain, March 27, 1770. See Molmenti, *Il Carpaccio ed il Tiepolo* (1885); Id., *Tiepolo, Acque Forti* (1896); Leitschuk, *Tiepolo* (1896).

TIERCE, TIERCE, in heraldry, a term of blazon used to indicate that the field is divided by lines into three equal parts. A shield may be tierce in pale, in fess, in bend, in bend-sinister, or in pall; all which, with other arrangements in tierce, are common in French heraldry. Tierce in pale, in English heraldry, is an occasional mode of marshaling three coats in one escutcheon under special circumstances.

TIERRA DEL FUEGO. See **TERRA DEL FUEGO**.

TIERS ÉTAT (Fr. third estate), the third branch of the French estates, which consisted of representatives of the trading inhabitants of the towns, and of the peasantry in the country. The *tiers état* played an important part in the opening scene of the revolution. On the two other estates of nobles and clergy refusing to join them and deliberate in a common chamber, they, on June 17, 1789, assumed the title of *assemblée nationale*, and the sole right to legislate for France. The French *tiers état* differed completely in its origin from the third estate or commons of England. The latter originated in the permission granted to the minor barons, instead of personally attending the national council, to appear by representatives; and with the representatives of the minor barons were joined in one house the representatives of the municipalities, which, as corporations, came to be considered in the light of tenants *in capite* of the crown. The designation "commons," and the absence of title, have often misled foreigners to suppose that the men who gained their liberties and constitution for the English people were the *roturiers* or *bourgeois*; whereas they mostly belonged to the class which would, in continental phraseology, be called the nobility of the country.

TIETJENS, or TITIENS, TERESA, one of the greatest of recent operatic singers. She was born at Hamburg, of Hungarian parents, in 1837, and made her *début* in that city in the character of Lucrezia Borgia in 1849, taking at once a very high position on the lyric stage: at Frankfort and Vienna she was even more warmly received; and her first appearance in London, in 1858, was quite a triumph. The great volume and purity of her voice, and her energetic but dignified acting, combined to make her an unrivaled representative of strong dramatic parts. She acquired great fluency and flexibility of

voice by hard practice. She was probably the hardest-worked singer that has appeared; and though this did not seem to injure her voice, it doubtless wore out her constitution. She died Oct. 3, 1877.

TIFFANY, a kind of very thin silk gauze.

TIFFANY, CHARLES COMFORT, D.D., b. Baltimore, Md.; educated at Dickinson coll., Andover theol. sem., and at the universities of Halle and Heidelberg; after some years in the Cong. ministry, was ordained priest in the Prot. Epis. church, 1866. He has held positions at Fordham, N. Y., Trinity church, Boston, Church of the Atonement and Zion church, New York; was chaplain of the 6th Conn. reg., U. S. vols., 1864-65. Dr. T. has written pamphlets on *Agnosticism*, *Modern Atheism*, *Rationalism* and *Romanism*, *Expression in Modern Architecture*, and *Norway and the Midnight Sun*.

TIFFANY, LOUIS COMFORT, artist, b. New York in 1848, studied in that city and in Paris, and traveled extensively in eastern lands. He was made a member of the Water Color Society in 1870, an academician of the National Academy in 1880, and treasurer of the Society of American artists in 1878. Since 1880 he has been prominently connected with the Society of Associated Artists in New York, which designs and furnishes interior decorations, stained glass, etc., for churches, residences, and public buildings. He has exhibited, among other easel paintings, "A Dock Scene, Yonkers" (1869); "The Hunter's Dinner" (1872); "A Merchant of the East" (1874); "The Cobblers of Boufarik" (1878); "Street in Algiers" (1889); "Potter's Market at Wurtzburg" (1891).

TIFFANY, OTIS HENRY, D.D., b. Baltimore, Md., 1825; graduated at Dickinson coll., Penn., 1844, and was received into the Baltimore Meth. Epis. conference, 1845. He was prof. of mathematics at Dickinson coll., 1850-57, and upon leaving was appointed sec. of the Maryland Bible soc. He has filled prominent stations in Baltimore, Chicago, Washington, Philadelphia, and New York, and has delivered numerous public orations, lectures, and addresses. In 1885 he was pastor of the Madison ave. Methodist church, New York.

TIFFIN. The Anglo-Indian name for luncheon, or for any light refreshment of food or drink. The word was long regarded as a corruption of the Arabic *tifanum* "pleasure," "recreation;" but Col. Yule, in his *Anglo-Indian Dictionary* (1885), shows it to be in all probability a transplanted English provincialism from the English verb "to tiff," meaning to drink or eat.

TIFFIN, city and co. seat of Seneca co., O.; on the Sandusky river, and the Baltimore and Ohio, the Cleveland, Cincinnati, Chicago, and St. Louis, and the Pennsylvania Co.'s railroads; 42 miles s.e. of Toledo. It is the seat of Heidelberg university (Ref.), and has an Ursuline academy, hospital, St. Francis's orphans' home, public library, electric lights, electric street railroads, national and state banks, about 16 churches, and several daily, weekly, and monthly periodicals. The principal manufactures are pottery, glass, agricultural implements, emery wheels, bent wood, lanterns, wire nails, machinery, and foundry products. Pop. '90, 10,801.

TIFFIN, EDWARD, 1766-1829; b. England; came to this country and settled in Charlestown, Va., 1786. He was both physician and Methodist preacher. He removed to Ohio in 1798, and was the first governor of that state, 1803-7; was then appointed to serve an unexpired term in the U. S. senate, 1807-9; was commissioner of the land office, 1812-15, and afterward surveyor-general of the north-western territory. The city of Tiffin was named in his honor.

TIFLIS, a government of the Russian lieutenancy of Caucasia, lying immediately south of the Caucasus. Area, 17,300 sq. m.; pop. '94, 1,090,000, chiefly Georgians, Armenians, and Tartars. It is traversed by several chains of Mountains, which belong either to the Caucasian mountains (the peak of Kazbeck, 17,500 ft. high), and extend over the n. and e. parts of the government, or to the Ararat, Achaltzick, and Alagiz mountains, spreading from the sources of the Kur and Arax over the s. districts. The principal lake, that of Goktcha, is about 50 m. long and nearly 20 m. in extreme breadth.

TIFLIS, an important Russian city, capital of the government of the same name and of the territory of the Caucasus (and s. of the mountain range of that name), stands on both banks of the Kur, in lat. 41° 42' n., long. 44° 48' e. The manufactures are not very important. The inhabitants are noted for their skill in metal working. Tiflis was formerly a fortress, and the capital of the district of Georgia. It carries on an active trade with Persia, principally through the Armenians, and is the great emporium of the Russian territory s. of the Caucasus. In the vicinity are naphtha springs as well as thermal springs, which are much visited. Tiflis was founded in the 4th c., and annexed to Russia in 1801. Pop. '97, 159,862.

TIGER, *Felis tigris*, one of the largest of the *felidæ*, equal perhaps to the lion in size and strength, and superior in activity. It has no trace of mane. It is more slender than the lion, its whole form more cat-like, its head smaller and rounder. All its motions are performed with the utmost grace and apparent ease. It does not climb trees, but winds its way through brushwood or jungle with great dexterity, runs very swiftly, and can leap an immense distance. It takes its prey either by running, or, more frequently, by lying in ambush and leaping upon it. Its strength is such that it is capable of carrying off an ox or buffalo. It is sometimes 15 ft. in entire length to the tip of the tail; an

instance is on record of 18 feet; the height is from 3 to 4 feet. The tigers of some regions differ considerably in size from those of others; thus the tiger of Bengal is much larger than that of Bokhara. The hair is thick, fine, and shining; in the colder countries which the tiger inhabits, it is thicker and longer than in tropical regions. The color is a bright tawny yellow, beautifully marked with dark transverse bands, passing into pure white on the under parts; the dark bands are continued as rings on the tail. The tail is long, slightly tapering, clothed with hair similar to that of the body. Individuals sometimes occur, of a pale whitish color, obscurely striped, the stripes only visible in particular lights. The tiger is found only in Asia. It abounds in Hindustan, in the Eastern Peninsula, in Java, Sumatra, and other tropical islands. It is found also in China and Japan, and in Persia. Its range, however, does not extend much to the west of a line drawn from the mouth of the Indus to the Caspian sea. It is found as far n. as the s. of Siberia, and even on the banks of the Obi. It inhabits woods, and cannot exist without free access to water. The islands of the delta of the Ganges have long been celebrated as a haunt of tigers. The tiger generally lies concealed in a thicket during the day, and seeks its prey by night. The prey is very often obtained by watching near the places to which animals resort for the purpose of drinking. Tigers prowl about villages, and enter cattle-folds; they also follow traveling-parties, and seize the yoke-oxen and buffaloes, particularly those which straggle away from the encampment at night. The ravages of tigers in some parts of the East Indies are very great; and a great number of human beings are destroyed by them. A notion prevails that a tiger which has once tasted human flesh becomes eager for it, and prefers it to all other food; and a single tiger has been known to kill and devour many people, watching near some frequented path, or prowling around a village. The truth appears to be that this is the mode of obtaining prey to which a tiger sometimes resorts, when incapable, through old age, of the active exertion necessary for capturing buffaloes or deer. The tiger brings forth three, four, or five young ones at a birth. When taken young, it is easily tamed, and often shows much affection for those who treat it with kindness. Tame tigers are not unfrequently to be seen in India. See illus., CARNIVORA, vol. III.

The tiger was less familiarly known to the ancients than the large African *felidae*. It is, however, mentioned by Aristotle, and it is frequently mentioned by the Latin poets. Pliny tells us that the first tiger seen at Rome was a tame one belonging to Augustus. Claudius exhibited four tigers at once.

The tiger frequently breeds in captivity, but not so frequently as the lion. A hybrid between the lion and tiger, the offspring of the male lion and the tigress, has been sometimes produced in menageries. It is striped like the tiger, and not maned. None of the hybrid cubs, however, have lived long.

Tiger hunting is a favorite Indian sport, not unattended with danger, but all the more exciting on that account. Europeans generally ride on elephants when engaged in it, and the tiger is shot from the back of the elephant. Natives, however, are employed to beat the wood or jungle for the tiger, and lives are not unfrequently lost; but the destruction of a single tiger is sometimes a thing of importance to a whole village or neighborhood. The East India company formerly gave a reward of ten rupees for every tiger killed. In most parts of India, tigers are now much less numerous than they once were. Many expeditions, of which the following are the chief, are adopted for their destruction in the countries infested by them. Bows with poisoned arrows are fixed in their paths, so as to be discharged on being touched. Heavy beams are also so placed as to fall upon the tiger pressing against a rope, and crush it by their weight. Traps of various kinds are set, sometimes baited with a live goat or other small animal. The Chinese use a box-trap with a looking-glass placed in it, and the tiger, attracted by his own image, disengages the fastening of the lid, and is captured. This method is very ancient, and is represented in ancient sculpture. A very curious mode, practiced in Oude, consists in scattering numbers of broad leaves smeared with a substance like bird-lime in the tiger's path, and if he sets foot on a smeared leaf, his fate may be regarded as sealed. He rubs his paw on his face, to get quit of the leaf, and the case becomes worse, the leaves are transferred to his face; fresh attempts to remove the nuisance only add more leaves, till he becomes completely blinded, and rolls on the ground for very rage; while the hunters, ambushed close by, apprized by his howlings, hasten to dispatch him.

The tiger is an emblem of power in the east. A tiger's head, gorgeously adorned with jewels, decorated the throne of Hyder Ali and Tippoo Sahib, and was among the spoils taken by the British at Seringapatam.

TIGER BEETLE, a name given to some of the species of the genus *cicindela*, of the family *cicindelide*, of the order coleoptera. This family comprises brilliant-colored beetles with large head and globose eyes, long antennæ, and very long, toothed mandibles. They inhabit warm sandy places, especially by the banks of streams, and are exceedingly carnivorous and voracious. The principal species are contained in the genus *cicindela*.

The common tiger-beetle, *c. vulgaris* of Say, is very swift in its movements, and difficult to capture. It lives in holes near the borders of water where it lies in wait for its prey. Another species is the hairy-necked tiger-beetle, *c. hirticollis* of Say. See CICINDELA.

TIGER-CAT, a name often given to some of the *felidæ* of middling size, which resemble the tiger in their form or markings. The ocelots (q.v.) and the serval (q.v.) sometimes receive this name, which, however, is not of very definite signification. The CHATI (*felis mitis*) is a tiger-cat of South America, rather more than two ft. in length, exclusive of the tail, which is about eleven inches. The color is yellowish, with irregular dark patches, those on the back forming four longitudinal rows; the markings indeed, more leopard-like than tiger-like. The chati prowls by night, and often carries away poultry from their roosting-places. Almost all tropical and subtropical countries have their tiger-cats. Several species are found in the East Indies.

TIGER-FLOWER, *Tigridia pavonia*, a plant of the natural order *iridaceæ*, the only known species of its genus, which is distinguished by the three outer segments of the perianth being larger, and by the filaments being united into a long cylinder. It is a native of Mexico, but hardy enough to endure the climate of the U. S., and much cultivated in flower-gardens for the singularity and great beauty of its flowers, which are, however, very evanescent. The root is a scaly bulb.

TIGRANES, THE GREAT, King of Armenia, B.C. 96-55; descendant of Artases, son-in-law and ally of Mithradates. He conquered Armenia Minor, Cappadocia, and Syria, the whole of n. Mesopotamia, and large possessions e. of the middle Tigris. His capital was Tigranocerta between the Tigris and lake Van. He lost all these conquests after the defeat of Mithradates. Lucullus, the Roman commander, invaded Armenia, and defeated near the capital the numerous army of Tigranes during the absence of Mithradates, and again near Artaxata. The treaty, concluded B.C. 63, left him only Armenia for which he paid to Pompey an enormous sum. His eldest son Tigranes involved him in many difficulties and bloody wars. His son Artavasdes succeeded him.

TIGRÉ, a province in Abyssinia, lat. 12° to 16° n., long. 37° 25' to 40° e.; drained by Mareb and Tacazze rivers. It is an elevated plateau varying from 3500 to 9000 ft. in height, having deep ravines, through which the rivers run; and is divided into a number of small districts. The chief towns are Antato, Axum, and Adowa, the capital, which is an entrepot for the caravan route of Massowah and Gondar. It was conquered by Theodore, king of Abyssinia, in 1855, previous to which it was an independent kingdom.

TIGRIS (Heb. *Ididdekel*; i.e., the "Dekel," equivalent to *Digla* or *Diglath*, probably a Semitic corruption of *tigra*, Medo-Persic for an arrow; hence Gr. *Tigris*, the "arrowy" stream), a large river of Asiatic Turkey, rises s. of lake Goljik, in the mountains of Kurdistan, within a few m. of the eastern bend of the Euphrates (q.v.), flows s.e. to Diarbekir, after which it makes a sharp turn, and flows due e. for 100 m. to Til. Here it receives from the north a considerable affluent, the Bitlis, and once more altering its course, runs in a south-easterly direction through desert wastes and unpeopled pastures, until it falls into the Persian gulf, after a course estimated at 1150 miles. Its chief tributaries, besides the Bitlis, are the Great and Little Zab, and the Dyala, all from the left, the waste land between it and the Euphrates (ancient Mesopotamia) not furnishing a single stream. At Kurna it joins the Euphrates, 90 m. above the mouth of that river in the Persian gulf, and henceforth the united rivers bear the name of Shat-el-Arab (see EUPHRATES). In the upper part of its course, the Tigris is a very swift stream, whence probably its name, and it brings down great quantities of mud. The principal places on its banks are Diarbekir, Mosul, and Bagdad, with the ruins of Nineveh, Seleucia, and Ctesiphon.

TILBURG, a flourishing trading and manufacturing t. in the Netherlands, province of North Brabant, is 36 m. s.e. of Rotterdam, and 14 e.s.e. of Breda. In '95, pop. 36,839, having more than doubled in 70 years. This prosperity began with king William II., when prince of Orange and commander of the army, taking up his headquarters at Tilburg, during the long contest which ended in the independence of Belgium. Much heath has been converted into arable and pasture lands, and numerous brick-works and woolen-cloth factories have arisen. The workmen's houses have each a strip of land attached, for the growth of vegetables and potatoes. Weaving woolen cloth, spinning, finishing and dyeing woolen fabrics, making soap, salt, tiles, bricks, and beer, are the principal industries. The chief buildings are the new palace, the town-house, the barracks, and the cloth-hall. Tilburg has four Roman Catholic churches, a reformed church, a synagogue, a high school with a course of five years, a drawing school, and several charitable institutions. The town is mentioned as early as 709.

TILBURY FORT, in Essex, is situated on the n. bank of the Thames, opposite to Gravesend. Originally erected in the time of Henry VIII. as a block-house, it was converted (1667) into a regular fortification after the bold expedition of De Ruyter into the Thames and Medway. It is of a rectangular form, built chiefly of brick, with a massive stone portal, and is surrounded by a deep and wide fosse, which can easily be filled with water. Batteries of heavy ordnance are placed so as to command the river and the reach below; there are also piers for the landing of troops, stores, etc. The banks of the Thames being here very flat, the ground around the fort is during floods and high tides laid under water, and the atmosphere of the place is unwholesome.

TILDEN, SAMUEL JONES, b. N. Y., 1814; graduated at Yale college; studied law in the University of the City of New York, and was admitted to the bar of the metropolis. He achieved a reputation for great legal skill, particularly in railroad litigation. Having interested himself in local and state politics, he was made chairman of the democratic state committee of New York, a position which he held for thirteen years. In 1846, and again in 1872, he was a member of the state assembly; and in 1874 was elected governor of the state by the democratic party. In June, 1876, he was nominated, by the democratic national convention at St. Louis, the candidate of the party for the presidency. At the election in November, Mr. Tilden received a majority of the popular vote, but the vote in the states of Louisiana, South Carolina, Oregon, and Florida being disputed, great popular excitement ensued, and the two political parties were forced to agree upon a compromise. A commission was appointed (see **ELECTORAL COMMISSION**), of 5 senators, 5 judges of the supreme court of the United States, and 5 representatives. This commission divided on party lines, and voted 8 republican to 7 democratic; and by their decision the disputed votes were given to Rutherford B. Hayes, the opposing candidate, who was declared elected president by a majority of one electoral vote. In 1880 Mr. Tilden was again in question for the democratic nomination for president, but declined it in a letter read before the democratic national convention at Cincinnati. After that period he lived in retirement. He d. 1886, leaving a large part of his property to found a library and reading room in New York city. In 1895 it was decided to unite this with the Astor and the Lenox libraries under the name of the New York Public Library (Astor, Lenox, and Tilden foundations).

TILES (Lat. *tegula*, from *teg-*, to cover; Fr. *tuile*), plates of baked clay, of various shapes, according to their use, some being for roofs, some for pavements. The finer kinds of paving-tiles are known as encaustic tiles (q.v.). The small cubical pieces of burnt clay, stone, glass, or other material used for mosaic pavements are called tesserae (Gr. *tessares*, four). See **MOSAIC**. Besides ornamental tiles, much improvement has been lately effected by various manufacturers in the different kinds used for roofing purposes, especially by the use of fire-clay, by which a tile is made not only greatly superior in strength and durability, but also in sharpness of form and diminution of thickness. Ridge-tiles of a very ornamental character are also largely made. Drain-tiles have been described under the head of **PIPES**.

TILE STONES, the uppermost group of the silurian period, consisting of a reddish, thin-bedded, slightly micaceous sandstone, which in some places attains a thickness of 1000 feet. The beds were originally considered as of old red sandstone age; then they were regarded as a transition group, forming a passage from the silurian strata to the old red sandstone; but it is now ascertained that the fossils agree in great part specifically, and in general character entirely, with those of the underlying upper Ludlow rocks, and they are accordingly considered to be the newest group of the upper silurian division. The tilestones are well seen at Kington in Herefordshire, and at Downton Castle, near Ludlow, where they are quarried for building purposes. From the latter locality they have received the name of the Downton sandstones.

TILGHMAN, TENCH, 1744-86; b. Easton, Md.; son of James and brother of Judge William; was a merchant in 1776; was appointed private secretary and aid-de-camp to Gen. Washington, and served in that capacity throughout the revolutionary war, with the rank of lieutenant-col. He was the bearer to congress of the news of the surrender of Cornwallis, and received a vote of thanks. His record, indorsed by Washington, is that of a brave soldier, who had been "in every action in which the army was concerned," and "a faithful assistant to him for nearly 5 years," a great part of which was gratuitous service.

TILIACEÆ, a natural order of exogenous plants, of which nearly 400 species are known, mostly trees and shrubs, with a few herbaceous plants. They are mostly natives of the tropics. A few are found in the temperate parts of the northern hemisphere. They have simple, alternate leaves, with stipules, and axillary flowers. The calyx is usually of four or five sepals; the corolla, of four or five petals. The corolla is sometimes wanting. The stamens are generally numerous, hypogynous, distinct; the outer ones sometimes abortive and petal-like. The ovary is composed of 2-10 carpels; there is one style, and the stigmas are equal in number to the carpels. As the characters somewhat correspond with those of *malvaceæ*, so do the properties of the order, which are generally mucilaginous and wholesome, the bark fibrous. Some yield a light and useful timber, as the lime (q.v.) or linden tree, a well-known European representative of the order, the halmalille (q.v.) of Ceylon, the *grewia elastica* of India, and the *tuehia divaricata* of Brazil. The bark of the lime-tree is valuable from its fibrous character; that of the species of *grewia* is used in the same way in India, and that of all the species of *apeiba* in South America. The most important fibrous plants of the order, however, are the species of *corchorus* (q.v.), which yield jute (q.v.).

TILL, a term employed, chiefly in Scotland, for the boulder clay (q.v.). See also **PLEISTOCENE**.

TILLAMOOK, a co. in n.w. Oregon, on the Pacific Ocean; about 1525 sq.m.; pop. '90, 2932, chiefly of American birth. The surface is mostly woodland. There is good pasture

land along the streams. Iron and coal are found. The principal productions are butter, wheat, oats, and live stock. Co. seat, Tillamook.

TILLANDSIA. See BROMELIACEÆ.

TILLEMONT, SEBASTIAN LE NAIN DE, the well-known ecclesiastical historian, was born at Paris, Nov. 30, 1637. His father was Jean le Nain, who held the office of *Maître des Requêtes*, the title, De Tillemont, by which the historian is commonly known, being derived from a small estate near Vincennes, which belonged to his family. He was educated at Port Royal, where he early imbibed those serious and rigorous views of the spiritual life which characterized the members of that celebrated society. His theological studies were marked from the first by a spirit of inquiry into the writings of the fathers; and he is said to have begun as a student those analyses of the works of the fathers, especially of the apostolic fathers, which form the staple of the early volumes of his history. Naturally of a timidly scrupulous disposition, he hesitated long about the choice of a profession; but after various changes of life, he at last received sub-deacon's orders in 1673, being then 35. He deferred his ordination as deacon till the end of 1673; nor was it till 1676 that he was ordained a priest, mainly at the persuasion of his friend, Le Maistre de Sacy, who had long been his spiritual adviser, and with whose attachment to the Jansenistic principles he sympathized at least to a certain extent. In 1679, Tillemont took up his residence at his family estate of Tillemont, where he resided till 1681. In that year he made a visit to Holland and the low countries, for the purpose of visiting Arnauld and the other Jansenist refugees. He was induced, in the following year, to undertake a parochial charge—that of St. Lambert; but he held it only for a short time.

During these years, he had steadily pursued the historical studies which he had commenced almost during his school-days; and he had now prepared the first portion of his long-projected work on the history of the church. He was induced, on the very eve of printing, to change the plan of the work. In order to avoid the opposition of the censor, to whom, as a theological work, it would have been necessary to submit it in its first form, and whose suspicions were aroused by the known association of Tillemont with the Jansenist party, Tillemont separated from the church history the history of the emperors, which he was enabled to print as a distinct work, without referring it to the censorship, under the title *Histoire des Empereurs* (6 vols. 4to, 1692). The success of this work disarmed the opposition of the church authorities. The hostile censor was replaced by a less exacting one; and eventually, in 1693, the first volume of the church history appeared under the title *Mémoires pour servir à l'Histoire Ecclésiastique des six Premiers Siècles* (16 vols. 4to). Neither of these works, however, was completed during the author's lifetime. Only 4 out of the 6 volumes of the *Emperors*, and 4 out of the 16 of the *Histoire Ecclésiastique*, were printed under his own care. The remaining volumes were completed by him, but did not appear till after his death. The *Emperors* comprises all the reigns from Augustus to Anastasius (518); the *Histoire Ecclésiastique* comes down to about the same period. The plan of both is very much the same, being in great part a compilation of the original writers, as far as possible in their own words, but arranged with great skill and judgment, and linked together by such explanations and such a chain of narrative (within brackets) as is necessary to render them intelligible, and to carry on the course of events in a connected recital. Both these works have maintained, even to this day, their reputation for learning and impartiality; and even in the acrimonious contest of the 17th c., there was but little impeachment of Tillemont's orthodoxy, so far as the histories are concerned. His other writings, left in manuscript, were for the most part used as materials by later compilers. Some of his letters have been appended to his *Life*, published by his friend Tronchet, canon of Laval (Cologne, 1711). Tillemont died at Paris, Jan. 10, 1698, having just entered upon his 61st year. The extent and accuracy of his erudition are still freely acknowledged, and his authorities have supplied the materials of most of the church histories compiled since his time.

TILLMAN, BENJAMIN RYAN, American politician, b. in 1847 in South Carolina, of which state he was governor from 1890 to 1894. He was then elected to the United States senate. As governor of S. C., his persevering efforts to enforce the state dispensary law, which gave to the state control over the sale of alcoholic liquors, attracted general attention. In 1896 he was conspicuous in the presidential campaign as a partisan of William J. Bryan.

TILLOTSON, JOHN, Archbishop of Canterbury, was the son of a clothier, and was born at Sowerby, in Yorkshire, in 1630. His father, Mr. Robert Tillotson, was a zealous puritan—a circumstance that is not a little curious, when we consider that the son ultimately turned out the most catholic churchman of his age. Tillotson studied at Clare Hall, Cambridge, where he took the degree of B.A. in 1650, and of M.A. in 1654. The writings of Chillingworth are said to have exercised a powerful influence on his mind during his university curriculum; but he owed not less to his friendly intercourse with Cudworth, More, Rust, Smith, Wilkins, and other eminent scholars. In 1656, he became private tutor in the house of Edmund Prideaux of Ford Abbey, Devonshire, attorney-general under the protector, but appears to have returned to London shortly before Cromwell's death. At what time Tillotson entered into orders, or who ordained him, is not known, but he was a preacher in 1661—attached apparently to the Presbyterian party in the church of England, for at the famous Savoy conference (q.v.) he was

present on the Presbyterian side; but he submitted at once to the act of uniformity (1662); and in December of that year, was offered the church of St. Mary Aldermanbury, London, of which Edmund Calamy had been deprived; but declined it. In 1663, he was appointed to the rectory of Keddington in Suffolk; but almost immediately after, was chosen preacher at Lincoln's Inn, where his mild, evangelical, but *undoctinal* morality was at first little relished. "Since Mr. Tillotson came," said the benchers, "Jesus Christ has not been preached among us." However, as the graces of his character gradually displayed themselves, his popularity increased, especially when it was found, that although not a puritan, he was nevertheless averse to atheism and popery. In 1664, he published a sermon *On the Wisdom of being Religious*; and in 1666, *The Rule of Faith*, in reply to a work by an English clergyman named Sargeant, who had gone over to the church of Rome. About the same period, he took the degree of D.D.; and in 1670, was made a prebend of Canterbury. Two years later, he was promoted to a deanery; and in 1680, published a somewhat notable sermon entitled *The Protestant Religion vindicated from the Charge of Singularity and Novelty*, in which he advanced the proposition, untenable by a Protestant, that "no man is at liberty to affront (i. e., to attack) the established religion of a nation, though it be false." This proposition he subsequently, on reflection, abandoned. Along with Burnet, he attended lord Russell during his imprisonment for complicity in the Rye-house plot; and on the accession of William III., rose high into favor. In 1689, he was appointed clerk of the closet to the king; and in April, 1691, was raised to the see of Canterbury, vacant by the deposition of Sancroft (q. v.), after vainly imploring William to spare him an honor which he foreboded would bring him no peace. Nor was he mistaken in his painful presentment. The non-juring party pursued him with unrelenting rage to the end of his life; but their animosity could not extract one murmur of complaint, or one vindictive retaliation from the meek, humane, and tolerant primate. He did not long enjoy his dignity, dying of palsy, Nov. 18, 1694, at the age of 65. A collected edition of his *Sermons* was published after his death by his chaplain, Dr. Barker; and has been frequently reprinted. They were translated into German by Mosheim; and were long highly popular on account of their clear, solid, and refined thought, their easy eloquence, and their humane and moral piety. Tillotson's life was written by Dr. T. Birch (Lond. 1752).

TILLY, JOHN TZERCLAES, Count of, one of the greatest captains of the 17th c., was born in 1559, at the château of Tilly in Brabant. A pupil of the Jesuits, his natural sternness of character inclined him to embrace their doctrinal ideas; and this bent of mind was fixed by the examples of Alba (q. v.) and Requesens, under whom he was initiated into the art of war in the Low Countries. After a term of distinguished service in Hungary against the Turks, he was appointed (1610) by duke Maximilian of Bavaria to reorganize his army, but resigned this post to take the command of the Catholic army at the outbreak of the Thirty Years' war (q. v.), and in conjunction with duke Maximilian gained (Nov. 8, 1620) the battle of Prague, which dissipated the ambitious dreams of the elector-palatine. During the course of this war, he separated, by able strategy, the armies of Mansfeld and of the markgraf of Baden, beat the latter at Wimpfen, expelled Christian of Brunswick from the Palatinate (1622), defeating him at Höchst (July 22, 1622) and at Stadtlohn (Aug. 1623); the latter conflict, which was of the most desperate character, lasting for three days. Created a count of the empire, he was next opposed to the king of Denmark, whom he conquered at Lutter (Aug. 17, 1626), and in conjunction with Wallenstein, compelled to sign the shameful treaty of Lübeck (1629). In the following year, he succeeded Wallenstein as commander-in-chief of the imperial forces, and took by storm the town of Magdeburg (May 10, 1631). The unheard-of atrocities which he allowed the Croats and Walloons of his army to perpetrate on this occasion have affixed to his otherwise high reputation a foul blot, ineffaceable by all the cosmetic arts of his numerous apologists. On May 14, he made a solemn entry into the ruined city, attended the celebration of a *Te Deum* in the cathedral, and then sent to the emperor a dispatch in which occurs this remarkable passage: "Since the capture of Troy, and the destruction of Jerusalem, a victory such as this has never been seen!" From this time, however, fortune deserted him; for his next opponent was the great Gustavus Adolphus, who completely routed him at Breitenfeld (Sept. 17, 1631); and though, in the following spring, he obtained some minor successes over the Swedish gen. Horn, the king speedily forced him to retreat behind the Lech in Bavaria, and (April 5) forced the passage of the river right in his front, after a desperate conflict in which Tilly was mortally wounded. He was removed to Ingolstadt, where he died, April 30, 1632. Tilly, the victor in 36 battles, was reckoned the best general of the time till his defeat by the Swedes; he was small in stature, and of a meager habit of body, with a stern and energetic cast of countenance. Sober and continent, a despiser of luxury and wealth, his zealous support of the Catholic party was entirely founded upon his ardent zeal for the supremacy of a religion which he regarded with more than monkish devotion.

TIL-SEED. See SESAMUM.

TILSIT, a t. of Prussia, in the province of East Prussia, on the left bank of the Memel or Niemen, 61 m. n.e. of Königsberg. Pop. '95, 28,217. It stands in a fruitful district, called the Tilsit Flat, has broad streets and a cleanly appearance. Its castle and town hall are the chief buildings. It carries on an active transit-trade with Russia,

besides considerable trade in timber, corn, butter, cheese, and Russian products, and has paper, sugar, and oil-mills. Tilsit will be ever memorable in history for the treaties which were there signed between France and Russia on July 7, and France and Prussia on July 9, 1807. By the former of these, Napoleon agreed to restore to the king of Prussia a great portion of his dominions, his Polish acquisitions being joined to Saxony (see POLAND), and his possessions west of the Elbe formed into the nucleus of the new kingdom of Westphalia; Dantzic was declared an independent city; the Prussian province of Bialystok was ceded to Russia; the dukes of Oldenburg and Mecklenburg, the czar's relatives, were reinstated by Napoleon, and in return, the Bonapartist kings of Naples and Holland were recognized by the czar, etc. By the latter, the king of Prussia recognized the kings of Holland, Naples, and Westphalia, and the Confederation of the Rhine, agreed to the cessions laid down in the Russian treaty, and to other minor alienations and concessions to Saxony, amounting in all to nearly one half of his dominions; and to the exclusion from his harbors of the commerce of Great Britain, and to the occupation of the Prussian fortresses by the French, till the payment of an enormous ransom. The weighty importance of the alterations effected by this treaty is, however, dwarfed before the startling magnitude of the *secret provisions* signed between France and Russia. By these were arranged the resignation of the empire of the east to Russia, Roumelia and Constantinople being specially excepted by Napoleon, and the acquisition of the Spanish peninsula by France; the two powers were to make common cause against Great Britain, and were to force the three courts of Stockholm, Copenhagen, and Lisbon to join them; and Napoleon agreed to increase no further the power of the duchy of Warsaw, and to do nothing which might lead to the re-establishment of the Polish monarchy. By a further agreement, not put formally into writing, the mouths of the Cattaro, the Ionian isles, Sicily, Malta, Egypt, and the papal dominions were to be taken by France; and Greece, Macedonia, Dalmatia, and the Adriatic coasts, on the partition of Turkey; while, on the other hand, Russia was to obtain the rest of Turkey, and was allowed to seize Finland. These secret articles are given on most excellent authority, and their correctness is further vouched for by the conduct of France and Russia for the next few years.

TILTON, JAMES, 1745-1822; b. Del.; educated at the Philadelphia medical school. As surgeon of a Delaware regiment he was at the battles of Long Island and White Plains; and he was hospital-surgeon, 1777-88, when he resumed practice, at Dover, Del. He was often a member of the legislature; sat in the continental congress, 1783-85; and was loan-commissioner, 1785-1801. In 1812 he became U. S. surgeon-gen. He published *Economical Observations on Military Hospitals* (1813).

TILTON, THEODORE, b. N. Y., 1835; educated at the N. Y. free academy; became connected with the N. Y. *Independent*, in 1856, and was its editor for many years. He was editor of the *Brooklyn Union*, 1871-2, when he founded the *Golden Age*, of which he was editor till 1874. In the latter year he sued Rev. H. W. Beecher, for alleged seduction of his wife, but the jury after a trial of six months disagreed. Among his works are: *The King's Ring* (1866); and *The Sexton's Tale* (1867), poems; and *Tempest Tossed*, a novel (1875). He lived in Europe after 1883. Mrs. Tilton died April 13, 1897.

TIMBER, in law. Timber on land belongs to the owner of the land. Where the land is leased the tenant may use the wood for the general purposes for which the land is hired, but may not cut it off to the damage of the land. When timber is still standing it goes with the premises, if sold. It may, however, be sold like any personal property, under an agreement to cut it and take it away. The law affords the same protection to owners of timber as of other property.

TIMBERS of a ship are the upright ribs, based on the keel, and rising to the gunwale, on which the planking is fastened. See SHIP-BUILDING.

TIMBREL (Spanish *tamburil*), a small musical instrument of the drum species, in use in ancient times, which was carried in the hand, and was apparently not unlike the modern tambourine (q.v.), with or without bells.

TIMBUCTOO, TOMBOCTO, or TIMBUKTU, a famous city of Sudan, occupies a position of the highest commercial importance on the great north-western bend of the Niger; lat. 16° 47' n., long. 3° 7' west. It stands only a few feet above the level of the Niger, and at a distance of about six m. from the principal branch of that river, is triangular in shape, is from 2½ to 3 m. in circumference, and at present without walls, though in former times it covered a much greater area, and was defended by walls. It is laid out mostly in straight, but partly in winding streets of hard sand and gravel, and having a sort of gutter in the middle. There are three chief squares. The houses are of clay—some low and unseemly, and others rising to two stories, and exhibiting considerable architectural adornment—and there are huts of matting, almost all in good repair. In the n. of the city is the mosque of Sankoré, an edifice of great grandeur, and which imparts an imposing character to the whole district in which it stands; and the other chief buildings are the "Great Mosque," an immense edifice of stately appearance, 286 ft. in length, by 212 ft. in width; and a few other mosques. The climate is not considered very healthy. Timbuctoo is not a manufacturing town, almost the whole life of the city being based upon foreign commerce, for which its situation renders it the

most favored center. Of the commerce, gold, which arrives at this place chiefly in the form of rings, is the staple. Salt, and the kola-nut, which is used in place of coffee (see *TEA*), are also largely imported and re-exported, as are also tobacco and dates. English manufactures, consisting of red cloth, sashes, looking-glasses, cutlery, and calico, arrive from the n. and north-west. It is a great center of Mohammedan learning, and contains a large library. It was founded about the year 1100 by the Tuaregs, and when it fell into the power of the ruler of the Mohammedan kingdom of Melli, in the 14th century, it became a great trading place. Toward the close of the 16th century it was conquered by the Moroccans, but in 1780, when the Tuareg kingdom of Haussa was founded on the northern bank of the Niger, T. became a part of the new empire. Later it was ruled over by both Fulba and Tuaregs, but in 1863 the former were driven out by the Sheik Ahmed el Bakhaï. In 1893, the French, after gaining possession of Segou and Massina, captured T. and incorporated it in their possessions. See Barth, *Travels in Central Africa* (1857), and Lenz, *Timbuctoo* (2nd ed. 1892). The regular pop. of Timbuctoo is estimated at 20,000.

TIME, in music, is used in three different senses: 1. The relative duration of musical sounds as measured by the rhythmical proportion of the different notes, a minim being half of a semibreve; a crotchet, half of a minim; a quaver, half of a crotchet, etc. 2. The division into measures or bars, and the division of each measure into equal parts, and subdivision of these parts; the different combinations of sounds into equal measures and values being said to form different kinds of time, each indicated by a distinct rhythmical signature. 3. The degree of movement—that is, the absolute, and not relative velocity, which is now more generally expressed by the Italian word *tempo*. For time in the first two senses, see RHYTHM; in the third sense, TEMPO.

TIME, RECKONING OF. See INTERNATIONAL DATE LINE.

TIME SIGNALS, established in many important cities of England and the United States for the purpose of transmitting standard time by the telegraph. The first use of the system was in 1852, by Mr. C. V. Walker, the English royal astronomer. There are now in the United States, observatories which perform this service, in Washington, Allegheny, Albany, Cincinnati; Chicago, Cambridge, and New Haven. The method now employed is known as the Jones system. In it the clock which furnishes the standard is placed in the same electrical current with those to be controlled. In the clock to be regulated is a helix, which alternately encircles two magnets attached to the pendulum, which are alternately attracted and repelled by the helix. In New York and Boston the time of exact noon is indicated by dropping a ball from the flag poles of conspicuous buildings by means of the electric current.

TIME, STANDARD. The confusion arising from the existence of so many different time standards had become so great, that in 1869, the question of having some standard time began to be agitated. Prof. Chas. F. Dowd was the first to take active measures to bring the question before railroad officials. In this country there were about 75 different standards in use on the railways, the difference between the Atlantic and Pacific coast being about four hours. The adoption of a single standard for the whole country was impossible, as in some places there would be a difference of at least two hours between the standard and local time. Four meridians, each one hour apart, were chosen as standard meridians. They are the 75th, which passes near Philadelphia; the 90th, passing near New Orleans and St. Louis; the 105th, passing near Denver, and the 120th, near Virginia city. By the adoption of the standard meridians, one hour apart, the minutes and seconds for all the different standards will be the same, so that a clock keeping the time of the 75th meridian will differ one hour from one keeping the time of the 90th, the minutes and seconds being relatively the same. Theoretically it was intended that each meridian should govern the belt $7\frac{1}{2}^{\circ}$ on each side of it; but there has been a slight variation from this. The local time of those places at the edge of the belt will differ from the standard by half an hour. The details of the system were worked up by W. F. Allen, sec. of the Railway Time Convention. In 1883, Nov., 90 per cent. of the railroads adopted the standard time, and not more than 5,000,000 people in the whole country were using local time. The time of the 75th meridian is called Eastern time, and that of the 90th, Central, the 105th, Mountain, and the 120th, Pacific time. The adoption of the standard made New York's time four minutes slower than previously. At the conference of the International Geodetic Assoc., held at Rome, 1883, the question of cosmopolitan time was discussed. The plan of establishing 24 meridians one hour apart has been suggested.

TIMOCLES, a comic poet of Athens, who flourished about 350–320 B.C. His works have not been preserved, but he was commended in antiquity for the purity and vigor of his style. His date classes him with the writers of the Middle Comedy.

TIMOCREON, a Greek poet, a native of Rhodes, and a contemporary of Themistocles, whom he attacked in his writings. His poetry was lyrical and remarkable for its combative and bitter tone. The dates of his birth and death are uncertain.

TIMO'LEON, a great Greek general, and the liberator of Sicily from the dominion of "tyrants," belonged to one of the noblest families of Corinth, and was born there about 394 B. C. Timoleon's brother, Timophanes, having made himself tyrant of his native city, Timoleon either killed him with his own hand, or caused him to be killed. Opinion

was divided in Corinth as to the merit of this deed, one party extolling it as an act of the noblest patriotism, while the other demanded Timoleon's death as a murderer. The difficulty was got over by appointing him leader of a small band of mercenaries sent (344 B.C.) to Syracuse, the exiled citizens of which had begged assistance from Corinth, the mother-city, against the "tyrant" Dionysius and the Carthaginians. Outwitting the Carthaginians, Timoleon arrived safely at Tauromenium, where he was welcomed by the Syracusan exiles. Hicetas, "tyrant" of Leontini, was then striving to dispossess Dionysius, and secure the tyranny of Syracuse for himself, and had succeeded in getting possession of the whole city except the island citadel. Timoleon, with only a fifth of the number defeated him at Adranum; and marching to Syracuse made himself master of two quarters of the city. From this time onward Timoleon's career in Sicily was one of complete victory over all opponents. Dionysius the younger (q.v.), in 343 B.C. surrendered in despair the citadel of Syracuse, and was sent to Corinth. Hicetas having failed in the attempt to assassinate Timoleon, called in the assistance of a Carthaginian force of 50,000 men, which, however, was shortly after withdrawn by Mago, who had become suspicious of treachery. Hicetas at last fled to Leontini, leaving Timoleon sole master of Syracuse. After repeopling the almost desolate city by recalling exiles, and inviting new colonists from Greece, Italy, and Sicily, he spent the next two years in enacting laws and organizing a constitution, which he put on a completely democratic footing. The Carthaginians, alarmed at the reviving power of Syracuse, and the prospect of union among the Sicilian Greeks, now sent an army of 80,000, under Hasdrubal and Hamilcar, to subdue the whole island. Timoleon, with only 12,000, encountered them (339 B.C.) on the Crimissus, and gained one of the greatest victories ever won by Greeks over barbarians. He now proceeded with his great project of expelling the tyrants of the other Greek cities, who, however, again called in the aid of the Carthaginians; but the successes of Timoleon soon made the Carthaginians glad to conclude a treaty, fixing the river Halycus as the boundary between their dominions and those of the Greeks. Hicetas, tyrant of Leontini, being now captured, was put to death with his wife and daughters; and shortly after Mamercus of Catana suffered the same fate. Timoleon thus in about six years freed Sicily from nearly all its tyrants, and conferred upon the cities free constitutions, himself all the time taking no advantage of the immense influence which he thus obtained. After his great work was accomplished he lived among the Syracusans as a private citizen, receiving from them and from all the Greek world the greatest honor and respect: his advice was had recourse to by all the Sicilian cities in any emergency. He died in 337 or 335 B.C., having been blind for a considerable time previously, and was buried in the market-place of Syracuse, where a gymnasium, called the Timoleonteum, was afterward erected over his tomb. Timoleon was undoubtedly one of the greatest generals and noblest characters produced by Greece; he appears to have been thoroughly unselfish, and to have set before him as his great aim the abolition of tyranny, and the establishment of freedom.

TIMON THE MISANTHROPE was a native of Athens, and lived in the time of the Peloponnesian war (431-404 B.C.). The little that is known concerning him is learned chiefly from Aristophanes and the other comic writers who attacked him. Disgusted with mankind, on account of the ingratitude of his early friends and companions, he lived a life of almost total seclusion from society, his only visitor being the "bold and insolent" Alcibiades. Numerous stories were current in antiquity regarding his eccentricities, one of which is, that he died because he would not allow a surgeon to visit him to set a limb. His grave, which was on the sea-shore, is said to have been planted with thorns, and to have been rendered inaccessible by the sea forming it into a small island.

We know him out of Shakespeare's art,
And those fine curses which he spoke—
The old Timon with his noble heart,
That strongly loathing, greatly broke.

—TENNYSON.

"The Timon of Plutarch and of the popular stories of Shakespeare's time was little different from the ordinary cynic. The Timon of Shakespeare is essentially high-minded and generous, his all-absorbing defect—the root of those generous vices which wear the garb of virtue—being the entire want of discrimination. If Timon had possessed one friend with whom he could have exchanged confidence upon equal terms, he would have been saved from his fall, and certainly from his misanthropy."—See Introductory Remarks to *Timon*, in Knight's Shakespeare.

This Timon must be distinguished from the Greek poet and philosopher of the same name, who lived about a century and a half later.

TIMOR, the most important of the chain of islands which stretch eastward from Java, lies in 8° 30' to 10° 20' s. lat. and 124° to 127° 30' e. long., has an area of 12,000 sq. m., and pop. of 500,000-600,000. A chain of wood-clad mountains runs throughout its entire length; Alas, on the s.e., being 11,500 ft. in height; Lakaan, in 9° 10' s. lat., 6,175 ft.; and Miomaffo, 4,630. The prevailing rocks are of the graywacke formation, which, at the s. base of Miomaffo, is cut by serpentine mountains of limestone; and calcareous rocks resembling ruins frequently occur. Magnetic iron, porphyry, syenite, gold, copper, malachite (containing 22 per cent. of pure copper), sulphur, and naphtha are found.

The dry monsoon is from May to November, during which no rain falls. From November to April there are daily storms of rain and wind from the n.w.; the streams are swollen; the thermometer rises to 94° F. in the shade; the earth is covered with a dark-green carpet, and myriads of insects come into life. The rivers are numerous, but small, and most of them yield gold. Near the sea are very fertile lands, on which are grown rice, maize, beans, tobacco, sugar-cane, cotton, potatoes, and all sorts of tropical fruits. There are many varieties of the palm, the lontar being useful for food and other purposes. Timber trees suited for masts attain a height of 100 ft., and from 3 to 4 in diameter; the wild nutmeg, cinnamon, and tamarind are plentiful; and bamboos make the forests impenetrable in many parts. About 600 species of plants are known, a great number being medicinal, and few poisonous. Indigo grows everywhere, and potatoes in the mountains.

Three-fourths of Timor on the s.w. is subject to the Dutch, whose chief settlement is Koepang (Kūpang); the remaining part in the n.e. belongs to the Portuguese, who have a town called Dilley, on the n. coast, with a safe roadstead, and a fort, which was nearly destroyed by an earthquake in 1857. Timor is divided into small kingdoms, ruled by rajahs under Dutch or Portuguese control.

Koepang lies at the base of a semicircle of wooded hills, on a beautiful bay in the south-west. It is irregularly built, the principal buildings being the governor's house and the Protestant church. There is a Mohammedan and a Chinese temple, one Dutch and two Malay schools. Whalers and trading-ships from Sydney, Van Diemen's Land, etc., call for provisions on their way to or from Java and Singapore; and Timor will be a convenient market for horses and supplies to the settlements in North Australia, which is only eight days' sailing distant.

The exports are—sandal-wood, horses, wax, tortoise-shell, edible nests, etc.; imports—cotton, woolen, and silk fabrics, provisions, and general supplies. Pearls are found on a bank 30 m. s.e. from Koepang. The natives are partly Oceanian negroes, and partly of Malay race. They worship a supreme being called "Lord of the sun." Near the Netherlands' settlements, some hundreds have been baptized, but missionary efforts have not been very successful. The fathers dispose of their daughters for gold and buffaloes, and polygamy prevails among the rich.

Koepang is the capital of the Netherlands' residency or government of Timor, which includes Samao, Rotti, Savu, the Sandal-wood island, Sumbawa, Flores, Adanara, Solor, Lomblem, Ombay, and all the small islands belonging to the chain.

TIMOR-LAUT, THE, or **TENIMBER ISLANDS**, lie e. from Timor, in 7° 10'–8° 30' s. lat., and 131°–131° 40' e. long., having an area of 2120 sq. m. Pop. 20,000. By far the largest island of the group is Timor-Laut, which is 78 m. in length, and 21 in breadth. The soil is rich, and covered with the most luxuriant vegetation, various palms and other useful trees growing in great abundance. At a little distance from the shore, mountains encircle the island.

The next in importance is Larat, the n.w. point of which is in 7° 6' s. lat., and 131° 47' e. long. Area, 147 sq. m. It is also mountainous. Further n. are Vorhate, Marū, and Molo. On the w. of Timor-Laut are Selū and Sejah; a multitude of smaller islands of coral formation being scattered around.

On the larger islands are small horned cattle, goats, swine, fowls, and a great variety of birds. Nothing can exceed the beauty of the blue-streaked lory (*eos reticulata*) and citron crested cockatoo (*cacatua citrino-cristatus*). Fish are plentiful in the rivers of the Timor-Laut and surrounding seas, and there is a considerable export trade in tortoise-shell and béche-de-mer (q. v.). English trading-ships from Singapore, and south-sea whalers, sometimes visit these islands, and not unfrequently have been treacherously attacked. The natives are tall, well made, fairer complexioned, and have more regular features than the Alfours. They are low in the scale of civilization.

TIMOTHY, a Christian disciple of Greek and Jewish parentage, well instructed in the Scriptures, and becoming, at Derbe, Paul's companion and helper in his missionary work. The apostle esteemed him "as a son with his father." In many of the epistles Timothy's name is joined in salutation with Paul's; he shared even imprisonment with the apostle, and was anxiously looked for by him when, having finished his course, he was ready to be offered. He is commonly spoken of in ecclesiastical history as the bishop of Ephesus; in the New Testament he appears as an apostolic vicar in the church in that city.

TIMOTHY, FIRST AND SECOND EPISTLES TO, form, along with the epistle to Titus (q. v.), the three "pastoral epistles," the authorship of which is all but universally ascribed to St Paul. The external evidence for their genuineness is very strong, yet not complete. They occur in the Muratorian canon and the Peshito version as writings of St. Paul; Eusebius classes them among the *homologoumena*; while still earlier, Irenæus, Tertullian, and others of the fathers quote them as authoritative. On the other hand, Tatian (q. v.), one of the earliest of the fathers, denies their genuineness, as did also Marcion, Basilides, and most of the Gnostic teachers. Origen speaks of some who rejected 2d Timothy on account of the mention of "Jannes and Jambres," two apocryphal characters; while in modern times, Schleiermacher and Neander admit the Pauline origin of 2d Timothy, and

endeavor to disprove the genuineness of the 1st. Eichhorn, De Wette, Baur, and others go further, and seek to demonstrate the spuriousness of the whole three pastoral epistles. They consider the language and mode of thought quite distinct from the Pauline, and they (particularly Eichhorn) find no period in the apostle's life to which they could be properly fitted in. Their arguments have largely influenced the conclusions of very many scholars in this field. The purpose and scope of the epistles to Timothy are so well known, that an analysis, however slight, is almost superfluous. They consist of a series of warnings, exhortations, advices, and predictions.—See the "Introductions" of Alford, Wordsworth, Davidson, Wiesinger, Hug; and the list of commentators on the "Pastoral Epistles," appended to the article on the epistle to Titus. The general design of the First Epistle to Timothy is to instruct Timothy in the duties intrusted to him, and to guide the churches through him. Besides the introduction and conclusion it consists of three parts: The 1st sets forth Timothy's general duties, and gives him a special charge concerning false teachers who sought to bring Christian believers again under the yoke of the law. The 2d contains instructions concerning divine worship, the qualifications to be required in ministers and deacons, and the conduct to be exhibited by Timothy himself. The 3d condemns vices which were common at Ephesus. The design of the Second epistle is chiefly to utter a final warning against the errors and delusions which were making progress in the churches. It exhorts Timothy to maintain zealously sound doctrine, to be patient under trials, careful concerning his own conduct, and diligent in his endeavor to resist the efforts of false teachers. It closes with announcing the apostle's belief that his martyrdom was near and urging Timothy to come quickly to him.

TIMOTHY GRASS, the name commonly given to *phleum pratense*, a grass much valued for feeding cattle. It first received the name timothy grass in America, from the name of a person who did much to promote its cultivation there. Along with the other species of the genus, it often receives also the English name of CAT'S-TAIL GRASS. The genus *phleum* is distinguished by a panicle so compact as to resemble a close spike, single-flowered spikelets, with two nearly equal acuminate or almost awned glumes, two awnless paleæ, and the seed free. The species are mostly natives of Europe; a number of them are British, but the timothy grass alone is of any economical value. It varies very much in size according to soil and situation, succeeding best in moist rich soils. It is very extensively cultivated both in Britain and in America. It has strong culms, attaining a height of 4 to 5 ft., but is tender and nutritious, and much relished by cattle. It is perennial, but springs up rapidly, even in the year in which it is sown. Its spike-like panicle, from the form of which the name cat's tail has been given, is cylindrical, and often of several inches in length. The seed is very small.—*Phleum nodosum* is a very similar species, perhaps a mere variety, with the lower part of the culm prostrate and swollen into knots or bulbs; the spike much smaller than in *P. pratense*. It is a very inferior grass, and is found only on dry soils.

TIMBOD, HENRY, 1829-67; b. Charleston, S. C.; educated at the Georgia university. He practiced law and was a teacher for several years, during which he contributed verse to southern papers and magazines. He was editor of the *South Carolinian* (Columbia) from Jan., 1864, to the time of the burning of the city in the civil war. Two editions of his collected poems have been published; the last, 1873, accompanied by a *Memoir* written by Paul H. Hayne.

TIMUQUANS, an extinct tribe of Indians, a part of the Choctaw family, which inhabited the coast of Florida, near St. Augustine. Missionaries were sent to them by the Franciscans as early as 1592, and continued their labors among them until Carolina and Georgia made war upon the tribe, almost annihilating them, the few who survived joining other tribes. A catechism, grammar, and church manual, in their language, was printed in Mexico about 1612, written by father Francisco Parejo. They were generally a peaceful tribe, and became somewhat civilized.

TIMUR, called also TIMUR-BEG and TIMUR-LENG, from his lameness, and vulgarly known among western writers as TAMERLANE, was the second of the great conquerors whom Central Asia sent forth in the middle ages, and was b. at Sebz, 40 m. from Samarkand, April 8, 1336. His biographers make him the fifth in descent from Karatchâr Nuyan, the relative and counselor of Genghis Khan (q.v.), and the ninth from Tûmna Khan, the direct ancestor in the male line of his renowned predecessor. The royal line of Jagatai (see TURKISTAN) had so utterly degenerated that the real power was in the hands of a number of independent chiefs of Mongol blood, each of whom, choosing a prominent city of the kingdom, there set up his standard and lorded it over the surrounding district. One of these chiefs, Hadji Berlas, the uncle of Timur, had established himself at Kesh, and here the future conqueror passed the first 24 years of his life in peaceful obscurity, devoting himself to the national amusements of hunting and equestrianism. But a formidable inroad (1360) of the Kalmucks of Jettah, who speedily subjugated Turkistan, expelling those chiefs who refused submission, effectually called forth Timur's hitherto untried energies. Declining to accompany his uncle in his flight, he boldly advanced with a small retinue to meet the invader, who was so charmed with his eloquence and address that he at once confirmed him in the government of Kesh, and

appointed him one of the principal ministers of his son, the new monarch of Turkistan. But neither chiefs nor people of the conquered country could long endure the tyranny of a race more cruel and barbarous than themselves, and the exiles and fugitives having been collected by the Ameir Husseyne, and joined by a powerful force under Timur, the Kalmucks were ultimately expelled in 1365, and Turkistan divided between its two liberators, who ruled together in the utmost harmony for some time; but war having arisen between them, Husseyne was defeated and slain, and Timur, by unanimous consent of the chiefs, was hailed as supreme lord of Turkistan. It was in the war with the Kalmucks that Timur received the wound in the thigh which rendered him lame for the rest of his life. He did not, however, either then or afterward, assume the rank of a sovereign, but elevating one of the royal race to the throne, reserved for himself the real authority and the title of *emir*. Having thus, in the space of ten years, risen, by dint of superior ability, to absolute authority over a numerous and warlike people, he proceeded to avenge his nation's wrongs on the Kalmucks of Jettah and Mogulistan; then turned westward to punish the predatory tribes of Khaurezm, who had plundered Bokhara; and spent the interval between these campaigns in supporting Toktemesh Khan, one of the claimants to the throne of Keptchak, ultimately (1376) placing him in undisputed possession. With the view of restoring its former limits to the empire of Jagatai, he summoned the prince of Herat and the other chiefs of Northern Khorassan to attend a "kouriltai;" and on their refusal, immediately attacked and reduced them to submission, levying a moderate contribution as a penalty. But soon after (1383) the people of Herat again rebelled, murdered the envoys whom he sent to remonstrate; and 2,000 of the garrison, built up with an alternate layer of brick and mortar into the form of a pyramid, were left by Timur as a horribly singular and effective reminder of the consequences of rebellion. Seistan was next reduced, the Afghans of Suliman Koh chastized, and Timur returned, as was his wont, to spend the winter in the bosom of his family, at one or other of his numerous palaces near Samarkand. In the following year he commenced his career of aggression by the invasion of Mazanderan; and by the close of 1387 the whole of the districts west of the Tigris, from Tiflis to Shiraz, were subdued; those chiefs who voluntarily submitted being mostly confirmed in their governments, while the inhabitants of Ispahan—who, after a pretended submission, suddenly rose upon the Tartar garrison and massacred 3,000 of them—were almost completely exterminated. Meanwhile, Toktemesh Khan, of Keptchak, took advantage of his absence to invade Timur's territories on the Amu-Daria; on which Timur returned home, and, after driving the invaders out, pursued them to the head of the Tobol, then west across the Ural mountains and river, and though long baffled by the Arab tactics of his opponents, finally brought them to bay on the banks of the Bielaya (a tributary of the Kama), June 18, 1391, and almost wholly annihilated them. Resuming in 1392 his conquering march westward, he crossed the Tigris, subdued the numerous and warlike principalities to the east of the Euphrates, then advanced northward, through the gates of Derbend, to the Volga, and again routed Toktemesh (who had ventured to resume hostilities) on the banks of the Terek (1395), turned west as far as the Dnieper, and then north to Moscow, returning by Astrakhan and the Caucasus, leaving death and desolation in his track. In 1398 Timur campaigned in Hindustan, entering by the passes of the Hindu Koh, near Cabul, and routing *seriatim* the numerous armies collected to oppose him, till the number of prisoners became so great, that four days before the great battle before Delhi between Timur and the Indian emperor, the former, as a precautionary measure, ordered the murder, in cold blood, of all the males (said to be 100,000 in number), and then, after totally routing his opponents, took the capital. After a further advance to the Ganges, and more military successes, Timur retraced his steps to Samarkand, where the immense spoils of the expedition were expended in the adornment of the capital. Timur returned to Western Asia in the following year, and attacked the Egyptian empire in Syria, to avenge the murder of his ambassador, and the aid which the Mamaluke sultan had given to his enemies. Timur was as usual completely successful in the field; and the capture of Aleppo, Hama, Hems, Baalbek, and Damascus, equally proved his skill in the attack of fortified places. His mode of attack was to undermine the fortifications on all sides, then to fire the mines with wood steeped in naphtha, and on the destruction of the walls and battlements, which uniformly resulted, to charge in overwhelming force through the breaches. Similar conduct to that of the Mamluk sultan on the part of sultan Bajazet I., drew from Timur repeated remonstrances, which the other, in the overweening confidence springing from uninterrupted success, treated with contempt and answered with insult; but the advance of the Tartars to his frontiers soon opened his eyes to the greatness of his error, and with a powerful army he hastened to oppose them. The two hosts met at Angora (July 20, 1402), and after a long and obstinate contest, in which, although the generalship of Bajazet and the steadiness of 20,000 Servian auxiliaries long balanced the superiority of Timur's troops, the Turks were totally routed, and Bajazet captured. The conquest of the whole of Asia Minor speedily followed; the Byzantine emperor did submission to the victor, as did also the Turkish ruler of Thrace; and the knights of St. John were expelled from Smyrna. The unfortunate Bajazet died after a few months' captivity, though uniformly treated with the greatest consideration; and about the same time Timur commenced his return—receiving on the way a most satisfactory embassy from the Egyptian sultan,

who was now glad to come to terms—conquering Georgia, where he passed the winter, and resuming his march in the following year by Merv and Balkh, reached Samarkand in 1404. Here he resumed preparations for the long projected invasion of China, continued the embellishment of the capital, and celebrated his great successes by the most gorgeous festivities. All things being now ready, he started with a large army for the Sihun, marched down that river to Otrar, where, being detained by the severity of the weather, he was attacked by an ague-fever, and died after a week's illness, *R. b.* 17, 1405. Timur holds a high position as a mere conqueror: his antagonists were mostly warlike and disciplined, and seldom much inferior in number; yet, from the savage horsemen of the Siberian steppes to the mail-clad warriors of Servia, all were alike forced to bow before the invincible prowess of the Mongol conqueror. The charge of cruelty brought against him is completely established by the massacre in India, but opposite to this might be placed numerous instances of a lenity and forgiveness almost incredible in a "barbarian." He did much to promote the arts and sciences throughout his dominions, but the speedy dissolution of his empire deprived his labors of any permanent utility. The principal authority for the life of Timur is Sherif-ed-Din-Ali's *History* (in Persian), translated into French by Pétis de la Croix, under the title of *Histoire de Timur-Bec, connu sur le nom du grand Tamerlan* (4 vols., Par. 1723). Several writings exist in Persian, attributed to Timur, but are of doubtful authenticity. Among these are the *Institutions* (with an English translation and a valuable index, Oxford, 1783); and the *Commentaries* of Timur, translated from a MS. of Maj. Davy by Maj. Stewart, late professor of oriental languages in the East India company's college. See also a translation of the narrative of Clavijo, envoy of Henry III. of Castile to Timur, by C. R. Markham (Hakluyt society, 1860).

TIN (symb. Sn, atomic weight 118,* spec. grav. 7.29) is a beautiful silvery-white metal, with a tinge of yellow, and a high metallic luster. It possesses a crystallized texture, and may be obtained in well-formed crystals of the pyramidal or tetragonal system; and it is in consequence of this crystalline texture that a bar of tin, when bent, emits a creaking sound, termed the *cry* of tin (the *Zinngeschrei*, or tin-shriek of the Germans). Tin is a soft metal—being softer than gold—and is very malleable, and can be beaten out into very thin laminæ, in which form it is known as tin-foil. At a temperature of about 212° F. (100° C.) its ductility is considerable, but by no means remarkable, and it may then be easily drawn into wire, the tenacity of which is only moderate, as a wire with a diameter of 0.17 of an inch is broken by a weight of about 50 pounds. It is a tolerably good conductor both of heat and electricity, and when handled communicates a peculiar odor to the skin. It melts at a temperature of 455° F. (235° C.); and at a higher temperature, if air be present, it becomes converted into the binoxide, and burns with a brilliant white light. At ordinary temperatures it is very slightly acted on by exposure to the air or to moisture. With regard to the action of the ordinary acids on this metal, Prof. Miller observes that "nitric acid of specific gravity 1.3 acts upon it violently, and produces an insoluble hydrated binoxide, known as metastannic acid; at the same time, owing to the decomposition of water, a considerable quantity of ammonia is formed, which enters into combination with the excess of acid. Strong hydrochloric acid, when heated upon tin, dissolves it gradually, with evolution of hydrogen. Aqua regia, if not too concentrated, dissolves the metal, and converts it into tetrachloride. Dilute sulphuric acid is without action on the metal in the cold; but if the concentrated acid be boiled upon it, the tin becomes converted into sulphate, while sulphurous acid escapes. The hydrates of potash and soda act upon tin at high temperatures, hydrogen being evolved, while a soluble metastannate of the alkali is formed."—*Inorganic Chemistry*, 2d ed., p. 588.

There are two oxides of tin—viz., the protoxide, SnO, and the binoxide, SnO₂.

Protoxide of Tin, or stannous oxide, SnO, is obtained as a white hydrate, 2SnO.H₂O, by precipitating a solution of the protochloride of tin with an excess of carbonate of soda. The protoxide acts as a base, forming salts which are colorless, redden litmus, and are for the most part soluble in water, from which crystalline tin is deposited on an inserted mass of zinc, constituting the so-called *tin tree*. None of these salts are of any special importance. *Binoxide of tin*, or stannic oxide, SnO₂, occurs native as cassiterite or tinstone, crystallizing in square prisms, which are sufficiently hard to scratch glass, and generally of a brown color, from the presence of peroxide of iron or of manganese. In its artificially-prepared hydrated condition, it has the character of an acid, and according to its different modes of preparation, forms two remarkable varieties, known as stannic and metastannic acids. *Metastannic acid* is prepared by the action of strong nitric acid on tin, and occurs as a white, crystalline, insoluble mass, which, when dried in air, consists of H₁₀Sn₆O₁₅.5H₂O, but when dried at 212° F. (100° C.), loses five molecules of water, and consists of H₁₀Sn₆O₁₅. By ignition, it becomes anhydrous, and of a pale straw color. In this form (in which it resembles the native binoxide in its properties), it is known in commerce as *putty-powder*, and is employed for polishing plate, and for giving whiteness and opacity to enamels. In the hydrated state, it is insoluble in hydro-

* The atomic weights (and corresponding notation) adopted in this article are those of the unitary system (H=1, O=16, S=32, C=12) instead of the older dualistic system (O=8, S=16, C=6). See art. CHEMISTRY.

chloric or nitric acids, but is freely soluble in solution of potash or soda, forming salts which are not crystalline, but may be obtained in a granular form. Metastannic acid, in its hydrate state, may be recognized by the beautiful golden yellow metastannate of tin, which is formed when it is moistened with protochloride of tin. *Stannic acid*, $\text{SnO}_2 \cdot 2\text{H}_2\text{O}$, is procured by the addition of carbonate of lime or of baryta to a solution of tetrachloride of tin, when it falls as a gelatinous precipitate. Unlike metastannic acid, it is readily soluble in nitric and hydrochloric acids; and at a temperature of 284°F . (140°C .) it is converted into metastannic acid. In combination with the alkalies, it forms stannates, which crystallize readily, and whose formula is MO_2SnO_2 . The stannate of soda, Na_2SnO_3 , is largely used as a mordant by the dyer.

There are two chlorides of tin—viz., a protochloride and a tetrachloride. The *protochloride of tin*, or stannous chloride, SnCl_2 , may be obtained in a hydrated form by dissolving the metal in hydrochloric acid, and evaporating the solution, when the salt crystallizes in prismatic needles, having the composition $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$. The hydrated protochloride is extensively used as a mordant, and for deoxidizing indigo and the peroxides of iron and manganese, by the dyer and calico-printer; and in consequence of its deoxidizing or reducing powers, it is sometimes employed in analytical chemistry, especially in the determination of the quantity of mercury, since all the mercurial salts, when boiled with it, are decomposed, and yield their mercury in the metallic form. *Tetrachloride of tin*, or stannic chloride, SnCl_4 , forms numerous double salts with the soluble chlorides; the compound of this nature which it forms with chloride of ammonium is represented by the formula $2\text{NH}_4\text{Cl} \cdot \text{SnCl}_4$, and is employed by the dyer under the technical term of *pink salt*. An impure tetrachloride, prepared by dissolving tin at a gentle heat in a mixture of nitric acid and sal-ammoniac, and known in the trade as *nitromuriate of tin*, or *composition*, is also largely used by dyers and calico-printers.

The sulphides of tin are three in number—viz., the protosulphide, the sesquisulphide, and the bisulphide. The *bisulphide of tin* SnS_2 , may be obtained in the hydrated state, in the form of a dingy yellow precipitate, by passing sulphureted hydrogen through a solution of a persalt of tin. In the dry way, it is procured in the form known as *Mosaic gold*, which is insoluble in any acid, though soluble in aqua regia; and is employed in the arts to give an appearance of bronze to the surface of metals.

Tin forms two sets of salts—the protosalts and the persalts, of which the protochloride and tetrachloride of tin may be taken as good examples. The *protosalts* (stannous salts) yield a very characteristic reaction with sulphureted hydrogen, a chocolate-colored precipitate of hydrated protosulphide of tin being thrown down; moreover, with a dilute solution of chloride of gold, they give either a beautiful purple precipitate, known as the *purple of Cassius*, or a brown precipitate of reduced gold, according to the quantity of the test that is used. The *persalts* (stannic salts) yield a dirty yellow precipitate of hydrated bisulphide of tin; while all the compounds of tin, when exposed on charcoal to the reducing flame of the blowpipe, give a white malleable globule of the metal.

Reduction and Manufacture.—Tin must have been one of the metals earliest known, as it enters into the composition of bronze (q.v.), of which the most ancient metallic weapons and tools were made. Tin and oysters were the products for which Great Britain was earliest famous. This general statement of facts is particularly noticeable. Tin is still largely obtained in Cornwall; and from that locality the Phœnician navigators took it to Tyre and Sidon. To this day England is one of the greatest tin-producing countries, having produced in 1894 18,461 metric tons of tin, and in 1895, 6755 metric tons. Bohemia and Saxony have some tin mines, and so also have Spain and Portugal. Tin has long been obtained from Malacca, in the Malayan peninsula, and from some of the neighboring islands. Australia, among her other mineral riches, produces tin, and it is found in the Black Hills of Dakota.

There was no tin produced in the United States in 1896, and there was very little done in prospecting for the metal. There was a little systematic work done in that direction in South Dakota, while the California mines and those of Virginia remained idle. New discoveries of tin ore were reported in 1896 in Lemhi Co., Idaho, and Garfield Co., Utah, but they are presumably of little consequence. In the tin producing countries 1896 was generally an unfortunate year. Malacca, Banca, and Billiton made a slight increase in production. Bolivia which has been coming to the front rapidly in recent years fell off a little, while in Australia, Tasmania and Cornwall there was considerable decrease. One reason for this, without doubt, is found in the low price ruling for the metal. South Africa is now a small producer of tin ore, it having been discovered there in 1893. In that year there were exported 30 tons of ore, in 1894, 141 tons, and in 1895, 246 tons. Mexico produces a small amount of tin, but only sufficient to meet domestic requirements, and there are no accurate statistics of the output. The world's production of tin during 1895 was 83,357 metric tons, of which Australia produced 2235 tons, Austria, 60 tons, Banca and Billiton, 10,932 tons, Bolivia, 4166 tons, England, 6755 tons, Germany, 884 tons, India, 22 tons, Mexico, 30 tons, Singkeep, 654 tons, Straits Settlements, 53,354 tons, and Tasmania, 4262 tons.

There is but one ore of tin of any importance—viz., the binoxide, or stannic oxide, SnO_2 , which in its pure state consists of tin 78, and oxygen 22. It is called *tinstone* or *cassiterite*. Tin ore has nothing remarkable in its appearance; it is of various colors—as gray, various shades of yellow, and red and black. Its specific gravity—a notable

feature—is 6.9; and it strikes fire with steel. In Cornwall the tin ore occurs in mineral veins running through granite and slate rocks, or disseminated in crystals through their mass. The tinstone obtained from the veins or lodes is called *mine-tin*; and that procured by washing alluvial deposits is called *stream-tin*—the latter is the result of the disintegration of granite and other rocks which contained veins of tin. Washed Cornish tin ore, usually called “black tin,” produces on an average about 67 per cent of metallic or “white” tin. Tin pyrites, or sulphide of tin, is found in some of the Cornish mines, but it is of little importance commercially. It may also be stated that ores containing copper are sometimes found with so large a proportion of tin that it is difficult to say whether they should be regarded as tin or copper ores.

The dressing of tin ore obtained from the mine is a difficult and delicate operation. It is so much dispersed through the gangue, that it requires to be stamped to a very fine powder by apparatus described under METALLURGY, before the metallic particles can be effectually separated. So small, comparatively, is the valuable portion of the ore, that at Huel Kitty mine, St. Agnes, not more than 84 lbs. of oxide of tin is obtained from a ton of the material brought to the surface; and in some mines the proportion of oxide to the rest of the material is not so much as 10 lbs. to the ton.

The stamped ore is copiously supplied with water passed through a grating adjoining the stamps, and conveyed into a channel where there are two pits. The purer and heavier portion falls into the first, and is called the *crop*; the remainder, called the *leavings*, passes through the first, and is retained in the second pit. Repeated washings are now necessary to separate as thoroughly as possible the impurities from the ore, and for this purpose a machine called a *buddle* is largely employed. Various kinds of apparatus are, however, used, but they are similar in principle to the jigging sieve and sleeping table described under METALLURGY. We may notice here that a new form of buddle, known as “Borlase’s buddle,” has been recently introduced for dressing tin ores, by which a saving of about 30 per cent is said to be effected. Fig. 1 shows this machine. The ore and earthy matters, in the state of a thick mud, are conveyed by square pipes or channels to the circumference *a, a*, around which, by the aid of water, the metallic portion separates, while the lighter stony impurities flow toward the center, and are carried away. There are brushes at *b, b*, for agitating the ore during the operation. In the older form of buddle, this action is reversed, and the machine, instead of being depressed, is raised in the center.

The tin ore thus far purified has next to be deprived of its sulphur and arsenic; this is done in a reverberatory furnace (q.v.), the flues of which are connected with large condensing chambers, in which the arsenic is deposited in a crystalline form (see ARSENIC), and is afterward resublimed, to form the white arsenic of commerce. The sulphur which is present in the state of sulphide of iron is decomposed by the heat into sulphurous acid gas, and the remaining oxide of iron is removed by a subsequent

FIG. 1.

washing. Sulphide of copper, when present, is converted by roasting, and afterward exposing it to the air, into sulphate of copper, and is then easily dissolved out by lixiviation.

After this final washing the ore is ready for smelting in a reverberatory furnace. The charge consists of from 20 to 25 cwts. of ore mixed with one-sixth of its weight of powdered anthracite or charcoal, and a small quantity of lime or fluor-spar, to serve as a flux for the siliceous impurities. Before being put into the furnace, the mixture is moistened with water, to prevent the finely-powdered ore being carried away by the draught. When the charge is placed on the hearth of the furnace, the doors are closed, and the heat gradually raised for about six hours; the oxide is then reduced by the carbon of the coal. At this stage the furnace-door is opened, and the mass worked with a

paddle, to separate the slag, which is raked off, and the richer portion of it melted over again. The reduced tin subsides to the bottom, and is run off into a cast-iron pan, from which it is ladled into molds, to produce blocks or ingots of a convenient size.

The tin has still to be purified, first by a process of *liquation*, and afterward by that of *boiling*. "Liquation" consists in moderately heating the blocks in a reverberatory furnace till the tin, owing to its comparatively easy fusibility, melts and flows into the refining basin, leaving on the hearth of the furnace a residuary alloy of tin with iron and other metals. More blocks are added and heated in the same way, till the refining-basin contains about five tons. The tin is then ready for "boiling." In this operation billets of green wood are plunged into the melted metal, the disengagement of gas from which produces a constant ebullition, and so causes a scum (chiefly oxide of tin) to rise to the surface, which is then easily removed; at the same time, impure and dense parts fall to the bottom. When the agitation has gone on long enough, the bath is allowed to settle and cool. The tin then separates into zones—the upper consisting of the purest portion; the middle being slightly mixed with other metals; and the lower so much so that it requires to go through the refining process again. The residuary alloy of the liquation process has also its tin extracted and refined again.

In former times in Cornwall tin was smelted in a blast furnace (q.v.) instead of a reverberatory one; and this is still the case on the continent. By this method a pure tin is obtained, but the loss of metal in the process is greater. It suits best where coal is scarce and wood abundant.

Tin ores which contain the mineral wolfram (tungstate of iron and manganese) are treated by a special process, patented by Mr. R. Oxland, of Plymouth. This mineral and tin ore are so nearly the same in specific gravity, that no mechanical process of washing will separate them. Mr. Oxland's process consists in roasting the dressed tin ore with sulphate of soda, for the purpose of converting the insoluble tungstate of iron and manganese into the soluble tungstate of soda, which is easily removed by lixiviation. The oxides of iron and manganese, which are left in a finely-divided state, can then, from their lower density, be readily got rid of by washing. Since the invention of this process, some of the Cornish tin ores which used to sell at the lowest, now bring the highest price. The tungstate of soda procured in the operation has lately been found to be one of the most valuable substances for rendering cotton cloths noninflammable.

Tin when heated up to nearly its melting-point becomes brittle, and can then be broken into prismatic fragments called *dropped* or *grain tin*. The metal which is susceptible of this change may be considered to be of fine quality, as impure tin does not become brittle when so treated. The peculiar properties of tin, especially its malleability, its brilliancy, and the slowness with which it oxidizes at common temperature in the atmosphere, render it of great service in the arts. Utensils coated with silver require six cleanings for one that would suffice with "tinned" vessels. Tin is consequently very largely used to coat the surface of other metals, as iron and copper, especially thin sheet-iron, to form tin-plate.

With other metals tin forms some valuable alloys. See ALLOY. An amalgam of tin and mercury forms the metallic coating of mirrors. The applications of tin-foil, which is not more than $\frac{1}{1000}$ of an inch in thickness, are well known. From 60 to 80 tons of tin are annually used in Birmingham in the manufacture of coffin-lace.

MANUFACTURE OF TIN-WARE IN THE UNITED STATES.—Tin-ware recommends itself not only on account of its lightness and general convenience, but because of its incorrosibility. It is as bright and handsome as silver, far less expensive, and more serviceable. The milk-pan was, before its advent, a heavy earthen article; the milk and water pail a wooden bucket; the dipper a gourd, or a heavy pewter scoop. The first manufacture of tin-ware in the United States is claimed to have been in Berlin, Hartford County, Connecticut, in 1770, by Edward Patterson, a native of Ireland. As late as 1810, Connecticut supplied nearly the whole United States with wares made of tin. The work was done principally through the agency of peddlers. Extensive manufactures were begun in other parts of New England during the earlier part of the present century and rapidly spread into all parts of the country, until every town, village, and nearly every hamlet in the land has its tin-shop, and in the more rural districts the peripatetic peddler, who often carries around a repairing and manufacturing shop of no mean dimensions. In addition to the immense number of small manufacturers working throughout the country there were found to be in 1880 a total of 7595 large establishments in the United States, where the manufacture of tin-ware was extensively carried on. The same establishments, however, or a great number of them, also manufactured copper-ware and sheet-iron ware. The capital invested was estimated at \$22,252,290.00, and more than 26,000 persons were employed, but it would be impossible to tell the proportion of labor given exclusively to the manufacture of tin-ware, and an attempted approximation might be misleading.

The United States is a large consumer of tin plate whose uses are various. Much of it is required for house-roofing, while the canning of fruits, vegetables, fish, oysters, milk, etc., and the manufacture of domestic utensils demand an enormous supply. Immense numbers of children's toys are manufactured from the same material, the money value of which runs up into the hundreds of thousands annually.

Nearly all the tin-plate of commerce has heretofore been manufactured in Great

Britain, and the plate used in the United States comes very largely from that country. The ore is obtained chiefly from Cornwall although large quantities are imported by Great Britain from Australia, the islands in the Straits of Malacca, also the Malayan peninsula. In 1880 the United States imports of tin in bars, blocks, or pigs, were 14,248 tons, valued at \$6,223,176. The exports of foreign tin of the same kind were 205 tons, valued at \$82,594. There was a steady increase in the imports year by year, when in 1888, the record showed 1,587,029 tons of block tin, valued at \$8,758,562. In the same year there was also of tin-plate imported the enormous quantity of 31,611,214 lbs., having a value of \$19,034,821, making a total value of tin imported in that year of nearly \$28,000,000. In 1895, the imports of tin in bars, blocks, or pigs amounted to 40,484,183 pounds, valued at \$5,713,300.

Tin-plate has heretofore consisted of sheets of iron coated with tin, or a mixture of tin and lead. Some of the stock still imported is of the same material, but steel is rapidly superseding the cheaper material and affording a better and more durable product. The discoveries recently made in South Dakota, Wyoming, and California have been of the black oxide of tin. While showing in the majority of assays a very high grade, and of great value, yet it is not block tin, and no process has as yet been discovered to make it equal in its work to the product of the Cornish mines.

The re-tinning process is carried on in a few localities in the United States. It consists in disintegrating the previous tin-coating by an enormous pressure on the metal, and then re-plating. The article to be re-plated is dipped into a caldron of boiling tallow so hot that the original plating having already been crushed is melted from the surface of the iron. The ware is then dipped into a pot of fused tin where it receives its new coating. Various secondary features of treatment follow, when the article is as good if not better than the original. As processes have improved, and new discoveries been made, instead of cutting the tin-plate into sections, then fitting and soldering them together, mechanical appliances have been devised, patented, and put into successful operation whereby from a single piece of metal or plate, a complete pan, basin, or other article is stamped out, and a household, or other product made, lighter, stronger, more durable, and cheaper than the older style.

In order to stimulate the tin production and manufacture in the United States, the McKinley administration bill imposed upon tin plates a duty of $2\frac{3}{4}$ cts. per pound on and after July 1, 1891, as against an existing duty of 1 ct. per pound; and upon tin ore, which had previously been admitted free of duty, a charge of 4 cts. per pound, to be imposed on and after July 1, 1893. In the tariff act of 1897, tin ore in bars, blocks, pigs etc., is again admitted free and tin plate is taxed $1\frac{1}{2}$ cents per lb.

TINAMIDÆ, a family of *gallinaceous* birds inhabiting the tropical portions of South America, having many remarkable features in their internal organization, and with the striking external character that the tail is exceedingly short or entirely absent. They are intermediate in form between the *phasianidæ* and the *bustards*, having the long neck and legs and small feet of the latter, and the naked scale covering the nostrils, as in the former. They are sometimes classed as a genus of the *tetraonidæ*, or grouse family. See GROUSE. Many of the skull sutures are persistent, the brain is very small, and they have but little intelligence. Mr. Darwin saw many of the *tinamus rufescens* (called by English travelers partridges) while in South America. He says that a man on horseback by riding round them in a spiral, could kill an indefinite number by knocking them on the head with a stick. The more common method, however, was to catch them in a noose made of the stem of an ostrich's feather fastened to the end of a long stick. Of the family there are said to be as many as 41 species, and 9 genera, included in two sub-families, *tinamina* and *tinamotina*, the first containing the genus *tinamus* with 7 species, and the genera *nothocercus*, 3 species; *crypturus*, 16 species; *rhynchotus*, 2 species; *nothoprocta*, 6 species; *nothura*, 4 species; *taoniscus*, 1 species. The second sub-family contains two genera, *eudromia*, 1 species, and *tinamotis*, 1 species. Some of the species inhabit the deepest forests, some live on the open plains.

TINCAL. See BORAX.

TINCTURE. See HERALDRY.

TINCTURES are defined by sir Robert Christison to be "solutions of vegetable and animal drugs, and sometimes of mineral substances, in spirituous liquids." The spirit most commonly employed is proof-spirit; sometimes rectified spirit is used; and occasionally ether. Ammonia is sometimes conjoined with the spirit, in which case the solution is termed ammoniated tincture. (It may be as well to remind the reader that *rectified spirit* is alcohol with 16 per cent of water, and that its specific gravity is .838; and that *proof spirit* is composed of 5 parts of rectified spirit mixed with 3 parts of water, the resulting compound containing about 47.5 per cent of water, and having a specific gravity of .920.) The choice between proof and rectified spirit depends on their respective solvent powers over the active principles of the drugs employed. The ether and ammonia are principally used for their antispasmodic properties. "The form of tincture," says sir Robert Christison, "is one of the best in pharmacy; for the menstruum is a powerful solvent of the active constituents of drugs; it presents them in small volume; it preserves them very long unaltered, and it is for the most part a convenient medium for uniting them with other substances in extempore prescriptions."

TINDAL, Dr. MATTHEW, a notable deistical writer, was the son of a clergyman at Beer-ferris, in Devonshire, where he was born about 1657. He was educated at Lincoln and Exeter colleges, Oxford; took the degree of B.A. in 1676; and shortly after was elected fellow of All Souls' college. In 1685 he became a doctor of law; and, after a brief lapse into Romanism during the reign of James II., reverted to Protestantism, or rather, as events showed, into rationalism. His first work was entitled *An Essay concerning Obedience to the Supreme Powers, etc.* (Lond. 1693); followed in the course of a few months by *An Essay concerning the Laws of Nations and the Rights of Sovereigns*; but it was not till 1706 that he attracted any particular notice, when the publication of his treatise on *The Rights of the Christian Church asserted against the Romish and all other Priests who claim an independent power over it; with a Preface concerning the Government of the Church of England, as by Law established*, raised a storm of opposition, that may, perhaps, be considered to have fulfilled the prediction of the author, who told a friend that "he was writing a book which would make the clergy mad." A perfect torrent of replies and refutations poured from the press. Among those who signalized themselves as the adversaries of Tindal, the least obscure were Dr. G. Hickes and Conyers Place. Swift, it may be noticed in passing, also indulged in some "Remarks." On the continent, Tindal's work was quite differently received. Le Clerc, in his *Bibliothèque Choisie*, praises it very highly, as one of the solidest defenses of Protestantism ever written. In 1730, when he had nearly reached the age of 73, he published his most celebrated treatise, entitled *Christianity as old as the Creation, or the Gospel a Republication of the Religion of Nature*, which effectually settled the question of his religious creed. The design of the work is to strip religion "of the additions which policy, mistake, and the circumstances of the time have made to it,"—in other words, to eliminate the *miraculous* element, and to prove that its morality, which is admitted to be worthy of an "infinitely wise and good God," is its true and only claim to the reverence of mankind. Tindal's purpose was rather constructive than destructive; and it was on this account that he called himself a "Christian Deist." He was answered, among others, by Dr. Waterland, Mr. Foster (an eminent dissenting minister), Dr. Conybeare (afterward bishop of Bristol), and Dr. Leland (q.v.), with various degrees of ability and success. Tindal's book is written in excellent English, and is unquestionably a very able performance, giving its author a distinguished place among the 18th c. deists. Tindal died Aug. 16, 1733.

TINDER, an inflammable material, usually made of half-burned linen. It was formerly one of the chief means of procuring fire before the introduction of chemical matches. The tinder was made to catch the sparks caused by striking a piece of steel with a flint; and the ignited tinder enabled the operator to light a match dipped in sulphur. This intermediate step was necessary in consequence of the impossibility of making the tinder flame. Partially decayed wood, especially that of willows and other similar trees, also affords tinder; and certain fungi furnish the German tinder, or Amadou (q.v.).

TINEA is a term somewhat vaguely employed to designate certain parasitic diseases of the skin, and especially of the scalp. Three of the most important varieties of tinea, viz., *tinea circinata* (ringworm of the body), *tinea tonsurans* (ringworm of the scalp), and *tinea sycosis* (ringworm of the beard), have been already described in the article Ringworm (q.v.). In these three varieties, which are included in the general term *tinea tonsdens*, the vegetable parasite known as *trichophyton tonsurans*, figured in the above article, is always present. It now remains to notice the *tinea decalvans* of Bateman, known also as *porrigo decalvans*, *alopecia circumscripta*, etc. It is defined by Aitken as "a fungus disease, causing the formation of rounded or oval patches of baldness, sometimes solitary, more generally multiple. It affects the hairy scalp principally; but the beard and hairy portion of the skin may also suffer."—*The Science and Practice of Medicine*, 2d ed. vol. i. p. 925. The fungus which causes these patches of baldness was detected by Gruby in 1843, and named the *microsporon audouini*. It differs from the *trichophyton* by its numerous waved filaments, and the extremely small size of its sporules, and likewise by its position, not being found in the interior of the root of the hair, but forming a little tube round each hair, and thus causing it to soften and break down. The hairs thus affected become dull and partially loose; the skin in which they are implanted becomes red, swollen, and slightly itchy; and a whitish matter (the sporules of the fungus) may soon be observed on the diseased skin and hairs. The hairs then suddenly fall off from the affected part, leaving a round bald patch of a very white color. The disease is capable of transmission from one person to another, although less readily than *tinea tonsurans*. It chiefly affects children. The treatment consists in preventing the spread of the disease by extracting the hairs round the circumference of the patch, and washing the head daily with soft soap; and all the young hairs within the patch must be extracted till a healthy crop begins to appear. Moreover, a solution of sulphurous acid, as recommended for ringworm, should be applied. When by these means the fungus has been destroyed, stimulants must be applied to the bald patches. A mixture of equal parts of *collodium* and of *ether cantharidalis* (*collodium vesicans*) is, according to Dr. Aitken, the most useful stimulant in these cases.

TINEIDÆ, a family of small moths, the smallest insects of the lepidopterous order. The body is long and slender, the wings entire, often narrow, mostly convoluted in repose. Many of them are very brilliantly colored, exhibiting beautiful little stripes and

patches of gold and silver. Many deposit their eggs in animal substances, on which the larvæ feed, making cases for themselves out of the substance they feed on. The clothes moths (q. v.) are a familiar example.

TINGI, *Magonia glabrata*, a tree of the natural order *sapindaceæ*, which covers large tracts of country in some parts of Brazil, to the exclusion of almost everything else, generally growing to the height of 30 or 40 ft., but sometimes much higher. An infusion of the bark of the roots is used to poison fish. The fruit is a large dry triangular capsule, filled with broad flat seeds, from which a kind of soap is made. The membrane which covers the cotyledons is stripped off, and they are steeped in water till they begin to swell and soften, and boiled with a little tallow. A homogeneous mass is formed, which is used for washing clothes.

TINNÉ, a name given to the tribes of Indians of the Athabaskan family, inhabiting the portion of land lying between Hudson's bay and Central Alaska. They number about twenty tribes, the most prominent of which are the Chippewyans or Montagnais, the Dog Ribs, Beavers, Taculies or Carriers, Yellow Knives, Kenai, Brushwood, and Rocky Mountain Indians. They are peaceful, and subsist on game and fish; their weapons are of stone or bone, of simple construction. The Chippewyans do not bury their dead; the Taculies burn them. They are tall, have dark complexions and full faces, with considerable beard.

TINNEVELLY, *Tiru-nel-vēli*, chief t. of the British district of the same name, is situated near the river Chindinthoora, in lat. 8° 44' n. The town of Tinnevely is connected with the town and military station of Pallamcottah, on the opposite bank of the river. Pop. '91, 24,678.

TINNITUS AURIUM is the Latin translation of, and ordinary medical term for, ringing in the ears. In most cases it is an unimportant symptom, depending on some local temporary affection of the ear, or on some disturbance of the digestive system with which the part of the brain, from which the auditory nerve springs, sympathizes, or which excites the cerebral circulation (as often occurs in the morning after too liberal evening potations); but as it is also a common symptom of organic disease of the auditory nerve, it may indicate a dangerous condition, or may be a prelude to complete deafness. Hence, although commonly of no consequence, it is a symptom that, especially if permanent, must be carefully watched. It may be readily induced for a few hours by a large dose of quinia.

TINOCERAS, an extinct genus of herbivorous mammals from the cocene formation of Wyoming and Utah, the first known members of the new order *dinoceraæ*, so named from the best known genus *dinoceras*, which may be regarded as the typical one, and characterized as follows: Skull long and narrow; facial portion much extended. The upper surface of the skull has three pairs of bony processes, which are regarded as having been the support of horns (whence the name "terrible-horned"). The smallest pair are near the end of the nasal bones; a larger pair spring from the cheek bones in front of the orbits; the largest pair are on the cranial parietal bones, and are situated upon a large crest or ridge which extend from near the orbits around the lateral and posterior margins of the cranium.

TINOS, or **TINO** (anc. *Tenos*), an island in the Grecian archipelago, belonging to the group of the Cyclades, lies immediately s.e. of the island of Andros, 53 m. off the coast of Boeotia. It is 18 m. long, 8 m. in extreme breadth, has an area of 79 sq. m., and a pop. '89 of 11,442. The Tenians were conspicuous among the ancient Greeks for their industry, and they still maintain their pre-eminence in that respect. The island is carefully cultivated, well-watered, has a delightful climate, and is very productive in silk, wine, barley, and fruits. Silk gloves and stockings are manufactured; and the inhabitants have made themselves famous as workers in marble, which is found in the island. In the modern town of Tenos, or St. Nicholas, is a cathedral built of white marble, and famous as a resort for pilgrims.

TIN-PLATE. See **TIN**.

TINTERN ABBEY, a famous ecclesiastical ruin on the right bank of the Wye, in Monmouthshire, about 17 m. n.w. of Bristol. The abbey—properly so called—was founded in 1131 for Cistercian monks, by Walter de Clare, and dedicated to St. Mary; but already in the previous century a church had been built, and in 1268 mass was celebrated by abbot and monks for the first time. The style of architecture is a transition from early English to decorated, and is very fine. Most of the building, except the roof and tower, remains. Tintern abbey owes not a little of its celebrity to Wordsworth's poem, entitled *Lines Composed a few Miles above Tintern Abbey, on Revisiting the Banks of the Wye*—though in reality the poem has nothing whatever to do with the abbey, which is not once mentioned or alluded to in it.

TINTORETTO, a Venetian historical painter, so called from the fact of his father being a dyer (*tintore*), but whose real name was **JACOPO ROBUSTI**, b. 1518, d. 1594. He studied for a short time under Titian, but appears to have been for the most part self-taught. His motto was a very fine one: *Il disegno di Michael Angelo e 'l colorito di*

Tiziano (The design of Michael Angelo, and the coloring of Titian); but it cannot be said that he adhered to it, and he is certainly a long way inferior to either artist. Still, his assiduity, when young, in acquiring a varied knowledge of the human figure under all possible aspects of light and shade, commands respect, in spite of the theatrical means to which he often resorted; and the rapidity of his pencil (which got him the name of *Il Furioso*) is at least astonishing. Sebastian del Piombo remarked that Tintoretto could paint as much in two days as he could do in two years. A catalogue of Tintoretto's works, specimens of which are to be found in almost all galleries, is impossible within our limits. We can only mention a few of the more famous, as "Belshazzar's Feast, and the Writing upon the Wall" (fresco for the arsenal at Venice), "The Tiburtine Sybil," "The Last Supper and the Washing of the Disciples' Feet," "A Crucifixion," "The Worship of the Golden Calf," "The Last Judgment" (the last two immense pictures, 50 ft. high, and very splendid in conception), "St. Agnes Restoring to Life the Son of a Prefect," "The Miracle of St. Mark," a "Resurrection of Christ," "The Slaughter of the Innocents," and a grand picture of "Paradise"—34 ft. high by 74 long, with upward of 100 figures. Some of Tintoretto's earlier pictures are very carefully finished, but his later ones are dashed off with a fatal haste, that justifies the remark of Annibal Caracci, that if he "was sometimes equal to Titian, he was often inferior to Tintoretto." Tintoretto lavishly indulged in *chiar' oscuro*, but his coloring is not gay or brilliant; it is rather cold and leaden, as might be expected of a painter who, when asked what were the prettiest colors, replied: "Black and white."

TIN WEDDING. See WEDDING ANNIVERSARIES.

TIOGA, a co. in s. New York, adjoining Pennsylvania, drained by the n. branch of the Susquehanna river, and by Owego and Cayuta creeks; traversed by the Delaware, Lackawanna, and Western, the Erie and the Lehigh Valley railroads; about 498 sq. m.; pop. '90, 29,935. The principal productions are oats, wheat, corn, buckwheat, wool, and butter. Manufacturing is extensively pursued. Co. seat, Owego.

TIOGA, a co. in n. Pennsylvania, adjoining New York; drained by the Tioga river, and by Pine and Lycoming creeks; crossed by the Fall Brook and the Erie railroads; about 1120 sq. m.; pop. '90, 52,313, chiefly of American birth. The surface is hilly and well wooded. Iron and coal abound. The soil is suitable for grazing. The principal productions are oats, corn, wheat, buckwheat, maple sugar, and butter. There are extensive manufactures. Co. seat, Wellsboro.

TIPPAH, a co. in n. Mississippi, adjoining Tennessee; drained by Tippah creek, and the Tallahatchee and Hatchee rivers, traversed by the Gulf and Chicago railroad; about 490 sq. m.; pop. '90, 12,951, includ. colored. The surface is rolling. The soil is fertile. The principal productions are corn, cotton, wheat, wool, butter, and cattle. Co. seat, Ripley.

TIPPECANOE, a river of Indiana, which rises in a lake of the same name in the northern part of the state, flows s.w. 200 m., and empties in the Wabash, 9 m. above Lafayette. It is famous for the battle fought on its banks, Nov. 7, 1811, in which the Indians, under Tecumseh's brother, the Prophet, were defeated by Gen. Harrison.

TIPPECANOE, a co. in w. Indiana, drained by the Wabash river, the Tippecanoe river, and several creeks; traversed by the Cleveland, Cincinnati, Chicago, and St. Louis, the Lake Erie and Western, the Louisville, New Albany, and Chicago, and the Wabash railroads; about 500 sq. m.; pop. '90, 35,078, chiefly of American birth. The surface is level. The soil is productive. The principal productions are corn, wheat, oats, butter, and wool. There are extensive manufactures. Co. seat, Lafayette.

TIPPECANOE, BATTLE OF, fought Nov. 7, 1811, in Indiana, on the banks of Tippecanoe river, on the site of the present village of Battle Ground, between the Americans under Gen. Harrison, and the Indians under the Prophet, Tecumseh's brother.

TIPPERARY, an inland county of the province of Munster, Ireland, bounded on the s. by Waterford; and on the w. by Cork, Limerick, Clare, and Galway. Area, 1659 sq. m., or 1,061,731 acres, of which 225,000 acres were under cultivation in 1893. Pop. 91, 177,308.

The county of Tipperary, for the most part lies in the basin of the river Suir. This river rises near Templemore, in the n. of the county; and after traversing Tipperary for a distance of about 76 m., forms for a time its boundary with Waterford; through which county it ultimately passes to the sea. The other rivers of Tipperary are the Nore, the Nenagh, and the Brosna. The lakes are numerous, but of small size. The county is intersected by the Great Southern and Western, and the Limerick and Waterford railways. The surface is generally plain, and the mountains which diversify it are rather groups than portions of any connected range. These mountains are the Galtees, rising to 3,000 ft., Knockmeledown (2,700 ft. high), and Slievenam on the s.; Keeper mountain, 2,100

ft. high, and its group on the w.; and the Slievardagh Hills on the east. There is one very curious isolated height called the Devil's Bit, to which many popular legends attach. The soil of the plain is a rich calcareous loam, singularly fertile and productive, especially a district called the Golden Vein, in the center of which stands the town of Tipperary (q.v.), and which extends from Limerick to the county of Kilkenny. There is another similarly fertile district in the n. of the county. In geological formation the plain belongs to the great central limestone district. The mountains are for the most part of clay-slate, surrounded or surmounted by sandstone; the Galtees, together with a contiguous group called Slievenamuck, as well as the intervening valley, being sandstone. There is a large amount of bog in the central and eastern districts, one continuous tract extending a distance of 30 miles. The mineral productions are coal (anthracite), copper, and lead, also zinc and very good fire-clay; and slates of an excellent quality are quarried near Killaloe. Wheat was formerly grown in large quantities; but of late years dairy-farming and the raising of cattle have been rapidly taking the place of the production of cereals. Flax is but sparingly produced.

The county, which sends four members to the house of commons, is divided into two ridings, n. and s., each of which is subdivided into six baronies.

Anciently, Tipperary formed a part of the two distinct principalities of Ormond, or n. Munster, and Desmond, or s. Munster: after the English invasion, Tipperary was formed into a county by king John in 1210; but the authority of the conquerors was long little more than nominal. Eventually, it came to be divided between the Anglo Norman families of Butler, which held Ormond, and Geraldine, to whom a portion of Desmond fell. The antiquities are numerous, as well Celtic as Anglo-Norman. In the latter, the city of Cashel is specially rich; and the ruin of Holy Cross is a noble specimen of the monastic remains of the mediæval period, as the castle of Cahir is of the military and baronial architecture of the same age. There is a series of caves near the border of the co. of Cork, in the vicinity of Mitchellstown, which attract much notice as a natural curiosity. They consist of a number of chambers and galleries formed by stalactite deposits, one portion of the range being no less than 870 ft. in length.

TIPPERARY, a market t. of the county of the same name, on the river Arra, 111 m. s.w. from Dublin by the mail-coach road, and 110 by the Great Southern and Western railway, with which it is connected by the Limerick and Waterford railway. Tipperary occupies a central position in a fine county, and carries on, therefore, an extensive trade in butter. Pop. '91, 6,391. The town is of very ancient foundation, and soon after the invasion was occupied as a strong place by the English, who built a castle in it during the Irish expedition of king John. This castle, however, fell soon afterward into the hands of the Irish under the prince of Thomond. The town is well built, but of no architectural pretensions, and contains Roman Catholic and Protestant churches, national schools, and a school of the Erasmus Smith endowment.

TIPPOO SAHIB, Sultan of Mysore, and son of Hyder Ali (q.v.), was b. in 1749. Efforts were made to carefully instruct him in the various branches of learning cultivated by Mohammedans; but Tippoo much preferred the practice of athletic exercises, and the companionship of the French officers in his father's service, from whom he acquired a considerable acquaintance with European military tactics. This knowledge he put to effective use during his father's various wars, by completely routing Col. Bailey at Perimbakum (Sept. 10, 1780), and (Feb. 18, 1782) Col. Braithwaite on the banks of the Kolerun in Tanjore, though these were his only important engagements with the British forces in which he could boast of success. On the death of his father, he was crowned with little ceremony, returning at once to the head of his army, which was then engaged with the British near Arcot. On April 28, 1783, he captured and put to death most of the garrison of Bednore; but news of the peace between France and England having reached his French allies, they retired from active service, and Tippoo ultimately agreed to a treaty (Mar. 11, 1784), stipulating for the *status quo* before the war. During the continuance of this peace, he occupied himself in regulating the internal administration of Mysore, sent ambassadors in 1787 to France to stir up a war with Britain, and failing in this, at length so far allowed his inveterate hatred of the English to overcome his judgment, as to invade (April, 1790) the protected state of Travancore. In the ensuing war (1790-92), the British, under Col. Stuart and Lord Cornwallis, were aided by the Mahrattas and the Nizam, who detested their powerful and aggressive neighbor equally from fear and religious hatred (Tippoo being a fanatical Mohammedan); and though the tactics of the sultan in laying waste the Carnatic almost to the very gates of Madras baffled his opponents for a time, he was ultimately compelled (Mar. 16, 1792) to resign one-half of his dominions, pay an indemnity of 3,030 lacs of rupees, restore all prisoners, and give his two sons as hostages for his fidelity. Nevertheless, his secret intrigues in India against the British were almost immediately resumed; another embassy was sent to the French; and the invasion of Egypt by the latter in 1798, and Tippoo's machinations, having become known to the governor-general almost contemporaneously, it was resolved to punish the perfidious sultan. Hostilities commenced in Mar., 1799; and two months after, Tippoo was driven from the open field, attacked in his capital of Seringapatam, and after a gallant resistance, slain. He was buried in his father's mausoleum. May 5,

1799, during a storm of thunder and lightning, which caused the death of several Europeans and natives. His government of Mysore after 1792 was of a most oppressive character, yet Tippoo was extremely popular, and after his death was esteemed by the Mohammedans as a martyr to the faith of Islam. Of the chief articles of *virtù* with which his palace abounded, many are now in Fife house, Whitehall (having been removed thither from the East India house in Leadenhall street), as also the half of his library, the other half being preserved at fort William, Bombay.

TIP'TOFT, JOHN, Earl of, 1425-70; b. England, educated at Balliol college, Oxford. He was noted for his scholarship and for his patronage of William Caxton, who printed his translation of Cæsar's *Commentaries* and the *De Amicitia* of Cicero. By Henry VI. he was made earl of Worcester and lord-deputy of Ireland, ruling with great severity. In the "war of the Roses" he sided with Edward IV., by whom he was made lord high treasurer and knight of the garter. His cruelty in Ireland and toward his Lancastrian prisoners contrasts strangely with his love of literature and education. He visited Rome and Jerusalem, and brought many valuable manuscripts now in the Oxford libraries. After the Lancastrians came into power he was beheaded for alleged maladministration in Ireland.

TIPTON, a co. in central Indiana, drained by Cicero creek and the Wild Cat river; traversed by the Lake Erie and Western, the Pittsburg, Cincinnati, Chicago and St. Louis, the Chicago and Northwestern, and the Burlington, Cedar Rapids, and Northern railroads; 260 sq. m.; pop. '90, 18,157, chiefly of American birth. The surface is level. The soil is fertile. The principal productions are corn, wheat, wool, and butter. Co. seat, Tipton.

TIPTON, a co. in w. Tennessee, on the Mississippi river, drained by the Hatchie river and other streams; traversed by the Louisville and Nashville and the Illinois Central railroads; about 404 sq. m.; pop. '90, 24,271. The surface is level. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Covington.

TIPULA AND TIPULIDÆ. See CRANE-FLY.

TIRABOSCHI, GIROLAMO, an eminent Italian author, was b. at Bergamo, Dec. 28, 1731, studied at Monza, and afterward entered the order of the Jesuits. Toward 1766 he was appointed professor of rhetoric at Milan, where he wrote his first work, *Vetera Humiliatorum Monumenta* (1766); and in 1770 succeeded father Granelli in the post of librarian to the duke of Modena. Tiraboschi now availed himself of the rich stores of the ducal library, besides making extensive researches in other archives, to compose his *Storia della Letteratura Italiana (History of Italian Literature)*, which began to appear in 1770, and was finished in 1782 in 14 vols. It embraces the history both of ancient and modern Italy, and is especially valuable for the light which it throws upon the intellectual condition of the Peninsula during the dark ages, and the brilliant period from Dante to Tasso. Tiraboschi ends his elaborate survey with the close of the 17th century. It is impossible to praise too highly the learning and the conscientious accuracy of the author, even although the circumstance that many of the epochs have since been made the subject of minute and special inquiries necessitates a revision of parts of the work. A second edition was edited by Tiraboschi (1787-94), and abridged translations have appeared in French and German. The best edition is that published at Milan (16 vols., 1822-26). A continuation, embracing the literature of the 18th c., was written by Lombardi (*Storia della Letteratura Italiana nel Secolo XVIII.*). Tiraboschi died at Modena, June 4, 1794. Other works by this author are *Biblioteca Modenese* (6 vols., Mod. 1781-86); and *Memorie Storiche Modenesi* (3 vols., Mod. 1793).

TIREE, one of the inner Hebrides, included in Argyleshire, lies 20 m. n. w. of Iona. It is 13 m. long, and over 6 m. in extreme breadth. The surface is low, rising in the n. to little more than 20 ft., and in the s. to about 400 ft. above sea-level. The absence of trees and shrubs gives to the island a bleak appearance. There are numerous small lakes. The soil is very fertile and there is a large plain of good pasture land in the center. Some interest attaches to the island from the number of Scandinavian forts which dot the shores, and from the standing stones, ruined churches, and ancient graves which occur in the interior. Pop. '91, 2600, who support themselves by rearing cattle, fishing, and exporting poultry and eggs.

TIRESIAS, in Greek mythology, figures as a famous prophet, who, according to one legend, was struck blind by the goddess Athena, because he had seen her bathing. Another legend represents Hera as depriving him of his sight because, being made arbiter in a dispute between her and Zeus, he had decided in favor of the latter; when Zeus as a compensation granted him the inner vision of prophecy, and prolonged his life for several generations. He is consequently prominent in many of the mythical stories of Greece, but at last found death by drinking from the well of Tiphossa. Even in Hades Tiresias retained his prophetic power.

TIRLEMONT (Flemish, *Thienen*), a town of Belgium, in s. Brabant, on the Great Geete, 30 m. e.s.e. of Brussels, on the Brussels and Cologne railway. The church of St. Germain, on an eminence, dates apparently from the 9th c., and contains an altar-piece by Wappers. Beer, machinery, woolen stuffs, leather, soap, gin and hosiery are manufactured. Tirlemont was ravaged by Marlborough in 1705; and here the French, under Dumouriez, defeated the Austrians in 1793. Pop. '94, 16,864.

TIRNOVA, a t. in the principality of Bulgaria, on the Jantra, 35 m. s.s.e. of Sistova. It was formerly the chief t. of Bulgaria; and after 1878 (see BULGARIA) was again for a short time the seat of the national government. There are numerous mosques, churches, and synagogues; dyeing is carried on, and silk and coarse cloth are manufactured. The population (1893) was 12,858.

TIRO, MARCUS TULLIUS, the amanuensis (pupil and formerly slave) of Cicero, whose life he wrote and whose letters he collected. He is known chiefly as the inventor of the ancient *stenography* (q. v.). He died 5 A.D., almost a hundred years of age.

TIRYNS, an ancient city of Argolis, in the Peloponnesus, one of the very oldest cities of Greece, situated a short distance s.e. of Argos, near the head of the Argolic gulf. According to the common tradition it was founded by Prætus, a mythic king of Argolis; and its massive walls, like other rude massive structures in Greece of unknown antiquity, were reputed to be the work of the Cyclopes. Prætus is said to have been succeeded by Perseus; and in this place Hercules was believed to have passed his youth. At the time of the Trojan war Tiryns appears to have been subject to the kings of Argos. Some time subsequently to the battle of Plataea (to which the Tirynthians sent troops), probably about the year 468 B.C., the city was taken by the Argives, and entirely destroyed; and after this period Tiryns remained uninhabited, the walls of the citadel only being left standing, the wonder and admiration of later ages. Tiryns affords one of the most interesting specimens of what is called Cyclopean architecture, the ruins of this place, and those of the neighboring city of Mycenæ, being the grandest of all in Greece. The acropolis, or citadel, of Tiryns, was built on the summit of a low, flat, rocky hill, rising abruptly out of the dead level of the plain of Argos, and appears to have consisted of an upper and a lower inclosure of nearly equal size, with an intermediate platform. There were two main entrances, on the e. and on the s. sides, with a postern on the west. The entire circuit of the walls still remains more or less preserved; they are upward of 20 ft. in thickness, and are formed of unhewn stones of enormous size, rudely piled in tiers one above the other, without the use of mortar or cement, the interstices being filled up with smaller stones, so as to make the whole mass solid and compact. There are several covered galleries of singular construction in the body of the wall, on the e. and the s. sides, the roof being formed by sloping the courses of masonry on each side of the passage at an angle to each other. One of them has six recesses, or niches on the outer side of the walls, intended probably to facilitate defense. See Schliemann, *The Prehistoric Palace of the Kings of Tiryns* (1885).

TISCHBEIN, JOHANN HEINRICH WILHELM, 1751-1829; b. Germany; lived for several years in Rome, and from 1790 to 1799 was director of the art academy of Naples. He then returned to Germany and settled in Hamburg. He excelled in painting scenes from animal life, but is best known by his illustrations in *Homer nach Antiken gezeichnet* (1801).

TISCHENDORF, LOBEGOTT FREDERICK KONSTANTIN VON, a very eminent Biblical scholar, was born at Lengenfeld, in Saxony, on Jan. 18, 1815. His labors in search of the best and rarest MSS. in reference to the Bible, in which he was liberally assisted by the Saxon and Russian governments, were exceedingly valuable. Among the most important of his numerous excellent works are the editions of the *Sinaitic MS.* (1862, 1863, 1865), the *Eighth Critical Edition of the New Testament* (1864-72), and the *Monumenta Sacra Inedita* (1854-65). After being an extraordinary and ordinary professor at Leipsic, from 1845, he became professor of theology and of Biblical palæography in 1859, a chair in the latter subject having been instituted for him. He was created a count of the Russian empire, an LL.D. of Cambridge, a D.C.L. of Oxford, etc. He died on Dec. 1, 1874.

TISHOMINGO, a co. in n.e. Mississippi, adjoining Tennessee and Alabama; drained by the Tennessee and Tombigbee rivers and their branches; traversed by the Memphis and Charleston railroad; about 435 sq.m.; pop. '90, 9302. inclu. colored. The surface is hilly. The soil is fertile. The principal productions are corn, butter, tobacco, and cotton. Co. seat, Iuka.

TISSAPHERNES, a satrap of Persia. Artaxerxes II., son of Darius II., being informed by Tissaphernes of the design of his younger brother Cyrus to deprive him of the throne, put him in command of his forces, which met and defeated Cyrus at Cunaxa. As a reward he obtained in marriage the daughter of Artaxerxes, and command of the provinces of which Cyrus had been governor. Attempting to punish the Greek cities which supported Cyrus, he was defeated by Agesilaus in Lydia. Afterward proving treacherous, he was slain by order of Artaxerxes.

TISSOT, SIMON AUGUSTE ANDRÉ DAVID, 1728-97; b. Switzerland; educated at Geneva and Montpellier, and gained a great reputation as a physician at Lausanne, in whose university he was professor. He held the chair of clinical medicine at Pavia, 1780-83. Among his works are *Historia Epidemice Lausaniensis Anni 1755*; *Avis au Peuple sur la Santé* (1761); and *De la Santé des Gens de Lettres, suivi de l'Essai sur les Maladies des Gens du Monde* (1768-70).

TISSUES, ANIMAL, may be either normal or pathological. The most important of these tissues have already been considered in special articles, and we shall here

merely notice the view at present most generally adopted regarding their classification (see HISTOLOGY). The normal tissues are divisible, according to Virchow and his followers, into three groups or categories. We have (1) tissues which consist exclusively of cells, when cell lies close to cell; or (2) tissues in which one cell is regularly separated from the others by a certain amount of intermediate matter, or intercellular substance; or (3) tissues in which the cells have attained specific, higher forms of development, by means of which their constitution has acquired an entirely peculiar type. As illustrations of the first group of tissues, the simple cellular tissues in the modern sense (cellular tissue here being quite distinct from areolar or connective tissue), we may take the epithelial formation, such as occur in the epidermis and the nails, and in the epithelium of mucous and serous membranes, in the crystalline lens of the eyes (which is originally a mere accumulation of epidermis), and in the glands. The second group is formed by the connective tissue, which is composed of intercellular substance, with cells of various forms embedded in it, and includes cartilage, fatty tissue, etc. In the third group, which is somewhat heterogeneous, the structures are usually more or less tubular. This group includes the muscles, nerves, and vessels, and Virchow also places the blood in it. Such an arrangement as this is quite distinct from, and altogether at variance with, those adopted a comparatively few years ago. This arrangement has reference to general histology (*tissues*, properly so called), while *that* has reference to special histology, or the structure of organs in which a combination of various tissues may enter. Thus, the *osseous tissue* of general histology consists of bone cells + calcified intercellular substance, while *bone as an organ* consists of osseous tissue + medullary tissue + periosteum + vessels + nerves; similarly, nervous tissue is by no means identical with cerebral matter, which additionally contains membranes, vessels, etc.

Morbid tissues may be classified upon exactly the same plan as the physiological or normal tissues. The belief is gradually extending that there is nothing peculiar or specific in pathological structures, or, in other words, that every pathological tissue has its physiological prototype, and that "no form of morbid growth arises which cannot in its elements be traced back to some model, which had previously maintained an independent existence in the economy."—Virchow's *Cellular Pathology*, translated by Chance, p. 60. The distinguished pathologist whose words we have just quoted maintains that there is no other kind of heterology in morbid structures than the abnormal manner in which they arise, and that this abnormality consists either in the production of a structure at a point where it has no business, or at a time when it ought not to be produced, or to an extent which is at variance with the typical formation of the body; "but," he adds, "practical experience shows us that it would be altogether incorrect to conclude from the mere correspondence of a pathological tissue with a physiological one that the case would continue to follow a benignant course." The curious bodies provided with large nuclei and nucleoli, which have been described by many pathologists as "the specific polymorphous cells of cancer," are merely irregularly developed epithelial cells, such as occur, for example, in the lining of the urinary passages; and the apparent heterology of other morbid growths may be similarly explained.

TISSUES, VEGETABLE. See CELLULAR TISSUE, VASCULAR TISSUE, and VEGETABLE TISSUES.

TISZA VON BOROSJENŐ, KOLOMAN, prime minister of Hungary, b. Dec. 16, 1830, at Geszt, was educated for the civil service. The revolution of 1848 interfering with his career, he gave some years to travel. In 1850 he became known as an opponent of the policy of religious intolerance which was pursued by the Hungarian government. He gained a seat in the parliament of Hungary in 1860, succeeding Count Teleki. In 1875 he was able to carry over the moderate radical party, with which he had allied himself, to the United Liberals under Deák, and became, first, minister of the Interior, and then Prime Minister of the Hungarian Cabinet. In 1876-8 he opposed Russia and Pan-slavism. He resigned when Austrian finances did not meet the expenses of the Bosnian occupation, but returned to his position in 1889, and retired 1890.

TIT, or **TITMOUSE**, *Parus* a genus of birds of the order *insectores*, tribe *corvirostris*, and family *paridae*. The *paridae* are small birds, of which there are more than 50 known species, widely distributed throughout Europe, Asia, Africa, and North America. They are more numerous in cold and temperate than in tropical regions, those which are found within the tropics being mostly inhabitants of elevated mountainous districts. The bill is small, short, somewhat conical, the tip entire, the base beset with hairs, and the nostrils generally concealed by feathers. The wings are not very long, but are pointed; the tail is rounded or even; the tarsi long, slender, scaled in front, the inner toe shortest, the claws long and curved. The plumage is beautiful, often gay. The popular names tit and titmouse are very generally given to all the *paridae*. They are bold sprightly birds, extremely active, flitting from branch to branch, running rapidly along branches in quest of insects, and often clinging to the under-side of branches with their back downward. They feed not only on insects but on grain and seeds, have no objection to carrion, and sometimes kill young and sickly birds by strokes of their bill. They are very pugnacious, and the female tit shows great courage in defense of her nest, often continuing to sit when the nest is approached, and vigorously assailing the intruding hand with her bill. In winter many of the species gather into small flocks.

and approach houses and villages, competing with sparrows and chaffinches for a share of the food of domestic poultry. Most of the tits lay at least six eggs, some of them twelve or more, and even in temperate countries they often produce two broods in a year. They generally build in trees. The young are fed chiefly on caterpillars. A pair of blue tits have been observed to carry a caterpillar to their nest, on an average, every two minutes during the day, so that these birds must be extremely useful in preventing the multiplication of noxious insects. Seven species are found in Britain, but one of them, the CRESTED TIT (*parus cristatus*) is a mere accidental visitor. The GREAT TIT (*P. major*) is the largest European species. It is common in almost all parts of Europe. It is not quite six inches long; the head and throat are black; the cheeks are white; the back, breast, and sides yellowish; the wings and tail grayish. Its usual note is a kind of chatter, but it sometimes imitates the notes of other birds. The BLUE TIT (*P. cæruleus*) and the COLE TIT (*P. ater*) are very common in Britain. The blue tit is perhaps the most pert and audacious of all the British species. It very generally receives the familiar name of *tomtit*. The upper part of the head is light blue, and a bluish tinge prevails in the plumage. The CHICKADEE or BLACK-CAP TIT (*parus atricapillus*) is very common in North America. The TUFTED TIT (*lophophanes bicolor*) is the largest American species. See CHICKADEE. See illus., LARKS, ETC., vol. VIII.

TITANIUM (sym. Ti, atomic weight—new system, 48—sp. gr. undetermined) is a comparatively rare metal, which, according to the method by which it is procured, occurs as a gray, heavy, iron-like powder, which burns with brilliant scintillations in the air, and is converted into titanitic acid, or in prismatic crystals. At 212° F. (100° C.) it decomposes water, and it is soluble in hydrochloric acid. It is obtained in the crystalline form by heating sodium with dry potassium titanofluoride. It never occurs native, but is found in association with other elements in various minerals, of which the most important are *anatase*, *rutile*, and *brookite*, containing titanitic acid; *titanite*, containing silicate of lime and titanitic acid; *perovskite*, containing titanite of lime; *æschynite*, containing titanitic and niobic acids, and the oxides of cerium and lanthanum; and lastly, *titanic iron*, composed of titanate of protoxide of iron. A remarkable artificial compound of the metal is often found in the form of copper-colored cubic crystals, adhering to the slags of iron furnaces. They are hard enough to scratch agate; and no acid except a mixture of nitric and hydrofluoric acids has any action on them; but they are volatile at an extremely high temperature. They consist of a combination of cyanide with nitride of titanium, and are represented by the remarkable formula, $Ti(CN)_2 + 3Ti_2N_2$. The most important compound of this metal is *titanic acid*, TiO_2 , which occurs in the minerals *menaccanite* and *iserine*, as titanate of iron, but is more common in the uncombined state, as titanitic anhydride, in the form of *rutile*, *brookite*, and *anatase*, each of which possesses a distinct crystalline form, and has a different specific gravity. Hence titanitic acid in the anhydrous state is trimorphous. It is usually obtained by a somewhat complicated process from *rutile*. Titanium was discovered by Gregor, as a constituent of *menaccanite*, in 1791.

TITANOSAURUS, or ATLANTOSAURUS, a genus of extinct reptiles belonging to the order *Dinosauria* (q.v.), and therefore allied to *hadrosaurus* (q.v.), *megalosaurus* (q.v.), and *iguanodon* (q.v.). Their fossils are found in the Jurassic formations of North America. The *Atlantosauros montana* from Colorado, according to Prof. Marsh, "is by far the largest land animal yet discovered, its dimensions being greater than was supposed possible in any animal that lived and moved upon the land. It was some 50 or 60 ft. in length, and when erect, at least 30 ft. in height.

TITANOTHERIUM, an extinct genus of mammals from the "bad lands" of White river, S. Dakota, probably of the miocene formation. They were discovered by Dr. H. A. Prout, and named by Dr. Leidy *titanotherium Proutii*. They belong to the extinct family *brontotheridæ*, which includes as many as four genera, *titanotherium*, *megacerops* (q.v.), *brontotherium*, and *diconodon*. The best known genus is *brontotherium*, having the following characteristics: skull long and depressed, resembling that of the rhinoceros; large horn cores in front of the orbits, on the maxillary bones, and having large air cavities, nasal bones large and firmly ossified together; occipital condyles large and widely separated; dental formula; $i \frac{2-2}{2-2}$; $c \frac{1-1}{1-1}$; $pm \frac{4-4}{3-3}$; $m \frac{3-3}{3-3}$. Upper incisors small; canines short and stout with no diastema between them and the molars. The upper molars are large grinding teeth, often measuring 5 in. in diameter; brain cavity small in proportion to the skull, the cerebral hemispheres not extending over the cerebellum, and only to a small extent over the olfactory lobes; hemispheres comparatively large and much convoluted; cerebellum small, indicating clumsiness in motion; atlas or first cervical vertebra large and having great transverse extent; axis large, with massive odontoid process; lumbar vertebrae smaller than dorsal. There were four sacral vertebrae, and the caudal bones indicate a long and slender tail; limbs intermediate between elephant and rhinoceros; carpal bones shorter than in rhinoceros, supporting four stout toes, radius and ulna, and also tibia and fibula, separate; *os calcis* long, astragalus short. The hind feet had three toes of nearly equal size. None of the bones of the skeleton were hollow; nose probably flexible and tapir like, and not a true proboscis.

cis. These animals nearly equaled the elephant in size. The fossils of *brontothervidæ* are all as far as known from miocene beds of Dakota, Nebraska, Wyoming, and Colorado. Prof. Marsh, who discovered these extinct forms in these regions, remarks that the name *titanotherium* must give way to the previously applied name *menodus*.

TITANS AND TITANIDÆ (originally called *Ouraniones*, celestials), in Greek mythology, were the sons and daughters of Uranus (heaven) and Gæa (earth). Their names as commonly given, were: Oceanus, Cœus, Crius, Hyperion, Iapetus, Kronos, Theia, Rhea, Themis, Mnemosyne, Phœbe, and Tethys; Dione, Phorcys, and Demeter are added by some writers. Instigated by their mother, the Titans, headed by Kronos, rose against their father, emasculated and deposed him, and liberated their brothers the Hecatoncheires (hundred-handed) and the Cyclops (q.v.) from Tartarus. Kronos being made king, threw the Cyclops back again to Tartarus, and married his sister Rhea. In order to escape being deposed by one of his own children, as it was foretold he would be, Kronos swallowed each as it was born. Rhea, when she gave birth to Zeus (q.v.), saved his life by giving a stone wrapped in a cloth to Kronos, who swallowed it, believing it to be his child. Zeus, when he grew up, gave his father a potion which caused him to vomit the stone and the children he had swallowed. Assisted by his brothers and sisters, along with the Cyclops and Hecatonchieres, Zeus began with the Titans the ten years' conflict which resulted in the complete triumph of the former and the overthrow of the latter, who were hurled down into a dungeon below Tartarus, surrounded by a brazen wall, and guarded by the Hecatoncheires. During the war Zeus and his allies occupied mount Olympus in Thessaly, his opponents being encamped on mount Othrys. The name Titan is also given to the descendants of the Titans, such as Prometheus, Hecate, Helios, Selene, etc.

TITE, Sir WILLIAM, 1802-73; b. London, England; studied architecture under Laing. His first work was the rebuilding of the church of St. Dunstan's-in-the-East in the Gothic style. This at once established his fame. Among his best designs was that of Edward Irving's church in London. In 1855 he was returned to parliament from Bath as a liberal, and was made a member of the banking committees. His title was bestowed in 1869. In 1848 he published a catalogue and description of the antiquities found in the excavations for the royal exchange, of which he was architect.

TITHES (A. S. *teotha*, a tenth; Lat. *decima*, i.e., *pars*, a tenth part), the tenth part of the produce of the land, which, by ancient usage, and subsequently by law, is set aside for the support of the clergy, and other religious uses. This provision for the clergy passed at a very early period from the Jewish into the Christian church, and indeed the same or some analogous appropriation has been traced in the other ancient religions. It is observable under the patriarchal system in the words employed by Jacob (Gen. xxviii. 22), and in the offering of Abraham to Melchisedec (Gen. xiv. 20); and mystical reasons have been devised for the selection of the tenth part, rather than any other fractional portion of the produce of the earth, to be consecrated to the uses of religion and the ministers of religion. (See Spencer, *De Legibus Hebræorum*, iii. 1 to 10.) The details of the institution among the Jews will be found in Levit. xxvii., Deut. xiv., and many other places. The tribe of Levi not having lands assigned, as was the case with the other tribes, drew their support from this impost.

In the Christian dispensation the very circumstance of the existence of the clergy as a distinct class supposed a certain fixed provision for their maintenance. The necessity of such provision, and the right on which it is founded, is distinctly expressed in many passages and allusions of the New Testament, as Matt. x. 10, Luke x. 7, Rom. xv. 27, 1 Cor. ix. 7 to 14. The obligation in the general sense which these passages involve has been put forward in ecclesiastical legislation from the earliest period. The apostolical canons, the apostolic constitutions, St. Cyprian on *The Unity of the Church*, and the works of St. Ambrose, St. Chrysostom, St. Augustine, and the other fathers of both divisions of the church, abound with allusions to it. As yet, however, this obligation was discharged mainly in the form of voluntary offerings; and the legislation of the first Christian emperors, while it presupposed the duty of maintaining the clergy, and even assigned lands and other property for their support, did not extend to any general enactment for the payment of the tenth of the produce of the lands. The council of Tours, 567 A.D., the second council of Macon, 585, that of Rouen, 650, of Nantes 660, of Metz, 756, and some others, distinctly sanction that form; and at length Charlemagne by his capitularies formally established the practice within those portions of the ancient Roman empire to which his legislation extended.

From this and other sources the payment of a tenth to the church extended throughout western Christendom. By some the claim was held to be of divine law; by others, of human institution; but in the gradual progress of relaxation it came to pass that the right thus established solely for the church began to be usurped for themselves and for purely secular uses by nobles or other powerful laymen. See **IMPROPRIATION**.

The first introduction of tithes into England is ascribed to Offa, king of Mercia, in the close of the 8th century. The usage passed into the other divisions of Saxon England, and was in the end made general for all England by Ethelwulf. It would seem that, at first, although all were required to pay tithes, it was optional with each to select the church to which his payment should be made; but by a decretal of Innocent III.,

addressed to the archbishop of Canterbury in 1200, all were required to pay tithes to the clergy of their respective parishes, and this parochial distribution of tithes has ever since obtained in England. The ancient canon and civil law distinguishes many varieties of tithes, into which we shall not enter, as royal, indominate, fiscal, salic, etc. We shall confine our remarks to the provisions of the English law, premising that in most respects it is founded upon the general principles of the civil and canon law.

Tithes are of three kinds—*predial*, *mixed*, and *personal*. Predial tithes are those which arise immediately from the earth itself, as of grain of every kind, fruits, and herbs. *Mixed* tithes are those proceeding from things nourished by the earth, as calves, lambs, pigs, colts, chickens, milk, cheese, eggs, etc. *Personal* tithes are those arising from the profits of personal industry, in the pursuit of a trade, profession, or occupation; but it is commonly held that personal tithes were ordinarily paid in the form of a voluntary offering at Easter or some other period of the year. From these explanations, it will be understood that no tithe was due from the proceeds of mines or quarries, as their produce is not the result of any growth or increase of the earth, but forms part of its substance; nor from houses, as having no annual increase. The common law, moreover, held wild animals, game, fish, etc., not to be proper subjects of tithe, as also tame animals kept for pleasure or curiosity, and not for profit or use.

A more arbitrary distinction is into *great* and *small* tithes, the first being tithes of corn, hay, wood, etc.; the second being the other kinds of prædial tithes, as well as all personal and mixed tithes. This distinction, although purely arbitrary, is important, inasmuch as the great tithes of a parish belong to the rector (q.v.), and the small tithes to the vicar (q.v.). Tithes were originally paid "in kind;" that is, by the actual numeration of the products of the land, and the apportionment in each of the numerical tenth part, as of the tenth sheaf, the tenth lamb, calf, etc. The inconvenience and trouble, as well as the unsettled and variable quantities involved in this mode of payment, led to early attempts to provide other modes of apportioning the result (the particular manner being called technically a *modus decimandi*, or simply a *modus*). This was done either by making an agreement to pay a fixed quantity irrespective of actual produce in each year, or by a money payment settled between the parties; or by a partial substitution of payment or labor, as when the party contributed a smaller quantity of produce, but free from the expense of harvesting, carriage, etc.; or finally, by a payment of a bulk sum in redemption of the impost, either for a time or forever, as the case might be, in which case the land so redeemed became temporarily or permanently tithe-free. By such compositions, many lands in England were made anciently tithe-free, and have so continued; but by 1 Elizabeth 19, and 13 Elizabeth 10, such alienations of tithe-payment were restricted to a term of twenty-one years, or three lives.

Besides the exemption from tithe thus created, a still more comprehensive occasion of immunity is traceable to the exemption enjoyed by the lands of religious houses. Originally, convents occupying lands in England paid tithes like other land-owners to the parochial clergy; but a decretal of Paschal II. exempted them from such payments in regard to lands held by themselves in their own occupation. This exemption was confined by subsequent legislation to the four orders—templars, hospitaliers, Cistercians, and præmonstratensians, and after the 4th council of Lateran (1215), only in respect of lands held by them before that year. Frequently, however, exemptions were given in favor of particular houses; and in cases in which religious communities were themselves the incumbents of a parish, as they could not pay tithes to themselves, their own lands within such parish became exempt by what was called "unity of possession." And thus it came to pass that a large extent of land in England and Wales was held free of tithes. Now, when, on the suppression of monasteries, those lands were assigned to lay possessors, they passed of course into lay hands with the same immunity; and hence this exemption from tithe has become perpetual even in the hands of lay possessors, as, on the other hand, by a similar transfer, lay proprietors have in many instances acquired the right to tithe, and the property of many rectories.

The arrangements between parties for commuting the mode of payment, to which allusion is made above, were permitted, and even protected by law; but they were nevertheless purely voluntary and partial, and the perpetually recurring contests to which the system led, as well as the oppressive nature of the exaction when the parties from whom it was claimed did not belong to the church established by law, rendered the impost odious; and in Ireland it became impossible to enforce its collection in great part of three of the four provinces. A measure of commutation became absolutely necessary. This had been recommended by committees as far back as 1822, but it did not pass into law until 1838. Various statutes for England or Ireland have since been enacted regulating the payment of tithe—6 and 7 Will. IV. c. 71, 7 Will. IV. and 1 Vict. c. 69, 1 and 2 Vict. c. 64, 2 and 3 Vict. c. 32, and 5 and 6 Vict. c. 54. Their object for England is to substitute a money rent-charge, varying on a scale regulated by the average price of corn for seven years, for all the other forms of payment. This commutation may either be voluntary, or may be effected by the tithe commissioners, according to a valuation. Land not exceeding twenty acres may be given by a parish in commutation of tithes; but only in the case of ecclesiastical persons, and not of lay improvers. Similar arrangements have been made in those few Catholic countries in which tithes still continue to be paid.

In Ireland the settlement was effected by a general commutation of tithe into a money rent charge, regulated by a valuation of the tithes (one-fourth being deducted

for the cost of collection), and payable by the proprietors, who should receive it from the occupiers of the land. By the Irish church act (32 and 33 Vict. c. 42), this rent-charge became vested in the commissioners of church temporalities, with power to sell such rent-charge to the owner of the land charged therewith at 22½ years' purchase. In 1890-91 a general agitation for the abolition of tithes was begun in Wales, and in many districts the collection of tithes was resisted by force. No final action, however, was taken by parliament although the liberal party endeavored to secure a commutation of the tax.

TITHING, an ancient Saxon division of the country, consisting of the tenth part of a hundred, being occupied by ten families, each of whom was responsible for the good behavior and peace of the rest. The institution has been long growing obsolete, and the police constables (q.v.) now supersede the officer called a tithing-man.

TITHO NUS, son of Laomedon, brother of Priam, and spouse of Eos, the goddess of morn. The story is that Eos, in asking immortality for her spouse, forgot to ask at the same time eternal youth, so that in his old age he became completely shrunk and decrepit, whereby his "cruel immortality" was rendered a burden to him.

TITIAN, or **TIZIANO VECELLI**, the head of the Venetian school, and one of the greatest painters that ever lived, was b. of a good family at Capo del Cadore, in the Friulian Alps, in the year 1477, or, according to some, in 1480. His predilection for drawing caused his father to send him to Venice at the age of ten, that he might learn to be a painter. His instructors were Sebastiano Zuccati and the two Bellini, particularly Giovanni; but the painter that exercised the greatest influence on his style was Giorgione (q.v.). So vivid and keen was his appreciation of the distinctive features of any artist's work, that he never failed to reproduce them with striking fidelity, and even to leave the impression that he had beaten the master whom he imitated, in his own style. It was owing to this irrepressible superiority that the friendship between Giorgione and him was interrupted. The first work that brought Titian prominently into notice was his completion of the "Homage of Frederick Barbarossa to Pope Alexander III." (1512), begun by Giovanni Bellini, but left unfinished by that artist at his death. The Venetian senate, who had commissioned the piece, were so much pleased with Titian's performance, that they conferred on him an office with an annual salary of 300 crowns. In 1514 he painted a "Bacchus and Ariadne," and other works of a similar kind, for the duke of Ferrara, a portrait of the duke himself, and of the lady who afterward became his wife, besides a picture of the "Tribute-money." While residing at the court of Ferrara, he made the acquaintance of the poet Ariosto, who sat to him for his portrait. On his return to Venice he painted an "Assumption of the Virgin," one of his grandest achievements. His reputation now rapidly rose. Pope Leo X. and Raphael both invited him to Rome, and Francis I. to France; but he declined. During 1520-30 the most celebrated of his numerous productions were—"St. Peter, Martyr," a work of unsurpassable beauty; "Victory of the Venetians over the Janizaries;" and "St. Sebastian." In 1530 his friend Ariosto (q.v.), the poet, introduced him to the notice of the emperor Charles V., whose portrait he painted at Bologna, and who gave him several other commissions. From Bologna Titian proceeded to Mantua, where he executed a great number of works for duke Frederico Gonzaga. In 1532 he appears to have accompanied Charles to Spain, where he remained for three years, and painted several of his masterpieces, now found in that country. In 1537 he executed an "Annunciation;" in 1541 a "Descent of the Holy Ghost upon the Apostles," a "Sacrifice of Abraham," "David and Goliath," and a "Death of Abel;" and in 1543 pictures of the "Virgin," and "San Tiziano," and portraits of pope Paul III., cardinal Farnese, and duke Octavio Farnese, at Rome, where he remained three years. The emperor Charles V., who greatly admired his genius, twice called him to Augsburg (1547 and 1550). Among the religious works which he executed for Philip II. of Spain are a "Last Supper," "Christ in the Garden," "St. Margaret with the Dragon," and a "Martyrdom of San Lorenzo;" besides these we notice a "Venus and Adonis," a "Danaë," a "Medea and Jason," and other classic subjects. A complete catalogue of Titian's works does not exist, but the number known is extraordinarily great—upward of 600. Titian died of the plague in 1576, having attained the extreme age of 99. He is best studied at Venice or Madrid, but splendid specimens of his work are to be seen in the chief European galleries. As already observed, he had at first a tendency to reproduce the style of acknowledged masters, but his genius soon emancipated itself from all imitativeness, and displayed a glorious originality and power. The luxury of light did never so enrich a painter's canvas. This is, indeed, his transcendent excellence. Not inaccurate in design, not sterile in invention, not infelicitous in composition—these, his minor merits, are nevertheless wholly thrown into the shade by the splendor, boldness, and truth of his coloring, which alone has sufficed to give him a place alongside the greatest names in art, Raphael, Leonardo da Vinci, and Michael Angelo.—See Hume's *Notices of the Life and Works of Titian* (Lond. 1829); Northcote's *Life of Titian* (Lond. 1830); *Titian, his Life and Times*, by Crowe and Cavalcaselle (Lond. 1876); and Lafenestre, *La Vie et l'Œuvre du Titien* (1886).

TITLARK AND TITLING. See **PIPIT**.

TITLE, REGISTRATION OF, in England, is a modern experiment, set on foot after long-continued opposition, and still frowned on by the solicitors, who conceive that its operation will be to reduce their emoluments. Owing to the total want which had always existed of a register for deeds or writs connected with the transfer of land, except in the counties of Middlesex and York, the complexity and uncertainty attending the operations of conveyancing had long been the opprobrium of English law, and the mercantile classes at last called for a remedy by which an acre of land might be sold with the same expedition and certainty as bank stock. Under the system referred to, so far from expedition being a feature of conveyancing, delay, expense, and insecurity were the chief characteristics. It was till 1874 the inveterate practice for a purchaser of land to demand, and for the vendor to give, what is called a sixty years' title—i.e., he must show the successive owners for sixty, and since 1874 for forty years previous to the sale, and all that these owners did in connection with it. This created great expense and delay. But if the property were sold next month, or next day, precisely the same process had to be repeated between the new purchaser and his vendor, for what might have been done between other parties previously was not binding, nor was it safely to be acted on by their successors in the property. These evils called loudly for some remedy, and of late years all the legal reformers have been busy with projects to provide some relief. An important impetus was given to reform by the passing of the Irish incumbered estates act in 1848, the object of which was to break up and compel a sale of the deeply incumbered estates of Ireland. In 1854 a similar statute was applied to the estates of the West India islands. In 1862 two acts passed for establishing in England a land registry, 25 and 26 Vict. 53, 67, for registering indefeasible titles, but they were confined to good marketable titles. Land of the value of about £6,000,000 had been registered under those acts of 1862, when a more elaborate scheme was prepared by the land transfer act, 1875, 38 and 39 Vict. 87, which greatly amplified and matured the previous efforts in the same direction. The office of land registry is conducted by a registrar, appointed by the lord chancellor, who must be a barrister of ten years' standing. He has assistants and clerks. The office has a seal and various forms to be used in connection with the business. The fees are all fixed by the lord chancellor and the treasury, and these are paid by means of stamps. Power is also given by the act to create hereafter district registries. And it is provided that any land situated in Middlesex and Yorkshire, two counties which already had land registries, should, if registered under the new act, be exempt from the jurisdiction under the local acts, it being contemplated that the general law now established will gradually supersede the former local machinery.

Under the land transfer act, 1875, any person who has contracted to buy freehold land, or any owner or any person having power to sell it, may apply to the registrar to be registered, with an absolute title or with a possessory title only. In case of a purchaser applying the vendor must consent. The registrar must approve of the title submitted, and in case of a sale the vendor and his solicitor must make an affidavit that they have produced all the deeds, wills, instruments of title, and all charges and incumbrances affecting the title, as well as all facts material. The registrar can also compel third parties to produce deeds relating to the land. If doubtful questions as to law or fact arise in reference to it, the registrar may refer a case for the opinion of the high court of justice; and that opinion will be conclusive, because all parties having any possible interest are fully heard by the court. The freehold absolute title will show all incumbrances on such land, and other rights which the act declares not to be incumbrances. The possessory title does not prejudice the enforcement of adverse rights which exist at the time of registration, but in other respects it has the same effect as the absolute title. Leasehold lands may also be registered, and they are registered in a separate register. When once the title is registered no adverse title will acquire any advantage by length of possession. The registered proprietor can by a simple form charge or burden the land with a payment of a sum of money at an appointed time. When the registered land is sold the transferee's name is entered on the register, and a land certificate given to him. Any person claiming on adverse interest may lodge a caution having the effect of entitling him to notice of all future dealings with the property if registered, or he may lodge a like caution against the land being registered at all. No notice of a trust is to be entered on the register, and a trustee selling land may authorize the purchaser to be registered as the first proprietor. The land transfer act is not compulsory, but it was expected that it would gradually become generally accepted when the simplicity it secured for titles came to be better known.

The registration of title in American law, confined usually to real estate, has been defined as "the means whereby the owner of a real estate in real property acquires his right of property, his right of possession, and his actual possession." The title may be by descent or by purchase, the latter term being used to include all methods of acquisition except that by descent. Title by purchase may be by grant or by devise, by operation of the law, or by act of the parties. The various modes by which title may be acquired by act of law are described under the topics ABANDONMENT, ESCHEAT, FORFEITURE, PRESCRIPTION, MARRIAGE, EXECUTION, and EMINENT DOMAIN. Grants may be private or public; the former are by deeds, for consideration *valuable*, as money; or *good*, as

affection, and the deed must be signed, sealed, and delivered; in many states the signature must be attested and acknowledged before a magistrate. As to registration, see RECORD OF CONVEYANCES. Title by public grant in this country is that acquired in real property previously belonging to the government of the United States or one of the states. The fee simple of all unsold lands is in either the general government or the states, and is parted with by an instrument called a patent, the terms of which (unless there has passed some consideration), are construed in favor of the government as against the patentee.

TITLE-DEEDS are the evidences of ownership of real property in this country. Each owner is supposed to be in possession of his own, either by himself or his solicitors; and the ownership of the title-deeds passes along with that of the lands themselves. In England there is no general register, except in Middlesex and Yorkshire, and elsewhere to the extent allowed under the land transfer act. It is a dangerous thing to part with title-deeds, for, by merely pledging them as a security for money a mortgage may be created over the lands. In Scotland there is a general register where all title-deeds may be kept, or authentic copies, so that the loss of one may be replaced without much difficulty.

TITLES OF HONOR, designations to which certain persons are legally entitled, in consequence of possessing particular dignities or offices. King and emperor are titles of honor belonging to the sovereigns of different countries; and your majesty is the form of address to which, by the usage of most European countries, they are entitled. Your grace was in England, in former times, the usual mode of addressing the sovereign. The epithet majesty, taken from the *majestas* of the emperors of Rome, was adopted by the emperors of Germany, who considered themselves their successors; but its use by other European sovereigns is of comparatively recent date. Henry VIII. was the first king of England, and Henry II. the first king of France, who adopted it. Your highness is the style adopted by the sultan of Turkey. The proper style of the reigning sovereign of the United Kingdom is, "Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, queen, defender of the faith." The sons of the sovereigns of England are styled princes, and their daughters princesses; and the sovereign's eldest son is prince of Wales (q.v.). The title of royal highness is given to all the children of the sovereign, and by letters-patent under the great seal in February, 1864, her majesty declared her pleasure that the children of the sons of the sovereign should also enjoy the same title. The different grades of the peerage have their several titles—duke, marquis, earl, viscount, and baron—each of which was in its origin a name of office involving certain specific duties. See FORMS OF ADDRESS, COURTESY TITLES.

Though most European countries have their dukes, marquises, counts, viscounts, and barons, these often differ considerably in rank from the seemingly corresponding titles in Britain, and the English rules and practices regarding title are not applicable abroad. The complicated system of titles by law, and still more by courtesy, which prevails in England, is a source of endless perplexity to such foreigners as endeavor to make themselves acquainted with it.

TITMOUSE. See TIT; CHICKADEE.

TITULAR one who enjoys the bare title of an office, without the actual possession of that office. Thus, the English kings styled themselves kings of France from the time of Henry IV. down to the year 1800; and previous to the recent changes in Italy, the king of Sardinia, as well as the king of Naples, was titular king of Jerusalem. In English ecclesiastical law a titular is a person invested with a title, in virtue of which he holds a benefice, whether he performs its duties or not. In the law of Scotland the term has received another acceptation. When the king, at the reformation, became the proprietor of all church lands, he erected the monasteries and priories into temporal lordships, and bestowed them on laymen, who were known as lords of erection, or titulars; this latter name indicating that they had the same title as had formerly been possessed by the religious houses to the lands and tithes.

There are many titular dignities in the Roman Catholic church; but the class of them which is chiefly noticeable is that which has grown out of the separation between the eastern and western churches. It is well known that the Roman pontiff, notwithstanding the schism, claims to retain authority over the entire extent of Christendom; and even where there is not any longer resident within the limits of an ancient church or province a body of Christians of the Roman communion, the pope claims to appoint an ecclesiastic to be bishop, metropolitan, primate, or patriarch of the ancient see (see IX PARTIBUS INFIDELIUM). In England, and still more in Ireland, where archbishops and bishops of the Roman Catholic church exist *de facto*, but not *de jure*, they are styled titular.

TITUS, a co. in n.e. Texas; drained by the Sulphur fork of the Red river; and by White Oak and Cypress bayous; 400 sq.m.; pop. '90, 8190, incl. colored. The surface is level. The soil is fertile. The principal productions are corn, cattle, cotton, and potatoes. Co. seat, Mount Pleasant.

TITUS, a companion of Paul in the embassy from Antioch to Jerusalem and in his next missionary journey to Asia Minor and Macedonia; was twice sent as a confidential

messenger to the church of Corinth. Having been associated with the apostle in preaching the gospel in Crete, he remained some time there having charge of the churches. Afterward they met at Nicopolis, a city of Epirus, and Titus having then been sent into Dalmatia, does not again appear in Scripture. Nothing more concerning him is certainly known.

TITUS, EPISTLE to, one of the three "pastoral epistles," was written by St. Paul, probably in the latter part of his life, and after he had been liberated from his first imprisonment at Rome. From the 12th verse of chapter iii., we learn that the apostle was staying at Nicopolis when he wrote the letter, and the subscription identifies this place with Nicopolis of Macedonia; but this is impossible, for, as De Wette notices, that city appears to have been founded by the emperor Trajan long after St. Paul was dead. Jerome's opinion is probably the correct one, that the Nicopolis referred to was the famous city in Epirus. The epistle concerns itself mainly with the organization and discipline of the church in Crete, is very practical, and at times unpleasantly sharp in its tone, as if Paul had felt more acutely than usual the vexations which "unruly and vain talkers and deceivers, *specially they of the circumcision*," caused him. Above all things, however, he is nobly solicitous that the Christians of Crete should prove the sanctifying power of their new faith by rising superior to the immoral practices of heathenism. The natural character of the people was unsteady and quarrelsome. They were greedy, licentious, false, and given to strong drink; and the Jews who had settled among them were even worse than the natives. Among such a people Titus was left to carry on the work of establishing Christianity. Hence Paul addressed this epistle to him, adopting in it a sharpness of style which critics consider unusual. First he enlarges on the qualifications of church officers, and on the vices from which they must be free. He then describes the virtues which should adorn old persons, women, the young, servants, and Christians generally. In the third place he commands obedience to civil rulers; commands moderation and gentleness; and condemns all idle and vain speculations. He finally urges Titus to join him at Nicopolis and adds loving salutations and benedictions. See the Commentaries of Chrysostom, Jerome, Aquinas, Luther, Melancthon, Calvin, Cocceius, Grotius, Rosenmüller, De Wette, Alford, Wordsworth, Ellicott, etc.

TITUS FLAVIUS SABINUS VESPASIANUS, Emperor of Rome, was the eldest son of Vespasianus (q.v.) and Flavia Domitilla, and was born at Rome, Dec. 30, 40 A.D. Brought up at the court of Nero along with Britannicus, the son of the emperor Claudius, he received an excellent training both of body and mind, became an adept in manly exercises, and an accomplished scholar; and subsequently, as *tribunus militum* in Germany and Britain, and commander of a legion in Judæa under his father, proved his qualities as a soldier and a general. On his father's elevation to the imperial throne, Titus was left to prosecute the Jewish war, which he brought to a close by the capture of Jerusalem after a long siege. The news of the success was received with the utmost joy, and Vespasian's too suspicious temper was awakened. However, Titus by returning to Rome, and laying the trophies of victory at the emperor's feet, removed his unfounded jealousy, and father and son obtained the honor of a joint triumph (71 A.D.). About this time Titus became his father's colleague in the empire, and the impression which the conduct of the young conqueror made upon the Roman people was, and with just reason, very unfavorable. He gave himself up to the pursuit of pleasure in all its forms, put to death various suspected persons very summarily, and even caused one of his guests, whom he justly suspected of conspiracy, to be assassinated as he left the palace. His *liaison* with Berenice, the daughter of Herod Agrippa I. (q.v.), was also very distasteful to the Romans; and on the death of his father (79 A.D.), whom he was at that time believed by a few to have poisoned, the Romans had satisfied themselves as to the advent of a second Nero. But Titus's behavior after his hand grasped an undivided scepter completely belied their anticipations. The very first act of his reign was to put a stop to all prosecutions for *læsa majestas*, which had abounded since the time of Tiberius (q.v.); informers were scourged in the forum, dragged along in front of the theaters, and then either sold as slaves or banished. The ancient and venerated buildings of Rome were repaired; new ones, as the Colosseum (see AMPHITHEATER) and the baths which bear his name, were erected; and the prominent tastes of the populace were abundantly gratified by games on the most stupendous scale, which lasted for 100 days. Titus's beneficence was unbounded, and it so happened that during his brief reign there was the most urgent need of its exercise. In 79 A.D. occurred the eruption of Vesuvius which overwhelmed Herculaneum and Pompeii and ruined numerous other towns and villages; in 80 A.D. a fire broke out in Rome, which raged for three days, destroying the capitol, Augustus's library, Pompey's theater, and numerous houses; and in the tracks of these calamities followed a dreadful pestilence. Titus dealt out gifts with lavish hand to the houseless and ruined sufferers; he even despoiled his palaces of their valuable ornaments, to obtain money for distribution, and schemed and planned to furnish occupation for them. He was now the idol of his subjects, the "love and delight of the human race;" but, unfortunately for that part of the human race over which he ruled, in the commencement of the third year of his reign he became suddenly ill, and

died at his patrimonial villa in the Sabine country (Sept. 13, 81, not without the suspicion that he had been poisoned by Domitian, his younger brother.

TITUSVILLE, a city in Crawford co., Pa.; on Oil creek, and the Western New York and Pennsylvania and the Dunkirk, Allegheny Valley, and Pittsburg railroads; 28 miles e. of Meadville, the co. seat. It has a high school, public library, electric lights, water-works owned by the city and supplied from cisterns and wells, churches, national and state banks, public parks, and three handsome bridges across the creek. The manufactures include boilers, engines, oil well drilling tools, iron forgings, steel, leather, chairs and furniture, silk goods, soap, radiators, etc. The first petroleum well in America was drilled in the suburbs of Titusville in 1859, and since then the city has been one of the most important oil centers in the country, and its principal industries are those connected with the petroleum trade. Pop. '90, 8073.

TIUMEN', a t. of West Siberia, in the government of Tobolsk, stands on the Toura, an affluent of the Ob (q.v.). Its advantageous situation on the highways, both by land and water, which communicate between Russia and Siberia, has made it an important commercial center, and the seat of flourishing manufactures. The vessels which navigate the Ob, the Irtysh, the Tobol, and the Toura, for the most part receive their cargoes here. Large quantities of leather, wooden articles, carpets, soap, candles, and common pottery are manufactured and exported through West Siberia, the Ural countries, the Kirghis steppes, Khokan, Bokhara, and China. Pop. '91, 36,763.

TIVERTON, a municipal and parliamentary borough and market town in the N.e. of Devonshire, 14 m. n. of Exeter. There are important weekly markets, and great markets for cattle annually. There is a large lace-factory, in which upward of 1800 hands are employed. The town was formerly a great center of the woolen trade. The town is built on a hill between the rivers Exe and Lowman; hence the old names of the town, TWYFORD and TWOFORDTOWN. There is a peculiarity about the town in the rapid streams of water flowing down the channels along the sides of the streets. These streams of water were given to the town about the year 1272, by Isabella Rivers, countess of Devon. The castle was built in 1106. The free grammar-school, an old building in the Elizabethan style, was endowed by Mr. Peter Blundell in 1604. Other buildings were added in 1800, at a cost of \$20,000. There are other schools and numerous charities. Tiverton sends two members to the house of commons. Pop. '81, 10,462; '91, 10,892.

TIVOLI (anc. *Tibur*), a poor t. of central Italy, province of Rome, 19 m. e.n.e. from Rome, stands on the slope of Monte Ripoli, one of the Apennines. Tivoli is walled, and has a fortress. The streets are steep, narrow, and beset by beggars. There is a fine cathedral, formerly a temple of Hercules, where Augustus held his tribunal. The surrounding hills are covered with olive trees. The vines of Tivoli are famed for a peculiar sort of grape, in great request for its firmness and luscious flavor, noticed as early as the time of Pliny the Elder. The stone called "travertino," of which great part of Rome is built comes from Tivoli. Pop. '81, 10,927. Near Tivoli is the extensive villa d'Este. Within and without the city there are many monuments of antiquity. In a commanding position above the falls of the Anio rises the temple of Vesta, of a circular form, and in good preservation, built 70 B.C.; there are the extensive remains of the emperor Hadrian's magnificent villa; the villa of Mæcenæ; remains of mausoleums, aqueducts, bath, etc. The place is much visited by tourists for its waterfalls, which are lofty, but not very picturesque. The Anio furnishes excellent water-power, which since 1892 has been utilized for electric lighting both at Tivoli and at Rome, and for iron-works at the former town.

Tibur long existed as a town (according to ancient tradition) before the building of Rome; but the first mention of it in recorded history occurs 446 B.C., during the Roman decemvirate. It was one of the principal towns of the Latin confederation. Its healthy and picturesque situation induced many of the wealthy Romans to choose it for their country residences. Mæcenæ, Scipio, Æmilianus, the famous Marius, Metellus Numidicus, and Munatius Plancus, had their Tiburtine villas. Horace preferred Tibur to all other places of resort (although he makes allusion to its moist atmosphere, calling it "Udum Tibur"), and had a country-house in the neighborhood. It is one of the few towns of Latium which still stand on their ancient sites.

TILAXCALA, or TLASCALA, a city and state of Mexico, the state being bounded on three sides by Puebla, and w. by Mexico; drained by the Mescala, crossed by the Malinche mountain, and traversed by the Mexico and Vera Cruz railroad, completed in 1872; 1595 sq.m.; pop. '95, 166,803. The city and capital is situated on the Mescala, between two mountains, 20 m. n. of Puebla; pop. abt. 8000. The surface of the state is mountainous, and the soil fertile, producing large quantities of maize, also the maguey or pulque plant, and in some parts hemp has been successfully cultivated. There are manufactures of cotton and woolen cloths. The Tlaxcalans were a warlike and powerful race, remaining unconquered till 1519, when Cortes defeated them, and they became subject to Spain, not, however, renouncing their religion. They are intelligent and of Indian descent.

TLEMCEŃ, a t. of Algeria, in the province of Oran, and 80 m. s.w. of the city of that name, stands in an undulating country, everywhere irrigated, and brought completely under cultivation. It contains Catholic and Protestant churches, mosques, and synagogues, and there are numerous educational institutions, including schools for Arabs and Jews. It is protected from the s. wind by a range of hills, 4200 ft. in height. The town is accessible only from the s.w., the other sides presenting steeply escarped fronts. The district around Tlemcen is covered with fruit-trees of all kinds, of which the olive is one of the most valuable, and there is much cultivated land, producing cereals, tobacco, etc. Besides the special markets, a daily market is held, at which cattle, wool, grain, and oils are largely sold. Ostrich feathers and corks are exported; but the trade is for the most part in cloths, hides, grain, and oils. Pop. '91, 19,802.

TOAD, *Bufo*, a genus of *batrachia*, of the *anourous* or tailless section of the *caducibranchiata*. See **BATRACHIA**. The original genus has been subdivided, and is now constituted into a family, *bufonidae*, to all which the popular name toad is often extended. The form resembles that of the frogs, but is more thick and clumsy, and the hind-legs are generally short, so that the species rather crawl than leap; some of them, indeed, are not known to leap at all. The skin is warty, and the warts or tubercles produce a milky exudation, which in some species is very fetid. Behind the ear there is a porous pad—a very large parotid gland—from which a copious exudation takes place. The muzzle in the restricted genus *bufo* is rounded, but some of the family have an elongated muzzle. The mouth of the true toads is destitute of teeth. The food of toads consists chiefly of small insects and slugs, and they mostly inhabit shady places, avoiding the sunshine, and crawling about either among the stems and leaves of plants or among stones. In their adult state they are much less aquatic than frogs, but their spawn is deposited in water, in which their tadpoles live like those of frogs. They are commonly regarded with disgust, on account of their appearance, the exudation from the skin, and the smell of many of them, yet the eye of the toad is remarkable beautiful. A notion has very generally prevailed that the exudation of the skin is venomous, but it is unsupported by evidence, and toads are handled with perfect impunity. They are eaten by some savage tribes.—Only two species are British. The **COMMON TOAD** (*B. vulgaris*) is abundant in most parts of Britain, and in the western parts of Europe, but is not found in Ireland. A description of it is unnecessary. It spends the winter in a dormant state, and issues from its retreat on the return of spring. Its spawn is deposited in March or April, and much resembles that of the frog, but the ova are smaller and more numerous. The young toad is very small when it loses its tail and gills, and exchanges the tadpole for the adult form. Toads are very useful in gardens, in preventing the excessive increase of some kinds of insects; and on this account it is a frequent practice to put them into hot-bed frames, for which use the market gardeners of the neighborhood of London often purchase them at the price of fourpence each. They have occasionally been tamed, and display some intelligence, readily recognizing those who feed them and are kind to them. A tame toad, of which an account is given by Pennant in his *British Zoology*, lived for more than 40 years, and was at last killed by a raven.

Numerous instances are on record in which toads are said to have been found embedded in rocks, walls, and even in the trunks of trees, where the necessary conclusion is that they must have lived a very long time, in a dormant state. Unfortunately, however, the discovery of these toads has almost always been made by unscientific persons, and there is a want of proper and trustworthy observations as to the places in which they have been found. Attempts have been made by several naturalists, and among others by the late Dr. Buckland, to throw light on the subject by experiment, immuring toads in various ways, and the result, although showing that when air is not wholly excluded they are capable of living for a long time in their imprisonment, probably in a dormant state, is not favorable to the belief that such existence could extend over many years. An interesting account of Dr. Buckland's experiments will be found in Mr. F. Buckland's *Curiosities of Natural History*.

The other British species of toad is the **NATTERJACK** (*B. calamita*) which was first described as British by Pennant, and has since been found to be pretty abundant in some parts of England, and in the s.w. of Ireland, chiefly in the vicinity of the sea. It much resembles the common toad, but is of a yellowish-brown color, clouded with dull olive, a bright yellow line passing along the middle of the back. It has a disgusting smell. It never hops, and its motion is more like walking or running than the crawling of the common toad.—Several other species of toad are found in Europe. Some of those found in tropical countries attain a very large size. The **OBSTETRICIAN TOAD** (*B. obstetricans*), after the female has extruded her eggs, places them about his thighs and carries them, it is said, till the eyes of the embryo become visible. See illus., **REPTILES**, ETC., vol. XII.,

TOAD-FISH. See **FROG-FISH**.

TOADFLAX, *Linaria*, a genus of plants of the natural order *scrophularineæ*, very closely allied to **SNAPDRAGON** (q.v.), from which genus this has but recently been separated, and is distinguished chiefly by the spur at the base of the corolla, and the capsule opening by valves or teeth, not by pores.—The species are herbaceous plants, natives chiefly of the colder and temperate parts of the old world. Some of them are

natives of Britain, of which the most common is *L. vulgaris*, a species with erect stem 1 to 3 ft. high, glaucous, linear-lanceolate leaves which thickly cover the stem, and terminal spikes of yellow flowers. It grows in hedges, the borders of cornfields, etc. It possesses purgative and diuretic properties, and a decoction of it is used as a fly-poison; but it is regarded as a troublesome weed by farmers. It has found its way, probably along with grain or other grass seeds, into the United States. A very remarkable monstrosity is sometimes seen in this plant, to which the name *peloria* has been given, the flower presenting five spurs, and five usually imperfect stamens.

TOADSTOOL. A popular name for any poisonous variety of mushroom (q.v.).

TOADSTONE, a local Derbyshire name for a soft and earthy variety of trap, looking like an argillaceous deposit.

TOAST (Lat. *tostus*, scorched or roasted) is the name given to bread dried or scorched before the fire. So early as the 16th c. toasted bread formed a favorite addition to English drinks. Sack was drunk with toast, and so was punch. The practice of drinking healths, particularly that of an entertainer, is one so natural, so likely to spring up spontaneously, that it is impossible to say when it began. Certain it is, however, that it received an artificial development owing to the prevalence of convivial habits in the 17th century. Then it became the fashion to drink not to the health of entertainers only, but to that of each guest, of absent friends, and more especially of the unmarried woman whose attractions were most generally acknowledged. It also became the custom to describe a woman whose health was so drunk as herself "a toast." In this sense, the application of the word is said to have had its origin in an incident which occurred at Bath, and which is recorded in the 24th number of the *Rambler*, in the following passage: "It happened that on a public day, a celebrated beauty of these times" (when it was the fashion for ladies to bathe publicly in elegant dresses made for the purpose) "was in the Cross Bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow, half fuddled, who offered to jump in, and swore, though he liked not the liquor, he would have the toast" (making, of course, allusion to the custom of putting toast in punch). "He was opposed in his resolution; yet this whim gave foundation to the present honor which is done to the lady we mention in our liquor, who has ever since been called a toast." Whatever may be the origin of the use of the word "toast" in this sense, we now apply it not only to any person, but to any sentiment mentioned with honor before drinking. The French have adopted the word "toast" from us; making it masculine when applied to a man or a sentiment, but feminine when applied to a woman.—See Chambers's *Book of Days*.

TOBACCO (of uncertain derivation, but most probably from the native American name), a genus (*nicotiana*) of plants of the natural order *solanaceæ*, having large broad leaves; a five-parted calyx; a funnel-shaped, five-lobed corolla, and five stamens; the flowers growing in panicles at the top of the stem; the fruit a two-celled, five-valved, many-seeded capsule. The species are mostly herbaceous plants, rarely shrubby, with large broad leaves, and everywhere covered with clammy hairs. They are natives of warm countries, most of them American, although some are found in the East Indies. They all possess the narcotic property, on account of which a few of them are extensively cultivated. It resides in almost all parts of the plant, although the leaves are almost exclusively used. The most important species is the COMMON TOBACCO, or VIRGINIAN TOBACCO (*N. tabacum*), a native of the warm parts of America, the cultivation of which had extended, before the discovery of the new world by Columbus, far to the n. of the regions in which the plant appears to be indigenous. It is about 5 or 6 ft. high, erect, with lanceolate, sessile leaves, 6 to 18 in. long, and rose-colored flowers, the throat of the corolla inflated, the segments pointed. There are numerous varieties, differing more or less in the size and form of the leaves, and in the form and color of the flowers, some of which are regarded by some botanists as distinct species. One of these is the BROAD-LEAVED TOBACCO, or MARYLAND TOBACCO, which has a thicker stem, and much broader leaves. The GREEN TOBACCO (*N. rustica*), sometimes called ENGLISH TOBACCO, because it was the first kind introduced into England for cultivation, is a smaller plant, from 3 to 5 ft. high, with ovate, stalked leaves, and the segments of the corolla rounded, its tube cylindrical. It is a native of the east, but is more hardy than the Virginian tobacco, and is therefore cultivated in more northern regions. The PERSIAN TOBACCO (*N. Persica*) has the root-leaves oblong, those of the stem lanceolate and sessile; the corolla salver-shaped, with a long tube; its lobes rather unequal. It is a native of Persia, and furnishes the Shiraz tobacco, so much esteemed in the east, and which is milder than the common tobacco. Other species of tobacco are used in different parts of America, and some of them are cultivated to a small extent, as *N. repanda*, in Cuba; *N. quadrivalvis*, by the Indians on the Missouri; *N. multivalvis*, by the Indians on the Columbia; and *N. nana*, by the Indians of the Rocky mountains.

It is somewhat doubtful whether the use of tobacco as a narcotic was known in the east before the discovery of America. Meyen, in his *Geography of Plants*, expresses the opinion that the smoking of tobacco is of great antiquity among the Chinese, because on very old sculptures he has "observed the very same tobacco-pipes which are now in

use." Meyen's authority, however, is greater as a botanist than as an archæologist, and cannot be received as decisive of the antiquity of the sculptures of which he speaks. It is not improbable that the smoking of tobacco has been long practiced in China, but it is not certain. If it was so, the custom did not extend among neighboring nations, which, however, has been the case also as to the use of some other narcotics; whereas, on the introduction of the use of tobacco from America, it rapidly extended throughout Europe, and soon became extremely prevalent among oriental nations. In the present state of our knowledge, no ethnological argument can be founded upon the prevalence of smoking among the Mongolians and the American Indians. The smoking of tobacco was found by Columbus to be practiced in the West Indies, where the natives made it into cylindrical rolls, wrapped in maize-leaf. It has been prevalent from unknown antiquity among the American Indians as far north as Canada. With them it even has a religious character, and is connected with their worship and with all their important transactions. Thus the calumet (q.v.), or pipe of peace, is indispensable to the ratification of a treaty; and smoking together has even greater significance of friendship than eating together has among other nations. "In the belief of the ancient worshippers, the Great Spirit smelled a sweet savor as the smoke of the sacred plant ascended to the heavens; and the homely implement of modern luxury was in their hands a sacred censer, from which the hallowed vapor rose with as fitting propitiatory odors as that which perfumes the awful precincts of the cathedral altar, amid the mysteries of the church's high and holy days."—Wilson's *Prehistoric Man*, i. 383. The seeds of the tobacco plant were first brought to Europe by Gonzalo Hernandez de Oviedo, who introduced it into Spain, where it was first cultivated as an ornamental plant, till Nicolo Manardes extolled it as possessed of medicinal virtues. It was introduced into Italy in 1560. The use of tobacco in the form of snuff soon followed its introduction for smoking. There is no reference to the use of tobacco in Shakespeare, yet it is certain from other evidence that it was well known in England in his time, although at first its use was confined to the wealthy, as the price was very high and it was smoked in very small pipes—probably the same which are known to antiquaries as *elfin pipes*—and the smoke was expelled, not from the mouth, but by the nostrils, in which way the narcotic power of the herb is much greater. Tobacco was at first recommended for medicinal virtues, which were greatly exaggerated, but soon became an article of luxury. The popes Urban VIII. and Innocent XI. fulminated against it the thunders of the church; the priests and sultans of Turkey declared smoking a crime, Sultan Amuret IV. decreeing its punishment by the most cruel kinds of death; the pipes of smokers were thrust through their noses in Turkey; and in Russia the noses of smokers were cut off in the earlier part of the 17th century. King James I. of England issued a *Counterblaste to Tobacco*, in which he described its use as "a custom loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black, stinking fumes thereof nearest resembling the horrible Stygian smoke of the pit that is bottomless." All opposition, however, was in vain. The use of tobacco increased and has continued to increase to the present day, when it is more prevalent than at any former time, the luxury of rich and poor, of civilized nations and of savage tribes. Although it did not become prevalent in the east till the 17th c., the Turks and Persians are now the greatest smokers in the world. In India, all classes and both sexes smoke; in China, the practice—perhaps there more ancient—is universal, and girls, from the age of eight or nine, wear, as an appendage to their dress, a small silken pocket to hold tobacco and a pipe. How the practice of smoking has increased everywhere, every one knows. The use of snuff has not increased in the same manner, but has rather diminished. Tobacco is used in the three modes of smoking, chewing, and snuffing.

Tobacco derives its botanical name (*Nicotiana*) from Jean Nicot, who introduced it into France. In that country, its use in the form of snuff began in the reign of Francis II. About the same time, a snuff-manufactory was established at Seville, which produced the celebrated Spanish snuff. The tobacco plant was soon after introduced into other countries of Europe. In 1657, the manufacture and sale of tobacco were farmed out in Venice, and began to yield a considerable revenue. Much revenue has since been derived from the same source, in many countries. Tobacco is now extensively cultivated in many parts of Europe, as well as in Asia and America. Prohibitory laws alone prevent its cultivation in the southern parts of Britain and Ireland, of which the climate is quite suitable to it. The quality of the leaf, however, deteriorates in the more northern regions in which it is cultivated, as in Germany, when it is continuously raised from home-grown seed, and seed is therefore imported from warmer countries.

Cultivation and Commerce.—The cultivation of tobacco requires a rich, loose soil, and the strongest manures are advantageous. The influence of soil, climate, and manures on the quality of the produce is very great, almost beyond what is known in any other cultivated plant. Vegetable manures are best for tobacco intended for smoking; animal manures are preferred for that which is to be made into snuff. In the more northern regions in which tobacco is cultivated, the seed is sown in a hot-bed, protected from frost by mats, and the plants are planted out in rows from two feet to three feet apart in the field. The ground is frequently hoed and stirred. Where the plants are not intended for seed, the top is usually broken off, so as to prevent flowering, that its whole strength may be directed to the leaves. In America, when the leaves begin to become yellow, or are marked with yellow blotches, the plants are cut down, and hung up in a

large barn to dry, but in Germany, the leaves are gathered as they become yellow, are tied in small bunches, and are hung up in a shady place to dry.

The cultivation of tobacco is comparatively easy, and, although a warm climate suits it best, it is without much difficulty raised in most parts of Europe. The usual plan in the great tobacco-producing countries is to sow the seed in seed-beds of rich soil, and, as the seed is extremely minute, it is first mixed largely with sand or wood-ashes, to assist in spreading it thinly. In Virginia, which may be taken as one of the best tobacco-growing districts, this is usually done in the first week in January. After the seed-beds have been carefully prepared and sown, small branches of trees are laid over, to protect the seed, when it germinates, from the effects of frost; but these are removed as soon as can be done with safety, and the plants then grow rapidly, and are ready for transplanting into the fields about the beginning of June. The land in the fields is very carefully prepared, and small hillocks are raised up in rows; each is about a foot in diameter, and flattened at the top. With the first appearance of rain, the plants are carefully raised from the seed-beds, and carried usually by children, who deposit one on each hillock, on which it is carefully planted by experienced men, who follow after the children. Only wet weather will do for planting, so that this operation often lasts until the end of July. When planted, the tobacco crop requires much careful attention to weeding, and a watchful eye to prevent the ravages of various insect enemies. Much of this latter work is done by flocks of turkeys, kept on purpose by the planters. As soon as the plants begin to throw up the flower-shoot it is nipped off; otherwise it would weaken the leaves; but this process is neglected in some countries, especially in Turkey and Greece, where small leaves are preferred, and where, in some cases, as in the celebrated Latakia tobacco, both leaves, buds, and flowers are used. The time generally chosen for cutting it is mid-day, or when the sun is powerful, and the morning and evening dews absent. The cutting is done by hand, and only such plants are chosen as are ready, which is known by a clammy exudation which forms over the leaf, often giving it a spotted appearance. If the plants are very large, the stalk is often split down, to facilitate the drying. They are then removed from the field to the tobacco-house, around which are erected light scaffolds, to which the plants are suspended, generally by passing a thin stick through a split in the stalk of each, and so placing a number of plants on each stick, just near enough to prevent them touching each other. After some time hanging in the open air, the plants on the sticks are removed, and suspended in a similar way inside the curing-house, until the drying is completed. The leaves are next removed from the stalks, and all bad ones rejected. The chosen ones are tied up in bundles called hands, and these are packed in hogsheads, enormous pressure being applied in the packing. These hogsheads are very large casks, which must not contain less than 950 lbs. net in the United States, where the government exercises a very strict surveillance over the weight and quality of all tobacco grown and cured there. Previously to the late disastrous war with Brazil, a large tobacco-export had been carried on by Paraguay. The quality, though not equal to that grown in the United States, was, however, fair, and had been improving. Turkey has also, for several years past, been steadily increasing her exports of tobacco to other countries. The quality of Turkish tobacco is very peculiar: it is small in the leaf, and of a light color—either a bright yellow, a yellowish green, or a yellowish brown. Being extremely mild, it is a favorite with many smokers.

Tobacco, owing to the high rate of duty when in any manufactured form, is mostly imported in the leaf; but small quantities are brought in, chiefly for re-export, in various states of manufacture. The chief of these is called cavendish, which is made by stripping the blades of the leaves from the midribs, and, after sprinkling them with an infusion of tobacco made from the stalks and other waste parts, laying them in heaps to heat or ferment. This darkens their color; and while still moist and flaccid, they are laid smoothly upon each other, so as to form cakes about 9 in. in length by 3 in breadth, which are pressed by powerful machinery until they are very compact and hard. Another kind is called negrohead, which is formed into sticks about an inch thick, and 8 or 9 in length, which are laid across each other equally, and are then pressed into cakes. When the sticks are pulled apart, the rounded depressions caused by pressing them into one another gives them a slight resemblance to the wavy locks of a negro's hair, whence they receive their name.

Cigars and *cheroots* are also forms of manufactured tobacco; but so much in favor are these with smokers, that the exorbitant duty is very little check upon their importation. The island of Cuba supplies not only the best but also the largest quantity; the Havana tobacco being exceedingly well cultivated and cared for.

The best cigars known to the experienced smoker are those that are made from the tobacco grown in the Cuban district of Vuelta Abajo and hence known as Vuelta tobacco. Next comes that known as the Partido, of which nearly 70 per cent. of the Cuban cigars imported into the United States are manufactured. The Partido cigar regularly retails at from 25 to 30 cents.

The greater proportion of genuine Havana cigars now smoked in this country are not manufactured in Cuba, but at Key West (Tampa), by Cuban workmen from genuine imported tobacco, under the system used in Cuba and known to the trade as "Cuban hand-work." This term characterizes a very careful method, by which each piece of leaf is so graded that the entire cigar is of the same color throughout, with each vein of the leaf running in the same direction, in order to insure even and perfect burning.

The whole cigar is thus necessarily made by hand; and for work of this description very high wages are paid, often as much as \$40 per 1000 cigars, or four cents apiece.

Next to Cuba, the best tobacco is grown in Virginia, while the product of Borneo, Ceylon, and the Philippine Islands is little inferior. Persia also produces a good article. Turkish tobacco is very aromatic. The name "Turkish" is loosely applied to the leaf grown in Syria, Roumelia, Karamania, and about the Persian Gulf. A light yellow tobacco is smoked in China, and some of it is exported thence to England. Japanese tobacco is of an inferior quality. Very excellent tobacco is that grown in the Dutch possessions in Java and Sumatra and shipped to Amsterdam, where the best cigars in Europe are most readily obtained. Burmese tobacco is fair. Mexico and South America, especially Brazil, produce a very aromatic tobacco. That of Brazil is said to be the quickest burning tobacco in the world. England is the only European country where no tobacco is grown. In Germany, inferior tobacco is produced along the Rhine, near Baden and at Mainz, and is for home consumption. In France, where tobacco is a government monopoly, it can be grown only by those who receive a special license. These producers have the choice of selling their tobacco to the government manufactories or of exporting it. In 1891, tobacco was cultivated in 22 departments of France. The strongest French tobacco is grown in the departments of the Nord and Pas-de-Calais. The government has 19 manufactories, of which two are in Paris.

The best cigars made in Europe of European tobacco are those manufactured in Seville, Spain. They are thought by many to equal the Havana Partido. In Germany and Belgium, many cheap imitations of Havana cigars are made from beet-leaves soaked in tobacco juice. Hamburg and Frankfort are the seat of an extensive manufacture of inferior cigars. Cigars may be purchased in Germany as low as three for a cent.

The United States produce more tobacco than any other country in the world, and export about half of the product, chiefly to Germany, England, France, Italy, Austria, and Holland, in the order named. The value of our tobacco export in 1850 was \$6,417,251; in 1860, \$15,917,901; in 1865, \$45,209,512; in 1870, \$22,705,225; in 1875, \$27,844,470; in 1880, \$18,442,273; in 1885, \$24,762,305; in 1890, \$25,355,601.

The average amount annually exported to our three great customers, is in each case as follows: Germany, 69,240,770 lbs.; to Gt. Britain, 50,105,427 lbs.; to France, 29,506,250 lbs.

The amount received by the United States government from the internal revenue tax on tobacco products is a large one. In 1865 it was \$11,401,373; in 1870, \$31,350,708; in 1875, \$37,303,462; in 1880, \$38,870,140; in 1885, \$26,470,088; in 1890, \$33,949,997.

The McKinley Tariff Act of 1891, largely increased the duty on imported tobacco and tobacco products. The old rate for cigar-wrappers was \$0.75 per lb.; the new rate, \$2.00 per lb.; old rate for "stemmed" tobacco, \$1.00 per lb.; new rate, \$2.75 per lb.; old rate for cigars and cigarettes, \$2.50 per lb.; new rate, \$4.50 per lb. The value of the tobacco imported in 1890 was \$21,710,454.

CIGARETTES. Of late years cigarette smoking has increased greatly, especially in the United States. As cigarettes are classed as cigars in the revenue returns, it is difficult to secure satisfactory statistics on this head. In 1880, however, more than 408,000,000 cigarettes were manufactured by American companies. The great manufactories of cigarettes are at New York, Richmond, Va., and Rochester, N. Y. The manufacture is now practically in the hands of a single "trust." In France, there are now seven factories exclusively devoted to the production of cigarettes, employing over 2000 women and turning out more than 400,000,000 cigarettes a year. In Spain, the consumption of cigarettes is very great, but the practice is for the smoker to roll his own, rather than to smoke the manufactured article. Of the foreign cigarettes imported into the United States, the most sought after are now the so-called "Turkish" or "Egyptian," made from tobacco grown in Roumelia and Syria, and made with mouthpieces. The coarse-rolled cigarettes from Cuba that were once in great vogue in this country are now little used.

SNUFF was originally made in Spain, and later in England, Scotland, Holland, and Belgium. It was at first made by grinding the leaf tobacco in mortars, and scenting the powder in various ways. It is now ground in metal mills by steam-power. The best-known brands are *Macebooy* (from Spain), *Rappee* (from France), and *Scotch* or *Lundy-foot*. The United States produce a small amount of snuff. In 1882, 6468 pounds were exported; but the practice of taking snuff is declining with every year, and at present it survives in this country chiefly in some parts of the South where the unpleasant practice of "snuff-dipping" still prevails. In the reports of the manufactories of tobacco, snuff is classed with chewing tobacco.

Tobacco is used as a sedative or narcotic over a larger area, and among a greater number of people than any similar substance, opium being the next to it in these respects, and the hemp-plant the third. Tobacco-leaves, when submitted to chemical analysis, yield nicotine (q.v.), which is its most characteristic constituent, albumen, a gluten-like substance, gum, resin, malic and citric acids, and a large amount of inorganic constituents, 100 parts of the dry leaf yielding from about 19 to 27 per cent of ash, in which potash, lime, and silica preponderate. In a physiological and medical point of view, the analysis of the smoke of tobacco is of far more importance than that of the leaf. From the researches of Dr. Richardson, it appears that although "the widest differences prevail in respect to the products arising from differing cigars, differing kinds of tobacco, and differing pipes," there are certain substances which are common to all varieties of

tobacco-smoke. Firstly, there is in all tobacco-smoke a certain amount of *watery vapor*, impregnated with various substances, from which it may be separated. Secondly, a small quantity of free *carbon* is always present; it is to the presence of this constituent that the blue color of the smoke is due. "It is this carbon," says Dr. Richardson, "which in confirmed and inveterate smokers settles on the back part of the throat and on the lining membrane of the bronchial tubes, creating often a copious secretion, which it discolors, and which is coughed up of a dark coaly appearance."—*For and Against Tobacco*, Lond., 1865, p. 5. Thirdly, there is a certain quantity of *ammonia* present. The presence of the ammonia gives to the smoke an alkaline reaction. Moreover, "it is the ammonia that bites the tongue after long smoking; it is the ammonia that makes the tongue and throat of the smoker so dry, and induces him to quaff as he smokes, and that partly excites the salivary glands to secrete so freely. The ammonia also exerts an influence on the blood."—Richardson, *op. cit.*, p. 6. Fourthly, *carbonic acid* is always present, as may be shown by its action on lime-water. The amount differs extremely in the smoke from different kinds of tobacco, but, according to Dr. Richardson, it may be fairly inferred that the sleepiness, headache, and lassitude which follow the prolonged inhalation of tobacco-fumes, are largely due to this agent. Fifthly, tobacco-smoke yields a *product having an oily appearance*, and possessing poisonous properties. It is popularly known as *oil of tobacco*; and on further analysis, it is found to contain three substances—viz., a fluid alkaloid, *nicotine*; a *volatile substance* having an empyreumatic odor; and an *extract* of a dark resinous character, having a bitter taste. The symptoms of tremor, palpitation, and paralysis which ensue after excessive smoking, especially in persons unaccustomed to indulgence in this practice, seem to depend upon the nicotine, which is known, by experiment, to be highly poisonous.

It is unnecessary to enter into details regarding the symptoms of slight tobacco-poisoning, because they are well known to the great majority of the male population. Fortunately, the effects produced by tobacco are very transitory, as the poison finds a ready exit from the body. The system, after being subjected for a few times to the poisons of tobacco-smoke, becomes accustomed to their influence, the distressing symptoms no longer occur, and a condition of "tolerance" is established. From the extensive investigations of Dr. Richardson, it appears that there are no grounds for believing that smoking can produce any organic changes. It may, however, produce various functional disturbances: (a) On the stomach. (b) On the heart, producing debility and irregular action. (c) On the organs of the senses, as dilatation of the pupil, confusion of vision, subjective sounds, etc. (d) On the brain, suspending the waste of that organ, and oppressing it if it be duly nourished, but soothing it if it be exhausted. (e) On the nerves leading to over-secretion of the glands which they control. (f) On the mucous membrane of the mouth, causing what has been described as the "smoker's sore throat." "The disease consists of an irritable state of the mucous membrane at the back of the throat, redness there, dryness, a tendency to cough, and an enlarged soft, sore condition of the tonsils, rendering every act of swallowing painful and difficult." It may exist without detection for a long time; but if a damp, cold, foggy state of the air comes on, the throat becomes troublesome and painful, enlargement of the tonsils is detected, and the symptoms become much aggravated by any attempt to smoke. This condition is more readily induced by the use of cigars than of pipes: it is quite incurable so long as the patient continues to smoke, but soon disappears when the use of tobacco is entirely suspended. In association with this condition of the throat, the gums are usually abnormally pale and firm. (g) On the bronchial surface of the lungs, sustaining any irritation that may be present, and increasing the cough. There is no evidence that tobacco-smoke can cause specific diseases, such as insanity, epilepsy, St. Vitus's dance, apoplexy, organic disease of the heart, cancer, consumption, or chronic bronchitis. If, as is universally allowed, tobacco possesses, like alcohol, arsenic (in minute doses), opium, tea, coffee, etc., the power of arresting the oxidation of the living tissues, and thus checking their disintegration, it follows (1) that the habit of smoking must be "most deleterious to the young, causing in them impairment of growth, premature manhood, and physical degradation" (Richardson, *op. cit.*, p. 73); and (2) that the habit may be conducive to the physical well-being of the individual, provided he cannot supply himself with sufficient nourishing food.

For a long controversy on the question, *Is Smoking Injurious to Health?* in which Sir Ranald Martin, Mr. Solly, Dr. Ranking, and other medical men took a part, the reader is referred to the 1st volume of *The Lancet* for 1857. The whole matter is very fairly summed up by Dr. Richardson in the excellent pamphlet from which we have so freely borrowed in this article—a memoir which we can cordially recommend to all who take an interest in this subject. Before the full maturity of the system is attained, even the smallest amount of smoking is hurtful; subsequently, the habit is, in most instances, only prejudicial when it is carried to excess. We cannot honestly say more against tobacco than can be urged against any other luxury, and of nearly every luxury it is the least injurious. "It is innocuous as compared with alcohol; it does infinitely less harm than opium; it is in no sense worse than tea; and by the side of high living altogether, it contrasts most favorably."—Richardson, *op. cit.*, p. 75. In conclusion, a word or two may be said regarding the kind of pipe that should be used. A long, perfectly clean pipe, composed of an absorbing material like clay or meerschaum, which can suck up the oily matter before it reaches the mouth, is always to be preferred; and M. Melseus.

to whom the scientific world is indebted for many ingenious applications of chemistry to hygiene and the treatment of diseases, has recently suggested, that if a plug of cotton, saturated with a strong solution of citric or tannic acid, were placed in the stem, so as to filter the smoke before it reached the mouth, all the nicotine would be seized by and combine with the acid. The different kinds of tobacco exert a different influence on the smoker according to the amount of noxious ingredients which they contain. Thus, cavendish, pigtail, and coarse shag yield the oily matters in much more abundance than Latakia or Turkish, which are hence termed mild tobaccos. Cigars produce dyspepsia much more rapidly than pipes, for in smoking them, unless with a long mouth-piece, nicotine is necessarily absorbed.

Snuffing is probably the least injurious form in which to take tobacco, and chewing the most deleterious; yet sailors, who chew more freely than any other class in this country, are usually men in vigorous health, and after prolonged practice the quantity they can consume is enormous. Dr. Arrott mentions the case of a harbor-superintendent, formerly a sailor, aged 64, in the almost uninterrupted enjoyment of good health, who chewed tobacco for upward of 50 years, and at length ate it, swallowing every particle of leaf and juice. For many years, he had been in the constant practice of "eating a quarter of a pound of the strongest negrohead every five days."

The effects which tobacco produces in large doses, when taken by persons unaccustomed to its use, in the form of powder, infusion, or excessive smoking, are "faintness, nausea, vomiting, giddiness, delirium, loss of power of the limbs, general relaxation of the muscular system, trembling, complete prostration of strength, coldness of the surface, with cold, clammy perspiration, convulsive movements, paralysis, and death. In some cases, there is purging, with violent pain in the abdomen; in others, there is rather a sense of sinking or depression in the region of the heart, creating a sense of impending dissolution. With the above-mentioned symptoms, there is a dilatation of the pupils, dimness of the sight, a small, weak, and scarcely perceptible pulse, and difficulty of breathing."—Taylor's *Principles and Practice of Medical Jurisprudence*, p. 321. Although there are two recorded cases of poisoning by nicotine, poisoning by tobacco has rarely given rise to medico-legal investigation. There is, however, reason to believe that porter is often drugged with tobacco or Scotch snuff, for the purpose of stupefying persons with a view to robbery. In all cases of poisoning with tobacco, if it has been swallowed, an emetic of a scruple of sulphate of zinc should be at once administered, and the most powerful stimulants, both external and internal, should be employed. Prof. Haughton has shown that nicotine and strychnine antagonize one another; on this assumption, strychnine, carefully administered, would be the proper antidote.

Tobacco has been used in medicine in the form of an enema, with the view of relaxing the muscular fibers, in cases of strangulated hernia, stricture of the bowel or urethra, tetanus, etc.; but in such cases, it has now been generally superseded by chloroform. If it continue to hold a place in the pharmacopœia, it will probably be as an antidote to strychnine.

It must be recollected that *Indian tobacco* has nothing in common with the subject of this article, and is a synonym for *lobelia inflata*.

In America the culture of tobacco began in Virginia with the earliest settlement of the colony. It is recorded that in 1615 the gardens, fields, and even the streets of Jamestown were planted with tobacco; which immediately became, not only the staple crop, but the principal currency of the colony. In 1619 "ninety agreeable persons, young and incorrupt," and in 1621, "sixty more maids, of virtuous education, young and handsome," were sent out from London on a marriage speculation. The first lot of these ladies was bought by the colonists for 120 pounds of tobacco each; the second lot brought 150 pounds each. By the year 1622 the annual product of tobacco amounted to 60,000 pounds, and it more than doubled during the next 20 years. The culture of this plant was introduced into the Dutch colony of New York in 1646, though it never gained the same prominence there as further south. But Maryland, the Carolinas, Georgia, and later Kentucky, made it the leading object of their culture almost from their first settlement. It long constituted the most valuable export of British America; but the product per acre had been diminishing for many years before the revolution, owing to the difficulty of supplying manure, and the consequent exhaustion of the soil. From 1744 to 1776 the exports of this crop averaged 40,000,000 pounds a year. Tobacco has now become a somewhat prominent crop in Massachusetts and Connecticut, and in both of these states its culture has rapidly extended. In 1850 but 138,246 pounds were raised in Massachusetts; in 1860 the crop increased to 3,233,198 pounds, and in 1870 to 7,312,885. Since the latter date it has fallen off, and in 1878 was 4,320,000; and 1883, 4,038,278 pounds. The aggregate yield of the country in 1840 was reported by the census of that year as 219,163,319 pounds; in 1850 it was reduced to 199,752,655 pounds; but in 1860 it went up to 434,209,461 pounds, to fall again in 1870 to 262,735,021 pounds, a fluctuation to be explained in part by the many casualties to which it is liable, damage by insects, hail, drought, frosts, etc. Though it is produced in all the states, there were only 15 states in 1880 that produced, each, as much as 1,000,000 pounds, while several counties in tobacco states yield each two, three or five

millions of pounds. Kentucky and Virginia were credited with more than half the crop, the former state alone 40 per cent of it. Only ten states separately exceeded 10,000,000 pounds, by the census of 1880: Kentucky, Virginia, Pennsylvania, Ohio, Tennessee, North Carolina, Maryland, Connecticut, Missouri and Wisconsin, in order of precedence. Connecticut grows some tobacco in every county, though Hartford co. was credited in 1880 with 9,039,514 pounds of the 14,044,652 pounds reported. Three Atlantic states, with four western, at one time monopolized the production, as may be seen by the following table:

| STATES. | 1850. | 1860. | 1870. | 1874. |
|----------------------|-------------|-------------|-------------|-------------|
| Virginia | 56,803,227 | 123,967,757 | 37,086,364 | 35,000,000 |
| Kentucky | 55,501,196 | 108,102,433 | 105,305,809 | 34,500,000 |
| Tennessee | 20,148,932 | 38,931,277 | 21,465,452 | 5,780,000 |
| Maryland | 21,407,497 | 38,410,965 | 15,785,339 | 16,500,000 |
| North Carolina | 11,984,786 | 32,853,250 | 11,150,087 | 8,500,000 |
| Ohio | 10,454,449 | 25,528,972 | 18,741,973 | 13,000,000 |
| Missouri | 17,113,784 | 25,086,196 | 12,320,483 | 13,800,000 |
| Total | 193,413,871 | 392,880,850 | 221,855,567 | 127,140,000 |
| Other states | 6,338,784 | 41,328,611 | 40,879,774 | 51,215,000 |
| Grand total | 199,752,655 | 434,209,461 | 262,735,341 | 178,355,000 |

None of the cotton states produce much tobacco, but one county in Florida, Gadsden, has long been celebrated for the production of Cuba tobacco, which always brings a high price. In 1880 there were 231 counties in the United States producing more than 100,000 pounds each, Lancaster co., Penn., leading, with a production of over 23,000,000 pounds. The number of acres planted in tobacco in all the states was, in 1883, 630,609, divided as follows: New Hampshire, 107; Massachusetts, 2,814; Connecticut, 8,145; New York, 5,440; Pennsylvania, 28,879; Maryland, 40,593; Virginia, 129,996; North Carolina, 60,000; Arkansas, 2,300; Tennessee, 40,221; West Virginia, 4,108; Kentucky, 230,116; Ohio, 32,128; Indiana, 11,863; Illinois, 5,679; Wisconsin, 12,750; Missouri, 15,400. The price per pound in 1880 ranged from 5-15 cents in the different states. There are a great many varieties of American tobacco, the exhibit in the economic museum of agriculture in connection with the department at Washington showing in 1877 90 specimens from 21 states, the best sample being a Virginia tobacco, said to have brought \$4 per pound. Included in the exhibit was a specimen of wild Indian tobacco from Arizona. The Connecticut seed-leaf is cultivated almost exclusively in New England, and in certain counties in New York. A cross from Havana seed is grown in Bucks co., Penn., much resembling imported Cuba tobacco. The Maryland tobacco is of two varieties, the broad leaf and the narrow leaf. The former commands a higher price; the latter yields a larger quantity. Much of it is exported, a large order being usually filled for the French government. There are in Maryland the bay tobacco, big Pryor variety, white stem, Frederick, etc. North Carolina produces the Gooch, white stem, yellow Pryor, big Orinoco, and little Orinoco; Tennessee has some of these, and also the big and little Frederick, blue Pryor, big stem, etc. Much of the Kentucky tobacco goes to Germany, Austria, and the north of Europe; certain varieties are sent to Mexico and to the coast of Africa. The white Burley, long green, Baltimore Cuba, twist bud, and big shoe-string, are among the Kentucky varieties. Rotation is commonly practiced with this crop. Thus, in the Connecticut valley it is customary to take from one to three crops of tobacco, then a hay or grain crop, followed by grass for several years. In the Onondaga district, N. Y., the order is clover, wheat, tobacco; Steuben co., clover, corn, tobacco; in Lancaster co., Penn., which produces a large proportion of the crop of that state, tobacco is preceded by corn and followed by wheat; in Virginia the custom frequently is to take off two or three crops of tobacco, followed by wheat, afterward clover or grass.—Up to 1877, tobacco had paid to the general government a revenue of more than \$426,000,000 in 16 years; meanwhile, it is a remarkable fact that the return to the government had been greater than that to the producers: the excess in 1877 reaching \$12,500,000.

The following table shows the production of tobacco in the United States in 1889, by states:

| STATES. | Pounds. | Acres. | Value. | STATES. | Pounds. | Acres. | Value. |
|----------------------|-------------|---------|------------|------------------------------------|-------------|---------|--------------|
| Arkansas | 1,156,000 | 2,408 | \$80,909 | Ohio | 35,195,000 | 39,105 | \$2,745,171 |
| Connecticut | 9,603,000 | 6,136 | 1,248,369 | Pennsylvania | 24,180,000 | 19,500 | 2,587,260 |
| Illinois | 2,947,000 | 4,648 | 223,959 | Tennessee | 45,641,000 | 67,119 | 3,651,274 |
| Indiana | 16,153,000 | 18,252 | 1,130,711 | Virginia | 64,034,000 | 127,052 | 3,842,052 |
| Kentucky | 383,306,000 | 323,409 | 21,247,971 | West-Virginia | 4,496,000 | 5,620 | 359,680 |
| Maryland | 14,017,000 | 33,775 | 770,914 | Wisconsin | 12,846,000 | 13,813 | 1,220,379 |
| Massachusetts | 3,893,000 | 2,464 | 486,640 | Other States and Territories | 2,976,000 | 6,613 | 312,464 |
| Missouri | 13,109,000 | 14,126 | 1,048,714 | Total | 565,795,000 | 747,326 | \$43,666,665 |
| New-York | 6,488,000 | 6,179 | 778,554 | | | | |
| North-Carolina | 25,755,000 | 57,107 | 1,931,644 | | | | |

The product of tobacco in Europe is nearly equal in quantity to the average production of the United States. Neumann-Spallart has usually made it about 500,000,000 pounds. Austria-Hungary produces about one-third of it, Russia one-tenth, Germany nearly as much, France about 35,000,000 pounds, and the other countries a small quantity. Europe can easily produce all the tobacco required, but two reasons are prominent for importation of tobacco from this country. It is very cheap, and it is very desirable for mixing with and fortifying European leaf. If it becomes dearer, a smaller quantity is purchased; if very much dearer, it would scarcely find sale at all. The production is regulated and limited by governmental edicts. Our exportation is not increasing; the proportion of our crop exported is declining, and will continue to fall off as our population increases.

TOBACCO-HEART. A name used of the cardiac symptoms that occur in many persons who use tobacco to excess. Irregularity of action and debility are the chief of these. See **TOBACCO**.

TOBACCO-PIPES, are made of various materials, the commonest in Europe being a fine white clay, which has consequently received the name of *pipe-clay*. Their usual form is too well known to need description, but the manufacture of a clay tobacco-pipe is by no means a simple affair. The first part of the operation is performed by trained children, who, with nice skill, roll out upon a board a small piece of clay into a long slender cylindrical rod, at the end of which is then attached a lump of clay, just enough to form the bowl. These rudimentary pipes are arranged by dozens on a board, until they have become sufficiently hardened. They are then handed to the pipe-maker, who takes a pointed iron wire, and first dipping it into oil, pushes it into the end of the thin column of clay, and having passed it through, forms the bowl with a folding brass mold. The wire is then withdrawn; and after a slight dressing with a knife, the pipes, now complete, are slightly curved in the stem, and are laid by to dry for a few days, when they are removed to the kiln, which is of a peculiar construction, and consists of an interior chamber, with a number of small stages, so that the pipes can be conveniently arranged in circles without touching each other. This interior chamber can be closed so as to exclude smoke, and, in fact, is only a *seggar* on a large scale, such as is used in making pottery (q.v.). The fire acts all round it, and fires or burns the pipes without smoking them. When thoroughly baked, they undergo a kind of polishing or dressing, and are fit for sale. Finer and more expensive pipes are made of *meerschau* (q.v.). Under the head of **PIPE-STICKS** will be found an account of the various materials used for making the tubes of these and other pipe-bowls. *Brier-root pipes*, now very common, have the bowl and stem made of one piece of wood; and although the stem is short, they partially absorb the oil produced in smoking.

Various opinions have been entertained as to the antiquity of the practice of smoking, and consequently of the use of pipes. That pipes for smoking herbs for medicinal and other purposes were in use in England and elsewhere long before the introduction of tobacco, is tolerably certain, and the custom is still prevalent in some places. Colt's-foot, yarrow, mouse-ear, lettuce, and other plants are occasionally smoked, and no doubt have been so for centuries. A primitive kind of pipe, doubtless such as has been made generation after generation, is still in use in some remote districts. It consists of a stick of elder from which the pith has been removed, with a bowl formed of common clay, and dried by the kitchen-fire. However much the habit of smoking herbs might obtain in Britain before that time, it is certain that the introduction of tobacco is to be traced the rise of the trade of the pipe-maker. Pipes have been found in situations near the Roman wall in Northumberland, and other Roman stations in Britain, suggesting the idea that they were used by the Roman soldiers. But this opinion was relinquished by Dr. Bruce, the antiquary, who first propounded it; and very few now imagine that any of the pipes to be seen in the antiquarian museums of Europe are many centuries old. The names Danes' pipes, Celts' pipes, elfin pipes, fairy pipes, old man pipes, etc., are popularly given to these old pipes, but afford no evidence as to their real antiquity. Many of them are remarkable for their very small size, whence, perhaps, some of the names; but this is easily accounted for by the consideration of the very high price of tobacco when first introduced into Europe, and the manner in which it was used, the smoke inhaled by the mouth being expelled through the nostrils, so that the narcotic power of the herb was enjoyed to the utmost. Similar very small pipes have also been found in North America, and the same mode of using tobacco has always prevailed among the American Indians. See Wilson's *Prehistoric Man*, vol. ii. Stone pipes, or pipe-bowls, have also been found in Britain, cut in rude forms, and which apparently were used by the insertion of a tube, perhaps a straw. Such pipe-bowls, but elaborately carved, are among the most remarkable American antiquities. They continue, however, to be made by the American Indians to the present day, often of stone, which are not cut without great difficulty, and are adorned with figures of men and animals. Some of them are adapted for the insertion of two tubes, that two smokers may inhale the fumes of the tobacco at once. Among some of the American tribes, the greatest care is bestowed on the ornamenting of the pipe-stem; by others, on the bowl.

The clay-pipe, much the same as is now used, probably came into use very soon after the introduction of tobacco in Britain. Aubrey, writing in 1680, says that tobacco-smokers at first used silver pipes, "but the ordinary sort made use of a walnut-shell and a straw." In the reign of William III., pipes were occasionally made of brass and of

Iron. Examples of these are preserved in various collections. The pipe was, in the earlier days of smoking, passed round the table—one man taking a whiff or two, and then handing it to his neighbor; thus, one pipe of tobacco would “suffice three or four men at once.” It has been supposed by some writers that the smaller the pipe, the more ancient is its date; but this is decidedly an error. The better criterion of age is the *form*. The barrel-shaped bowl was most usual during the commonwealth and the reign of Charles II., although it was made in many various shapes, which are well known from representations of them in prints of the time and on the traders’ tokens. In the reign of William III., a more elongated form of bowl began to be prevalent, probably introduced from Holland, although the barrel-shaped bowl still continued to be used. In the middle of the 18th c., the wide-mouthed bowl, now so universal, became the prevalent form, and the spur, which had hitherto been flat, to rest the pipe upon when in use, was elongated, after a fashion supposed also to have originated in Holland. The Scottish *catty-pipe* and Irish *dudeen* are short clay-pipes.

In Germany for ordinary smoking, the porcelain pipe-bowl is more used than the clay. They are made of very pure kaolin and covered with an enamel. Pipes of red clay in Oriental designs and long stems have come into use of late in France.

The finest pipes are made from *meerschaum* (sea-foam). The first meerschaum pipes were probably made in Hungary in the early part of the last century. Two samples of pipes, made as early as 1724 from a block of meerschaum brought from Turkey, are now in the Pesth Museum. Blocks of this precious material are found in three or four departments in France, as well as in Italy, Spain, Greece, and the Crimea. The finest deposits of magnesite are found at Anatolia, in Turkish Asia, where it is extracted in the same manner as coal. When taken out of the ground it is so soft that it can be cut with a knife. Its color is yellowish white. The rough blocks are dried and submitted to certain preparations before being sent to the town of Eskee Shehr, where they are examined, roughed out, polished, and glossed. This last operation consists in rubbing them while they are moist with a woolen cloth impregnated with mutton grease. Then the blocks are classified according to their quality, into sublime, superior, first-class, second-class, etc. Large pieces of superfine quality and exempt from defects are very rare. The blocks are packed in cases of an average weight of sixty to eighty pounds. A case is worth more in proportion, as it contains a smaller number of blocks, for then they are larger in size. Although the price varies according as the production is more or less abundant, it averages from \$120 to \$160 a case for the inferior qualities, and \$360 to \$400 for the finest qualities. For their own use the Turks prefer the red clay pipe, and send their meerschaum to Europe and America. The most artistic pipes are to-day made in France, although formerly the Germans and Austrians had a monopoly of this special manufacture. The Germans, however, still lead the market in the fabrication of imitation meerschaum pipes made of a composition of real magnesite splinters mixed with oil and turpentine. The objection to these is that they color badly, burn and crumble.

See the designs of pipes of all countries given in *Smokiana* (Quaritch, London, 1890).

The pipe-makers of London, as early as 1601, had privileges which gave them a monopoly. In 1619 the craft of pipe-makers was incorporated in England. Holland has long been famous for pipe making. The Dutch manufacturers were very jealous of rivalry. In the middle of the last century a pipe-manufactory was established in Flanders, and the Dutch makers determined to ruin it. The duties were too high to admit of a large importation, and they therefore freighted a large ship entirely with tobacco-pipes, set sail to Ostend, and purposely wrecked her there. In accordance with the maritime laws of that city, the pipes were landed from the wreck, and sold at such “ruinous prices” as defied competition; and the new manufactory at once sunk, and was closed.

TOBAGO, one of the Windward islands (see ANTILLES) belonging to Britain, lies 60 m. s.e. of Grenada, and 20 m. n.e. of Trinidad, is 26 m. long, from 6 to 9 broad, and has an area of 114 sq. miles. The island was discovered by Columbus in 1498, and named by him Assumption; the name of Tobago is supposed to have arisen from the free use of tobacco by the Caribs when first visited by Europeans. It came into British possession in 1763. From its gloomy-looking mountains, dense forests, and abrupt precipices, descending to the sea, Tobago has been called the “Melancholy isle;” but, on a nearer approach, the aspect becomes more pleasing, though still rough and irregular, being extensively occupied with conical hills and spurs, all connected by a ridge running through the interior, the greatest elevation of which is 1800 ft. above the level of the sea. From the high ridge descend deep and narrow ravines, which terminate in small alluvial plains. Scarborough is its chief town, pleasantly situated on the shores of Rochley bay, and at the base of a conical hill rising 422 ft. in altitude, crowned by fort King George. Plymouth, another town, is situated opposite Scarborough, on the leeward shore, about 6 m. distant, and is the landing-place for passengers, etc., from the royal mail-steamers. Two-thirds of the island is still covered with primitive forests, comprising many varieties of hard-woods and ornamental trees. The geological formation of the island is, on the whole, similar to that of Trinidad. Tobago is considered to be the island which Defoe describes in his *Robinson Crusoe*. The pop. in '91 was 18,353. The island produces sugar, rum, molasses, cocoanuts, cotton, coffee, and indigo; pimento also grows wild. The island was united administratively with Trinidad in 1880, and is governed by a subordinate commissioner.

TOBERMORY. See MULL, ISLAND OF.

TOBIT, BOOK OF, one of the most curious and interesting of the Old Testament apocryphal books. It exists at present in Greek, Latin, Syriac, and Hebrew MSS., the texts of which differ considerably, yet not materially, from each other. The oldest and most valuable is the Greek Septuagint; indeed, where the others depart from it, they possess little claim to our respect, although the *original* text was certainly not Greek. When and where the book was written, are questions to which various answers have been given; but the opinion of Ewald, who selects Persia as the scene, and the middle of the 4th c. B. C. as the date of its composition, agrees best with its internal character. The author he imagines to have been a Palestinian Jew who wrote in Hebrew, and conjectures that a translation of the work was made into Alexandrian Greek in the 1st c. B. C. That the contents of Tobit are not historical scarcely requires proof in modern times; yet up to the period of the reformation no serious difficulty was felt in receiving it as such. Luther was the first to speak of it as a "poetical," i. e., an imaginary, didactic production; and since his time biblical critics have been pretty unanimous on the point; although some contend for what they call a historical basis. The leading incidents of the story do not differ by a hairbreadth in grotesque and puerile *miraculousness* from the fantastic extravaganzas of the Arabian Nights. Tobit, sleeping outside the wall of his court-yard one night, is blinded by sparrows "muting warm dung into his eyes;" his son Tobias is attacked on the Tigris by a fish, which leaps out of the water to assail him; and marries a Jewish maiden called Sara, seven of whose betrothed lovers had been successively carried off by an evil spirit called Asmodeus. Asmodeus is driven off by an angel—who first appears under the name of Azarias, but subsequently turns out to be Raphael—and then flies to the uttermost parts of Egypt, where he is bound. Old Tobit is cured of blindness by an application to his eyes of the gall of the fish that had tried to devour his son. The sentiments are often very pious and didactic, the descriptions of social life are picturesque, and apparently true, but no excellence of that kind can reconcile us to the childish absurdities of the story.

TOBOGGAN (corruption of Indian *odabagan*), a sled without runners, common in Canada. It is turned up at one end, and is used on either natural or artificial slopes. In its primitive form, it consisted of one or two pieces of thin, flat wood; the modern toboggan is usually made of 7 rock-maple, kiln-dried slats, oval-shaped on the bearing surface, and is 18 in. wide and 6 or 7 ft. long. Another sort of T. is drawn by dogs over soft and deep snow.

TOBOLSK', a government of w. Siberia, occupies the n.w. angle of the country, and is by the governments of Yeniseisk and Tomsk. Area, 564,825 sq. m.; pop. '94, 1,411,475, mostly Russians, but including also Ostiaks, Tartars, Bokharians, and Samoides. The northern part of the government is a frozen swamp for the greater part of the year, while in the south good agricultural land is to be found. There are rich mines of silver, iron, copper, gold, and platinum in the mountains. The chief rivers are the Ob (q. v.), and its great navigable affluents, the Irtish, Tobol, Om, and Toura.

TOBOLSK, a town of western Siberia, capital of the government of the same name, stands at the confluence of the Irtish and the Tobol, about lat. 58° 21' n. It is well built, with timber houses and wide and regular streets, and its position on the two great rivers is picturesque; but its lower part is subject almost annually to inundation from the high floods of the Irtish in spring. Its situation, considerably n. of the great commercial highway between Russia and Siberia, and at a distance from the more productive regions of the country, is unfavorable for the development of commerce. Tobolsk contains a large prison. There are manufactures of leather, soap, and powder. Several regiments are stationed here. Pop. '93, 23,980.

TOCANTINS, an important river of Brazil, South America, rises in the province of Gojas, flows n. through the province of Para, and joins the waters of the Para (q. v.), the southern branch of the estuary of the Amazon, 130 m. from the Atlantic. Its principal affluent is the Araguay, which joins it in lat. 6° south, and has a longer course and bears along a greater volume of water than the stream to which it is tributary. The Tocantins, at its junction with the Araguay, is 5500 feet wide; at its mouth is 8 m. wide. Total length from Para, about 1700 miles.

TOCHER, in the law of Scotland, is an ancient name for the marriage-portion given by a father on the marriage of his daughter. It is settled according to the wish of the father, or as may be agreed with the intended husband of the daughter. Where the father by will leaves a legacy to his daughter, and afterward during his lifetime gives her a like sum as a tocher, this is not presumed to be a satisfaction of the legacy, though it is otherwise in England. See MARRIAGE.

TOCQUEVILLE, ALEXIS CHARLES HENRI CLEREL DE, a French statesman, and the most eminent writer of this century on the science of politics, was born at Verneuil, in the department of Seine-et-Oise, July 29, 1805. His father was the representative of an old family, the Clerels, proprietors of Tocqueville, in Normandy. The Clerels, although in the direct line *noblesse d'épée*, had been closely connected with the magistracy, and, indeed, might be considered to belong more properly to that order, which in France has

produced so many distinguished men. The mother of De Tocqueville was a granddaughter of Malesherbes, the academician, political writer, and magistrate, who defended Louis XVI. at the bar of the Convention, and whose fearless intrepidity was punished by the execution of himself and all the most distinguished of his relatives. Mme. de Tocqueville and her husband narrowly escaped the guillotine by the fall of Robespierre; but they did not emigrate, like other royalist families, and they preserved their property. At the restoration in 1815, the father of De Tocqueville re-assumed the title of count, which belonged to the family before the revolution. Young De Tocqueville was called to the bar at Paris in 1825; and after a short tour in Italy, entered the magistracy as *juge auditeur* at Versailles. In this situation he carefully studied the administrative system of France; and, struck by the perpetual recurrence of revolution, devoted much thought to political questions. In 1831 he threw up his appointment at Versailles, and with his colleague there, M. Gustave de Beaumont, accepted a government mission to America, to report on the working of the penitentiary system. The commissioners, after their return to Europe, published their report (*Du Système pénitentiaire aux Etats-Unis*, 1832; Eng. transl., Philadelphia, 1833)—an admirable work, which modified all the ideas previously entertained in France regarding prison-discipline. But this was not the most important result of their inquiries. In 1835 De Tocqueville published his great work, *De la Démocratie en Amérique* (Eng. transl. by Reeve, London, 1835). In his introduction he sought to show that a great democratic revolution has for centuries been going on in Europe. There is a general progress toward social equality, which must be looked on as a providential fact. In France it has always been borne on by chance, the intelligent and moral classes of the nation never having connected themselves with it, in order to guide it. In America he found that the same revolution has been going on more rapidly than in Europe, and has indeed nearly reached its limit in the absolute equality of conditions. There, accordingly, he thinks we may see what is about to happen in Europe. He points out that the people in America may be strictly said to govern. They make the laws and administer them. He draws from what he has observed the conclusion, that democracy may be reconciled with respect for property, deference for rights, safety to freedom, and reverence for religion. He does not propose the laws and manners of the Americans for the imitation of other democratic peoples. He merely seeks, by a faithful picture of an existing democracy to allay the dread of democratic progress, and to induce those at the head of affairs to recognize it as irresistible, and to seek to control it by wise concessions. *The Democracy* made at once a great sensation. The accuracy of the statements, the skill with which the matter had been digested, and the beauty of the style, were loudly praised by critics. The author was described as the continuator of Montesquieu, and the greatest political writer of his time. He became successively a member of the academy of moral sciences and of the French academy. In 1835 De Tocqueville visited England, where his work had made him known, and where he received an enthusiastic welcome from the leaders of the whig party. In the same year he married Miss Mottley, an Englishwoman. He shortly afterward, by a family arrangement, entered into possession of Tocqueville. He stood in 1837 as candidate for the representation of Valognes in the chamber of deputies. His opponent was a retired mill-spinner, who raised the cry of "No nobles" against him. Alluding to the great dovecot of Tocqueville, his opponent said: "Prenez garde! Il va vous remener les pigeons." De Tocqueville was defeated; but two years after he had become a great favorite with his neighbors, the Norman farmers, and they returned him to the chambers by an overwhelming majority. As a speaker, De Tocqueville did not succeed, but he exercised great influence on the legislature. Immediately after the revolution he was the most formidable opponent of the socialists and extreme republicans. He opposed Louis Napoleon as one who believed in his right to the throne as firmly as Charles X. He became, however, in 1849, vice-president of the assembly; and from June to October in the same year, minister of foreign affairs. At this time he vindicated the policy of the expedition to Rome, on the ground, it must not be forgotten, that it would secure liberal institutions to the states of the church. After the *coup d'état*, he returned to Tocqueville, where he devoted himself to agricultural pursuits. He there wrote *L'ancien Régime et la Révolution* (Par. 1856; Eng. transl., London and New York, 1856), a work worthy of his fame. In June, 1858, he broke a blood vessel, and was obliged to leave the bleak coast of Normandy for a warmer climate. He took up his abode at Cannes, where lord Brougham and chevalier Bunsen spared no effort to soothe his lingering illness. He died there April 16, 1859. De Tocqueville's *Œuvres et Correspondance Inédites* were published in 2 vols. (1860), by his friend M. de Beaumont, who prefixed a biographical notice. The English translation of this work appeared at London and New York in 1861.

TOCSIN (French *toque-sin*; from *toquer* "to hit," and Old French, *sein* "a bell"). A bell sounded with loud double-quick strokes to alarm the people. In the French Revolution it was often a signal to revolt.

"Since the 14th of July, the tocsin had been the quickstep of the great seditions of the people."—Lamartine.

The word is sometimes used figuratively.

TOD (derivation unknown), a weight for wool now unused; it was fixed at 28 lbs. avoirdupois in 1671.

TODARS, **TODAWARS**, or **TUDAS**, a remarkable race inhabiting the upper part of the Neilgherry mountains (q.v.), in southern Hindustan. They are rapidly diminishing in number, chiefly owing to the practice of polyandry (q.v.), and their not allowing intermixture with other races; in 1871, it appears that only 693 were left. They are tall, well proportioned, and athletic, with finely molded limbs, and bold, independent carriage; the nose aquiline, with black, bushy hair and beard. The dress of the men consists of a single toga, worn so as to leave the right arm free, not unlike the plaid of the Scottish Highlander. Both sexes are of a dull copper color, but the women are rather fairer than the men, and are often tall and handsome in feature and person. They have no occupation except tending their herds of buffaloes, and converting the milk into butter. The buffalo, indeed, is so important to them, that they look on the pen where the herd is cooped up at night with superstitious veneration. They never attempt the cultivation of the land around them, as they obtain what grain they require from the Burghers and other agricultural tribes, who pay it in the shape of tribute (*goodoo*) for the lands they cultivate, over which the Todars assert an imaginary right. The Todars hold that their ancestors were the aboriginal inhabitants of these regions (see *INDIA, Inhabitants*); that the Kothers, and afterward the Burghers, came among them; and that they allowed these tribes to cultivate land on condition of paying a *goodoo* of one-sixth of the harvest. The Burghers continue to pay their tribute of grain, but only in such amount as suits their own wants and inclinations, and rather in the shape of charity than otherwise. The only use the Todars get of the buffaloes, besides their milk, is to furnish sacrifices to the manes of the dead. They are wont to salute the sun at his rising and setting, and believe that the soul after death goes to the "great country." They have no distinct places of worship, except the hut in which they keep their milk, where they pour out in libations to their deities what remains after their daily consumption. They have never been known to steal the smallest article. No civil servant, or native of any of the other tribes, has ever been able to acquire their language, which has no written character, and not the slightest affinity with Sanscrit. Their mode of collecting the *goodoo* is singular enough: "As soon as harvest is over, and the *goodoo* collected in *Todanaad*, the *Toda* men of that division pay visits to the *munds* (villages, or groups of huts) in *Meyleanaad* and *Paranganaad*, and take up their abode with the women of the community (to the temporary exclusion, as is the custom, of the legitimate husband). They then pay visits to the surrounding Burgher villages, and demand in their right, as temporary husbands of the women of the *naad*, the *goodoo*, which, strange to say, is paid; and thus the same man, perhaps, who has laid a whole village in his own *naad* under contribution, goes the round of the other two *naads*, appropriating the fruits of the Burghers' labor and industry, and carrying off enough grain to support his whole community in idleness and plenty until the arrival of the next year's harvest-time, and to produce by sale in the nearest bazaar sufficient money to pay the tax which is levied yearly on their tribe. I should have refused credence to such a statement, had I not received it on the best authority, that of the *tahsildar* of the district."

TODD, a co. in s. w. Kentucky, adjoining Tennessee; drained by Pond river, Elk creek, and other streams; traversed by several branches of the Louisville and Nashville railroad; 360 sq. m.; pop. '90, 16,814, includ. colored. The surface is hilly. The soil is fertile. The principal productions are tobacco, wheat, corn, and cattle. Co. seat, Elkton.

TODD, a co. in central Minnesota; drained by the Partridge and Long Prairie rivers; traversed by the Great Northern and the Northern Pacific railroads; 972 sq. m.; pop. '90, 12,930, chiefly of American birth. The surface is level. The soil is fertile. The principal productions are wheat, oats, butter, and live stock. Co. seat, Long Prairie.

TODD, a co. in S. Dakota, touching Nebraska, drained by the Missouri; about 45 sq. m.; pop. '90, 188, chiefly of American birth. The surface is diversified. The soil is productive; but little of it as yet is under cultivation. Co. seat, Fort Randall.

TODD, HENRY JOHN, 1763-1845; b. England; graduated, Oxford, 1785; vicar of Milton, 1792; rector of All-Hallows, London; keeper of the mss. at Lambeth Palace, 1803; rector of Settrington, Yorkshire, 1820; prebendary of York, 1830; archdeacon of Cleveland, 1832. He published among other books, *Poetical Works of John Milton*, with notes and a life; *The Works of Edmund Spenser*, with notes and a life; *Illustrations of the Lives and Writings of John Gower and Geoffrey Chaucer*; a new edition of *Johnson's Dictionary*; *Life of Archbishop Cranmer*.

TODD, JOHN, D.D., 1800-73 b. Vt.; graduated Yale college, 1822, and Andover theological seminary, 1826; Congregational pastor at Groton, Mass., 1827-31; of the Edwards church, Northampton, 1833-36; of the First Congregational church, Philadelphia, 1836-42; of the First Church, Pittsfield, Mass., 1842-72. He was one of the founders of Mount Holyoke Female Seminary. He published, *Lectures to Children*; *Students' Manual*; *Index Rerum*; *Sabbath School Teacher*; *Truth Made Simple*; *Great Cities*; *Lost Sister of Wyoming*; *Young Man*; *Simple Sketches*; *Stories on the Shorter Catechism*; *Summer Gleanings*; *Daughter at School*; *Bible Companion*; *Future Punish-*

ment; Mountain Gems; The Water Dove, and other Gems; The Angel of the Iceberg; Nuts for Boys to Crack; Polished Diamonds; Hints and Thoughts for Christians; The Great Pacific Slope. He had a vigorous and original mind, much practical shrewdness and wit, and fine descriptive power. Dr. T.'s works had immense circulation.

TODD, THOMAS, 1765–1826; b. Va.; served in the revolutionary army when but a boy, and in 1786 moved to Kentucky. He practiced as a lawyer at Danville, was clerk of the district court and court of appeals, and judge of the latter, 1801–06. In 1806 he was made chief-justice of the state, and the following year a justice of the U.S. supreme court, which position he retained until his death.

TODHUNTER, ISAAC, an English mathematician, b. in 1820; was educated at London and Cambridge, and became lecturer in mathematics at St. John's college, Cambridge. He wrote a series of text-books on mathematics. D. 1884.

TODI, a t. in central Italy, in the province of Perugia, 23 m. s. of the city of that name. It is surrounded by the ruins of Etruscan walls, and is built on a high hill overlooking the river Tiber. It has a Gothic cathedral with frescos by Le Spagna, and the ruins of a temple belonging to the Roman era. In 552 it was the scene of the decisive battle of Narses against Totila the Goth, in which the latter was killed, and the Goths defeated—this victory leading to the capture of Rome. Pop. commune, '81, 15,325.

TODIDÆ, or the **TODIES**, a family of tropical birds, of the tribe *pissirostres*, of the order *inseores*. Some of the groups are restricted to South America and the West Indies; others to India and the Eastern archipelago. They are birds of showy plumage and rapid flight. Their food consists of worms, small reptiles, insects, and occasionally berries. The *rollers* are the only representatives of the tribe in temperate parts of the old world, and they differ considerably from the common form, the bill being much longer and narrower than in the tropical todies. One species, the *garrulous roller*, is an occasional visitor of the British isles. It is about the size of a blue-jay, and is a beautiful bird. The more typical todies have short rounded wings, short tail; tarsi long and slender; toes three in front and one behind, well developed; claws short and well curved. Except while breeding they are solitary. They are said to make their nests in holes in the ground, laying from three to four eggs. Five species are enumerated by Sharpe.

TODLEBEN, FRANZ EDUARD, Russian gen. of engineers, was b. at Mitau, Russian province of Courland, in 1818. After studying at Riga, he was admitted as a student in the college of engineers at St. Petersburg. He was 2d capt. in the engineer corps when the Russian army entered the Danubian principalities in 1853, and served in the campaign of the Danube under Gen. Schilders. His genius as a military engineer was discovered before the Russian army crossed the Pruth, on its retreat from the principalities; and when the French and English troops undertook the siege of Sebastopol, col. Todleben was sent to assist in its defense. It was in the middle of April when he arrived, and the fortifications were soon placed under his direction. The principle on which he acted was to watch the works of the allies, and to establish against them on every point a superiority of fire, by multiplying the number and increasing the caliber of his guns. The prodigious activity displayed by the Russians in making good the damage sustained by the heavy fire of the enemy, filled the allied army with astonishment. Everywhere, massive ramparts of earthworks, mounted with formidable batteries, rose up as if by magic at each threatened point within the line of defense. According to Todleben, the defense was rapidly asserting an engineering superiority over the attack. The Malakoff, however, was carried by assault, and the allies entered Sebastopol (see *History of the Russian War* (illustrated), W. & R. Chambers). At the battle of Inkermann, Todleben, who was on the spot by chance, seeing that the Russian artillery was in danger of being taken, promptly halted a regiment, and caused four guns to open fire on the allies, and gave time to the artillery to retreat. At the latter part of the siege he was wounded in the leg, but all his great defenses had then been completed. After the conclusion of peace, he expanded what was at first a mere engineer's report into a history of the war in the Crimea. It is entitled *Défense de Sebastopol: ouvrage rédigé sous la Direction de Lt.-Gen. El. de Todleben, aide-de-camp général de S. M. l'Empereur*. In this work he writes a thoroughly Russian account of the Crimean war. In all that relates to the Russian army and its labors, and especially in regard to the work of the siege, the author may be accepted as an unimpeachable authority; but where the British and French armies are concerned, he is too often careless and inexact, and sometimes his statements are absolutely untrue. For services in the siege he was created a gen. and decorated. In 1865 he visited England, and was cordially received. He performed distinguished service in the war with Turkey in 1877–78. He died in 1884.

TODMORDEN, a market-t. of England, in the co. of Lancaster, on the border of Yorkshire, 6 m. n.e. from Rochdale, on the Manchester railway. The town is well built, has several churches and schools, and manufactures of cotton. Coal abounds in the vicinity. The town proper of Todmorden is composed of houses belonging to three townships, the pop. '81, being 23,861; '91, 24,725.

TOFFEE, or **TOFFY**, a sweetmeat made of sugar, melted with about half its weight of butter. Much care is required in making it, to insure its being crisp when cold. It

should be kept over the fire and slightly simmered for a quarter of an hour, when small drops are taken and let fall on a marble slab to cool quickly for trial; if they become brittle, it is complete. Everton, near Liverpool, has a name for its toffee.

TOGA (from Lat. *tego*, to cover) was the principal outer garment of the Romans, and originally, perhaps, the only one. Subsequently, an under-garment, the *tunic*, was added. It was probably of Etruscan origin, and yet it came to be considered the distinctive badge of the Roman citizen, whence the Roman people are called *togati*, or *gens togata*; and consequently, when the Cisalpine Gauls received the rights of citizenship, their country was spoken of as *Gallia togata*, in opposition to transalpine Gaul, or *Gallia braccata* (breeched). At first it was apparently semicircular in shape—so, at least, say Dionysius, Quintilian, and others—but afterward, when it came to be an elaborate and complicated dress, it must have been a smaller segment than a semicircle. The mode of wearing the toga is difficult to describe, and required considerable art to make the folds fall gracefully. The toga was made of woolen cloth, and except in the case of mourners, was of a white color. Accused persons sought to excite sympathy by going about in a soiled (*sordida*) and unsightly toga; while those who were seeking office were wont to dress themselves out in garments which had been made artificially bright by the help of chalk, hence their name of *candidati* (lit. shining ones), candidates. The *toga prætexta* had a broad purple border, and was worn by children, and most though not all of the magistrates. The *toga picta*, so called from being ornamented with embroidery, was worn by generals when enjoying their "triumphs." Under the emperors, the toga, as an article of common wear, fell into disuse, the Greek *pallium* and other garments being used instead; but it continued to be used by officials on solemn or festive occasions.

TOGGENBURG, or **TOCKENBURG**, a district in Switzerland, within the canton of St. Gall, formed by the long and fertile valley of the Thur. It was formerly governed by counts of its own, who ranked as the richest and most powerful land-proprietors in the country. On the extinction of their line in 1436, the possessions passed to the barons of Rasen, who sold them in 1469 to the abbot of St. Gall. Since 1803 Toggenburg has formed part of the canton of that name.

TOGGLE JOINT, a mechanical appliance sometimes called a mechanical power, acting on the principle of the inclined plane, as will be seen by the following demonstration. Let *ad* and *ag* represent the arms of the toggle joint, with the joint at *a*. Then, if the arms are brought to a perpendicular, the end *d* being stationary, the point *a* will move through the arc *ab* to *b*, and at each point in the arc in the direction of a tangent at that point. As the point *a* approaches *b* the tangent will become more and more horizontal, and at last perpendicular to the arms *ad* and *ag*. When they form one and the same straight line the weight *w* will have been raised to twice the height *bc*. The form in the figure here presented is given to show more clearly the action of the knee and elbow joints in man, but that which is more frequently used, particularly in hay and cotton presses (to which the appliance is peculiarly adapted) makes the ends *d* and *g* of the arms approach each other, applying the power at *a*, making *ac* the perpendicular. It will be seen that on the application of power the motion of the point *a* will at first be quite rapid (when the hay or cotton is loose) becoming slower and slower as the points *d* and *g* approach each other, so that when both arms become very nearly perpendicular the weight, or resistance will move very slowly; but the power will be extremely great, and adapted to the resistance offered by the greatly compressed bale. See **INCLINED PLANE**.

TOGOLAND, a German colony on the slave coast of west Africa, in Upper Guinea, lying between the French colony of Dahomey on the e. and the Gold Coast colony on the w., with an estimated area of 23,160 sq. m., and a native population of about 2,500,000. European pop. '95, 88. It has been a German protectorate since 1884. The principal towns are Togo, on lake Togo (pop. 8000), the capital Sebbe, and the seaports Lome, Little Popo, and Porto Seguro. The natives grow maize, yams, tapioca, ginger, and bananas, and coconuts, palm oil, caoutchouc, ivory, and dye-woods are exported. The climate at the coast is unhealthy for Europeans.

TOISE, in the ancient French system of measures, was the unit of linear dimension, and was divided into 6 ft., each foot (*pie*) into 12 in., and each inch (*pouce*) into 12 lines (*lignes* or *points*). It is equivalent to 1.94903659 French meters, or to 6.3946 English feet.

TOKAT, a t. of Asia Minor, in the vilayet of Sivas, and 65 miles from the s. shore of the Black sea, stands at the mouth of a defile, on the banks of a small stream. It is inclosed by mountains on three sides, so that in summer the heat is intolerable. Gardens and vineyards extend along the slopes of the valley to the distance of 3 m. above the town. The town consists principally of wooden huts, disposed in narrow and dark streets. It was formerly a place of considerable trade, but its importance as a commercial mart has declined. Extensive copper furnaces, however, in which copper ore, brought from near Diarbekir, by means of mules and camels, is melted, still exist, and

give employment to many persons. Cotton-printing and dyeing are also carried on. Pop. about 10,000.

TOKAY, a species of wine obtained from the vines which grow on the Hegyallya mountains, a group stretching n. and n.e. of Tokay. The Tokay wine-district comprises about 15,000 English imperial acres, the produce from the Mezesmali, a detached rounded eminence near Tokay, being most esteemed. Great care is bestowed on the proper assortment of the grapes (which are never gathered until fully ripe): and also on the preparation of the wine—of which about 34 sorts are reckoned; but all of these may be grouped into the two classes of sweet and dry. The wine is brownish yellow while new, changing to a greenish hue as it grows older. The average annual produce of the Tokay vineyards is 1,500,000 imperial gallons of the dry, and 50,000 gallons of the sweet, wines. Tokay enjoys an immense reputation on the continent for its great restorative and tonic qualities; and so much is it esteemed in Hungary, that every considerable proprietor for miles round makes it a point to acquire some property in this vine-district, that he may be able to procure his wine from his own vineyards. On this account, genuine Tokay, is obtainable by wine-merchants only in small quantity (and this is especially the case with the more valuable sort, the sweet or imperial Tokay), and is largely mixed with inferior wines, to increase the amount. The vine-gathering is celebrated at Tokay, Maad, and Tallya, the three chief places of the district, as a national fête, to which the magnates of Hungary with their families flock from all quarters; and during the season of festivity, many times more than the whole value of the vintage is expended. The crowd of visitors is swelled largely by the wine-dealers and medical agents, who eagerly buy up such lots as are for sale, and sometimes give the most extravagant prices for imperial or other good qualities of wine. Large quantities of "imitation" Tokay are made by French and German chemists, and sent to all parts of Europe, not excepting Hungary itself, so that purchasers require to guard against imposition by dealing only with the grower or his accredited agent.

TOKEN, the name given to the kind of money which was at certain periods current in Britain by sufferance, and not by royal authority. Tokens first came into use in England in the reign of Henry VIII., in consequence of the want of any authorized coins to represent the fractions of a penny; and in the reign of Elizabeth, stamped tokens of lead, tin, and even leather, issued by vintners, grocers, and other tradesmen, passed largely from hand to hand, and were payable at the shops where they were issued. The corporations of Bristol, Oxford, and Worcester, had also their tokens. In 1613, a royal proclamation authorized lord Harrington to issue farthing tokens, and prohibited the use of private tokens under penalties. This prohibition was renewed by Charles I., who granted to the duchess of Richmond, sir Francis Crane, and others, the exclusive right of coining authorized farthings for seventeen years; but the farthings made by these patentees were the subject of much discontent, as they were greatly below the intrinsic value of the metal. In the face of these prohibitions, private tokens, principally of brass, continued to circulate, and were especially abundant during the civil war. Numerous tradesmen's tokens, mostly of copper, were again struck during the scarcity of money at the close of the last century. On account of the scarcity of current silver money, previous to the new coinage of 1817, silver pieces known as bank tokens, of the respective values of 5s., 3s. and 1s. 6d., were issued by the Bank of England; they were called in on the revision of the coinage.

TOKIO, or **YEDO** (pronounced Edo, "River-door"), since 1868 called **TOKIO** ("Eastern capital"), the capital of Japan, is situated in the e. of the mainland, at the head of the bay of the same name, in lat. 35° 40' n., and long. 139° 45' east. The river O-gawa, or Great river, divides it into an eastern and western portion, the latter being by far the larger and more important. For postal and general municipal purposes Tokio has of late years been divided into six great sections, each of which is subdivided into from eleven to fifteen districts. Five of these sections lie to the w. of the river O-gawa; the sixth, lying to the e., forms the most densely populated part of an extensive suburb, which is for the most part farm-land, but also contains a great number of large timber-yards, brick-kilns, etc., and is ramified by a vast network of canals. These canals also serve to join O-gawa with Naka-gawa, which latter river bounds the above-mentioned suburb to the e., and by which a great deal of produce is brought to the capital from the interior. The O-gawa is a large and rapid river, and is spanned by wide bridges, whose lengths range from 250 to 350 yards. In 1878, however, a return was made to the old district names, two of which, Honjo and Fuku-gawa, lie between O-gawa and Naka-gawa. Under the Shogun (mistakenly called Tycoon, see JAPAN), Tokio proper was divided into O-shiro, or the citadel; Soto-shiro, outside the citadel; and Michi or streets. In O-shiro was the palace of the Shoguns, which, repeatedly burned and rebuilt, was again destroyed by fire in 1872. But the beautiful large parks surrounding it are maintained in good order, and here it has been proposed to build a new palace for the mikado or emperor.

Soto-shiro which engirdles O-shiro, is partly occupied with palaces and temples; and the more eastern part of it is intersected by the Tokaido, the most important high-road through Japan. It also contains Dai-gaku, the modern imperial university, where native youths get a liberal education and college training for the professions of law, medicine,

engineering, and industrial chemistry; as also Kobu-dai-gakko, which is a special school for engineers. The grounds of the university comprise 10 acres. Near the university are the higher normal school and a number of elementary schools. One of its numberless bridges is called Nihon-bashi ("bridge of Japan"), and is considered the center of the empire, all geographical distances being reckoned from it. The third of the old divisions of the city forms the exterior part of the city, and contains among others the temple of K'wanon, the most venerated and frequented in all Japan; that of Confucius, which under the Shoguns was the national university for the study of Chinese literature, and is now converted into a public library of native, Chinese, and European books; and that of Kanda-Niyojin, the tutelary deity of the city. In this division also is Yoshiwara, the most popular of the five districts of Tokio set apart for prostitutes.

The population of Tokio was formerly much greater than it is now, because of the Shogun compelling every daimio, or clan-prince, to live in Tokio for a great portion of the year with a large body of retainers. This custom being, of course, extinct since the revolution of 1868, the population has diminished, being in 1894, 1,242,224. The area covered by the capital, however, is about 28 sq. m.; and therefore Tokio, in point of extent, ranks among the largest cities in the world. It is situated in a great plain, which extends n. and s. about 100 m., and from the coast to the mountains from 20 to 60 miles. This plain is one of the most fertile in Japan, and is tilled with great skill and laborious care, irrigation and manuring being adopted to the fullest possible extent. It is traversed by many large rivers, from one of which an abundant water supply is brought to Tokio, a distance of 40 miles. Smaller streams intersect the plain in every direction, and form rich and lovely valleys, the ridges between which rise at very few places to more than 200 ft. above sea-level. Tokio is connected with Yokohama by railway, and a large extent of telegraphic line now keeps it in close communication with the s., n., and w. of the empire. In recent years a very eager desire for the acquirement of European knowledge of science, industry, and political and social philosophy has been manifested by the people. The classes of the recently established colleges of the capital are crowded with enthusiastic and industrious students. Immense improvement has been made both in the lower and the higher education of the people. There are schools of agriculture, forestry, music, mechanic arts, and for the training of teachers, besides various charitable institutions. Although external evidences of superstition abound in Japan, nothing illustrates the small practical influence superstition has upon the daily actions and thoughts of the Japanese people more forcibly than the marvelously rapid progress that rational European *medical* science has made in Japan, not merely in the education of a large body of intelligent and well-qualified physicians and surgeons, but still more remarkably in the confidence and faith in the doctors of the new school displayed by the people at large.

The main body of the new imperial army is located and drilled in the capital. Its creation after the great revolution of 1868 was superintended by French officers. There is a large arsenal, well stocked with excellent modern machinery, in Tokio; and also a naval college where cadets for the marine service receive a good scientific education and practical training.

The city was founded in 1456 but did not become important till the Shoguns made it their residence in 1598. Much of the former glory of old Yedo has vanished, many stately palaces and rich temples having been burned to the ground, or allowed to fall into decay. But the chief natural beauties of the city remain—the 30 m. of tortuous moats, with their summer blaze of lotus flowers, and the exquisitely beautiful parks and gardens with their luxuriant flowers and rich wooding.

The city suffers from fire frequently. In 1858 a single fire destroyed fully one-quarter of the whole city; and in one night in 1876, 8000 houses were burned. In 1894 the city was visited by an earthquake. The whole business part of the city is studded with clay fire-proof storehouses, into which all the chief valuables are hurriedly thrust immediately upon the breaking out of a fire in the neighborhood. The massive iron doors and shutters of these fire-proof "dova" are as soon as the interior is filled, cemented air-tight. Lighted candles having been placed inside before the closing of the last door in order to exhaust the inflammable oxygen of the inclosed air, the building may be left to be raged round by the flames of a dozen burning houses crowded about it, and may even be raised to a red-heat without there being any danger of combustion taking place inside. The houses burned down, being of a light wooden construction, are rebuilt with what appears to a stranger incredible rapidity.

In Tokio, as in other important towns of Japan, the use of electricity for street and shop lighting is gradually extending. There are numerous papers (including a dozen dailies) and periodicals published in Tokio; but although many of them are cleverly edited, the press suffers severely from government censorship. Important industries are the manufacture of silk goods, enameled articles, porcelain, and, faience, and the city contains machine shops, and shipyards. The Ishi Kawajinna dock is 220 feet in length and 42 feet broad at the entrance. A considerable export trade in silk, silk-worms' eggs, copper, lacquer-work, mats, timber, etc., passes through Tokio, the goods being shipped at Yokohama. The bay of Tokio is shallow, permitting only small craft to approach the city at high tide. See Adam's *History of Japan*; Griffiths' *Mikado's Empire*; Aimé Humbert's *Japon Illustré*; Maurice Dubard's *Japon Pittoresque*; Sir Rutherford Alcock's *Capital of the Tycoon*; Oliphant's *Narrative of Lord Elgin's Mission*; *The Treaty Ports of China and Japan*; Mossman's *New Japan*; Dixon, *The Land of the Morning*; Satow and Hawes, *Handbook for Travelers in Central and Northern Japan*.

TOLAND, JOHN, a well-known deistical writer, of the 17th and 18th c., was b. near the village of Redcastle, in the co. of Londonderry, Ireland, Nov. 30, 1669 (or 1670). His parents were Roman Catholics, and he was brought up in that religion. His baptismal name was James Junius; but the ridicule which it drew upon him at school, led him to change it into John, by which he is now known. He was educated at Redcastle, and entered the university of Glasgow in 1687, but removed to that of Edinburgh, where he took the degree of master of arts in 1690. Thence he passed to Leyden, where (having abandoned at Edinburgh the Roman Catholic faith) he entered upon theological studies with a view to orders as a nonconformist minister. One of his masters at Leyden was the celebrated Spanheim. He remained there about two years, during which time he made the acquaintance of Leibnitz and some other distinguished men; and on his return to England, he resided for some time at Oxford, where his extravagant vanity, and the reckless boldness of his opinions on religion, drew on him much notice. In the Bodleian library, he collected the materials of more than one of his later publications, and prepared in great part the work entitled *Christianity not Mysterious*, which he published in London in 1696, and in which he fully avowed his unbelieving principles. The work created a great sensation in the theological world. It was censured by convocation, and led to several replies (among which, those of Payne and Stillingfleet may be specially noticed); and in the following year, Toland resolved to return to Ireland, sending before him a large number of copies of his work; but he was received no less unfavorably than in England, and his book was burned publicly by the common hangmen, in virtue of an express vote of the Irish parliament. Finding it necessary to flee from Ireland, Toland returned to London, where he published a defense against this judgment of the Irish parliament; but he soon afterward turned his pen from theological to political and literary subjects. A pamphlet entitled *Anglia Libera*, on the succession of the house of Brunswick, led to his being received with favor by the princess Sophia at the court of Hanover; and to his being sent on a kind of political mission to some of the German courts.

During his residence abroad, he published in 1702 a vindication of his book against the judgment of the convocation, the tone of which was considerably more moderate; but again, in 1705, he outstripped the boldness of his former opinions, and with still less of disguise, openly avowing himself a pantheist. In this course he was emboldened by the patronage of Harley, in whose service he had engaged as a political pamphleteer, and by whom he was sent abroad to Holland and Germany in 1707, in a capacity which, however he disavowed it, was plainly that of a political spy. He returned to England in 1710; and having forfeited the favor of his patron, or at least having separated from him, he engaged as a partisan pamphleteer on the side of Harley's adversaries.

His after-life was that of a literary adventurer, and was checkered by every variety of literary conflict and pecuniary struggle. It forms one of the most curious and painful chapters in Disraeli's *Calamities of Authors*. He resided from the year 1718 at Putney, where he died, Mar. 11, 1722, in his 52d or 53d year; and it is observed by Disraeli, that on his table was found an *Essay on Physics without Physicians*, which he was writing, in revenge for the unskillful treatment which he himself had suffered in his malady.

Of his works, which were very numerous, but have never been collected into a uniform edition, the following are the most remarkable: *Christianity not Mysterious: a treatise showing that there is nothing in the Gospel contrary to Reason, nor above it* (Lond. 1696); *Apology for Mr. Toland* (1697); *Life of Milton*, prefixed to Milton's works, 3 vols. folio (1698); *Anglia Libera, or the Limitation and Succession of the Crown explained and asserted* (1701); *Vindicus Liberius, or Mr. Toland's Defence of Himself against the Lower House of Convocation* (1702); *Socinianism truly stated* (1705); *Reasons for Naturalizing the Jews* (1714); *State Anatomy of Great Britain* (1714); *Nazarenus, or Jewish, Gentile, or Mahometan Christianity* (1718). A detailed account of these works would be out of place, but they all exhibit in a general way the characteristics described above. His posthumous works were published in 2 vols. 8vo, in 1726, with a life by Des Maizeaux. An *Account of Toland's Life and Writings*, ascribed to Curle, had previously appeared in 1722. It should be added that the above list is far from containing all the writings of this now little known, but once active and notorious polemic.

TOLEDO, city and co. seat of Lucas co., O.; on the Maumee river, the Miami and Erie canal, and the Ann Arbor, the Cincinnati, Hamilton, and Dayton, the Flint, and Pere Marquette, the Lake Shore and Michigan Southern, the Michigan Central, the Ohio Central system, the Wabash, and other railroads; 53 miles s.w. of Detroit. It is about 4 miles from the entrance of the river into Maumee bay, which is the w. extremity of lake Erie, and about 8 miles from the lake proper. It thus has exceptional facilities for trade by rail and water with a vast area of territory, and is in direct communication with all of the ports on the great lakes. The largest lake steamers can load and unload at its docks. The city in consequence is a great distributing point for all kinds of manufactures and produce, and is particularly noted as a soft coal and clover seed market. Toledo has a U. S. government building, an extensive state asylum for the insane on the separate cottage plan, co. court-house, Central high school, Ursuline convent, Smead school, medical college, Toledo hospital training school for nurses, public and other libraries, soldiers' memorial building, armory, and a large number of hospitals

and public and private charitable institutions. Public school property, which includes over 40 buildings used for public school purposes, has a value of over \$1,000,000; school population over 29,000; enrollment in public schools 15,000, and in private and parochial schools 4500; annual expenditure for public education over \$400,000. There are several public parks, nearly 100 churches, more than a dozen banking institutions, and many daily, weekly, and monthly periodicals. The U. S. census of 1890 reported for Toledo 734 manufacturing establishments, employing \$12,700,372 capital and 10,313 persons, paying \$5,214,443 for wages and \$12,189,924 for materials, and having a combined output valued at \$21,651,574. The principal manufactures are coffee and spice, malt liquors, flour and grist, carriages and wagons, foundry and machine shop products, lumber products, bicycles, and furniture. It also has large shipbuilding interests. Toledo is the port of delivery for the Miami customs district, and in the fiscal year 1896-7 had imports of merchandise valued at \$354,865, and exports \$752,049. The net bonded debt exceeded \$5,000,000, including a water debt of over \$1,000,000; the city owned the waterworks, which originally cost \$1,000,000; and the total assessed property valuation was over \$47,500,000. Pop. '90, 81,434.

TOLEDO, a famous city of Spain, capital of the province of the same name, and long the capital of the whole country, stands on the n. bank of the Tagus, by which it is encompassed on three sides, 41 m. s. s. w. of Madrid by railway. It is situated on a number of hills at the height of about 2,400 feet above sea-level; and the climate, excessively hot in summer, is bitterly cold in winter. The Tagus is the great fortress of the town. Rushing round it, on the e., s., and w., between high and rocky banks, it leaves only one approach on the land-side, which is defended by an inner and an outer wall, the former built by the Gothic king Wamba, in the 7th c.; the latter by Alfonso VI. in 1109, and both remarkable for the number and beauty of their towers and gates. Seen from a distance, the city has a most imposing appearance; within, it is gloomy, silent, inert, and its narrow streets are irregular, ill-paved, and steep. In the middle of the city rises the lofty, massive cathedral, surrounded by numerous churches and convents, mostly deserted, for here the churches are without congregations, and the streets and walks are almost destitute of people. The cathedral, completed in 1492, and built on the site of a former mosque, is a large edifice, in simple, pointed Gothic. It was ransacked and plundered in 1521 and 1808, but previous to these events, its interior was of the most magnificent description. The stained glass that remains is superb; the choir is a perfect museum of high-class sculpture; and there are two pulpits of metal, gilt, the workmanship of which is as fine as that of the richest plate. The cathedral is 404 ft. long, and 204 ft. wide; and has 5 naves, supported on 84 piers. Besides the cathedral there are 26 other churches, and 37 monasteries of great interest, alike from their architectural beauty, their decorations, and their historical associations. The Zocodover, "square market," thoroughly Moorish in its architectural character, is a fashionable promenade, and was for years the site on which heretics were burned, and bull-fights took place. The *Fabrica de Armas*, or manufactory of Toledan swords, a huge, rectangular, unsightly building, standing on the right bank of the Tagus, was erected in 1788, though long before that time the Toledan blades had become famous, and the fondness of the Iberians for their weapons, as well as the weapons themselves, were written about both by Livy and Polybius. The temper of the best Toledan blades is such, "that they are sometimes packed up in boxes, curled up like the mainspring of a watch." The buildings of the town also include a theological seminary, military school, female college, hospitals, and manufactories of coarse woollens, paper, guitar-strings, and leather. Pop. '45, 13,431; '87, 20,837.

Toledo, the *Toletum* of the Romans, is of very early origin, and was taken by Marius Fulvius in 193 B.C. It was the capital of the Goths during their dominion; in 714 it fell into the possession of the Moors, who retained it till 1085, when it was permanently annexed to the crown of Castile. In the days of its highest prosperity, it is said to have contained 200,000 inhabitants.

TOLEDO WAR, a controversy between the state of Ohio and the then territory of Michigan, which arose in 1835 from questions as to boundary. Congress in the ordinance of 1787 had reserved the right to form new states out of the part of territory n. w. of the Ohio river "lying n. of an e. and w. line drawn through the southerly bend or extreme of lake Michigan." Ohio was admitted as a state in 1802, the above line being described in the act as its n. boundary, though the state constitution claimed more territory. The true latitude of the bend was not given in Mitchell's map, and when in 1805 Michigan territory was organized, and, later, Indiana and Illinois became states, the most confused ideas existed on the boundary question. A survey was made by order of congress in 1817 which established the present line. The old line had included in Michigan the city of Toledo, and this was the main point in dispute. In 1835 Ohio laid claim to all within the new or Harris line, and proceeded to organize townships. Michigan declared the intention of resisting such invasion, and the militia of both sides was called upon to maintain the alleged rights of their respective governments. An opinion of the U. S. attorney-general, B. F. Butler, favored Michigan; President Jackson sent out a "peace commission" with no result, and serious conflict seemed imminent. In Sept., 1835, the Michigan troops occupied Toledo to prevent the formal organization of

Wood co. by Ohio officers. The latter, however, accomplished their purpose secretly and withdrew. The trouble was finally settled by the admission of Michigan into the union on condition of accepting the Harris line, while as a make-weight that state was given the upper Wisconsin peninsula, which afterward proved from its mineral wealth to be far more valuable than the disputed territory.

TOLENTINO, *Tolentinum*, a town of central Italy, province of Macerata, 11 m. s.w. of Macerata, on a rising ground, left bank of the Chienti. It has a fine cathedral dedicated to St. Nicholas, and a town hall with ancient inscriptions, a statue of Agrippina, and several good paintings. Tolentino has been a bishop's see from the 5th century. In the Parisani palace at Tolentino Pius VI. signed a treaty with Bonaparte in 1797, by which the pope ceded Bologna, Ferrara, and the Romagna to the cisalpine republic. Under the French empire, it formed part of the department of Musone. Here Murat was defeated by the Austrians, 1815. Pop. '81, 4114.

TOLERATION is the liberty which, in some countries where a particular form of religion is established by law, is allowed to nonconformists to publicly teach and defend their theological and ecclesiastical opinions, and to worship whom and how they please, or not at all. But no permission is thereby given to violate the rights of others, or to infringe laws designed for the protection of decency, morality, and good order, or for the security of the governing power. The enforcement of this class of laws, which have merely civil and political objects in view, is indispensable to the public welfare, and must proceed without regard to the notions of religious duty which their contraveners may entertain or profess. In Britain, there are still in force certain statutes imposing penalties on opinions and practices generally regarded as impious, and which were thought to be criminal because of their offensiveness to God (see **BLASPHEMY**); but these laws are seldom executed now, the opinion having become prevalent, that, except when the religious feelings of the public are so wantonly outraged as to make the perpetrator a nuisance, theological error is best opposed by refuting it, and that when those accused of heresy (q.v.) are men of piety and earnest conviction, any degree of severity short of extirpation tends rather to diffuse than to suppress their tenets. Besides, the right of private judgment in matters of faith and worship is now more generally recognized *in practice* than it used to be, though such is human pride that even yet many resent the exercise, by their neighbors who differ from them, of the freedom which they claim for themselves. They seem to forget the maxim that we should do to others as we would have others to do to us—a principle admirably applied by St. Paul to the case of religious differences (Rom. xiv.), and which indeed is the only one that has been found to work well in all circumstances for every sect; it condemns not only political disabilities and restraints unwarranted by the exigencies of the state, but still more, that uncharitable treatment through which, almost exclusively, the spirit of intolerance can now find a vent in free Protestant countries. Were it not for the inconsistency thus displayed in our own day by many professing advocates of the right of private judgment, it might seem wonderful that the Reformers, by whom that right was first asserted, and who on no other ground could justify their separation from the church of Rome, became in their turn the persecutors, not only of the Romanists, who had persecuted them, but of such fellow-Protestants as had drawn from Scripture conclusions that differed from their own. Instances of such inconsistency on the part of the Reformers and their successors will be found in the articles CALVIN, SERVETUS, SOCINUS, BIDDLE, and JEWS. In a church claiming infallibility (q.v.), and believing that salvation is unattainable beyond her pale, it is not only consistent, but to her most earnest members must seem a duty, to prevent by force the spread of what is accounted a fatal heresy; and, in fact, toleration has never been either professed or practiced by the church of Rome. See ALBIGENSES, WALDENSES, DOMINICANS, INQUISITION, HUGUENOTS, BARTHOLOMEW'S (ST) DAY, NANTES (EDICT OF), CEVENNES, DRAGONNADES. But even the Puritans (q.v.), though long oppressed themselves, were so blind to the right of others to differ from them, that in their own brief day of power they eagerly repudiated, by word and deed, as a monstrous and impious error, the principle of a universal toleration. In the assembly of divines (q.v.) held at Westminster in 1643-46, the Presbyterian members fought successfully against the proposal of the Independents that all sects should alike be tolerated. "We hope," wrote Baillie to his Presbyterian friends in Scotland, "that God will assist us to remonstrate the wickedness of such a toleration. . . . For this point, both they and we contend *tantum pro aris et focis*" (Baillie's *Letters*, ii. 328, 350; Bannatyne club ed.: see also the strong expressions of George Gillespie, another member of the assembly, in his *Propositions concerning the Ministry and Government of the Church*, prop. 41 and 42). We accordingly find in the 23d chapter of the *Westminster Confession* an assertion of the duty of the magistrate to promote the true religion, and to restrain and punish heterodoxy—a principle which, soon after the restoration, was found to work very inconveniently for the Presbyterians themselves, the magistrate being then one who differed from them as to what the true religion was. The Independents, on the other hand, had learned the lesson of toleration in Holland—that nursery of liberty in modern Europe—whither they had fled from oppression in the reign of James I.; and it is a mistake to suppose, as some have done, that they were the first to understand and practice the principles of religious freedom. In the 16th c., Zuinglius and the Hunga-

rian reformer Dudith, disclaimed, by word and action alike, the notion that any man is entitled to assume, in his dealings with others, that his own interpretations of Scripture are true, and those of other men, if different, false and culpable. "You contend," wrote Dudith to Beza, "that Scripture is a perfect rule of faith and practice. But you are all divided about the sense of Scripture, and you have not settled who shall be judge. You say one thing; your opponent, Stancarus, says another. You quote Scripture; he quotes Scripture. You reason; he reasons. You require me to believe you: I respect you; but why should I trust you rather than Stancarus? You say he is a heretic; but the papists say you are both heretics. Shall I believe them? . . . You say that your lay hearers, the magistrates, and not you, are to be blamed, for it is they who banish and burn for heresy. I know you make this excuse; but tell me, have not you instilled such principles into their ears? . . . Do you not daily teach that they who appeal from your confessions to Scripture ought to be punished by the secular power? . . . When you talk of your Augsburg confession, and your Helvetic creed, and your unanimity, and your fundamental truths, I keep thinking of the sixth commandment—'Thou shalt not kill.'" In the history of England, also, from the Reformation to the Commonwealth, there is, as Bishop Heber has observed, "abundant proof that (much as every religious party, in its turn, had suffered from persecution, and loudly and bitterly as each had, in its own particular instance, complained of the severities exercised against its members) no party had yet been found to perceive the great wickedness of persecution in the abstract, or the moral unfitness of temporal punishment as an engine of religious controversy. Even the sects who were themselves under oppression exclaimed against their rulers, not as being persecutors at all, but as persecuting those who professed the truth; and each sect, as it obtained the power to wield the secular weapon, esteemed it also a duty, as well as a privilege, not to bear the sword in vain."—*Life of Jeremy Taylor*, p. 27. It is chiefly to the many keen discussions in Holland and England during the century which followed the restoration (aided, no doubt, by that moderation or indifference which characterized the Protestant churches a hundred years ago—by the ever-increasing number and power of the dissenters—and by that wider mental culture which enables men not only to see that diversity of mental gifts and acquirements naturally leads to diversity of opinion, but, in Cromwell's language, to "think it possible they may be mistaken"), that we must ascribe the tolerant spirit now actuating most of the statesmen of England and the United States, and which has lately made rapid progress among the people at large. Not only is the right of free thought and discussion now generally recognized, but its necessity to the well-being of mankind is asserted by eminent thinkers. Mr. John Stuart Mill, in his able treatise *On Liberty*, thus sums up the grounds on which the necessity of such freedom is affirmed by him: "(1) If any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this, is to assume our own infallibility. (2) Though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any subject is rarely or never the whole truth, it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied. (3) Even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but (4) the meaning of the doctrine itself will be in danger of being lost, or enfeebled, and deprived of its vital effect on the character and conduct; the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground, and preventing the growth of any real and heartfelt conviction, from reason or personal experience" (p. 95).

TOLL (Gr. *telos*, a public tax; Gr. *telonion*, Lat. *telonium*, a toll-house; Ang.-Sax. *tol*, Ger. *zoll*, seem related to the root Ger. *zahl*, Eng. *tell*, to count, to pay), a payment exacted under a royal grant, or some prescriptive usage, or by express statute; such as by the owner of a port for goods landed or shipped, by the owner of a market or fair for articles sold, or by those charged with the maintenance of roads, streets, bridges, etc., for the passage of persons, goods, or cattle. It is essential in a toll that it be for some reasonable consideration; otherwise, it is void. In modern times, the right to take toll is always created by statute, and nothing short of statutory authority will authorize its levy, for it is a species of tax.

Many tolls receive special names, as dues, customs, etc.; and the term toll is now mostly used in connection with turnpike roads (so called from the turnpike or gate turning on an upright axis or pike, at which the tolls are collected) and bridges. See HIGHWAY.

TOLLAND, a co. in n.e. Connecticut, drained by the Willimantic and other small rivers, traversed by the New England and the Central Vermont railroads; about 403 sq. m.; pop. '90, 25,081, chiefly of American birth. The surface is diversified and fairly fertile. Tobacco and corn are raised, and the butter is noted for its excellence. Co. seat, Tolland.

TOLLENS, HENDRIK CAROLUSZON, a popular modern Dutch poet, born at Rotterdam, Sept. 24, 1780. At the early age of 14, his father, a merchant in dyestuffs, placed him in his counting-house, and first looked favorably upon, but afterward discouraged the boy's poetical efforts. The sympathies of young Tollens were at that time with what was called the patriotic party, who thought that the entrance of the French, in 1795, would be the cure for all political evils, and he made many verses in the spirit of the times. In his 17th year, he began to study English, German, and Latin; but French literature was his favorite study, and translations of French tragedies his chief work. At 19, he published translations from the French poets, under the title of *A Nosegay of Fragrant Flowers culled on French Ground*. Three years later, appeared his *New Songs and Idyls*, in which he first came out as an original poet. Shortly after, followed another collection of miscellaneous poems, which showed more marked progress; in 1805, his tragedy of *Lucretia*; and in 1806, that of the *Hoekschen and Kabeljaavroschen*, or the contest between the nobility and the towns in Holland, in the olden time—both original pieces of great merit. In 1804 Loots carried off the first prize, and Tollens the second, for a poem on Hugo de Groot; and in 1806, the order was reversed, when both again sung the deaths of counts Egmont and Hoorn. There flowed from his pen an uninterrupted series of songs and poems, in which the warmest feelings were expressed in the most natural and chaste language. Of these may be mentioned, as a few gems, "William I.," the "Victory at Nieuwpoort," the "Four Days' Naval Fight," the "Cry to Arms in 1815," the "Wintering of the Dutch in Nova Zembla," and the "National Song of the Netherlands," which is an echo of the calm but patriotic spirit of the people. His deep fellow-feeling with his countrymen is seen in the poems which he wrote during the Belgian revolution in 1830-31, as in the heart-stirring poems, "The Evening Prayer," and "The General Prayer-day." The popularity which Tollens attained, his poems reaching the fifth edition in 1831, arose chiefly from his singing of subjects always dear to the heart of the nation—of family-life, country, religion, and love—and that in simple, unartistic language, and pure Dutch style. The people loved the poet because they understood him, and his words touched their hearts. Tollens published *Romances, Ballads, and Legends*, (1818); *New Poems* (1821-29); *Songs of Claudius* (1832); *Poetical Flowers gathered from Neighboring Nations* (1839); *Scattered Poems* (1840); two volumes (1850), in which, though advanced in life, the tone of his lyre was more beautiful, powerful, and rich than ever. Tollens died at Rijswijk, Oct. 21, 1856.

Of modern Dutch poets, Tollens stands in the first rank. The wintering in Nova Zembla is the most wonderful piece of descriptive poetry in the Dutch language. Tollens was an excellent man, distinguished for his sincere piety and benevolence. His compassion for the poor comes out in his *Bedelbrief*, or begging-letter, which he published for the benefit of the distressed in the severe winter of 1844-45. While the people's poet, he was also God's priest for spreading Christian love among men. In early life, Tollens belonged to the Roman Catholic church, and in 1827 joined the Protestant Remonstrants; but both before and after the change, he was essentially a religious man.

TOLOSA, a t. in the n. of Spain, capital of the province of Guipuscoa, 25 m. n.w. of Pamplona. It stands in a deep valley watered by two streams, and abounds in old family mansions. There is a royal factory for arms, and in the vicinity are zinc and lead mines. Pop. '87, 7223.

TOLSTOI, LYOF OR LEO NIKOLAJEVITCH, count; b. Yasnaya Polyana, government of Tula, Russia, Sept. 9 (n.s.), 1828; author and social reformer. He entered the university of Kazan, but did not complete his studies, and in 1851, having visited the Caucasus, joined the army, becoming a captain, and distinguishing himself at the siege of Sevastopol. In 1854 he resigned, and after residing for a time in Moscow and St. Petersburg and traveling twice in Europe, retired to his country estate in 1861, the year before his marriage, and has since made it his permanent home. His writings fall into three well-defined periods. To the first belong *Childhood* (1852), and its sequels *Boyhood* (1854), and *Youth* (1855-57); *The Cossacks* (1854); *Sevastopol* (1855); and other military sketches.

To the second belong his two great novels, *War and Peace* (1865-68), and *Anna Karenina* (1873-76). Soon after this he underwent a remarkable change of character, becoming imbued with mystical religious and philanthropic ideas, and formulated a creed based on a communistic interpretation of scripture, and has since, as farmer, school-teacher, etc., adopted the life and habits of the peasantry, and promulgated his religious ideas so successfully that a numerous sect called "Shalaputui" (the Extravagants) has arisen. His doctrines are amply set forth in his works, *My Religion*, *My Confession*, a *Commentary on the Gospels*, and *Work While Ye Have Light*. His theory of marriage is set forth in his *Kreutzer Sonata* (1888). See REALISM AND NATURALISM.

TOLTECS or **TULHUATECAS**, a Mexican nation, who, according to Mexican tradition came from some other country to Anahuac in the 7th c., and established the kingdom of Tula. They were followed by the Chicimecs, by the Nahuatl tribes, and last of all by the Mexicans. The Toltecs, who are represented as the first civilized people in Mexico, were of the same race as the Nahuatl tribes. Their numbers were thinned by pestilence, and in the 11th c. wars between the nobility and clergy destroyed the Toltec kingdom. Many of the Toltecs removed to Guatemala, where they founded another monarchy; and the Quichés derived their ancestry from them. The Toltecs remaining in Mexico were incorporated with the Chicimecs, who were of a different race.

TOLU. See BALSAM.

TOLUCA, a t. of Mexico, capital of the state, and 32 m. w.s.w. of the city of Mexico, about 8800 ft. above the sea. Pop. '95, 23,648. Near the town is the volcano of the same name.

TOMAHAWK, a light war-hatchet of the North American Indians. The early ones were rudely made of stone, ingeniously fastened to their handles by animal sinews, or cords of skins. European traders supplied hatchets of steel, the heads of which were made hollow, for a tobacco-pipe; the handle of ash, with the pith removed, being the stem. These hatchets are used in the chase and in battle, not only in close combat, but by being thrown with a wonderful skill, so as always to strike the object aimed at with the edge of the instrument. The handles are curiously ornamented.

TOMATO or **LOVE-APPLE**, *Lycopersicum esculentum*, a plant of the natural order *solanaceæ*, formerly ranked in the genus *solanum*, and known as *S. lycopersicum*. The genus *lycopersicum* is distinguished by a 5-6-parted calyx, a wheel-shaped 5-6-cleft corolla, 5 stamens, and a 2-3 celled berry, with hairy seeds. The tomato is an annual, from 2 to 6 ft. in height, requiring support when tall. The leaves are unequally pinnate, the leaflets cut; the flowers numerous, followed by berries, which are very various in shape and color—generally red and yellow—in different varieties. The plant is a native of the tropical parts of America, but is now much cultivated in all parts of the world suitable for it, as the s. of Europe and the United States.

TOMB (Gr. *tymbos*), a monument erected over a grave, in order to mark the resting-place, and preserve the memory of the deceased. In early ages, and among eastern nations, it sometimes became the practice to place the remains of the dead in excavated sepulchers, whose interior was often decorated with painting or otherwise. Where the usage was to burn the dead, their bones and ashes were placed in urns in these receptacles. Some of the most remarkable rock-tombs were those of Egypt, belonging to the 18th and following dynasty of the Theban kings. The monarch's burial-place began to be excavated as soon as he ascended the throne, and the excavation went on year by year, the painting and decoration progressing till the king's death, when it was suddenly broken off, the tomb thus becoming an index both of the king's magnificence and of the length of his reign. The most costly articles are often found in these sepulchers. The decoration was almost entirely reserved for their interiors, the façades being comparatively unobtrusive. On the other hand, the rock-tombs of Persia and Lycia, less rich and elaborate internally, have imposing architectural façades, those of the Persian kings being copied from their palaces; and during the Roman period, this species of magnificence prevailed at Petra (q.v.) to an extent that gives that now deserted valley the aspect of a city of the dead. See also ETRURIA.

Tombs, in more modern times, have generally been mounds or masses of building raised over the remains of the dead. In the Homeric poems, heaps of cairns of stones are placed as honorary memorials above the graves of departed heroes. The sepulchral mound (q.v.) or tumulus of rude ages is found over the greater part of northern Europe, and is probably older than the subterranean tomb. The pyramids (q.v.) were the sepulchers of the Egyptian monarchs from the 4th to the 12th dynasty. The tombs of Greece, and still more those of the Greek colonies in Asia Minor, were sometimes pillars, or upright stone tablets, sometimes small buildings in the form of temples. The most celebrated was the *mausoleum* (q.v.). The Roman tombs were not unfrequently important architectural structures, varying in form, but oftenest consisting of a circular tower resting on a square basement; familiar examples being the tomb of Cæcilia Metella, and the yet larger and more solid tomb of Hadrian, on the banks of the Tiber, best known as the Castel St. Angelo, which is about 220 ft. in height, and of immense solidity. In Rome, Latium, and Magna Græcia, tombs were generally erected outside the towns, and

along the principal roads leading into the country, as in the Via Appa at Rome, and the street of tombs at Pompeii. A form of excavated tomb, without external architecture, called *columbarium* (q.v.) was also in use in Rome, whose walls were pierced with cells to receive cinerary urns. The prevalent circular tomb became in the later period of the Roman empire polygonal; and the central chamber, at first small, was gradually increased, till, in the age of Constantine, it became something like a miniature representation of the Pantheon, generally with a crypt below the principal apartment.

In the earlier centuries of Christianity, the burial of the dead in churches was prohibited. The first step which led to its adoption was the custom of erecting churches over the graves of martyrs; then followed the permission to kings and emperors to be buried in the church porch. The most important tombs of the middle ages are generally within churches or cloisters. There is much variety in the form and enrichment of mediæval tombs. The earlier examples consists of a single stone coffin, or sarcophagus, often with a low gabled lid and sculptured cross. An altar-tomb, or tomb in the form of a table, followed; and in the 13th c., a species of tomb was introduced, consisting of a sarcophagus, on which rests a recumbent figure of the deceased, the whole being surmounted by a canopy, often of exquisite symmetry and richness. In the renaissance period of art, the tombs became more and more complex. The sarcophagus was disguised, or made the least important part of the monument; the representation of the deceased was confined to a medallion likeness, and the most prominent part of the tomb was composed of sculptured upholstery, and groups of symbolical and eventually mythological figures. In some of the 16th c. examples, as Michael Angelo's tombs of Giuliano and Lorenzo di Medici, at Florence, the inappropriateness of the design is partly redeemed by the beauty of the figures.

TOMBAC, or **WHITE-COPPER**, is an alloy formed of about 75 parts of copper and 25 parts of arsenic; it is used in the manufacture of buttons, and is a very beautiful metal.

TOMBIGBEE RIVER, one of the streams which unite to form the Mobile river; rises in Tishomingo co., Mississippi; flows through Mississippi and Alabama in a general s.e. course, about 450 m., and joins the Alabama about 45 m. above Mobile.

TOMBSTONE, city and co. seat of Cochise co., Ariz., 76 m. s.e. of Tucson. It is about 9 miles e. of the San Pedro river, and about the same distance s.e. of Fairbank (the nearest railroad station 1897), on the Arizona and southeastern and the New Mexico and Arizona railroads. The city has an excellent public school, a co. hospital for both pay and needy patients, gas lights, waterworks supplied from the Huachuca mountains, and several churches and newspapers. The principal industries are silver mining, general merchandizing, and freighting. It has an exceptionally salubrious climate. Pop. '90, 1875.

TOMCOD, a common name in the United States for the species of the genus *microgadus*, having the general external characteristics of the common cod-fish; three dorsal and two anal fins, a barbel on the chin, and teeth on the vomer. The species on the Atlantic coast is *M. tomcodus*; on the Pacific, *M. proximus*. They are brought to some of the markets, but are not highly esteemed.

TOM GREEN, a co. in s.w. Texas, formed in 1875, including Bexar district, having New Mexico on the n.w. and the river Pecos on the w. and s.w. The surface is mountainous. Pop. '90, 5152. Area, 3548 sq. m. Co. seat, San Angelo.

TOMMASE'O, **NICOLA'**, 1802-74; b. Dalmatia; resided for some time in Florence, was exiled to France in 1833, and removed to Venice in 1838. During the revolutionary movement of 1848, he was arrested, but was soon released by the people, and became minister of public worship and education. After the Austrians resumed control in 1849, he was again exiled, and the rest of his life was spent at Corfu, Turin, and Florence. Among his works are a dictionary of Italian synonyms; *Canti Popolari* (1841); *Studi Critici* (1843); and *Poesie* (1872).

TOMMY ATKINS is a facetious, generic name applied to the British soldier, and brought into notice by Rudyard Kipling (q.v.), who writes of him as a separate human whole, instead of the thousandth part of a regiment.

TOMPKINS, a co. in s.w. central New York, drained by Fall, Salmon, and other creeks; traversed by the Southern Central and other railroads; 494 sq.m.; including part of Cayuga lake; pop. '90, 32,923. Co. seat, Ithaca.

TOMPKINS, **DANIEL D.**, 1774-1825; b. N. Y.; graduated Columbia college, 1795; admitted to the bar in New York, 1796; a member of the legislature and of the state constitutional convention, 1801; member of congress from New York city, 1804; resigning to become a judge of the state supreme court; governor of New York, 1807-17; vice-president of the United States, 1817-25; delegate to the state constitutional convention, 1821. He supported the national government in the war of 1812, and commanded the third military district, contributing much by furnishing troops to the national success. In a message to the legislature, 1817, he recommended the total abolition of slavery in the state of New York, and an act was passed to take effect July 4, 1827.

TOMSK, a government of western Siberia, bounded on the e. and n.e. by the government of Enisei or Yeneseisk, and on the n.w. and w. by that of Tobolsk. Area, 331,159 sq. m.; pop. '94, 1,442,681. Tomsk, more than any other government of Siberia, abounds in lakes and rivers. Of the latter, most of which flow northward from the foot of the Altai mountains, the principal are the Ob, Tom, Chulim, and Irtysh. The largest lakes,

which are both sweet and brackish, occur in the Barabinsky steppes. The climate is mild in the middle and southern districts, but severe in the north. Sandy and clayey soils prevail; but there are patches of good mold on which abundant crops of grain of various kinds, as well as hemp, flax, rye, barley, and oats, are raised. The extensive mountain slopes and plains are covered with luxuriant forests, in which the most common trees are the broad-leaved oak, the cedar, and the pitch-tree. The natural products of the country are numerous. In the s. and e. parts, droves of wild horses and herds of horned cattle are a source of considerable wealth. But the mineral products of the country are its chief source of riches. Manufactures are not extensively carried on; there is a large barter-trade with Russia and China, and the commerce of the country is maintained for the most part by means of fairs.

TOMSK, a trading t. of Siberia, capital of the government of the same name, on the Tom, a tributary of the Ob, 2809 m. e. of St. Petersburg, in lat. $56^{\circ} 29'$ n., and long. $84^{\circ} 58'$ east. Situated on the great trading highway of Siberia, it is the seat of an important transit trade, chiefly with the Kalmucks and Mongols; but the goods that pass to and from Irkutsk also go by way of this town. There are manufactures of soap, leather, and distilled liquors, and there is an active trade in furs, grain, and cattle. It is said to be the richest town in Siberia; and its commercial importance, its extent, and the number of its handsome buildings are increasing annually. The Siberian university was opened at T. in 1886. Pop. in '97, 52,430.

TOM THUMB. See STRATTON, CHARLES HEYWOOD.

TON, a suffix of frequent occurrence in the names of Anglo-Saxon settlements. It seems to be from the same root as the Gothic *tains*, meaning a twig (allied to which are the *tine* of a fork, the *tines* of a stag's horns, the *tines* of a harrow) the Anglo-Saxon *tynan*, to hedge, and the Ger. *zaun*, a hedge. "Hence, a *tun* or *ton* was a place surrounded by a hedge, or rudely fortified by a palisade. Originally, it meant only a single homestead or farm, and this use of it is still common in Scotland. In modern English, in the form of *town*, it is applied to a collection of houses. Similarly with *ton*, the terminations *worth*, *fold*, *garth*, *burgh*, and others also convey the notion of inclosure, protection."—See I. Taylor's *Words and Places*.

TON, the same word as *tun* (q.v.), denotes a weight of 20 hundred-weight (*cwt.*). In Britain, the hundred-weight contains 112 lbs., so that the ton contains 2240 lbs. In the United States the hundred-weight is usually reckoned at 100 lbs., and the ton at 2000 lbs. In both countries, 40 cubic ft. of rough or 50 of hewn timber constitute a ton or load of the same. The hundred-weight (*centner*) in Austria, Prussia, Denmark, Germany, and Switzerland, contains 100 lbs.; in Hamburg, 112; in Bremen, 116; its representative in France, Spain, and Portugal, is the quintal (q.v.); in Italy, the *centinajo*; in Turkey, Egypt, n. Africa, and the Balearic isles, the *kantar* (124 lbs.).

STONE, in music, the name given to the larger intervals in the diatonic scale, so called in contradistinction to the *semitones* (q.v.), or smaller intervals. Theoretically, some of the intervals called tones are larger than others, and none of them are equal to two semitones; thus, in the scale of C, the intervals CD, FG, and AB, are all equal; but DE and GA, which are also called tones, are smaller; and the semitones, EF and BC, are larger than half even of the larger tones. In instruments, however, which are tuned according to the equal temperament (see TEMPERAMENT), all the tones are made equal, and each equivalent to two semitones.

STONE, THEOBALD WOLFE, 1763–98; b. Dublin; graduate of Trinity college, Dublin; called to the bar in London, 1789. He belonged to the whig party and wrote a number of political pamphlets. He was a Roman Catholic and endeavored to influence members of that church to unite with dissenters against the government, and published, 1791, *An Argument on behalf of the Catholics of Ireland*. He was one of the founders of the first club of United Irishmen at Belfast, and similar organizations in other parts of Ireland; sec. and agent of the Roman Catholic committee, 1792; implicated in Jackson's proceedings, but allowed to go at large, and came to this country in 1795. In the following year he went to France for assistance and returned suddenly to Ireland, recalled by rumors of a revolt. In the expedition to Bantry Bay he was adjt. gen. to the commander, Hoche, but the fleet was driven off the coast and scattered, thus discouraging the French, who abandoned the enterprise. In 1798 he set sail for Ireland with Moreau's army, and was defeated by an English fleet, taken prisoner, court-martialed, and having been sentenced to be hanged, cut his throat with a pen-knife to preclude the event.

TONGA BAY, a small inlet on the e. coast of Africa, bounded on the n. by cape Delgado, and extending inland in a n. direction. Cocoa-nut trees and jungle line the shores of the bay, and at its head is the village of Tonga, small and insignificant, but important from its frontier position. Cape Delgado is the northern limit of the Portuguese colonial possession of Mozambique; and the village of Tonga, which is situated n. of the parallel of lat. of the cape, is in the possession of the Seyyid of Zanzibar, and is the most southern possession of that sovereign.—*Despatches from Her Britannic Majesty's Consul and Political Agent, Zanzibar*, 1863.

TONGA ISLANDS AND TONGATABU. See FRIENDLY ISLANDS.

TONGRES, a very ancient city of Belgium, in the province of Limbourg, 13 m. s.s.e. of Hasselt. Its church of Notre Dame, the first dedicated to the Virgin n. of the Alps, dates from 1240; and the cloister attached, the oldest in the country, was built in the 10th century. The mineral spring in the vicinity, of which Pliny wrote. "*Purgatio corpora tertianas febres discutit, calculorumque vitia*," still retains its ancient virtues. Various manufactures are carried on. Pop. '94, 8823.

TONGUE, **TIE**, is a symmetrical muscular organ, extending from the hyoid bone backward and downward, to the lips in front, and occupying the buccal cavity. The superior surface, borders, and anterior third of the inferior surface are free; while the remaining parts are attached to adjacent parts by the investing mucous membrane and subjacent structures. At certain points, this membrane, on leaving the tongue, forms distinct folds, containing fibrous or muscular tissue, which act to a certain extent as ligaments to the tongue. The most considerable of these folds is termed the *frænum* (or bridle) of the tongue, and connects its anterior free extremity with the lower jaw. It acts as a strong ligament, and limits the backward movement of the tip of the tongue. In rare cases, this ligament extends abnormally to the tip, so as to interfere with speech and mastication, and the child is said to be *tongue-tied*; recourse must be then had to division of the *frænum*, popularly known as *cutting the tongue*. Other folds of mucous membrane (the *glosso-epiglottid* folds) pass from the base of the tongue to the epiglottis; while from the sides of the base, passing to the soft palate, are seen two folds on either side, known as the *pillars of the fauces*. See **PALATE**. The *superior surface* of the tongue is divided into two symmetrical lateral parts by a median longitudinal furrow, commencing at the tip, and extending back about two-thirds of the tongue's length. The various kinds of papillæ which are seen on their surface are described in the article **TASTE, ORGAN AND SENSE OF**. At the back of the surface, just behind the circumvallate papillæ, are large mucous glands, extending into long and capacious canals, and helping to secrete the fluid that moistens the tongue. On the *inferior surface*, the longitudinal furrow, which extends from the tip to the *frænum*, is deeper than on the upper surface; on each side of it veins are seen running forward; and immediately beneath the tip is a cluster of mucous glands, known as the glands of Nuck (their discoverer in 1690). The *posterior extremity* or *base*, is flattened and extended laterally before it is inserted into the *hyoid bone* (known also as the *lingual* or *tongue bone*), which, with certain ligaments, must be regarded as the basis or framework of the tongue. The muscles of the tongue are usually divided into two groups—viz: the *extrinsic* muscles, which attach the tongue to certain fixed points external to it, and move it on them; and the *intrinsic* muscles, which pass from one part of the tongue to another, constitute its chief bulk, and move it on itself. These intrinsic muscular fibres run vertically, transversely and longitudinally, and are so interlaced as mutually to support one another, and to act with the greatest advantage. By the action of the various muscles, the upper surface of the tongue may be made concave or convex, or may be pressed against the roof of the mouth; the tip may be protruded straight out or laterally, upward and downward, and to any recess (as for instance, a hollow tooth) within the mouth where food might lodge; and the whole organ may be drawn back. The organ is freely supplied with blood, mainly by the lingual artery, which is given off by the external carotid. With regard to the nerves, the glosso-pharyngeal and certain branches of the third division of the fifth nerve are concerned in the special sense of taste (q.v.); other branches of the fifth nerve are concerned in ordinary sensation, while the hypoglossal nerve on each side is the motor nerve of the tongue.

The various uses or functions of the tongue cannot be thoroughly understood without a brief reference to its comparative anatomy. The tongue in mammals does not differ very materially from that of man; but in general there is a close coincidence both in size and form between this organ and the lower jaw. In the rodents the tongue has a wedge-like shape. In the giraffe and the ant-eater, the tongue is much prolonged, being an important prehensile organ in the former; while in the latter it is driven into ant-hills, and the victims are secured by its viscid secretion. In the feline races the conical papillæ are converted into recurved spines of great size and strength, which the animal uses in scraping bones and in combing its fur. Except in mammals, the tongue is probably not an organ of taste. For a good description of the tongue in birds, reptiles, and fishes, the reader is referred to Prof. Owen's *Anatomy of the Vertebrates*, vols. i. and ii. Among the mollusca, the gasteropoda are provided with a very singular apparatus known as the tongue, and consisting generally of a thin membrane, long and narrow, and rolled, except at its anterior extremity, into a tube. This membrane is covered on its upper surface with transverse rows of minute teeth, or more commonly with plates having tooth-like siliceous projections. These teeth present a great variety of patterns, which are constant in the different genera, and even characterize the species. Two eminent naturalists, Messrs. Loven, a Swede, and Troschel, a German, have independently made the teeth of the mollusca a basis of classification. The articulata do not present anything like a true tongue, although in insects a certain oval appendage is described as a *lingua*.

The functions of the tongue are gustation, prehension (in man and monkeys this function is supplied by the hand), mastication, insalivation, deglutition, and speech; to

which may be added spitting and whistling, and in the case of the gasteropoda, trituration of the food.

Among the diseases of the tongue may be mentioned INFLAMMATION or GLOSSITIS. The most marked characteristics of this affection are great swelling, tenderness, and difficulty in speaking and swallowing. It rarely occurs as an idiopathic or spontaneous affection, but often accompanies severe salivation. It must be treated by purgatives and low diet, and by gargling as in ordinary salivation (q.v.). Incisions are sometimes useful, both to relieve tension, and by the depletion that ensues. Cases occasionally occur in which the tongue suddenly enlarges to an immense size, so as almost to cause suffocation, without any true sign of inflammation.—See Druitt's *Surgeon's Vade-mecum*, 8th ed., p. 454, foot-note.

Hypertrophy, or persistent enlargement of the tongue, sometimes results from an imperfectly cured case of inflammation; but is probably in most cases congenital, although perhaps not noticed for a year or two. Bertholin (*Hist. Centur.*, iii. p. 85) mentions the case of a male child born with the tongue protruding out of the mouth as large as a filbert; and as the child grew, the tongue increased to the size of a calf's heart. For a reference to various cases, and for the mode of treatment, we may refer to a memoir by Dr. Humphry in vol. 36 of the *Medico-Chir. Transactions*. One of the most common forms of disease of the tongue is *ulceration*, which may arise (1) from the irritation of a decayed tooth with a sharp jagged edge; or (2) from constitutional syphilis; or (3) from a disordered condition of the digestive organs. In the first case the tooth must be removed; in the second, iodide of potassium with sarsaparilla should be tried; and in the third, the complaint generally yields to regulation of the diet and of the digestive organs, and sedatives at bed-time. M. Lawrance recommends a mixture of compound decoction of sarsaparilla with compound decoction of aloes, three times a day, and four grains of extract of hyoscyamus at bed-time, with advantage. *Cancer* of the tongue occurs either in the hard or in the epithelial variety. There is a popular belief that this terrible disease may be excited by the irritation caused by a broken tooth, or by smoking a clay pipe; but on comparing the prodigious numbers of jagged teeth and of clay pipes with the rare cases of cancer of the tongue, we must at once reject this hypothesis. All that such sources of irritation can effect is to determine the exact seat of development of cancer in persons predisposed to it. A typical case of epithelial cancer of the tongue occurred in the person of Prof. Reid of St. Andrews, the eminent physiologist. In Dec., 1847, his age being then 39, and his health good, he noticed a small ulcer on the right side of his tongue; it slowly extended, and acquired hard everted edges, but caused little inconvenience. In July, 1848, it had attained the size of a five-shilling piece; its surface and edges were ragged, and it caused considerable pain, especially at night. A hard ridge could be felt all round the ulcer, and the glands beneath the jaw became enlarged. The health by the end of August had completely given way from the pain, when the diseased part of the tongue was removed by the late sir William Fergusson. In less than a month the wound had healed, and the health was re-established. In November the enlarged glands were removed, but the disease returned in their scars, and spread till it caused death in July, 1849. The only treatment which can be adopted with any chance of success is full and early extirpation. Prof. Syme succeeded in removing the whole organ, without even—strange to say—much affecting the patient's speech or power of deglutition. *Tongue-tie* is an affection for which infants are often brought to the surgeon, and which is often operated on when this might be dispensed with. The division of the *frænum* with a blunt-pointed pair of scissors, with their point directed downward, is very easily performed, and fortunately does no harm to the child. Children who do not speak so soon or so clearly as is expected by their mothers, are always supposed to have tongue-tie.

TONGUES, GIFT OF, a gift of the apostles and other Christians in the first ages of the church. The main passages in the New Testament relating to it are Acts ii. 3-21; 1 Corinthians xii. 10, 28; xiii. 1, and particularly xiv. Allusions to it will also be found in Mark xvi. 17; Acts x. 46, and xix. 6. The only allusion to the possession of the gift in later times is in Irenæus, *Adv. Hær.* vi. 6: "We have many brethren in the church having prophetic gifts, and by the Spirit speaking in all kinds of languages." From these data, the following conclusions have been drawn by one of the most recent and intelligent expositors of the epistles to the Corinthians. The gift in question is represented as something entirely new in the apostolic age: "They shall speak with new tongues," Mark xvi. 17. The effect on the spectators at the day of Pentecost is of universal astonishment. It is represented as a special mark of conversion, immediately preceding or following baptism. It is a gift "of the Spirit." "They began to speak with other tongues, as the Spirit gave them utterance"—Acts ii. 4. It was, moreover, closely connected with the gift of "prophesying"—1 Corinthians xii. 10, 28; xiv. 1-6. It appears to be distinguished from prophesying by consisting not of direct warning, exhortation, or prediction, but of thanksgiving, praise, prayer, singing, and other expressions of devotion. It was an utterance of the heart and feelings, rather than of the understanding, so that the actual words and meaning were generally unintelligible to the bystanders, and sometimes to the speakers themselves: "He that speaketh with a tongue speaketh *not to men but to God*; for no one heareth; and in the

Spirit he speaketh mysteries"—1 Corinthians xiv. 2, 4, etc. So far, the account of the gift seems intelligible. It was, as Dean Stanley says, "a trance or ecstasy, which in moments of great religious fervor, especially at the moment of conversion, seized the early believers; and this fervor vented itself in expressions of thanksgiving, in fragments of psalmody or hymnody, and prayer, which to the speaker himself conveyed an irresistible sense of communion with God; and to the bystanders, an impression of some extraordinary manifestation of power, but not necessarily any instruction or teaching, and sometimes even having the appearance of wild excitement, like that of madness or intoxication." The special difficulty, however, remains, viz., as to the character of intelligibility which, on one prominent occasion, seems to have belonged to the gift. *Glōssa*, or the word translated "tongue," does not necessarily imply a distinct language of a people; this is usually expressed in the New Testament by *dialektos*. But in the description in the Acts ii. 6, 8, it is expressly said: "Every man heard them in his *own language*" (*tē idia dialektō*). "How hear we every man in *his own language*" (the same phrase in the original) "wherein we were born." The plain meaning of this account seems to be, that the gift of tongues, on this occasion, at any rate, assumed the form of intelligible communications in foreign languages. But there is no evidence that the apostles then, or at any subsequent time, enjoyed the ability, supernaturally imparted, of speaking a variety of languages, with a view to the more adequate discharge of their apostolic functions, as has sometimes been inferred from the passage in the Acts. "Probably," it has been said, "in no age of the world has such a gift been less needed. The chief sphere of the apostles must have been within the Roman empire, and within that sphere, Greek or Latin, but especially Greek, must have been everywhere understood. Even on the day of Pentecost, the speech of Peter, by which the first great conversion was effected, seems to have been in Greek, which probably all the nations assembled would sufficiently understand; and the speaking of foreign dialects is nowhere alluded to by him as any part of the event which he is vindicating and describing."—Dean Stanley (*Corinth.* p. 250).

TONIC, or **KEYNOTE**, in music, the note which forms the basis of any scale or key, and on which a piece of music written in that key naturally closes. See **KEY**.

TONICITY, **MUSCULAR**. The contractility of muscles shows itself under two distinct forms—*irritability* and *tonicity*, which are alike distinct in the mode of their action and in the conditions requisite for their exhibition. Irritability is most manifest in the voluntary muscles and in the heart, which, when in activity, exhibit powerful contractions alternating with relaxation; while *tonicity* is shown in a moderate and permanent contraction, which, instead of being consequent upon stimulation through the nerves, as in irritability, is especially excited by change of temperature in the tissue itself, and is mainly shown in the involuntary or non-striated muscles. Like irritability, it is an inherent property of muscular tissue during life. "It manifests itself," says Dr. Carpenter, "in the retraction which takes place in the ends of a living muscle when it is divided (as is seen in amputation); this retraction being permanent, and greater than that of a dead muscle. But its effects are much more remarkable in the non-striated form of muscular fiber; and are particularly evident in the contractile coat of the arteries, causing the almost entire obliteration of their tubes, when they are no longer distended with blood." It is to the moderate action of the *tonicity* of arteries that their contraction upon the current of blood passing through them is due. If the *tonicity* be excessive, the pulse is hard and wiry; but if it be deficient, the pulse is very compressible, though bounding, and the flow of blood is retarded. From the experiments of John Hunter and many subsequent physiologists, it is established that *cold* is the most efficient agent in inducing tonic contraction; while the application of moderate warmth causes a relaxation of this contraction. Thus, cold and heat are of extreme value as remedial agents, when the *tonicity* of the blood-vessels is deficient or excessive.

TONICS are medicines which, in cases of want of *tone* or *tonicity* in the muscular fibers, are employed to restore strength and vigor to the system. Tonics, to a certain degree, are stimulants; but while the latter produce a rapid but transitory excitement, the former slowly induce a certain degree of excitement, and the effect is permanent. Most, tonics, in which category we must place the shower-bath, cold sea-bathing, open-air exercise, friction, etc., as well as actual medicines of this class, act primarily through the nervous system (iron being, perhaps, the only exception); and secondarily produce their effects upon the muscular system at large. It is not only in general muscular debility that tonics are to be employed, but in all the numerous complaints which follow in its train, as palpitation, convulsions, epilepsy, chorea, neuralgia, and all forms of periodic disease. Among the chief medicines of this class are the dilute hydrochloric, nitric, nitro-hydrochloric, and phosphoric acids, various salts of bismuth, copper, iron, silver, and zinc, the various kinds of cinchona bark, with their alkaloids and their salts, cusparia, calumba, cascarrilla, chiretta, gentian, quassia, salix, simaruba, and taraxacum. Although nux vomica and its alkaloid strychnine are placed by writers on materia medica among the "special stimulants," when given in very small doses they have a well-marked tonic action; and there is probably no tonic medicine of more general utility than the *syrup of iron, quinine, and strychnine*, a non-official but widely-used preparation, of which every dram (the ordinary dose) contains $\frac{1}{16}$ of a grain of strychnine.

TONIC SOLFA. Various attempts have been made at different times to introduce a musical notation in which the staff with its lines and spaces is dispensed with. Jean Jacques Rousseau suggested, but afterward discarded, a notation where the notes of the scale were indicated by the Arabic numerals. A system similar to Rousseau's in its leading features, called the tonic solfa, has, through the influence of its principal promoter, the Rev. John Curwen (who obtained his main principles from the writings and practice of Miss Glover of Norwich), been brought into use to a considerable extent in singing schools in this country. It proceeds on the principle of giving the chief prominence to the fact, that there is in reality but one scale in music, which is raised or lowered according to the pitch of the key. The seven notes of the diatonic scale are represented by the solfeggio (q.v.) syllables, or rather Miss Glover's modification of them—*doh, ray, me, fah, soh, lah, te*; *doh* standing for the key-note in whatever key the music is written. In the early exercises, the pupils are accustomed to a scale or diagram, called the modulator, representing pictorially the exact intervals of a key, with the semitones in their proper places. In written music, only the initial letters of the solfeggio syllables are used—**d, r, m, f, s, l, t**; the higher octaves of a given note being distinguished by a ¹ above, as **d¹, r¹**; and the lower by a ₁ or ₂ below, **m₁, m₂**. The name of the key is prefixed to a tune as its signature, as "Key A," "Key B flat"—the key-note being, in all the major

keys, *doh*. To indicate rhythm, a perpendicular line precedes the

stronger or louder accent, a colon : the softer accent, and where necessary, a shorter perpendicular line | the accent of medium force. Preparatory to writing the notes, the accent-marks are placed at equal

distances along the page—thus, | : | : or : | : : | : : | :

or | : | : | : | : A note immediately following an accent-mark, is supposed to occupy the time from that accent to the next—

thus, | d : d : d | d : d : d | d, or | d : r | m : d. A horizontal line indicates the continuance of the previous note through another *aliquot* (the term used by Mr. Curwen for the distance

of time between any accent and the next)—thus, d :— | d : d. A dot

divides an aliquot into equal subdivisions, d : m.r | d. A dot after a mark of continuance indicates that the previous note is to be continued

through half that aliquot—thus, | d :— . f | m : d. A comma indicates

that the note preceding it fills a quarter of the time from one accent to the next—thus, | d : r.m,f | ; a dot and comma together, three-quarters—thus, | f.m : r.,d. An inverted comma , is used to denote that the note preceding it fills

one-third of the time from one accent to the next—thus, | d | s : l.s.f | m : r | d. An

aliquot or part of it unfilled, indicates a rest or pause of the voice. A line below two or more notes signifies that they are to be sung to the same syllable.

In modulating into a new key, the note from which the transition is taken is indicated by a combination of the syllabic name which it has in the old key with that which it has in the new—*me lah*, for example, being conjoined into *m'lah*; and in writing this note, the initial letter of its syllable, as a member of the old key, is placed in small size before and above the initial of the syllable of the new, as ^m**l**, ^e**s**. In the case, however, of an accidental, where the transition is but momentary, a sharpened note changes its syllabic vowel into *e*, and a flattened note into *aw*, spelled *a*, as *fah, fe*; *soh, se*; *te, ta*. In the minor mode *lah* is the key-note; the sharp sixth is called *bah*, and the sharp seventh *se*. The signature of the key of A minor is "Key C, minor mode."

TONKING. See **TONQUIN**.

TONNAGE, in regard to ships, is the measure of capacity, the ton being one not of weight, but of cubic content—i.e., 40 cubic feet. Very early in the history of navigation, some scale must have been established by which the relative capacity of different vessels could be determined. In England there are early laws upon the subject, settling the data upon which the calculation should be made. The present system, called "new measurement," dates from 1835; but the prior system, established in 1719, and

Modulator.

now known as O. M. (old measurement), still subsists among yachts and some other vessels. The old measurement was greatly erroneous, for the actual depth of the ship was not taken into account, but was assumed to be equal to her breadth. The tonnage was then obtained by multiplying together length, breadth, and assumed depth in feet, and by dividing the product by 94. As harbor-dues and such like taxes were levied according to each vessel's tonnage, it naturally followed under such a system that traders built their ships with as little beam and as great depth as they possibly could. The ships thus became highly dangerous in rough weather, and, moreover, every principle of correct naval architecture was set at nought, to produce deep wooden boxes capable of carrying a maximum of cargo with a minimum of beam.

TONNAGE (more properly **TUNNAGE**) AND **POUNDAGE**, certain duties on wine and other merchandise, which began to be levied in England in the reign of Edward III. They were at first granted to the crown by the vote of parliament for a limited number of years, and renewed on their expiry. The object of these imposts was said to be that the king might have ready money in case of a sudden emergency demanding it for the defense of the realm and the guarding of the sea. Originally fluctuating in amount, tonnage and poundage came to be fixed at 3s. on every tun of wine, and 5 per cent on all goods imported. In the reign of Henry V. they were first conferred on the king for life; and the same course being followed with his successors, the sovereign began gradually to consider them as his proper right and inheritance, and the vote of parliament as but a formality expressive of the popular recognition of his prerogative. Though these duties were not voted to Henry VIII. until the sixth year of his reign, he, notwithstanding, levied them from the date of his accession; and parliament in voting them took occasion to blame those merchants who had neglected to make payment. It was, in fact, usual to levy these duties during the period intervening between a sovereign's accession and his first parliament, and this was done by Charles I. as by his predecessors. The commons, however, in Charles's first parliament accorded these imposts not for life, but for a year only; and the house of lords objecting to this departure from previous usages, and rejecting the bill, tonnage and poundage were attempted to be levied by the royal authority alone, a proceeding which raised the opposition of the commons. Charles was, in 1629, induced to pass an act renouncing the power of levying these or any other imposts without parliamentary sanction. On the restoration, Charles II. obtained a grant of tonnage and poundage for life; and the same course was followed on the accession of James II. and of William III.; but by three several statutes of Anne and George I. (9 Anne, c. 6; 1 Geo. I. c. 12, and 3 Geo. I. c. 7) these imposts were made perpetual and mortgaged for the public debt. The customs consolidation act, introduced by Mr. Pitt in 1787, 27 Geo. III. c. 13, swept away tonnage and poundage, and all the other then existing charges, and substituted a new and single duty on each article. See **CUSTOMS DUTIES**.

TONQUIN, or **TONG KING**, a French dependency of Indo-China, bounded by China, the Gulf of Tonquin, Anam and the Shan States, with an area of 34,740 sq. miles and a pop. estimated at 9,000,000. Rice, sugar cane, cotton and tobacco are cultivated. The exterior trade is mainly in the hands of the Chinese. The capital is Hanoi (pop. about 150,000) and the chief port Haiphong. It is ruled by a French resident under the council of Indo-China, and the French maintain there an army of occupation which, in 1896, was about 19,000 strong. The French attempts to gain possession of T. date from 1873, when a French force under Garnier laid siege to Hanoi. The resistance offered by the Chinese pirates, called the Black Flags, rendered this attempt fruitless, but in the following year the French secured free trade with some of the towns and protection to the missionary stations in the country. The depredations of the Black Flags, however, continued and, in 1883, another expedition was sent against the country. This again was unsuccessful, but in the spring of 1884 as a result of the successes of generals Courbet and Millot, the French gained possession of the delta of the Red river. China renounced her claim to T. by the treaty of Tientsin, but, failing to evacuate the country with sufficient promptness, the French came into conflict with Chinese troops. In 1885, the Chinese troops were withdrawn. See the articles **ANAM** and **COCHIN CHINA**; also Rousset de Pomaret, *L'Expédition du Tonquin* (1894), and Lanessan, *La Colonisation Française en Indo-Chine* (1895).

TONQUIN, GULF OF, an arm of the China sea, bounded by Cochin China on the w., by China on the n., and by the Chinese province of Quang-tung and the island of Hainan on the east.

TONSILLITIS. See **QUINSY**.

TONSILS. See **PALATE**.

TONSURE (Lat. *tonsura*, a shaving, from *tondeo*, I shave), a religious observance of the Roman Catholic and oriental churches, which consists in shaving or cutting the hair as a sign of the dedication of the person to the special service of God and commonly to the public ministry of religion. It is a very ancient usage, and by some writers is represented as of apostolic origin; but that it did not prevail in the early ages is sufficiently plain from the fact with which Optatus upbraids the Donatists of his time (4th c.) of having shaved the heads of certain Catholic priests and bishops in derision. Jerome also in his *Commentary on Ezekiel*, c. 24, is equally explicit. It would appear that the usage first arose in reference to the monastic rather than the clerical life. Paulinus of

Nola, in the end of the 4th or beginning of the 5th c., alludes to it as then in use among the western monks; and it speedily passed from them to the clergy, the crown-like figure being regarded partly as a symbol of our Lord's crown of thorns, partly as an emblem of the "royal priesthood" of the Christian dispensation. The form of the tonsure was different in different churches, and the varieties of it are of some historical interest. That of the Roman church, called "the tonsure of Peter," consisted in shaving the crown as well as the back of the head, so that there remained a circular ring or "crown" of hair. This was the form in use in Italy, Gaul, and Spain. In the "Scottish (or Irish) tonsure," which was in use in Ireland, in north Britain, and in those parts of Germany in which the Irish missionaries had preached, the entire front of the head was shaved, leaving the front bare as far back as the line from ear to ear. This tonsure was called "the tonsure of James," and sometimes of "Simon the magician." The Greeks and other orientals shaved the *entire head*. The supposed derivation of the Irish form of tonsure from the apostolic times led to its being held both in Ireland and in Britain, as well as other churches of Irish foundation, to be of the most vital importance, inasmuch that the introduction of the Roman form was almost the occasion of a schism. Originally the tonsure was merely a part of the ceremonial of initiation in orders, and was only performed in the act of administering the higher order; but about the 7th c. it came to be used as a distinct and independent ceremonial, and a question has been raised whether it is to be considered as itself an order and to be added to the list of what are called the "minor orders" (see *ORDERS, HOLY*). The now received opinion of Catholic writers is that tonsure is not an "order," but only a "preparation for orders."—See Wetzzer and Welte's *Kirchen-lexicon*, art. "Tonsur."

TONTINE. This term is derived from the name of Tonti, a Neapolitan, who seems to have been the first propounder of a scheme for a financial association of which the prize or prizes were to accrue to the longest liver or livers. Generally, in an association on what is called the tontine principle, a payment is made by each member of the association, and with the capital so formed, an annuity, payable at the same rate until all the lives forming the association are extinct, is bought from some company or individual. This annuity is divided among the members according to age and premium paid by each; and on the decease of any member, the surplus thence arising is divided among the survivors; and on the death of the last member of the association, the total annuity reverts to the source from which it has hitherto emanated. There are, however, various kinds of tontines; and the designation of tontine may, with propriety, be applied to any financial scheme by which it is proposed that gain shall accrue to survivorship. In England, tontines have rarely been resorted to as measures of public finance. The last for which the government opened subscriptions was in 1789.—See Hamilton's *History of Public Revenue*, p. 210. Schemes on the tontine principle seem generally to be acceptable to the public, owing, probably, to the sort of sentimental faith which most persons have in their own prospects of longevity, and to the prudent desire for ease and affluence in old age. The application of the principle by life assurance companies in their mode of distributing "bonus," or surplus profits, has long been a subject of controversy among these valuable institutions. It would be impossible here to go into the argument with any degree of nicety. It may, however, be broadly stated as follows: A company formed for the purpose of life assurance means a company in which the members who are lucky in having long life are to pay for those who are unlucky in dying prematurely. But over and above the net mathematical premium payable by each member of an assurance society, or by each person assured at the risk of a company, a percentage, or "loading," as it is technically called, is added, to cover expenses of management and other contingencies. Where the funds of the company or society have been invested with average success, the loading is generally found, at the periodical actuarial investigations, to have been in excess of actual requirements; and the question then arises, How are "profits," or, in other words, the overcharges on premiums, to be divided? The question is plainly one of great intricacy. The argument used by the offices favoring the younger policy-holders is, that those which favor the older are really acting on a tontine principle, which is the very converse of what ought to prevail in life assurance; on the other hand, it is said that the fulfillment of the insurance contract is provided for by the net premium, and that the distribution of over-payments, as "profits" really are, is to be determined on principles wholly independent of insurance. See "Notes on the Early History of Tontines," by J. Hendricks, in the *Assurance Magazine* for July, 1862.

TONTY, HENRY DE, Chevalier, 1650–1704; b. France; served in the French army and navy. He came to Canada with La Salle in 1678, and accompanied him in his exploration of the Mississippi. He endeavored to establish a colony in Arkansas, went down the Mississippi twice to find La Salle and again to meet Iberville, and died at what is now Mobile.

TOOELE, a co. in w. Utah, adjoining Nevada; bounded n.e. by the Great Salt lake; 6240 sq. m.; pop. '90, 3700, chiefly of American birth. Co. seat, Tooele.

TOOKE, JOHN HORNE, a celebrated etymologist and political adventurer, was the son of John Horne, a London poulterer, and was b. in that city, June, 1736. He was educated first at Westminster and Eton, and afterwards at St. John's college, Cambridge, where he took the degree of B.A. in 1758. After spending some time as an usher in a

school at Blackheath, he entered the church (to please his father, and strongly against his own wish), and in 1760 became curate at New Brentford. The disgust he entertained for the sacred profession led him to indulge (by way of revenge) in a license of speech and life, which appears to us to have fatally affected the honesty of his character. It is impossible, for instance, to read a passage like the following (from one of his letters to Wilkes), without feeling a deep distrust of the whole man: "It is true I have suffered the infectious hand of a bishop to be waved over me; whose imposition, like the sop given to Judas, is only a signal for the devil to enter; but I hope I have escaped the contagion; and if I have not, if you should at any time discover the *black spot* under the tongue, pray kindly assist me to conquer the prejudices of education and profession." When Wilkes (whose acquaintance he had made during a trip to Paris) stood as a candidate for the county of Middlesex, Tooke zealously aided him, pledging his credit for Wilkes's expenses, and declaring that, "in a cause so just and holy, he would dye his black coat red;" but he afterward quarreled with his dubious associate, and in 1770-71, the two had a rasping epistolary controversy, which appears to have hugely gratified their enemies. He still, however, continued to meddle in political affairs, and even ventured to encounter (not without success) the formidable Junius. In 1773 he resigned his living at New Brentford, and commenced the study of law, a profession in which he was really fitted by nature to excel. About this time, he rendered some important private service to a Mr. Tooke of Purley in Surrey, who designed to make him his heir, but altered his mind, and only left him a legacy of £500. Altogether, however, he is said to have received from this gentleman about £8,000, and, in consequence, adopted the surname of Tooke, by which he is now known. In 1775 he was fined and imprisoned in the King's Bench for publishing an advertisement in which he accused the king's troops of barbarously murdering the Americans at Lexington. While in prison, he penned his celebrated *Letter to Mr. Dunning*, in which are to be found the germs of his *Diversions of Purley*. It excited a good deal of attention at the time, and even Dr. Johnson, who detested Tooke's political sentiments, expressed his intention—should he publish a new edition of his *Dictionary*—to adopt several of the "dog's" etymologies. On his release from confinement, Tooke made an attempt to gain admission to the bar, but was refused, on the ground of his clerical orders. Soon after, he reverted to political writing, at once the pleasure and the poison of his life, and in a *Letter on Parliamentary Reform*, advocated universal suffrage. In the struggle between Pitt and Fox, he pamphleteered on the side of the former, but soon got to hate Pitt too, as he had learned to hate most other public men. In 1786 appeared his famous *Epea Pteroenta, or the Diversions of Purley*, a work on the analysis and etymology of English words, which, amid much that is erroneous, both in principle and detail, contains still more that is acute, original, and true. In particular, he has demonstrated, says a *Quarterly Reviewer* (No. 14), that "all words, even those that are expressions of the nicest operations of our minds, were originally borrowed from the objects of external perception." See PHILOLOGY. But Tooke's passion for politics soon drew him from the calm pursuit of literature into the vortex of public life. In 1790 and again in 1796 he stood as a candidate for Westminster, but was unsuccessful on both occasions. At length, in 1801, the great enemy of rotten boroughs entered parliament for the most notorious rotten borough in England—Old Sarum; but he made no figure there. He died at Wimbledon, Mar. 19, 1812. Tooke was never married, but had several natural children, to whom he left his property. The best edition of the *Diversions of Purley* is that of Taylor (Lond. 1840).

TOOKE, THOMAS, 1774-1858; b. St. Petersburg; an English merchant in the Russian trade. He devoted himself to the study of economic laws, and published in 1823 *Thoughts and Details on High and Low Prices*. His chief work is his *History of Prices*, 6 vols. (1838-57), upon the last two vols. of which he was assisted by his pupil Newmarch. He was the founder in 1831 of the political economy club.

TOOLE, JOHN LAWRENCE, English comedian, b. in London, Eng., March 12, 1830, was educated at the City of London School, and became clerk to a wine-merchant, an occupation which he soon forsook. Being led to join the City Histrionic Club, he appeared at the Haymarket Theatre (London), July 22, 1852. Resolving to become an actor, he began his career at the Queen's Theatre, Dublin, Ireland, and achieved great success. In 1854 he accepted an engagement at the St. James' Theatre, in London, and sustained low comedy characters with acceptance. On the opening of the new Adelphi Theatre by Mr. Webster, Mr. Toole became leading comedian. He made professional tours throughout the English provinces for years. In July, 1875, he visited the United States, making his début in America, Aug. 17th. On the 17th November, 1880, he opened Toole's Theatre in London, having reconstructed and re-named the Folly Theatre.

TOOMBS, ROBERT, b. Washington, Ga., 1810; graduated at Union college, 1828; studied law at the university of Virginia, and began practice in Wilkes co., Ga. In the Creek war of 1836 he served as capt. of the volunteers. From 1837 to 1843, he was a member of the state legislature; in 1845 he was elected to congress and held his seat for four terms, or until 1853, when he was elected to the U.S. senate, and in 1859 re-elected. In politics Toombs was then, and remained, an extreme Jeffersonian democrat, believing fully in states-sovereignty, the right of secession and the propriety of slavery. It should be added, however, that in 1840 and 1844 he supported Harrison and Clay with the old line

whigs. As an impassioned political speaker he had few equals. The movement of secession had his full approval; and his influence, more than other's, led his state to pass the ordinance of secession, to which there was a strong opposition, especially among the "old line whigs." He was the choice of a great part, perhaps the majority, of southern voters for president of the new confederacy. On the election of Davis, Toombs was offered the office of secretary of state and with reluctance accepted it for a short time, on his resignation receiving a commission as brig.-gen.; he served at Manassas and Sharpsburg, and in 1863 was made brig.-gen. of the Georgia militia. After the war he lived for some time abroad, and after 1867 he carried on a successful law practice at his old home. He was noted for his brilliant wit, his legal sagacity and his benevolence. He was a bitter opponent of the "reconstruction" measures, and never took the oath of allegiance. He d. 1885.

TOON, or **TOONA**, *Cedrela toona*, a tree of the natural order *cedrelaceæ*, one of the largest timber trees of India. Dr. Hooker mentions one which he measured which was 30 ft. in girth at 5 ft. above the ground. The leaves are pinnate, the flowers small, in panicles, with a honey-like smell, the petals erect, and approaching each other so as to form a sort of tube. The tree ascends to the height of 4,000 ft. on the Himalaya mountains, and is found to the furthest s. of the East Indies. It is sometimes called *bastard cedar*. The wood is soft, but is used for furniture. The bark is a powerful astringent, and is used in dysentery, diarrhea, etc.

TOORKISTAN, or **TURKESTAN**. See **TURKISTAN**.

TOOTHACHE. See **TEETH**.

TOOTHACHE-TREE. See **ARALIA** and **XANTHOXYLUM**.

TOOTH-ORNAMENT, much used in the early English style.

TOP, in a ship, is the platform at the head of each lower-mast. It is supported on the trestle-trees and cross-trees, and serves to give a wider base to the top-mast shrouds. It is also used for working the upper sails. In a well-ordered ship, there is a captain and crew for each top. Formerly, in vessels of war, the top was fortified with hammocks all round, and in action was made to do duty as a sort of redoubt, whence a fire of small-arms, or even light swivel-guns, was poured upon the deck of the enemy.

TOPAZ, a mineral, ranked by mineralogists among gems (q. v.), and the finer varieties of which are much valued both for their luster and the beauty of their colors. It is composed chiefly of alumina and silica, the former, in general, more than 50 per cent of the whole, with fluoric acid, and usually a little oxide of iron. It is found generally in primitive rocks, and in many parts of the world. A crystal 19 ounces in weight was found in the Cairngorm mountains in Aberdeenshire, Scotland; and fine topazes are sometimes found in that part of Scotland, in Cornwall, and in the Mourne mountains in Ireland. Fine topazes are found in Ceylon, but those most prized by jewelers are generally from Brazil. The finer varieties of topaz are in general found either crystallized, or as small rolled masses, which may have been formed from crystals, in alluvial soil. Topaz is either colorless, or red, blue, green, or yellow, in great variety of shades. Its crystals are rhombic prisms, generally terminated by four-sided pyramids, but often variously bevelled and acuminate. The prisms are finely striated. The cleavage parallel to the base of the prism is easy. The specific gravity is about 3.5. The luster is vitreous. Topaz is translucent or almost transparent on the edges. It is harder than quartz. It is rendered very electric by heat or friction, and by this property a topaz may at once be distinguished from a diamond or ruby, for which otherwise, when cut and set, it might readily be mistaken. A coarse variety of topaz, called *pyrophyllite*, occurs near Fahlun, in Sweden, which is not crystallized. It is greenish white. When reduced to powder, it can be used as emery for grinding and polishing. —Topaz derives its name from the *topazion* of the ancients, which, however, seems to have been a totally different mineral.

TOPE, *Galeus canis*, a small species of shark, of the family *galeidae*, which has two dorsal fins and one anal, spout-holes, and the eyes furnished with a nictitating membrane, the first dorsal situated over the space between the pectorals and ventrals.

TOPE is the vernacular name of Buddhistic monuments intended for the preservation of relics. In Ceylon and elsewhere they are also called *dagops*; and another of their designations is *chaitya*. The difference between these terms results from their meaning. Tope is the Pāli *thūpa*, and the Sanskrit *stūpa*; it means, therefore, literally "accumulation," and conveys a sense analogous to that of the Latin *tumulus*. *Dagop* is a corruption of *dhatu-gopa*, i. e., relic-preserver; and *chaitya* applies generally to objects of worship, as images, temples, sacred trees, etc. *Tope* is, therefore, the name of those monuments in regard to their shape; *dagop*, in regard to their purpose; and *chaitya* the general term. Though the shape of the topes underwent many changes according to time and locality, it is possible to distinguish its oldest type from its later development. The oldest topes are in the shape of cupolas, generally spherical, but sometimes elliptical, resting on a cylindrical or quadrangular, or polygonal base, which rises either in a straight or inclined line, or in terraces. The top of the cupola, surrounded by a balcony of pillars of a peculiar kind, is crowned by a structure generally quadrangular, but sometimes in the shape of a reversed pyramid of a few steps; and over this structure is a roof in the shape

of an extended parasol (Sanskrit, *chhattra*; in Pāli, *chatta*). This was the form, for instance, of the topes of Sanchi, of the dagops of Ceylon, and the oldest monuments of this kind in the Punjab and Afghanistan; though in most of them the parasol, being of wood, is either completely destroyed, or merely recognizable in its fragmentary condition (see art. *Buddhism*, where, in the section of the cave temple at Karli, the tope is seen still surmounted by the wooden umbrella). The cupola was sometimes ornamented with more than one parasol; in some of the topes of Sanchi there are three, and even five parasols side by side, the middle one exceeding the rest in height. The different arrangement of these parasols, especially when their number increased, led to a different shape of the topes, such as occurs, for instance, in China and Thibet. This arrangement consists in placing them one *over* the other; and not only three or five, but even seven, nine, or more are so placed. The height of the structure thus became naturally greater than it originally was, and the topes, instead of having the character of cupolas, now assumed that of pyramids resting on a cupola base, the parasols gradually giving way to a real pyramidal form. In some monuments of this class, however, the cupola was placed above, when the base consists in round or quadrangular towers rising in a spiral form, or in several stories. The Chinese, on the contrary, rejected the cupola altogether, and merely retained the succession of parasols extended one over the other, converting them into a many-storied tower; and the same is the case with the topes of the Mongols, the *ssuvurghans*, which are pyramids erected on a low quadrangular base. The top of the pyramidal topes always carries some metal ornament, frequently gilt, resembling a parasol, or a needle, or a trident, or a rising flame. The height of these buildings varies from a few feet to 300, and even more; there are also topes of a few inches only, but they serve merely as ornaments in temples or buildings, or as symbols of the real topes. If erected in cave-temples the tope generally stands at the end of a long hall especially cut out for it, but sometimes also in the sanctuary of the cave-temple itself; if erected overground it stands always in the vicinity of a temple or convent. In the interior of the tope is the cell or chamber (*dhātugarbha*) where the box containing the relics and "the seven precious things" was placed. This cell consists of six slabs of stone, firmly closed after the box with the relics, etc., had been placed in it; and it was immured into the tope after its structure had, in the course of building, attained a certain height; the building then being brought to its completion, so that the cell enshrining the relic was inclosed on all sides with solid brickwork. The "seven precious things" referred to, with which the relics were ornamented, are differently enumerated; according to one account, they are gold, silver, lapis lazuli, crystal, red pearl, diamond, and coral; others mention ruby and emerald; and others, again, omit gold and silver. In several cells which have been opened the box contained, besides the relics, precious stones of various kinds, golden ornaments, and coins; and the box itself generally consisted of an outer casement of stone, clay, or bronze, which inclosed a silver cylinder, and within this a golden cylinder, which was the real receptacle of the relics. Both cylinders had generally a convex lid, representing the shape of the cupola, and the box exhibited inscriptions commemorating the name of the saint to whom the ashes or other relics contained in it had belonged. It seems that there are also topes which had the relics placed, not within, but under them—or, in other words, in the ground on which they were erected; for, in some which were opened, neither a cell nor any relic was found; and though it is possible that such monuments were merely erected in commemoration of some personage, there are, on the other hand, accounts which relate that relics were also placed under the dagops. Whether these accounts be correct it is at present impossible to say, as no foundation on which such dagops stand has as yet been explored. It has been supposed by some authors that the topes contained some secret passage leading to the relic-cell, known only to the priests or the initiated, who thus might gain access to the relics; for legends relate that during night such relics occasionally shed light, and that some pious king was deigned worthy of being favored with their sight; but none of the topes hitherto explored—and some of these are of the greatest dimensions—yielded any confirmation of this theory: they proved to be nothing but solid masses of brick and stone, without any chambers or passages—merely containing the relic-cell, of generally one foot in diameter. That the cupola of the topes was intended to represent the water-bubble, the Buddhistic symbol of the hollowness and perishability of the world is borne out by a legend in the *Mahāvans'a* (q.v.). The purport of the parasol may seem more doubtful; but as the parasol is the emblem of Hindu royalty, and as S'ākyamuni, himself the son of a king, replied to the question how he wished to be buried, by answering: "Like an emperor," it is not unlikely that the parasol of the topes was intended to imply the royal dignity possessed by a Buddhistic saint. When the topes became pyramids or towers consisting of terraces and stories, the number of the latter had likewise a symbolical import. Thus, only the topes of the most accomplished Buddhas had thirteen terraces, to show that these Buddhas had passed beyond the twelve causes of existence; three terraces imply the three worlds—the world of desire, that of form, and that of absence of form; five, the five steps of Mount Meru; and so on.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857), vol. i. p. 533, ff., and the works quoted there.

TOPEKA, city, capital of Kansas, and co. seat of Shawnee co.; on the Kansas river, and the Atchison, Topeka, and Santa Fé, the Chicago, Rock Island, and Pacific, the

Leavenworth, Topeka, and Southwestern, the Missouri Pacific, and the Union Pacific railroads; 67 miles w. of Kansas City. It was laid out in 1854, became the state capital in 1861, and was made a city of the first class in 1881. The city is built on ridges at right angles with the river, is lighted by electricity, and has electric street railroads, waterworks on the Holly system belonging to a private corporation, and excellent natural drainage. It contains the state capitol, the state asylum for the insane, the state reform school, U. S. government building, Christ hospital, the Atchison, Topeka, and Santa Fé railroad hospital, Washburn college (Cong.), college of the Sisters of Bethany (P. E.), the Kansas medical college, and a free public library. There are several national and state banks, nearly 100 churches, and numerous daily, weekly, and monthly periodicals. The U. S. census of 1890 reported for Topeka, 371 manufacturing establishments, employing a capital of \$3,282,899, paying \$3,670,106 for materials, and having an output valued at \$6,752,449. The principal industry is the manufacture of flour. The city has also large railroad shops. Pop. '90, 31,007.

TÖPFFER, RUDOLPHE, 1799-1846; b. Geneva; was first a landscape painter; was appointed professor of aesthetics at the academy of Geneva; and became a novelist. He published *Le Presbytère* (1839); *La Bibliothèque de Mon Oncle* (1843); *Rose et Gertrude* (1845); *Nouvelles Gênévoises* (1845); and *Collection des Histoires en Estampes* (1846).

TOP-GALLANT, in a ship, the name applied to the third mast or sail above the deck, i. e., to the mast and sail above the topmast and topsail respectively.

TOP'HANE (correctly, TOP-HANEH), a suburb of Constantinople, forms a continuation of Galata along the northern shore of the Bosphorus. See CONSTANTINOPLE.

TOPHET. See GEHENNA.

TOPICS (the Gr. term *topike*, from *topos*, a place) was the name given by the Greek and Roman rhetoricians and grammarians to the art of discovering arguments. It consisted in the eliciting out of the series of particulars certain general conceptions and propositions, which, in the elaboration of oratorical discourses, served as guides in the invention and choice of suitable arguments. Any one such general conception was called in Greek *topos*; in Latin, *locus communis* (a "common place"). The Greeks bestowed much attention on this art; among the Romans, Cicero composed *Topica*, and various other treatises of a kindred nature. During the middle ages, it was proposed to apply it to the whole circle of human knowledge, and even to the solution of the most difficult intellectual problems; but, in general, these efforts only resulted in empty exhibitions of mental vivacity (*jeux d'esprit*); and in modern times, the so-called "art" has sunk so low that by the term "topic" one understands nothing more than a theme or subject for discussion and talk.

TOPKNOT, the popular name of some small fishes of the same genus with the turbot (q. v.) and brill. MULLER'S TOPKNOT (*Rhombus hirtus*) is not uncommon on some parts of the British coast, particularly the west coast of England. BLOCH'S TOPKNOT (*R. punctatus*) is more plentiful in northern parts. They are very similar, brown and mottled with very dark brown or black on the upper surface, white below. They live among rocks, where they are not easily distinguished by the eye from the sea-weed. Although very delicate fish, they are little regarded, the largest being seldom more than 7 or 8 inches in length. The breadth is about half the length.

TÖPLITZ, or TEPLITZ, a watering-place of Bohemia, one of the most celebrated of the German spas, is pleasantly situated on the Saubach (Pig's stream), 46 m. n.w. of Prague. The chief building is the palace of prince Clary, to whom the town in great part belongs; and behind this building are a park and gardens, which are the principal places of resort. Within their limits are the theater and the Gartensaal, the latter of which serves the purposes of reading, dining, and ball room. The town is historically important for the treaty of alliance signed there Sept. 9, 1813, between Russia, Austria, and Prussia, against Napoleon. The baths are supplied from 12 hot alkalo-saline springs, with temperatures varying from 90° to 117° Fahr. They are taken exceedingly hot, and have great virtue in restoring persons afflicted with gout, rheumatism, etc. Pop. of Toplitz, '90, 17,526. Between 7000 and 8000 strangers annually visit the baths.

TOPLADY, AUGUSTUS MONTAGUE, 1740-78; b. England; educated at Westminster school, and Trinity college, Dublin; was ordained, and preached in a chapel near Leicesters fields, London, 1775. He was the great champion of Calvinism in the church of England, and wrote much against the Methodists with great vigor of language and argument, but often with undue asperity of style. He edited for several years the *Gospel Magazine*. His controversial works, mostly in reply to Wesley, are numerous. He published some popular hymns, one of which is *Rock of Ages, cleft for Me*.

TOPOGRAPHY is literally a description of places (Gr. *topos*, a place), as rivers, hills, woods, but more especially cities, roads, bridges, streets, and even particular buildings. It differs from ordinary geography only in being more special and minute. Thus we have topographical descriptions of counties, provinces, and kingdoms, excellent specimens of which are Lewis's *Topographical Dictionary of England*, Anderson's *British Topography* (1881), a catalogue of the works on this subject; Murray's *Hand-Books*, etc.

TOPOGRAPHY, MILITARY. Among the first necessities of a military commander is a thorough knowledge of the physical conformation, the obstacles, and the resources of

the country in which he has to operate. It frequently happens that the field of warfare is one of which no careful survey is procurable. It devolves, then, on the officers of the staff to make their chief acquainted with all the particulars he requires; hence, topographical drawing is made a principal ingredient in the course of study at the staff college. These surveys devolve, in the field, on the quartermaster-general's department. An officer of this service is expected to traverse a country with rapidity, to measure distances by eye or intuition, to note them roughly down as he rides, to obtain a rough knowledge of hills and valleys, of roads and ravines, rivers and the means of crossing them. He must at the same time make himself acquainted with the means of sustenance produced by the country, with the feelings of the people—whether friendly or hostile—with the transport which can be drawn from the villages, with the position and strength of fortified places, and, in short, with every particular which can be of service to his commandant. His reconnaissance finished, not without fatigue and danger, he is expected to sit down and produce an eye-map, or a full report of all he has seen and heard.

TOPOLOBAMPO. The name given to a colony of 400 Americans who in 1886 settled near the Bay of Topolobampo, in Lower California. The colony was conducted on the co-operative system, but was not very successful. The people suffered greatly from lack of food and water, the soil was not fertile; and finally the colony split up, part going to Kansas to join a similar colony, and those remaining settling near the Rio Fuerte.

TOP-SHELL. See TROCHIDÆ.

TOQUE (Ital., *tocca*, “a cap”) is a name given in France to a small hat of the turban shape, worn by ladies. The term has become to some extent Americanized.

TOR (Celtic), “a projecting rock, is found in the names of mount Taurus and the Tors of Devonshire (Yes Tor, Brent Tor, etc.), and Derbyshire (Mam Tor, Chee Tor, etc.). The highest summits of the *Tyr-ol* are called *Die Taur-en*.”—Taylor's *Words and Places*.

TOR. See THOR.

TORBANEHILL MINERAL, a name sometimes popularly given to a mineral substance also known as BOGHEAD COAL, found on the lands of Boghead and Torbanehill, near Bathgate, Scotland, and celebrated for its value as a source of paraffine oil or naphtha (q.v.), of which it yields a much greater quantity than any other coal or shale found in Britain.

TORBERT, ALFRED T. A., b. Del., 1833; graduated at West Point, 1855; commissioned in the infantry. In 1861 he was made col. of a New Jersey regiment, and was present at the battles of Yorktown, Gaines's Mill, and West Point. He served with the 6th corps at the second battle of Bull Run, Antietam, and Gettysburg. He was also engaged at Cold Harbor, and through the Shenandoah valley. In 1865 he was placed in command of the army of Shenandoah. He retired with the rank of brevet brig.gen. in 1866, was subsequently consul-general at Havana and in Paris. He d. 1880.

TORCE, or WREATH, in heraldry, a garland of twisted silk, by which the crest is joined to the helmet. A crest is always understood to be placed on a torce, unless where it is expressly stated to issue out of a coronet or chapeau.

TORENO, JOSÉ MARIA QUEYPO DE LLANO RUIZ DE SARAVIA, Count 1786-1843; b. Spain; conspicuous in the rising against the French in 1808. He was returned to the cortes in 1810, but when Ferdinand VII. resumed authority in 1814, left the country, not returning till the death of Ferdinand. He became minister of finance in 1834, and the next year president of the council and minister of foreign affairs. He pursued a moderate policy, and was forced to resign, 1835. He wrote *History of the Insurrection, etc., of Spain* (1835).

TORGAU, a strongly fortified t. of Prussia, in the province of Saxony, stands on the left bank of the Elbe, 70 m. s.s.w. of Berlin. Among the public buildings are the castle, now used as a barrack and magazine, and comprising a church consecrated by Luther in 1544; a town-church, with pictures by Cranach; a gymnasium, and other schools. Weaving and brewing were once briskly carried on at Torgau, but the prosperity of the town has decayed. A battle was fought here in Nov., 1760, in which Frederick II. of Prussia defeated the Austrians. The allies besieged it 1813, and it surrendered Jan. 14, 1814. Pop. '93, 11,780.

TORGET, a small island off the n.w. coast of Norway, in lat. 65° 30' north. It serves as a landmark to sailors, is the haunt of numerous water-fowl, but is chiefly noteworthy for its lofty rock called Torghattan (the hat of Torget), which rises to the height of 756 ft. above sea-level, and is pierced right through, near the top, by a cave or passage 80 ft. wide, and 1300 ft. long.

TORLONIA, a princely Roman family, remarkable for their wealth, and for their extraordinarily sudden rise from the very lowest condition, trace their origin to a poor "cicerone," Giovanni Torlonia (1754-1829), who hung about the piazza di Spagna in Rome, and gained a precarious living by showing visitors over the colosseum. By steadiness and honesty, he obtained a reputation in his profession, became afterward an agent of the French emissaries who were sent to excite the Roman populace to revolution, and on the failure of this project was left with considerable funds in his hands; he afterward married a widow of means, and became a merchant, gradually rising, by dint of great intelligence, keen foresight, and enterprise, to the position of a stock-broker, usurer, and money-dealer; and by acquiring mortgages over the properties of the impoverished Roman princes, and by various other happy ventures, ultimately amassed an immense fortune. He was made a grandee of Spain, and duke of Bracciano by the pope. His three sons allied themselves with princely families of the highest rank; the eldest succeeded to the dukedom, and the two others carried on their father's business. The youngest became Prince of Civitella-Cesi, and duke of Ceri.

TORMENTIL, *Tormentilla*, a genus of plants of the natural order *rosaceæ*, sub-order *potentilleæ*, differing from *potentilla* (q.v.) only in the 4-parted calyx and corolla, and now united with it by many botanists. The COMMON TORMENTIL (*T. officinalis*, or *potentilla tormentilla*) is a very common plant in moorish and heathy places in Britain and throughout great part of Europe. It has a large woody root, which has long been officinal, being an agreeable and efficacious astringent, useful in diarrhoea and other complaints; and which contains tannin, gum, and a red coloring matter, not soluble in water, used by the Laplanders for staining leather red. The leaves are ternate, the leaflets lanceolate, and inciso-serrate; the stems ascending and forking, the flower-stalks axillary and terminal, and the flowers yellow.

TORMINA is the technical term for *gripping* pains in the belly.

TORNA, a co. in n. Hungary, in the Cis-Tibiscan circle, otherwise called Turnya; the smallest county of Hungary, bounded by Zips, Abauj, Borsod, and Gömör; 238 sq. m. Its surface is mountainous, producing small crops of hemp, and the vine is cultivated to some extent. Capital, Torna.

TORNADO. See WHIRLWINDS.

TORNEÅ, a river, important as forming part of the boundary-line between Russia and Sweden, rises in lake Torneå, in Sweden, and flows s.e. and s. between Russia and Sweden, entering the gulf of Bothnia at its northern extremity, after a course of 250 miles. At the mouth is the small town of Torneå (q.v.).

TORNEÅ, a t. in Finland, situated in 62° 48' n. lat., and 24° 12' e. long., on the peninsula of Svensar, at the mouth of the Torneå, in the government of Uleaborg. The pop., which in 1895 was 1326, is principally engaged in the exchange-trade with the more northern and scantily inhabited districts of Finland and Sweden, of which Torneå is the active center, as the most northern town in the Russian empire; deals, salt-fish, tar, hemp, reindeer skins, and other peltries being brought to Torneå to be exchanged for tobacco, spirits, manufactured goods, etc. Torneå is often visited in summer by travelers, anxious to witness the singular spectacle of the sun remaining above the horizon both night and day at the summer solstice. Torneå was several times taken by the Russians from Sweden before its final cession at the peace of Frederickshamm, in 1809, when it was ceded, together with the whole of western Finland, to Russia.

TORO, or **TORRO**, an ancient but decayed t. of Spain, in the modern province of Zamora, stands on the right bank of the Douro, 38 m. n.e. of Salamanca. It contains numerous religious houses, most of which have been allowed to fall into a state of decay; there are brandy-distilleries, vineyards, and woolen manufactories. Pop. '87, 8721.

TORONTAL, a co. in s. Hungary, in the Banat, w. of Temesvar; 3670 sq. m.; pop., '90, 591,260. It is drained by the Maros, Theiss, Béga, and Temes rivers, and is traversed by the Béga canal. The soil is remarkably fertile, producing wheat, cotton, maize, melons, flax, rice, tobacco, and the vine, but the surface is dotted by many swamps and marshes. Silk-worms are reared, and live-stock in large numbers; mineral products are coal, copper, and lead. The population is mixed, comprising Magyars, Serbs, Germans, and Roumanians; and there are Roman Catholic, Greek-Oriental, and Evangelical churches. Capital, Pancsova.

TORONTO, the capital city of the province of Ontario, Canada, stands on the n. shore of lake Ontario, in lat. 43° 39' n., long. 79° 23' w., 161 m. from Kingston, and 333 m. from Montreal. It is over 2 m. in length between e. and w., is bounded on the s. by the bay of Toronto, a spacious inlet of lake Ontario, and is 1½ m. broad from s. to north. The scenery of the vicinity is somewhat tame, and the situation of the town is low and flat, the most elevated quarter—the Queen's Park in the w. containing the university, observatory, and handsome private residences—being only from 100 to 200 ft. above the level of the lake. The harbor or bay, about 5 m. long and 1 m. in width, is formed by a curving spit of land running into the lake in a s. and w. direction to the distance of 3 miles. It is

capable of accommodating the largest vessels that navigate the lakes, and is defended at the entrance by a fort, which was thoroughly repaired in 1864 by the imperial government, and mounted with the most efficient modern ordnance. Toronto has much the appearance of an English town, and is distinguished for the number of its churches—many of which are surmounted by handsome spires. The principal are St. James's cathedral (Anglican), a noble edifice in early English, erected in 1852; St. Michael's cathedral (Roman Catholic); St. James's and St. Andrew's (Presbyterian); Jarvis street Baptist; Bond Street Congregational; and the Church of the Ascension (Anglican). Toronto is the fountain-head of the Canada school-system. Its higher institutions include the famous Toronto university, an imposing Norman structure, in Queen's Park; Trinity college; Baptist college; Knox college; Upper Canada college; the school of practical science; veterinary college; schools of dentistry and pharmacy; Collegiate institute; schools of medicine; and normal and model schools. The university park, with its beautiful monument to the volunteers who fell at Ridgeway, and the horticultural gardens, are frequented by all classes of the community. There are many benevolent institutions, as hospitals, asylums, etc.; and handsome official buildings, the seat of the supreme courts of the province; the legislative buildings; the Government House; the customs-house; and the post-office. The Grand Trunk and the Canadian Pacific railroads pass through the city, and, during open navigation, magnificent steamers ply in all directions on the lake. Cabinet-ware and iron rails are manufactured, and foundries, distilleries, and flour mills are in operation; the exports are manufactured lumber, flour, wheat and other grain. Pop. '91, 181,220, who return two members to the provincial parliament.

The name Toronto is supposed to be of Indian origin, but the meaning of the word appears to have been lost. The town was founded in 1794 by Governor Simcoe. It was incorporated in 1834, was burned by the Americans in 1813, and suffered severely in the insurrection of 1837, on which occasion it was the headquarters of the rebellion, as also from fire in 1849.

TORPEDO, a genus of fishes of the order *raiiæ* (see RAY), and family *torpedinidæ*. All the *torpedinidæ* were formerly included in this genus, itself originally formed from *raia*; but it has been divided into a number of genera, as *torpedo*, *narcine*, *astrape*, etc. The *torpedinidæ* have a short and not very thick tail, cylindrical toward the end, keeled on the sides. The disk is rounded, and has neither scales nor prickles. The most remarkable characteristic, however, is the galvanic battery, which all the species possess, and which is described and figured in the article ELECTRICITY, ANIMAL. The name torpedo is very commonly extended in a popular sense to all the *torpedinidæ*. Two species of torpedo are occasionally found on the southern coasts of England.—*T. vulgaris* or *marmorata*, which sometimes attains a large size, weighing 100 lbs.; and *torpedo nobiliana*, which is apparently more rare. They are readily distinguished by the spiracles behind the eyes, which are round and fringed at the edges in the former, oval and perfectly smooth in the latter. These and other species are found more plentifully in the Mediterranean, and the *torpedinidæ* generally belong to the warmer seas. The popular names *numb-fish*, *cramp-fish*, and *cramp ray* are given to torpedos by English fishermen. The electric shock which a large torpedo gives when seized is so severe, that no one who has experienced it desires to experience it again.

TORPEDO. During the war between Great Britain and the United States in 1812-14, this name was applied to certain mysterious boats invented by Fulton and other Americans for the purpose of navigating beneath the surface of the water, and injuring the bottoms of hostile vessels. In those days of hand-to-hand naval war, these designs (which, by the way, were failures) were looked upon as little less than diabolical. The progress of destructive weapons since those days has removed this aversion. The modern torpedo is of two kinds—first, the locomotive torpedo, which is in various ways projected against the side of a hostile vessel; secondly, the fixed torpedo, a kind of stationary bomb-shell intended to explode under the bottom of the enemy's ship. To these fixed torpedoes it is now more usual to give the appropriate name of submarine mines.

The weapon was first used by the Russians in the Baltic in 1854; but in the American war of secession of 1861-65 it was extensively and often successfully employed. The damage effected by a torpedo exploding beneath a ship is very great, but the failures are very frequent by the explosion happening at a wrong moment. In the Franco-German war of 1870-71; the French fleet was effectually scared from the Prussian ports by the dread of torpedoes. Torpedoes were much employed in the Russo-Turkish war of 1877.

Of fixed submarine mines there are two classes—those which are self-explosive on a ship touching them, and those which are dependent on an electric current supplied from the shore. A torpedo of the self-acting class is shown in fig. 1: *abc* is a hollow iron cone, water-tight, with a ring at *b* by which to anchor it. The upper part, *B*, is left empty, for the sake of buoyancy, while the lower end, *A*, is filled with gunpowder, the charge varying from 100 to 300 lbs. At the top of the powder is an iron case, *C*, filled with lime, and in it a tube of thin glass, *D*, containing sulphuric acid. The upper part of the glass tube is enveloped by the ringed end of the iron rod, *E*, which passes through the top of the torpedo, and some distance above it; and has horizontal rods, *G*, called feelers, attached rigidly to its upper extremity. When a ship impinges on the feelers, the rod is

deflected from the perpendicular; the ring at its lower end breaks the glass tube; the acid acting on the lime, generates great heat, and explodes the powder.

In the electric torpedo a wire insulated in a small cable is laid from a battery on shore to the sub-marine mine. It enters it by an insulated joint, and is then soldered to a small piece of platinum wire placed in the middle of the priming of the torpedo; from the other end of the platinum a second wire communicates with the metal sides of the torpedo case. On closing circuit at the battery, the current passes by the cable into the torpedo, heating the platinum to incandescence, and exploding the mine. There is thus no need of a second cable; the water and the earth take its place. Submarine mines are usually charged with gun-cotton, which has the great advantage of

FIG. 1.

FIG. 2.

being explosive by means of a fulminating fuse, even when wet through leakage of the torpedo case.

Submarine mines are usually moored or laid on the bottom in several lines, the mines of the second line being opposite the intervals of the first, so that it is difficult for a hostile ship to pass up a defended channel without coming within reach of one or more of them. As a ship approaches, her course is carefully watched so as to fire a mine at the right moment. In order to explain how this is done, let us take the case of the channel AB.

Two or more lines of mines are laid down across its mouth. For the sake of clearness we show only a few of those of the first line in the diagram. At C and D two stations are selected, commanding a view of the defended waters. At C is the voltaic battery, and the wires from the mines connect them with D, while a second series of wires, each corresponding with one of the first series, connects D and C. There are thus two breaks in the circuit of every mine, one at C, where a number of "firing keys" are arranged so as to place at will the battery in connection with any of the wires; the second break is at D, where similar firing-keys connect at will each wire of one series with the corresponding wire of the other. A ship is seen approaching on the course AB. When she is at *a* the observer at C notices that her bearing is the same as that of mine No. 1. He therefore closes the break in the first circuit by means of the firing-key, but no current passes, for the observer at D sees her well to the left of the bearing of mine No. 1, and therefore leaves his break open. Not until she is actually over No. 2 will both observers at the same moment see that her bearing corresponds to that of No. 2. and closing both breaks in the circuit, fire the mine.

The torpedo as a machine is the further development of an idea which dates back to the invention of gunpowder—the petard on land, the powder-ship at sea; but Bushnell, of Connecticut, appears to have invented at once, during our war of the revolution, the two factors of success—a sunken boat and an explosive torpedo. His was exploded by clock-work, and is of the first, or *applied* kind, the true torpedo; though he afterward experimented, and as fruitlessly as usual, with the second kind, the *drifting* torpedo, or infernal machine. The third variety, the *sunken*, is the submarine mine. The drifting torpedo is usually sunk by a line from a log or keg, and explodes when driven up against an obstacle by the tide or current. During the Turkish war of 1877-78 a floating can with surrounding arms was in use, as also a shuttle-shaped torpedo with a surrounding ring. All are evidently precarious in their action, and dangerous to all, whether friends or foes, who may chance to encounter them. If their use cannot be discontinued by national agreement, it seems only fair that any caught setting them should be subjected to martial law forthwith, ranking by right with spies, marauders, and private corps. There has yet been no fair trial by an invading fleet armed with the latest appliances of the efficiency of the third, or submarine mine. The Turks, with divers and the electric light, cut loose and raised the Russian torpedoes; nor is it necessary for this to capture the firing-stations. The English, working on the fact that the explosion under water of the equivalent of 300 lbs. of powder will explode all mines within a radius of 100 yards, invented a steam launch, directed by wires, which could be sent ahead, could drop two torpedoes, retire, and finally explode them, without other handling than the battery-wires. It has not yet been tried, and probably, in a sea-way, never will be. Nothing is so effective as the torpedo run out by a spar and exploded by a battery. Ours of the

late war were percussive. The torpedo-boat invented by Admiral Porter, and constructed before the Turkish war, is an almost submerged steam launch, of iron, with a double skin, carrying four persons—the spar-man, who commands and manages the torpedo, the battery-man, a steersman, and an engineer. The idea was borrowed by the English about 1878, but almost all these boats are too large for the purpose. They carry a spar from the bow, and sometimes one on either side. The torpedo is launched, by dropping the spar, so as to strike the enemy at about 10 ft. below water; and a bowsprit, often with a spring buffer, prevents the launch approaching nearer than 20 ft. at the least, the limit of safety for the equivalent of 150 lbs. of powder. The Whitehead and its American prototype, the Harvey, and other towed torpedoes, and boom or spar torpedoes from a vessel itself, are all either uncertain in effect or impotent when in action and in a sea-way, from the very necessities of the case. Defense against torpedoes lies in booms of logs, with nets and, if possible, battery attachments, to show where the attack is made, and guns ready trained on certain points. Against torpedo-boats Hobart Pacha was the first to use a cordon of logs, made fast by lines to his yard-arms, and boomed out from the hull. Nets, and now wire-netting, have been substituted, with a line of spars all round to keep them at proper distance. The electric light should be used, with patrol boats, and a sufficient number of handy guns should be kept in readiness, so as to be quickly trained on any point. Gatling guns in the tops will pierce any common launch, made as they are of boiler iron; and the English rocket battery might be found useful. Better than anything is the new Hotchkiss repeating gun.

All the varieties of torpedo which military experts are testing at the present time, may be classed under two general heads: (1) the dirigible automobile torpedo, that is aimed, launched, steered, and exploded from a vessel or shore-battery by means of electricity; and (2) the self-steering torpedo, which after being started on its course makes its own way under the water toward its object, against which it explodes upon contact.

Of the first class the best known torpedoes are the Sims-Edison, which is somewhat favored by the United States Government, and the Patrick (also known as the Long, Hargin, or Wood). Several inventors have combined to improve and perfect the latter, which has been very favorably mentioned by a commission of United States officers after seven tests at the Torpedo School, Newport, R. I. The Patrick torpedo has been concisely described by Ensign J. M. Ellicott, U.S.N., as “a cigar-shaped vessel built of sheet-copper, about 40 feet long and two feet in diameter, and rigidly fastened on its back is a cigar-shaped float longer and narrower than the torpedo, made of the same material. Thus, while the float remains on the surface of the water, just awash, the torpedo hangs about four feet beneath it. The float is filled with lampblack, so that even if punctured repeatedly by bullets its buoyancy will not be seriously changed. It also carries two short flag-staffs, which indicate by their little flags the torpedo's course in the water. The torpedo carries in its head a charge of two hundred pounds of dynamite; in its central portion, a tank of liquid carbonic acid, and another containing lime and sulphuric acid separated; and in its after-end a spool of wire and an engine. It is started, steered, stopped, and exploded from the shore by electricity conveyed to it through a wire cable. About 7000 feet of cable is wound upon the spool in the torpedo, after being properly connected with the charge, the engine, and the rudder, and it then passes out through the propeller-shaft which is hollow and leads to the shore-station.”

AUTOMOBILE TORPEDO READY FOR LAUNCHING.

The torpedo is run out into the water upon a little truck, as shown in the illustration. A connection being then established between the lime and the sulphuric acid, heat is generated in the tank, and the carbonic acid passing by a coil of pipe through this heated receptacle goes on to the engine, which it sets to work, and the torpedo slips from the truck into the water, under which it glides toward the enemy, paying out the cable at its stern, and controlled by the operator at the station, who determines its progress by the little flags that rise just above the surface of the water. At the proper moment the touch of a button explodes its charge of 200 pounds of dynamite against the hull of the enemy's vessel. The Patrick torpedo has a range of a little less than a mile, and requires about three minutes to complete its run. The United States Government at the end of 1891 had purchased 15 of the Sims-Edison and 3 of the Patrick torpedoes.

The second form of torpedo is best represented by the Whitehead as a type, and it is this weapon which has been generally adopted by the governments of Europe. It represents the development of an idea originally put into shape in 1860 by Captain Luppis of the Austrian navy. The first design was for a torpedo-boat to be run by hot air and carrying a heavy charge of gun-cotton. This was to move above the water and to be guided and exploded from the shore. It was not then, in its inception, so different from the dirigible torpedoes already described. But Mr. Robert Whitehead, who was consulted by the inventor, so modified it as to produce an entirely novel form of torpedo, and one that now represents a quarter of a century of thought and study. It consists of a body of steel or bronze some 14 feet in length and about a foot in diameter. It carries a much less powerful charge than the Patrick torpedo; in fact, only some 60 to 70 pounds of gun-cotton. Its range is about half a mile, and it covers this distance in little more than a minute. It is driven by compressed air, which propels the torpedo by means of two screws, while the stern is fitted with two rudders. The Whitehead can be carried to sea by ships and from there launched at an enemy at a considerable distance.

The secret of the Whitehead torpedo has been purchased from the makers by each of the governments of Europe, except that of Turkey, for some \$75,000. Turkey declined to buy because during the Russo-Turkish war of 1878 two of these missiles fell into the possession of the Turkish admiral, Hobart Pasha, at Batoum. The secret was thus at the mercy of the Turks, and the manufacturers hastened to seek the recovery of the two torpedoes, a favor which was granted in return for the permission to manufacture the weapon without paying any royalty to the Whiteheads. The regular cost of each torpedo is \$1500.

The Whitehead torpedo is now used in the navies of England, Austria, France, and Italy, and of late the United States government has made a partial adoption of them.

The French Whitehead is 18.9 feet in length and 14.9 inches in diameter. It weighs 880 pounds, and has a speed of 28.5 knots up to 400 yards. The impulse of the weapon out of the torpedo tube is by gunpowder. All Whiteheads jump clear of the ship's side to a distance of about fifteen feet, plunge head foremost into the water like a great fish, dive down to a distance of about twenty feet, immediately shoot up again by the action of the water-valves, regulated to close and open under certain depth pressures, and then, for a hundred yards, pursue a slightly wavering motion until the action is progressive in a plane parallel to the surface of the water.

The Navy Department demands, drawn up in 1889 for the Howell torpedoes, were that the greatest diameter should not exceed 14.2 inches; that they might have any uniform length between 9 feet 6 inches and 12 feet. The total weight, it was specified, might vary in a proportional manner, from 428 pounds for a length of body or spindle of 9 feet 6 inches to 453 pounds for an extreme length of 12 feet, provided the space allowed for a charge of compressed wet gun cotton should be at least sufficient properly to stow a weight of that material equal to 17½ per cent. of the total weight of the loaded torpedo. The Howell torpedo is now compelled to have a speed of at least 32 knots per hour for the first 400 yards' run, and a speed of 28 knots for the second 400 yards' run. The vertical deviation after the first 100 yards must not exceed 2 feet, and the initial dive must not be greater than 25 feet.

The projectile of the submarine gun possesses elements of great simplicity, but since it depends entirely for its speed and range upon the force of its ejection, its usefulness is limited in radius below that of the automobile weapon. The automobile torpedo aims to attack the under-water hull of an enemy; in other words the vitals. To offset the attack of this weapon ships have been compelled to adopt the worst form of hamper ever foisted on ships of war—the net. All seagoing men-of-war are now compelled to carry the net as part of their defense system. No commander will use his net in action if he knows that his opponent does not carry automobile torpedoes, and every commander, it is safe to say, will use his net if he knows that his enemy carries them. A commander without automobile torpedoes, no matter how crude, must clog himself with this hamper, while he leaves his opponent who is provided with them not only unincumbered, but with a weapon capable of deciding an action at a single shot. The conclusion is an inevitable one that torpedoes must be employed so long as there is no weapon presented serving effectually to replace them.

An American rival of the Whitehead is the Howell, adopted by the United States. It was invented by Capt. J. A. Howell, of the United States navy, and is said to embody all the advantages of the Whitehead, with a superior directive capacity.

The invention of the modern torpedo has resulted in the creation of two new types of vessel—the torpedo-boat, built especially for the torpedo service, and the so-called "torpedo-catcher" or *contre-torpilleur*, built to overtake and destroy the torpedo-boat.

Torpedo-boats are of three varieties: (1) the sea-going torpedo-boat, intended to accompany squadrons on distant service; (2) the first-class or harbor-defense torpedo-boat; and (3) the second-class boat, a sort of steam launch, carried on board the huge battle-ships and lowered into the water when needed for action. All three classes are built for great speed, and are fitted with "torpedo-guns," or launching tubes at the bow and on turn-tables on the deck. These tubes discharge the torpedoes either by compressed air or with a small charge of gunpowder. In the different navies of the world in 1891 there were some 1300 torpedo-boats, of which the United States possessed only two—the *Cushing* and the *Siletto*—each having a speed of some 22 knots per hour. Great Britain had (1891) as many as 185.

The torpedo-catchers or *contre-torpilleurs*, of which the French vessel *Épervier* is a recent type, are in size between the largest torpedo-boats and the unprotected cruisers. They are built for extraordinary speed so as to overtake the torpedo-boats, and armed with rapid-fire and machine-guns (q.v.), and have also a number of torpedoes. The United States navy has no torpedo-catchers as yet. In 1891 Great Britain had 10, with a tonnage of 17,320, and built at a cost of \$4,424,400.

Mention may also be made of the so-called torpedo dépôt-ship, which is a vessel intended to accompany a fleet of torpedo vessels as a store-house of material, and rendezvous for repairs. Great Britain has but two of these and the United States none.

The development of the torpedo service has made new methods of protection for war-ships necessary. Electric search-lights are now provided for the instant detection of torpedo-boats in the darkness; a network of steel, commonly known as "crinoline," can be let down in such a way as to surround the threatened vessel on all sides with a hedge of protective metal, and batteries of machine-guns can in an instant be trained upon the approaching enemy. The torpedo in its latest development has yet to be tested in actual warfare, and naval experts are still in doubt how far the elaborate and ingenious mechanism will actually justify the labor and expense that have been lavished upon it for so many years. See an able paper by Ensign Ellicott, U.S.N., with drawings in *Engineering*, Nov. 14, 1890, and the article NAVIES, MODERN.

TORPEDO-BOATS. The United States up to 1890 had built but one modern torpedo-boat, the *Cushing*, which was launched by the Herreshoff Manufacturing Company at Bristol, R. I., on January 23, 1890. Her cost was \$82,750. She is 135 feet long, 15 feet beam, $3\frac{1}{2}$ feet draught, and 99 tons displacement. She is to carry eight automobile torpedoes and two 6-pdr. rapid-fire guns. Her trial took place in Narragansett Bay in March, 1890, during which a speed of 22.5 knots was maintained for three hours, and the Department accepted her. This torpedo-boat has developed additional speed and a remarkable handiness since she has been in service. The *Alarm* and the *Intrepid* were the first torpedo-boats built in the U. S., but they were for spar torpedoes and have not been duplicated. Foreign naval manœuvres have proved conclusively that torpedo-boats of small tonnage are not adapted for service at sea, and that their field of operations is restricted to within a short distance of the coast and harbors. The present tendency is to build boats exceeding 130 feet in length, with displacement ranging about 90 tons, carrying machine and rapid-fire guns in addition to the torpedo armament. European powers have begun but a comparatively small number of torpedo-boats during the past few years, although a large number have been added to the strength of the fleets; but these have, in a majority of cases, been completed in fulfillment of old contracts. In general it may be fairly said that the smaller type of torpedo-boats, so highly thought of in 1885, has lost much of its prestige. The principal sources of weakness in the smaller boats have been found to be in inefficient boilers and light construction of hull. The difference of the speed of torpedo-boats on trial and in actual service, almost always considerable, was well illustrated in races of the English torpedo flotilla in the Channel, in which the victor attained a mean speed of 16.25 knots per hour for five hours, while on the original measured mile it realized a speed of 21 knots. This was also illustrated in the competition trials of Russian torpedo-boats of various types, the loss of speed amounting to from $2\frac{1}{2}$ to 4 knots in boats but a year old. The six first-class torpedo-boats finished in 1890 in England were built by Messrs. Yarrow and Co. They are larger than those above referred to, being 130 feet long and having $13\frac{1}{2}$ feet beam, and they have had very successful trials: five of them attained a mean speed of 22.6 knots per hour during a continuous run of three hours, and the sixth boat made a little over 23 knots under similar conditions. The runs were made at stated intervals during the three hours' trial without any alteration whatever in the working of the machinery. They are propelled by triple-expansion engines and they have steel boilers of the locomotive type. Sufficient coal is carried to take them 2000 knots at a 10-knot speed, which renders them serviceable as sea-going boats for scouting duty. Their manœuvring powers are very remarkable, as they will turn a circle at full speed of a diameter of twice their own length, the time of

making the complete circle varying from one minute to one and a quarter. Their armament consists of one tube built in the bow for direct head fire, and two, mounted on a turn-table aft, are arranged to discharge on either beam at any desired angle. There are four rapid-fire guns, one on top of the conning tower, and three so mounted as to be available on either broadside. Early in the spring of 1890 the French Minister of Marine signed contracts for ten sea-going torpedo-boats of about 110 tons and thirty first-class boats of about 80 tons. These two are modeled after a type that has already rendered excellent service while attached to the Mediterranean squadron, and by superior speed and sea-going qualities are thought to more than make up for what has been lost in invisibility. The speed is placed at 24 knots. Italy has built a torpedo fleet of the Schichau type. These boats have a displacement of 130 tons, their triple-expansion engines develop about 2000 horse-power, their maximum speed is 25 knots, and their radius of action 4000 miles at 10 knots. Their armament is five rapid-fire guns and revolving cannon, one built-in stem tube, air impulse, two turn-table tubes aft, gunpowder impulse, and nine 14-inch Schwartzkopff torpedoes. Russia is adding several first-class torpedo-boats to her fleet each year. Germany had in 1891 sixteen under construction or about ready for trials. Eight have 110 tons displacement and 1400 horse-power, and the remainder 130 tons displacement and 2500 horse-power. They were designed to make about 23 and 25 knots respectively. All the old style of boats worth the change, and all the new Schichau boats have been uniformly fitted with one bow tube and two decked tubes on circular mounts. Austria had in 1891 twenty-one Schichau type boats of 83 tons displacement and twenty-seven Yarrow boats, varying in size from 48 to 88 tons displacement. She also has two Thornycroft and six Yarrow third-class boats of about 28 tons, making a total of 56 boats of all classes. She also has two English-built 25-ton Thornycroft boats. The Argentine Republic had in 1891 two first-class 110-ton boats built by Thornycroft, and she has six first-class 120-ton boats, to make 22.5 knots, and eight second-class to make 16 knots, built by Yarrow & Co. France and Spain have been the chief experimenters with submarine torpedo-boats, although the trial of the English boat Nordenfeldt attracted considerable attention about three years ago. The Gymnote and Goubet are the names of the French boats, and they have both performed remarkably well, although a general adoption of that type of boat seems not at present proposed.

The following table gives the torpedo-boats of the navies of the world, 1896.

| | Great Britain. | France. | Germany. | Austria-Hungary. | Russia. | Spain. | Denmark. | Netherlands. | Turkey. | Portugal. | Sweden. | Norway. | United States. |

* Not including boats now building.

No. 1 includes torpedo-boats and torpedo-catchers over 100 feet in length, and No. 2 are those under 100 ft. in length.

TORQUAY, a seaport t. on the s. coast of Devon, occupying a cove on the n. side of Tor bay, 18 m. s. of Exeter, and about 210 from London. The name is derived from the Celtic "tor" (q.v.), a hill, which occurs in the appellations of the neighboring peaks of Dartmore (Hey Tor, Rippon Tor, etc.), and thence is given to the bay, and to the ancient parish of Tormohun or Tormoham, in which Torquay is situate. The monastery of Tor abbey was founded in the 12th c.; but the town of Torquay is of recent origin. The bay is noted in history as the place where William of Orange landed in 1688, and was often used as a naval rendezvous during the war with France; but till the beginning of the present century Torquay was little more than an assemblage of fishermen's huts. About that time the advantages of its climate—which are a peculiarly sheltered position, an equable temperature, and freedom from fogs—caused it to be resorted to by consumptive patients; and it soon attained a European celebrity, which is still almost unrivaled. The romantic hills and valleys of Tormohun and its environs are being rapidly overspread with villas, gardens, terraces, and rows of smaller dwellings. There are St. John's church, a fine church of modern Gothic architecture, and a number of others of various denominations, and numerous dissenting chapels. A stone pier was built in 1803, and the port is resorted to by colliers and small traders. There is a town hall, a museum, and a theater and a good harbor, which is now used as a yacht-station. The geological formation consists mainly of a range of transition limestone cliffs in strata much contorted, forming an excellent building material; and in some places, as at Petit Tor, presenting beautifully-tinted marbles, which are extensively worked. The limestone gives place at some points to old red sandstone, which gives its predominating color to the soil, and to argillaceous shale in beds of considerable thickness. The scenery is of the most varied and picturesque description. Besides the mild-

ness of the winter, the vicinity of the sea in front and of Dartmoor in the rear greatly moderates the summer climate, so that while the mean winter temperature is 44° , being 3° above that of Greenwich, that of the summer is only 55° , nearly 1° below that of Greenwich. The population has increased from under 1000 in 1801 to 25,534 in 1891. Kent's cavern, discovered in 1824, and the Brixham cave, discovered in 1858, are rich in fossils, and are among the earliest places in the kingdom in which prehistoric human remains have been found.

TORQUEMA'DA, JUAN DE, Cardinal, 1388-1468; b. Spain; became a Dominican friar, 1403; graduated at the university of Paris, 1424; prior of convents at Valladolid and Toledo; made master of the sacred palace at Rome, 1431; assisted at the condemnation of the doctrines of Wycliffe and Huss, and advocated the dogma of the immaculate conception; drew up project for union between Latin and Greek churches at council of Florence, 1439, for which he was made cardinal, and called the "defender of the faith;" made bishop of Palestrina, 1455, and of Sabrina, 1464. His *Meditations* was among the first books printed at Rome.

TORQUEMADA, TOMAS DE, 1420-98; b. Spain; became a Dominican monk and prior of a monastery at Segovia; appointed inquisitor-general of Spain by Ferdinand and Isabella, 1483, and confirmed by the pope with the title "confessor of sovereigns;" labored zealously in organizing the inquisition throughout Spain, particularly at Seville, Cordova, Jaen, and Ciudad Real; drew up the code of procedure; was prominent in the expulsion of the Jews and Moors from Spain; and during 16 years caused to be burned at the stake between nine and ten thousand persons. In the later years of his life, Pope Alexander VI. reduced his authority by associating with him four colleagues.

TORQUES (Celtic, *torc*; Lat., *torqueo*, I twist), a species of gold ornament, meant to be worn round the neck, which was much in use in ancient times, both among Asiatic and north European nations. It consisted of a spirally twisted bar of gold, bent round nearly into a circle, with the ends free, and terminating in hooks, or sometimes in serpents. These ornaments seem to have formed an important part of the wealth of those who wore them, and of the plunder obtained by the Roman conquerors from a Celtic or oriental army. A monument erected to a Roman soldier not unfrequently specified the number of torques that had been conferred on him. Numerous examples of the torques have been dug up in Great Britain and Ireland, as well as in France, and are to be found in archæological collections. Both in Europe and in Asia, the torques resembled one form of bracelet (q.v.) on a larger scale.

TORRE DEL GRE'CO, a city of southern Italy, in the province of Naples, 7 m. s.e. of Naples. The town is situated at the base of Vesuvius. The town is always new, being from time to time destroyed by the lava, and always raised again from its ruins, by the attachment of its inhabitants to their native soil. The soil is fertile, producing fruit and wines similar to those of Greece. Its inhabitants are engaged in the tunny, oyster, and sardine fisheries. Mention is made of the town under its present name (the origin of which is unknown) as early as 1324 A.D. It suffered much in the eruption of 1631, and in that of 1794 it was almost totally destroyed by the lava. The earthquake of 1856, and the eruption of 1861 when the town was overwhelmed by vast showers of ashes, were equally destructive. Pop. '81, 21,588, commune 27,652.

TORRE DELL' ANNUNZIA'TA, a thriving t. of southern Italy in the province of Naples, stands on the southern base of mount Vesuvius, 13 m. s.e. of Naples. A fishery and a coasting-trade are carried on. There are manufactures of arms, and the thermal springs are celebrated. Pop. '81, 20,060, commune 22,013.

TORRE MAGGIORE, a city of Italy in the province of Foggia and the district of San Severo. It contains a monastery and its principal industry is oil refining. Pop. '81, 8234.

TORRE PELLICE, a town of Italy in the province of Turin, and the district of Pinerolo. It lies at the base of Mt. Bandalin, and is the chief center of the Waldensian communities in the region known as the "Waldensian Valleys," adjoining the French frontier. It contains the remains of a fort, a gymnasium, a lyceum, an orphan asylum, and its principal industries are the spinning of silk, dyeing, and printing. Pop. '81, 2840

TORRENS, LAKE, sometimes a brackish lake, at others, merely a salt-marsh, in s. Australia; lat. $30^{\circ} 11'$ to 32° s.; and long. $137^{\circ} 30'$ east. It lies 30 m. n. of Spencer gulf. Length, 130 m.; breadth, 18 to 20 miles.

TORRES STRAIT lies between n. Australia and Papua or New Guinea, in lat. $9^{\circ} 20'$ to $10^{\circ} 40'$ n.; and long. $142^{\circ} 30'$ east. The channel is about 80 m. in width; and its navigation, though practicable, is rendered dangerous and difficult by the innumerable shoals, reefs, and islands with which it is strewn. It was discovered by Torres in 1606.

TORRES-VE'DRAS, a t. in the province of Estremadura, Portugal, on the left bank of the Sizandro, about 26 m. n. of Lisbon. It had a pop., '90, of 6079, and carries on some trade in wine; but derives its reputation solely from having given name to those famous lines of defense within which Wellington took refuge in 1810, when he found it impossible to defend the frontier of Portugal against the French armies; and from which in the year following, he issued on that career of slow and hard-won victory, which

ended in the expulsion of the French from the peninsula. The *first*, or outermost of these lines, extending from Alhandra, on the Tagus, to the mouth of the Sizandro, on the sea-coast, and following the windings of the hills, was 29 m. long; the *second* (and by far the most formidable) lay from 6 to 10 m. behind the first, stretching from Quintella, on the Tagus, to the mouth of the St. Lorenza, a distance of 24 m.; the *third*, situated to the s.w. of Lisbon, at the very mouth of the Tagus, was very short, being intended to cover a forced embarkation, if that had become necessary. The entire ground thus fortified was equal to 500 sq. miles.

TORREY, CHARLES TURNER, 1813-46; b. Mass.; graduated Yale college, 1830, studied theology with Dr. Ide of Medway; was settled at Princeton and Salem, Mass., but left the pastoral work to labor for the abolition of slavery. Detected in aiding slaves to escape from Maryland, he was tried, convicted, and imprisoned in the state prison at Baltimore, where he died of consumption. His remains were taken to Mount Auburn Cemetery, Mass. He published *Home, or the Pilgrim's Faith Reviewed* (1846), written while in prison; and *Memoir of W. R. Saxon* (1838).

TORREY, JOHN, LL.D., 1796-1873; b. N. Y.; graduated New York college of physicians and surgeons, 1818; one of the founders of the New York Lyceum of Natural History, of which he was many years president; professor of chemistry, geology, and mineralogy at West Point, 1824-27; of chemistry and botany in the College of Physicians and Surgeons, 1827-55; of chemistry and natural history in the College of New Jersey, 1830-54; chief assayer in the U. S. assay office, New York, 1853-73. His publications are: *Catalogue of Plants Growing Spontaneously within Thirty Miles of New York*; *Flora of the Northern and Middle States*; *Compendium of the Flora of the Northern and Middle States*; *Cyperaceæ of North America*; *Flora of the State of New York*; with prof. Asa Gray, began, 1838, the publication of *Flora of North America*. He prepared the *Botanical Reports* of various land exploring expeditions of the United States, 1822-58; *Appendix* to Dr. John Lindley's Introduction to the Natural System of Botany; contributed many papers on chemistry, mineralogy, and botany to the *Annals* of the lyceum of natural history, N. Y., the *Medical Repository*, *Silliman's Journal*, *Smithsonian Contributions*. His valuable herbarium and botanical library he presented in 1860 to Columbia College, in which institution he held a professorship of chemistry at the time of his death.

TORREY, JOSEPH, D.D., 1797-1867; b. Mass.; graduated Dartmouth college, 1816, and Andover, 1819; pastor of a church at Royalton, Vt., 1819-27; professor of Greek and Latin in the university of Vermont, 1827-42; of mental and moral philosophy, 1842-67; and president of the university, 1862-66. He translated Neander's *General History of the Christian Religion and the Church*, with copious learned notes; edited *Remains* of President James Marsh and *Select Sermons* of President Worthington Smith. A posthumous volume of lectures on *A Theory of Art* was published.

TORREY, JOSEPH W., b. Maine, 1828. In 1859 he went to China and for a time was editor of the *Hong Kong Times*. He engaged in trade, acquired great influence among the native merchants, and in 1867 became (under the sultan of Borneo) rajah of Maloodu and Ambong in Borneo, districts containing over 2,000,000 inhabitants, and also was made president of the "American trading company." He d. 1884.

TORREYA, a genus of the order *conifera*, somewhat resembling the yews. There are many species of the tree, which was named after John Torrey, the botanist. In this country the best specimens are the *Torreya California* and *taxifolia*. The latter, found in Florida, reaches the height of 50 ft., and has a close grained and strongly scented wood. Other varieties are found in India, China, and Japan.

TORRICELLI, EVANGELISTA, a celebrated Italian mathematician and philosopher, was born at Piancaldoli in the Romagna, Italy, Oct. 15, 1608. He was brought up by an uncle who resided at Faenza, and who put him under the tuition of the Jesuits. When 20 years old, he was sent to Rome, and there devoted himself to mathematical studies. Galileo's theories on force and motion, which had been published a short time before, especially engaged his attention, and led to his publishing a *Trattato del Moto* (1643), a meritorious work, but containing few new discoveries of consequence. The publication of this work led to his being invited by Galileo to visit him; and on the old philosopher's death, three months afterward, he was appointed to succeed Galileo in the chair of philosophy and mathematics at Florence. Here he resided till his death in 1647. The discovery which will preserve Torricelli's name through all ages was the interpretation of the previously known fact, that water will rise in a suction pump only to the height of about 32 feet. The fact that water *could* be raised in a pump was expressed by the empirical law, that "nature abhors a vacuum," and after the limit of 32 ft. was ascertained, the law was modified accordingly by Galileo. Torricelli wishing to perform this experiment more conveniently, employed mercury, and found that nature's abhorrence of a vacuum varied for different fluids, and was represented by a column of fluid in height inversely proportional to its specific gravity; here, then, was an additional fact of importance, containing the clue to the mystery, and Torricelli was not long in hitting on the idea that the column of fluid was sustained by the pressure of the atmosphere on the open surface of fluid. See **BAROMETER**. Torricelli also effected the quadrature of the cycloid, but in this was anticipated by Roberval.

TORRINGTON, a municipal borough and market t. of the co. of Devon, on an eminence sloping to the Torridge, 5 m. s.s.e. of Bideford. Pop. '91, 3436. The name of Torrington emerges frequently during the great civil war; and the capture of the town by Fairfax in 1646 proved fatal to the king's cause in the west.

TORRINGTON, a town and borough in Litchfield co., Conn., on the Naugatuck river. It is an important manufacturing town, having factories for the manufacture of hardware, bicycles, copper, nickel, silver, and woolen goods. It was the birthplace of John Brown. Pop. town, '90, 6048, borough, 4283.

TORSHOK, one of the most ancient towns in Russia, in the government of Tver, stands on the Tverza, in an undulating district, 309 m. s.e. of St. Petersburg. Leather and malt are the most important branches of manufacture; but the gold and silk embroideries of this town are well known throughout the empire, and obtained much celebrity at the London Exhibitions of 1851 and 1862. There is an extensive trade in corn, which the merchants of Torshok purchase in the neighboring districts and at the landing-places of the lower Volga, and thence transport to St. Petersburg by water. Much of this corn is ground at Torshok and the flour exported. The town was founded in the 11th century. Pop. 1895, 14,814.

TORSION is a method of common application in surgery for the purpose of checking arterial hemorrhage in certain cases. The wounded vessel is drawn out and fixed by a pair of forceps a quarter of an inch from the end; the end of the artery is then twisted round till it will not untwist itself. It is especially useful when there are many small arteries wounded in an operation, as, for example, in the extirpation of a large tumor.

TORSION-BALANCE, (Lat. *torsio*, twisting) is an instrument first invented by Coulomb, in which the force exerted by a twisted thread or filament to recover its original position, is made the means of measuring small degrees of electrical and magnetical attraction. See ELECTRICITY. It has also been used in determining the mass and density of the earth. See EARTH.

TORSK or, by corruption, Tusk (*Brosmius vulgaris*), a valuable fish of the family *gadidae* (q.v.), abundant in the northern parts of the Atlantic ocean. The genus is characterized by a single long dorsal fin, and by having the vertical fins separate. The torsk is from 18 in. to 2 ft., rarely 3 ft. long; the head small, the body moderately elongated, one barbule under the chin, the dorsal and anal fins distinct from the tail, although separated from it by a very short interval; the tail rounded; the head dusky; the back and sides yellow, passing into white on the belly. It lives in deep water, approaching the land in shoals only at the spawning-time, which is very early in the year. It spawns among the sea-weed of the coast. It is caught in the same manner as cod, ling, etc.; and although rather firm and tough when fresh, is generally esteemed, when dried and salted, to be the best of stock-fish. It is occasionally caught in the frith of Forth, but belongs to more northern regions, and is very abundant in the Shetland isles, the Faroes, on some parts of the coast of Norway, and on the s. and w. coasts of Iceland.

TORSO (Ital.), strictly, signifies a trunk, e.g., the trunk of a tree, but is specially applied to an ancient statue of which only the body remains. Of such imperfect relics of classic art, the most famous is the *Torso of Hercules*, a masterpiece of manly beauty, discovered in the Campo del Fiore at the beginning of the 16th c., and placed, by order of Pope Julius II., in the Vatican.

TORSTENSSOHN, LENNART, Count of Ortala, the most active, enterprising, and successful of the Swedish generals who were engaged in the Thirty Years' war (q.v.), was born at Torstena, Aug. 17, 1603, became one of the royal pages in 1618, and attended Gustavus Adolphus in most of his earlier campaigns. When Gustavus entered Germany in 1630, Torstenssohn was capt. of the body-guard; and the brilliant services he rendered at Breitenfeld, the Lech, and on other occasions, were rewarded with rapid promotion. Taken prisoner at the combat of Nuremberg (Aug. 24, 1632), he was subjected to rigorous treatment, which so ruined his health, that on his exchange six months after, he returned to his post in the Swedish army a confirmed invalid; yet a vigorous mind and energetic character so overmastered bodily infirmity, that though reduced to the necessity of being always conveyed in a litter, he proved himself a most able officer under Bernhard of Weimar and Baner, the successors of Gustavus. In 1641, on the death of his former chief, the able and chivalrous Baner, he was appointed to the command-in-chief of the Swedes in Germany. His military career was marked by a brilliancy of conception, fertility of resource, resolute daring, and above all, by an extraordinary rapidity of execution, which broadly distinguished it from those of his contemporaries, and set at naught all the precautionary and defensive measures of his opponents. Having recruited and equipped his army, he invaded Silesia, routed the Austrians at Glogau and Schweidnitz, reduced most of Moravia, and being pressed back into Saxony by the archduke Leopold and Piccolomini, gallantly turned upon the multitude of his pursuers (Nov. 2, 1642), and on the field of Breitenfeld, where Tilly's reputation for invincibility was cast down in the dust by Gustavus, inflicted a bloody defeat on the same adversaries; he then resumed the execution of his plans of invasion, and laid Moravia and Austria under contribution. Ferdinand III., despairing of protecting his territories from Torstenssohn, negotiated with Christian IV. of Denmark to make a

diversion by invading Sweden; but Torstensohn, with characteristic promptitude, left Moravia in Sept., 1643, traversed Saxony and the Upper Palatinate, burst into Holstein, and in less than six weeks subjugated the Danish mainland. The Austrians under Gallus followed in pursuit of him, to aid their allies, but arrived too late; and in attempting to coop him up in Holstein, were routed, and driven into Saxony; and again totally defeated (Nov. 23, 1644) at Jüterbogk, in attempting to bar his return into Bohemia. Gallus was now deposed; but a combination of talented generals, as Montecuculi, Goertz, and others, was found to be equally ineffective against the resistless Swede, who, by a great victory at Yankovitz (Feb. 14, 1645), secured the navigation of the Danube, and the possession of the hereditary countries north of it. The emperor, empress, and principal nobility now deserted the capital; the Saxons again joined the Swedes; and the Danes, routed at sea as well as on land, besought peace, which was granted (Aug. 13, 1645). At this time, when a few more of Torstensohn's weighty blows would have completely unseated the Hapsburg family, his gradually increasing ailments compelled him to resign the command to one very much his inferior, and retire to Sweden, where he experienced a most distinguished reception from queen Christina, was created a count, and appointed to various high offices successively. He died at Stockholm, April 7, 1651.

TORT (Lat. *tortus*), in the law of England, includes all those wrongs for which a remedy by compensation or damages is given in a court of law, and which wrongs arise irrespective of any contract. Such are assaults, imprisonments, taking one's goods without title, injury to one's body or character. The general rule of law was, that the right of action for a tort died with the person who committed it; but this defect has been cured by a statute to a certain extent. If the wrong was done within six months preceding the wrongdoer's death, an action may be brought against his executors within six months after they have assumed office. So if the injured party lived, he could always bring an action of damages; but if he died, his executors or relatives could not do so, until lord Campbell's act enabled the wife, husband, parent, or child of such deceased injured party to sue for damages; and in such case the jury may apportion the damages between the widow and children who sue. The right to bring an action for a tort is limited to two, four, or six years respectively, according to the nature of the wrong.

Tort in U. S. law differs from a breach of contract in these respects; that the death of either party to the tort ends the right of action, that joint tort-feasors are severally liable, with no right of contribution from each other; and that persons under disability to contract are liable for their torts. One of the chief distinctions between torts and crimes is that in the latter a criminal intent must be proved, while in the former intent is immaterial; yet in some torts, e.g., slander or malicious prosecution, a malicious intent is essential. Torts may be committed against the person, as assault and battery, false imprisonment; or against one's character, as libel and slander; or against property, as trespass or trover. An injured party cannot recover for an injury in any way contributed to by his own wrong; and to maintain an action there must be a loss as well as a wrong.

TORTEAU. See **HERALDRY**.

TORTOISE, *Testudo*, a genus of chelonian reptiles, which once included the whole order, but is now much restricted. The popular name tortoise is never given to the marine chelonians, which are called turtles (q.v.), and although it is sometimes given—generally with a prefix, as marsh tortoise, river tortoise, fresh-water tortoise—to the kinds which inhabit fresh water (see *EMYS* and *TERRAPIN*), yet, when used by itself, it is commonly the designation of what are distinctively called land tortoises, which belong to the genus *testudo* as now restricted, and the genera most nearly allied to it. In *testudo* the carapace is of a single piece, bulged, and soldered by the greater portion of its lateral edges to the *plastron* (see *CHELONIA*); the legs are very short; the toes are very short, and united to the nails, which are thick and conical, five on the fore-feet, and four on the hind-feet. The species are numerous and widely distributed, inhabitants of the warmer temperate and of tropical countries. They all feed on vegetable food. None of them are found in Britain, but several in the countries around the Mediterranean. The most common of these is the GREEK TORTOISE (*T. Græca*), which attains a length of 12 in., and has a broad and equally bulged carapace; the scales of which are granulated in the center, striated on the margins, and spotted or marbled with black and yellow. This is the species of an individual of which a most interesting account is given by White in his *Natural History of Selborne*. It lives to a very great age, 100 years or more, as probably do all the other species, and spends the winter in a dormant state, as do all those which are not inhabitants of tropical climates; selecting for itself a place of hibernation when cold weather begins to come on, or preparing it by scooping a hole in the earth. During the heat of summer it feeds voraciously; but in colder weather, both before and after its hibernation, it eats little. The love-season, which is in the beginning of summer, is one of great activity, and tortoises express their amorous desires by striking their shells against those of their mates. The Greek tortoise is used for food in some parts of the s. of Europe. The flesh of all species of tortoise appears to be good for food, and the eggs of all are regarded as delicacies. A very large species is the Indian tor-

toise (*T. Indica*), if several species are not confounded under that name. It has been found on the coast of Coromandel, 4½ ft. in length, its bulge being about 14 inches. It is particularly abundant in the Galapago islands, and has even been supposed by Darwin to be originally a native of them, and to have been diffused from them by the buccaneers over other tropical regions. It is known that the buccaneers often carried away tortoises alive from the Galapagos, but this fact does not seem probably to account for the abundance of the species in other places. The Galapago tortoise is often 200 lbs. in weight. Its flesh is of excellent quality, as are also its eggs. It forms tracks from the arid districts near the shore to the high districts of the islands, where there are springs, for the purpose of drinking; and these tracks, which are broad and well beaten, are traversed apparently at irregular intervals, the animal swallowing a very large quantity of water at a time, so that its bladder is greatly distended, and the water contained in the bladder is at first almost pure, and is gradually absorbed. The numbers of tortoises in some tropical and subtropical countries are very great. Prof. E. Forbes speaks with admiration of the numbers of *T. Græca* and *T. marginata* straying about the plains of Lycia, and browsing on the fresh herbage in spring. Darwin describes the tortoises of the Galapagos as very numerous; and Leguat, in his account of the French Protestant expedition to the island of Rodriguez, in the beginning of last century, declares that the tortoises often came out together in such numbers to feed, that a man might have walked for a considerable distance on their backs as on a pavement.

The *testudo polyphemus*, or tortoise-gopher of the southern states (*xerobates Carolinus*, Ag.), has a shell fourteen or eighteen inches long, and burrows in the ground, digging holes four or five feet deep. They prefer the pine barrens, where they often live in troops. They are very strong, being capable of carrying a weight of over 200 pounds. The females are the largest, and their eggs are valued as food, as is the flesh of both sexes. See BOX TORTOISE.

Tortoises exhibit very little intelligence; they are, however, capable of recognizing the hand that feeds them.

TORTOISE PLANT. See HOTTENTOT'S BREAD.

TORTOISE-SHELL, the large scales of the carapace, or shield, of a species of sea-turtle, the *chelonina imbricata* and *testudo imbricata* of several authors—*caretta imbricata* of Dr. Gray. It is found in the Indian ocean, Amboyna, New Guinea, Seychelles, Havana, and the Red sea. Tortoise-shell is so called because formerly the order of animals to which it belongs was little known, and all were confounded under the general name of tortoises. A remarkable peculiarity in this species is the arrangement of the thirteen plates forming the carapace, which, instead of being joined together by their edges, so as to make apparently one piece, are thinned off at their edges, and overlap each other like the tiles of a roof. They vary in size according to the part of the shield they occupy. The larger are sometimes from a foot to 18 in. long, by 6 in. broad; the thickness rarely exceeds the eighth of an inch. The beautiful mottled color and semi-transparent characters of this material are well known. A remarkable quality is possessed by tortoise-shell, which very greatly increases its usefulness for the ornamental purposes to which it is generally applied—that is, its property of being easily softened by a heat equal to boiling water, and of retaining any form when cold which has been given to it when heated. Pieces can also be welded together by the pressure of hot irons properly applied. In Britain, the chief use of tortoise-shell is making combs for the hair; but it is also used for inlaying small pieces of ornamental furniture and various other fancy objects. In India, China, and Japan its use is well understood, and some very beautiful articles are made of it, exhibiting great skill and taste. Great Britain alone consumes about 15½ tons, of the value of about \$120,000.

TORTO'LA. See VIRGIN ISLANDS.

TORTO'NA (anc. *Antilia*, or *Dertona*), a t. of northern Italy, in the province of Alessandria, and situated on the right bank of the Servia (a small river which flows n. to join the Po), and 12 m. e. of Alessandria, with which it is connected by railway. Pop. '81 9230. The principal buildings are the *Duomo* and church of San Francesco. Tortona has manufactures of silk, leather, hats, etc. It was a notable place in the middle ages—the old walls and the ruins of a castle in which Frederick Barbarossa lived being a relic of those turbulent times.

TORTO'SA (anc. *Dertosa*), an old and fortified t. of Spain, province of Tarragona, picturesquely situated on a sloping eminence, overlooking the Ebro, from the mouth of which it is distant about 22 miles. The town has a cathedral with fine carved work and marbles. There are manufactures of paper, leather, soap and pottery, but the fisheries give employment to the greater part of the people. Pop. '87, 24,192.

TORTU'GAS (Sp. Turtles), a group of ten islets or keys, also called the Dry Tortugas, belonging to the United States, at the entrance of the gulf of Mexico, and included in Monroe co., Fla. They are low coral islets, partly covered with mangrove bushes. There are lighthouses on Loggerhead key and on the bastion of fort Jefferson, on Garden key. During the civil war the fort Jefferson was used as a penal station for confederate and other military prisoners.

TORTURE. Examination by torture, otherwise called "the question," has been largely used in many countries as a judicial instrument for extracting evidence from unwilling witnesses, or confessions from accused persons. In ancient Athens, slaves were always examined by torture, and their evidence seems on this account to have been deemed more valuable than that of freemen. Any one might offer his own slave, or demand that of his opponent, to be examined by torture; and it was supposed to constitute a strong presumption against any one that he refused to give up his slave for that purpose. No free Athenian could be examined by torture, but torture seems occasionally to have been used in executing criminals. Under the Roman republic, only slaves could be tortured, and, as a general rule, they could not be tortured to establish their master's guilt. Under the empire, torture, besides being much used in examining slaves, was occasionally inflicted even on freemen, to extract evidence of the crime of *læsa majestas*. Cicero and other enlightened Romans wholly condemned its use. Until the 13th c., torture seems to have been unknown to the canon law; about that period, the Roman treason-law began to be adapted to heresy as *crimen læsæ majestatis Divinæ*. A decree of pope Innocent IV. in 1282, calling on civil magistrates to put persons accused of heresy to the torture, to elicit confessions against themselves and others, was probably the earliest instance of ecclesiastical sanction being adhibited to this mode of examination. At a later period, however, torture came to be largely employed by the inquisitors.

From the civil war, torture became a part of the legal system of most European countries. It was adopted early, and to a large extent, by the Italian municipalities. In Germany, elaborate apparatus for its infliction existed, not merely in the dungeons of the feudal castles, but in the vaults beneath the town-halls of Nuremberg and Ratisbon, where the various implements used are yet to be seen. It continued to be practiced in the prisons of Germany when they were visited by Howard in 1770. In France it was part of the judicial system till 1789, and in Scotland it was still in frequent use after the restoration, and was only abolished by 7 Anne, c. 21, s. 5.

The use of torture seems always to have been repugnant to the genius of the law of England: though occasionally used by an exercise of prerogative, it may be doubted whether it was ever recognized as lawful in the ordinary course of the administration of justice. The first instance we have of its use is in 1310, in aid of the ecclesiastical law, during the struggle between Pope Clement V. and the templars. Edward II., when applied to to sanction the infliction of torture by the inquisitors in the case of certain templars accused of heresy and apostasy, at first refused; but on a remonstrance by Clement, he referred the matter to the council; and on the recommendation of the council, the inquisitors were authorized to put the accused to the torture, but without mutilation or serious injury to the person, or effusion of the blood. During the Tudor period, the council assumed the power of directing torture-warrants to the lieutenant of the Tower, and other officers, against state prisoners, and occasionally also against persons accused of other serious crimes; and similar warrants were at times issued under the sign-manual. Under James I. and Charles I., torture was less resorted to, and only in state trials. In 1628, in the case of Felton, the assassin of the duke of Buckingham, the judges declared the examination of the accused by torture, for the purpose of discovering his accomplices, to be illegal. Torture was inflicted for the last time in England in May, 1640. It is now disused in all countries of Europe, and is universally acknowledged to have been a most unsatisfactory mode of getting at the truth; often leading the innocent, from weakness of body, to plead guilty to crimes which he had not committed.

The instruments of judicial torture have been various. The most celebrated is the rack, an oblong horizontal frame, on which the accused was stretched, while cords, attached to his legs and arms, were gradually strained by a lever or windlass, an operation which, when carried to extreme severity, dislocated the joints of the wrists and ankles. It is as old as the 2d c. in the south of Europe, but is said to have been unknown in England till introduced into the Tower by the duke of Exeter, constable of the Tower, whence it acquired the name of the "duke of Exeter's daughter." In Germany, the rack was sometimes furnished with a roller, armed with spikes, rounded off, over which the sufferer was drawn backward and forward. A vertical rack was also in use in that country. The person subjected to it was raised to the roof by a rope attached to his arms, which were bound behind his back, and two heavy stones having been attached to his feet, the rope was loosened so as to let him fall with a jerk to within a few inches of the ground. Among the lesser tortures may be mentioned the thumbikins, boots, pincers, and manacles; and in England, an instrument called the Scavenger's (properly Skeffington's) daughter, the invention of sir William Skeffington, lieutenant of the Tower in the reign of Henry VIII.

TO'ULA CEREVIS'IE, or the YEAST-PLANT, is one of those fungi which are connected with the process of fermentation. The general history of this fungus will be noticed in the article YEAST, and we shall here only refer to the medicinal bearing of the subject. This plant, which is also known under the name of *saccharomyces*, *mycoderma cerevisiæ*, and *cryptococcus fermentum*, may be readily observed by examining a little yeast under the microscope, when it will be seen in the form of round or oval corpuscles

(cells), varying in diameter from the 800th to the 400th of a line, and many having smaller corpuscles in their interior. They grow by protrusion of gemmules, and germinate sometimes on one, and sometimes on several spots of the primitive fungus cells. These shoots throwing off new gemmules, the yeast-plant gradually forms single or branching rows of oblong cells, connected together like beads. This peculiar arrangement of the cells, and the fact that they are not acted on by acetic acid, is characteristic of the plant.

This fungus exists in the saccharine urine of *diabetes mellitus*, after it has been discharged for 24 hours or longer, and its appearance in urine within a day or two is sufficient to lead to the suspicion of the presence of sugar. It likewise is of not unfrequent occurrence in vomited matters and in fecal evacuations; and wherever it is found, it is indicative that the fluid is in a state of saccharine fermentation.

As fungi more or less closely resembling the yeast-plant often occur in non-saccharine urine that has stood for some days, the assumed presence of the *T. cerevisiæ* must not be taken as a proof of the presence of sugar, although it affords a strong hint for testing for that substance.

TORUS, the convex member of the base of classic columns. See **COLUMN**.

TORY, a political designation taken, it is said, from savage Irish tribes, and originally applied to the followers of the duke of York, afterward James II. Johnson defined the tory as "one who adheres to the ancient constitution of the state and the apostolical hierarchy of the church of England." The present "conservative" party of England is the historical successor of the tories. In this country during the revolution the adherents of the crown were called tories. A curious local use of the word was that of the common people in some parts of the south during the civil war, applying it to irregular troops or "bushwhackers" claiming to be federals. See **WHIG AND TORY**.

TOSHACH. See **TANISTRY**.

TOSTI, FRANCESCO PAOLO, composer, b. in Ortona di Mare in the Abruzzi, Italy, April 7, 1846. After studying at the Naples Conservatorio, he was appointed an instructor there. He resigned in 1869, went to Rome and appeared in concerts as a singer, after which he was made vocal-instructor at court. In 1875 he went to London, and in 1880 was appointed singing teacher to the royal family. His works are: *The Grand Duke*, opera, London, 1888; and *La Prima Donna*, opera, 1889; and Italian and English songs and duets, which have become universally popular.

TOTEM. The ruder races of men are found divided into tribes, each of which is usually named after some animal, vegetable, or thing which is an object of veneration or worship to the tribe. This animal, vegetable, or thing is the *totem* or *god* of the tribe. From the tribe being commonly named after its totem, the word is also frequently employed to signify merely the tribal name. Numerous tribes with totems exist in America, in Australia, the South Pacific islands, and in central Asia; and there are some reasons for thinking that such tribes were once numerous even in Europe among races belonging to what is called the Indo-European division of the human family.

Among the red Indians of America the following are totems of tribes existing or known to have existed: the wolf, bear, beaver, turtle, deer, snipe, heron, hawk, crane, duck, loon, turkey, musk-rat, sable, pike, cat-fish, sturgeon, carp, buffalo, elk, reindeer, eagle, hare, rabbit, and snake; the reed-grass, sand, water, rock, and tobacco-plant. Among the tribes of native Australians the totems are similarly, for the most part, selected from the fauna of the country.

It has been suggested that the explanation of the crests and emblems of the now disrupted tribes and clans of our own country, and of Europe generally, is to be found in the supposition that the creature or thing on the crest was originally the totem of the clan or tribe. On this supposition the wide-spread clan Chattan or Cattan, for instance, which is represented in the Scotch Highlands, and can be traced in France, Germany, and Egypt, would fall to be recognized as the *cat* tribe, the cat having once been its *totem*, as it is still its crest or emblem. It has also been thrown out that many of the mythical traditions of ancient Greece admit of a reasonable meaning, if we suppose that there were anciently in Greece tribes with *totems*—bull, boar, and lion tribes; snake, ant, and dragon tribes. These suggestions have not yet been put to the test of a thorough investigation; but so far as inquiry has gone, the results are in favor of the conclusions to which they point as to the early condition of human tribes all over the world. A single instance may be given of success in tracing back a totem to old times and in widely separated countries. There are numerous existing snake tribes both in America and the South Sea islands, and there is something like *proof* that the snake was the totem of very many and powerful ancient races. Its worship can be traced among Semitic races; there are traces of it in the traditions of the Pelasgi; there are proofs of it among the Celts; and the most magnificent ecclesiastical architecture in the world is that of the Nagas—the serpent-worshippers of Cambodia—still existing, and only recently brought to light. We may believe that, in the period of primitive animal-worship, when the serpent was a creature of so much importance, other animals also had their worshippers, and that snake-tribes were not the only tribes with animal totems in those times, any more than they are among existing primitive peoples.—See *Cambrian Journal*, vol. iii. 2d series, p. 149; *Grey's Journals*, vol. ii. chap. xi.; Mitchell's *Russians in Cen-*

tral Asia; Latham's *Descriptive Ethnology*; Sydenham's *Baal Durstrigensis*; and footnote to *Kinship in Ancient Greece*, by J. F. McLennan; *Fortnightly Review*, April-May, '66; and works of Tylor, Lubbock, Spencer; Dorman's *Origin of Primitive Superstitions* (Philadelphia, 1881).

TOTIPALMÆ, Cuvier's name for a group of birds, of the order *palmipedes*, having the hind-toe connected with the other toes by a web. Pelicans, cormorants, frigate-birds, gannets, and darters belong to this group. All the totipalmæ are marine; they feed on fishes, mollusks, and other marine animals, and are excellent swimmers and divers. Many of them have long wings, and are birds of powerful flight.

TOTNES, or **TOTNESS**, a parliamentary borough and market t. of Devonshire, pleasantly situated on the slope of a steep hill, on the right bank of the river Dart, about 21 m. n.e. of Plymouth. It is a place of great antiquity, has an interesting church of the 15th c., and some curious antique houses; the ruined keep of the ancient castle, on the summit of the hill, is said to have been built by Joel de Totneis, a Norman baron, on whom the manor was bestowed at the conquest, and who founded here also a Cluniac priory. Pop. '81, 4089; '91, 4016.

TOTTEN, GEORGE M., 1809-84; b. New Haven, Conn.; d. New York: was educated at Middletown, Conn. He was engineer on the Farmington, Juniata, and Delaware and Raritan canals; was also chief engineer of the Digua canal, in Colombia. He was one of the contractors who built the Panama railroad, and in 1879 went to the isthmus in connection with the Panama canal; and later was appointed consulting engineer.

TOTTEN, JAMES, 1818-71; b. Penn.; graduate of West Point, 1841; an artillery officer in the Florida and Mexican wars. In the late civil war he commanded the arsenal at Little Rock, Ark., when it was taken by the confederates; served as chief of artillery in Missouri under Gens. Lyon and Fremont; and commanded a division under Halleck. He was at one time inspector-gen. of the department of Missouri, and subsequently of the department of the Atlantic; brevet maj.-gen. of volunteers, 1865.

TOTTEN, JOSEPH GILBERT, 1788-1864; b. Conn.; graduated at West Point. During the war of 1812 he was chief engineer successively of the army under Van Rensselaer, Dearborn, Izard, and Macomb, and was brevetted lieut.col. for gallantry at Plattsburgh. As a member of the board of engineers he matured a plan for the defense of the coast and sea-ports. He supervised the construction of fort Adams, Newport, 1825-38. The latter year he became chief engineer, and col. of the corps of the engineers. During the Mexican war he had charge of the engineering operations at the siege of Vera Cruz in 1847, and was brevetted brig.gen. for his skillful conduct of the siege. In 1815 he made a model of an embrasure for casemated batteries. In 1830 he conducted a series of experiments to test the strength of different kinds of timber, and the expansion and contraction of building stone by changes of temperature. He made experiments, 1851-55 "on the effects of firing with heavy ordnance from casemate embrasures;" the results which he reached have been guides in such constructions down to a recent period. He published in 1838 *Hydraulic and Common Mortars*.

TOUCAN, *Ramphastos*, a Linnæan genus of birds now forming the family *ramphastidae*, which belongs to the order *scansores*, and contains nearly forty known species, all natives of tropical America, and remarkable for the magnitude of the bill. They are divided into two groups, the true toucans (*ramphastos*), and the aracarís (q.v.) (*pteroglossus*), of which the latter contains the greater number of species; the former has the largest bill, and the tail is shorter. There is a difference also in the prevalent colors, the aracarís generally exhibiting much green and yellow, while the true toucans have the ground color of the plumage usually black; the throat, breast, and rump often gayly adorned with white, yellow, and red. The colors, however, are not in general finely blended, but appear in strong contrast. The legs of toucans are short; the feet have two toes before and two behind. The form of the body is short and thick; the tail is rounded or even, varying in length in the different species from half the length to almost the whole length of the body, and is capable of being turned up over the body in a remarkable manner, which it always is when the bird is at roost. The neck is short and thick; the enormous bill is at the base of the full width and depth of the head, and is in some species more than half the length of the body. It is arched toward the tip, irregularly toothed along the margins of the mandibles, and extremely cellular and light, yet strong in structure. The tongue is very long, narrow, and singularly feathered on each side, the processes which give it this feathered appearance probably adding much to its sensibility as an organ of taste. When a toucan takes food between the points of the mandibles, the tongue is immediately applied to it, as if to test or enjoy it, and afterward it is tossed into the throat by a sudden throwing back of the head. Toucans may almost be described as omnivorous; they eat fruits with avidity, but they also seize and devour small birds. Their powerful bill enables them to kill a small bird by a single squeeze. They make a curious clattering noise with their great mandibles, and also emit at times a harsh cry. They live chiefly in the depths of the South American forests, in small flocks. They are easily tamed, and bear cold climates well. In captivity, they readily eat rice, bread, potatoes, eggs, and many other kinds of food. They are remarkable among birds for regurgitation of food, in order to a kind of mastication in the great bill, analogous to rumination in quadrupeds. The colors of the bill are, in most of the species, very brilliant dur-

ing life, but disappear from stuffed specimens in museums. The largest species, *ramphastos toco*, are about 24 in. in length, the bill in this species measuring $7\frac{1}{2}$ in., and the tail 10 inches. See *illus.*, AMERICA, vol. I.

TOUCH is the sense through which we take cognizance of the palpable properties of bodies. It is used in two senses. In its extended acceptance, it implies, says Dr. Carpenter, "our consciousness of *all* those sensory impressions which are neither olfactive, visual, auditory, nor gustative: and it is therefore designated as the *general sense*, in contradistinction to those which are considered as *special senses*. In its limited application, on the other hand, it is used to designate that modification of the general sensibility which is restricted to the tegumentary surface, or to some special portion of it, and which serves to excite definite ideas in our minds respecting the form, size, number, configuration, weight, temperature, hardness, softness, etc., of objects brought within its cognizance."—Article "Touch," in *Cyclopedia of Anatomy and Physiology*, vol. iv. p. 1163. In the article **SENSIBILITY**, we have briefly noticed touch in its general sense; and we shall here confine ourselves to the investigation of the sense of touch in its limited application, as exercised by the organs specially adapted for the reception of tactile impressions.

The special organs of touch are the papillæ, which are figured and very briefly noticed in the article **SKIN**. These papillæ are more elevated and numerous on the palmar surface of the ends of the fingers than on any other part of the skin (although they are still larger on the tongue). They have an average length in man of $\frac{1}{10}$ of an inch. Their surface, after the removal of the epidermis, appears, from the investigations of Todd and Bowman, to be composed of the basement membrane of the cutis itself; their interior is composed of fibrous tissue, vessels, and nerves. In each papilla is a small arterial twig, which, entering at the base, subdivides into capillary vessels, which form loops, whose convexity lies in the papillary summit. The vascularity of the papillæ is so great, that their presence and relative size may be determined simply by the depth of the color imparted to the skin by a good injection of its vessels. Hence, as a general rule, the vascularity of the integument is proportioned to its perfection as an organ of touch. With regard to the mode in which the nerves terminate, there is still considerable doubt. According to Todd and Bowman, it is often impossible to detect any nerves at all within the papillæ, when such were plainly visible at their base; and they incline to the belief, that the nervous tubules, either entirely, or in a great measure, lose the white substance when within the papillæ.

In the lower animals, as in man, the papillæ are especially developed in those parts of the outer surface which are especially endowed with tactile sensibility. For the following illustrations of this statement, drawn from comparative anatomy, we are indebted to Dr. Carpenter: "In the quadrumana generally, both the hands and feet are thickly set with papillæ, and in those which have a prehensile tail, the surface of this organ possesses them in abundance. In the carnivorous and herbivorous mammalia, whose extremities are furnished with claws, or encased in hoofs, we find the lips and the parts surrounding the nostrils to be the chief seat of tactile sensibility, and to be copiously furnished with papillæ; this is especially the case with those which have the lips or nostrils prolonged into a snout or proboscis—as in the pig, the rhinoceros, the tapir, and the elephant. In the mole, too, the papillary structure is remarkably developed at the extremity of the snout. The only part of the skin of birds on which tactile papillæ have been discovered is on the under surface of the toes, and on the web of the palmipeds, where they obviously receive impressions which guide the prehensile and other movements of the feet. In many lizards, a papillary structure is found on the under surface of the toes; and in the chameleon, it exists also on the integument of its prehensile tail. . . . In serpents and chelonians (tortoises), no papillary apparatus has as yet been detected; and in fishes and invertebrata, its presence has not been ascertained, although it would appear that certain parts, especially the tentacles around the mouth, are endowed with a high degree of tactile sensibility." *Op. cit.*, p. 1166. It is probable that in all animals which have a soft fleshy tongue furnished with papillæ, this organ is an instrument of tactile sensibility as well as the organ of taste. Besides the papillary apparatus, certain animals have special organs of touch, constructed on a totally different plan, and "consisting of a rod or filament, which is in itself insensible, but which is connected at its base with nervous fibers in such a manner that any motion or vibration communicated to it must be transmitted to them." The so-called "whiskers" of the cats and certain rodents, as the hare and rabbit, belong to this class; and it has been proved, experimentally, that if they be cut off, the animal loses, to a great extent, its power of guiding its movements in the dark.

Among the conditions necessary for the exercise of the sense of touch are (1) a normal condition of the papillary apparatus and of the nerves supplying it; (2) a due supply of blood to the tactile organs; and (3), as has been noticed in the article **TASTE**, a temperature not too far removed from the natural heat of the body. It has been shown by prof. Weber, that, if the fingers or the lips be immersed for half a minute or a minute in water heated to 125°, or cooled to 32°, the power of distinguishing between a hot or cold fluid or solid body is for the time completely lost, a feeling of pain alone being

experienced. The result was the same on applying cold to the trunk of a nerve, the ulnar nerve at the elbow, where it lies just beneath the skin, being selected for the experiment. The fingers supplied by this nerve soon lost the power of distinguishing between heat and cold, and could only imperfectly perceive the contact and pressure of bodies.

The above-named physiologist has made a large number of experiments on the general subject of touch. His investigations regarding the tactile discrimination in different parts of the skin have been noticed in the article SENSIBILITY. Prof. Valentin, whose results, on the whole, correspond very closely with those of Weber, found, however, a considerable extent of individual variation, some persons being able to distinguish the separate compass-points at half or even one-third of the distances required by others.

There is no sense which is so capable of improvement as that of touch. Of this power of improving the delicacy of touch, says Dr. Carpenter, "we have examples in the case of certain artisans, whose employments require them to cultivate their tactile discrimination; thus, the female silk-throwsters of Bengal are said to be able to distinguish by the touch alone *twenty* different degrees of fineness in the unwound cocoons, which are sorted accordingly; and the Indian muslin-weaver contrives by the delicacy of his touch to make the finest cambric in a loom of such simple construction that European fingers could at best propose to make a piece of canvas at it." The highest degree of tactile sensibility is met with in blind persons—a circumstance which is to be attributed for the most part to the concentration of the attention and of the powers of recollection and comparison which are brought to bear upon the mind; and probably to some extent to an increased development of the tactile organs themselves, resulting, as the above-named physiologist suggests, "from that augmented nutrition which would be the natural consequence of the frequent use of them, and of the increased flow of blood that seems to take place toward any part on which the attention is constantly fixed."—For much interesting information on this subject, the reader is referred to Dr. Kitto's *Lost Senses*, in which cases, apparently quite authentic, are given of blind persons being able to distinguish colors by the touch.

TOUCH-HOLE, or VENT. See GUN.

TOUCH-PAPER. See NITER.

TOUCH-STONE, a hard black stone, occasionally used in assaying. The best kind is a peculiar bituminous quartz obtained from Lydia, in Asia Minor; but black basalt may be employed. The process is as follows: A series of "needles" or small bars are formed, the first consisting of pure gold; the second, of 23 of gold and 1 of copper; the third, of 22 of gold and 2 of copper, and so on. The assayer selects one of these alloys, or "needles," which, from its color, he judges to approach nearest in composition to the alloy which he is about to assay. This he rubs on the stone, and the streak which it leaves is red in proportion to the copper that is present. The streak formed by the alloy to be assayed is then compared with that formed by the various "needles," and corresponding streaks indicate corresponding amounts of copper. Hence, an approximate estimate of the amount of copper in an alloy can be made.—See Miller's *Inorganic Chemistry*, 2d ed., p. 739, note.

TOUCH-WOOD is the wood of willows and some other trees softened by decay. It is used as tinder for obtaining fire, from the readiness with which a spark ignites it.

TOUL, a fortified t. of France, dep. of Meurthe-et-Moselle. On Sept. 23, 1870, this fortress surrendered to the Germans after a bombardment of three days' duration. It has an old cathedral, which took more than five centuries to finish (965–1496), and which is reckoned one of the most splendid in France. Earthenware manufactures are carried on. Pop. '91, 12,138.

TOUL, or TULA, one of the provinces of Great Russia, bounded on the n. by the government of Moscow. Area, 11,954 sq.m.; pop. '94, 1,560,704. The surface is for the most part level; the climate is temperate; the soil fertile. The Oka is the only river which is navigable throughout the government, and the other streams are tributaries either of the Oka or the Don. The surface is in general dry, there being no lakes or marsh lands, and forests are rare. The inhabitants are occupied chiefly in agriculture, cattle-breeding, the manufacture of pottery, fishing, and the working of iron mines.

TOULA, or TULA, an important manufacturing t. of Great Russia, capital of the government of the same name, on the Upa, an affluent of the Oka, 110 m. s. of Moscow. Its churches, its arsenal, theater, industrial museum, cathedral, and the ancient Kremlin are the principal buildings. Toul is an ancient town, and has suffered severely from Tartar invasion, and during the wars of the commencement of the 17th century. Iron-works founded here under Czar Alexis Michailovitch have acquired a well-merited reputation. The Russian army is largely supplied with muskets and small-arms from the works of this town. Cutlery, locks, tea-urns, and bells are made in great perfection; and bristles are prepared in large quantities both for home consumption and export. There are also breweries and distilleries. Pop. '97, 111,048.

TOULMIN, JOSHUA, D.D., 1740–1815; b. London; became pastor of a dissenting congregation in Colyton. In 1765 he accepted a call from a Baptist congregation in Taunton. He then became a Unitarian, and received the degree of D.D. from Harvard

college in 1794. In 1804 he became minister of a Unitarian congregation at Birmingham. He published *Memoirs of Faustus Socinus* (1777); *Dissertations on the Internal Evidences of Christianity* (1785); and a *Historical View of the State of the Protestant Dissenters in England under King William* (1814).

TOULON, a great sea-port and naval arsenal of France, in the dep. of Var, stands on the shore of the Mediterranean, 42 m. e.s.e. of Marseilles, with which it is connected by railway. It stands at the head of a deeply penetrating inlet or gulf, rises in the form of an amphitheater toward the n., where its ramparts extend to the foot of a chain of lofty elevations, in part clothed with beautiful forests. The port is divided into two parts, the old and the new; the former, on the e., appropriated to merchant vessels, and bordered by a quay; the latter, on the w., surrounded by the dockyard, slips, arsenal, storehouses, cannon-foundry, etc. Numerous forts defend the town on the land-side; and the mouth of the harbor, and the hills commanding it, are studded with forts and redoubts; while moles, hollow and bomb proof, and formed externally into batteries, level with the water's edge, separate the roadstead from the old and new ports. Belonging to the arsenal, which is perhaps the finest in France, the chief objects of attraction are the sail-yard, the armory, the museum, the magazine, and the basin for the repair of ships. The fortifications of the town have been greatly extended since the conquest of Algeria, Toulon having become the chief port of communication with Africa. The population has also greatly increased, and two new suburbs have been constructed. The town is surrounded by a double rampart, and by a wide and deep fosse. The streets are straight and wide; and, on the whole, the town is both agreeable and healthy. The town is the Plymouth of France; and its industry consists, for the most part, of those manufactures to which its position as a great naval arsenal gives rise. Pop. '96, 95,276.

Toulon was destroyed by the Saracens in 889, and again by the Saracens about the close of the 12th century. It is only at the end of the 16th c. that Toulon comes to be important as a naval and military stronghold. It was taken by the English and Spaniards in 1793; but the allies were obliged to evacuate the town in December of the same year, after being fiercely attacked by the republicans, whose guns were commanded by Napoleon—then a simple officer of artillery—who here evinced for the first time his genius and self-reliance.

TOULOUSE (anc. *Tolosa*), an important city in the s. of France, capital of the dep. of the Haute-Garonne, is situated in a broad and pleasant plain, on the right bank of the river Garonne, 160 m. by railway s.e. of Bordeaux. Pop. '96, 149,963. The *canal du Midi* sweeps round its eastern and northern sides. The Garonne is here crossed by a beautiful bridge upward of 810 ft. in length, and 72 broad, which connects Toulouse with the suburb of St. Cyprien. The city, with the exception of the southern faubourg, is not particularly handsome (though the broad quays have rather an imposing appearance), and there are few fine public buildings. One may note, however, the cathedral, containing the tombs of the counts of Toulouse; the *capitole*, or town-hall; the church of St. Sernin (1090 A.D.); the musée, with its interesting collection of antiquities, forming an almost uninterrupted chain in the history of art, from the Gallo-Roman to the renaissance period. Toulouse is the seat of an archbishop, has a university academy, an academy of "floral games" (*société des jeux floraux*), pretending to derive its origin from the contests of the ancient troubadours, academies of arts, sciences, antiquities, etc., schools of law, and medicine, and artillery, a national college, an observatory, a museum, botanic garden, and a public library of 70,000 volumes. Toulouse manufactures woollens, silks, leather, oil, candles, soaps, machinery, paper, tobacco, etc., and carries on a great trade with Spain. There are fairs annually.

History.—*Tolosa* was, in Cæsar's time, a city within the limits of the Roman *provincia*, and had been originally the capital of the Volcæ Tectosages, a Gallic tribe noted for its wealth and consequence. Under the empire its importance continued. Ausonius describes it as surrounded by a brick wall of great circuit, and so populous that it had founded four colonies. In 412 A.D. the Visigoths made it the capital of their kingdom; and after the time of Charlemagne, it was under the sway of counts, who made themselves independent about 920, but in 1271 the "county of Toulouse" was reunited to the crown of France by Philippe le Hardi. Its literary celebrity reaches as far back as the Roman empire. Ausonius speaks of the *toga docta* of "Palladian" Tolosa, and the favorite deities of the city were Jupiter, Minerva, and Apollo. At a little village close by, which still bears the name of *Viel Toulouse*, a multitude of cinerary urns, statuettes, Phœnician, Celtiberian, Gallic, Greek, and Roman medals, fragments of buildings, and an entire paved street have been discovered. Early in the middle ages, under the counts of Toulouse, it became a seat of provençal poetry, and was the center of the papal crusade against the Albigenses, conducted by Simon de Montfort. The parliament of Toulouse had also a great reputation, but unhappily it is likely to be best remembered by one of its most iniquitous decisions, that delivered in the case of the Calas (q.v.) family.

TOURAINÉ, one of the former provinces of France, of which the capital was Tours (q.v.), and which was bounded on the n. by the province of Orleannais, on the e. by Berri, on the s. by Poitou, and on the w. by Anjou. It was about 60 m. in length, and nearly the same number of miles in breadth, and consisted of the present department of Indre-et-Loire and a portion of Vienne.

TOURCOING, a frontier t. of France, dep. of Nord, $7\frac{1}{2}$ m. n.e. of Lille, is built on an eminence in the midst of a fertile territory. It has a great reputation for its manufacture of linen cloths, silks, and woollens, and also carries on sugar-refining, distilling, and manufactures of soap, colors, etc. Pop. '91, 65,477.

TOURGEE, ALBION WINEGAR, b. Ohio, 1838; educated at the university of Rochester, N. Y.; studied law; was in the army in the war of the secession, 1861-65; was twice wounded; practiced law at Greensboro', N. C., after the war; was a member of the convention of southern loyalists held in Philadelphia, 1866. He aided in preparing *A Code of Civil Procedure for North Carolina*, and he has also published some widely circulated works—*The Fool's Errand*; *Bricks Without Straw*; *Figs and Thistles*; *John Eax*; *An Appeal to Cæsar*; *Pactolus Primus* (1890); *An Outing with the Queen of Hearts* (1894). He edited *Our Continent*.

TOURMALINE, a mineral ranked among gems (q.v.), and occurring in primitive rocks in many parts of the world. Its chemical composition is very complex and somewhat various, but the chief constituents are always silica and alumina in about equal proportions, and forming about three-fourths of the whole; the remainder consisting of boracic acid, fluorine, phosphoric acid, peroxide of iron, peroxide of manganese, protoxide of iron, magnesia, lime, soda, potash, and lithia, which are not, however, all present in any specimen. Tourmaline is harder than quartz, but not so hard as topaz or emerald. Its specific gravity is a little more than 3. It occurs in crystals, or massive and disseminated, although always crystalline. Its luster is vitreous. Some varieties are transparent, some translucent, some opaque. Some are colorless, some green, brown, red, blue, and black. Red tourmaline is known as *rubellite*, blue tourmaline as *indicolite*, and black tourmaline as *schorl*. This last is the most common kind. Tourmaline crystallizes in prisms, with 3, 4, or 9 sides, variously acuminate. The sides of the prisms are striated. The finest tourmalines are much valued by jewelers, but are comparatively rare. They mostly come from Ceylon, Siberia, and Brazil. Tourmalines are found in several parts of Britain. Very large crystals abound in the granite of Aberdeenshire. Fine specimens are found in Maine, North Carolina, and other parts of the U. S.

TOURNAMENT (Fr. *tournoi*, from *turnoyer*, to turn round), a military sport of the middle ages, in which combatants engaged one another with the object of exhibiting their courage, prowess, and skill in the use of arms. The invention of the tournament has been ascribed to Geoffroy de Prenilly, ancestor of the counts of Anjou, who lived in the 10th c.; France was its earliest *locale*, whence it spread first to Germany and England, and afterward to the s. of Europe. A tournament was usually held on the invitation of some prince, who sent a king-of-arms or herald through his own dominions and to foreign courts signifying his intention of holding a tournament and a clashing of swords in presence of ladies and damsels. The intending combatants hung up their armorial shields on the trees, tents, and pavilions around the arena for inspection, to show that they were worthy candidates for the honor of contending in the lists in respect of noble birth, military prowess, and unspotted character. The combat took place on horseback, or at least was always begun on horseback, though the combatants who had been dismounted frequently continued it on foot. The usual arms were blunted lances or swords; but the ordinary arms of warfare, called arms *à l'outrance* were sometimes used by cavaliers who were ambitious of special distinction. Tournaments were the subject of minute regulations, which in some degree diminished their danger. The prize was bestowed by the lady of the tournament on the knight to whom it had been adjudged, he reverently approaching her, and saluting her and her two attendants. The period when tournaments were most in vogue comprised the 12th, 13th, and 14th centuries; and the place where the most celebrated English tournaments were held was the tilt-yard, near St. James's, Smithfield, London. The church at first discountenanced tournaments, some of its decrees prohibiting persons from engaging in them under pain of excommunication, and denying Christian burial to a combatant who lost his life in one. The church seems, however, to have looked with more favor on these combats after the middle of the 13th century. During the 15th and 16th centuries, tournaments continued to be held, but the alteration in the social life and warfare of Europe had changed their character, and they are rather to be regarded as state pageants than as real combats. The death of Henry II. of France, in 1559, consequent on the loss of his eye at a tournament, led to their general abandonment, both in France and elsewhere, and there have been few attempts to revive them even as mere spectacles. A magnificent entertainment, consisting of a representation of the old tournament, was given at Eglinton castle in 1839, by the late earl of Eglinton: lady Seymour was the queen of beauty, and many of the visitors enacted the part of ancient knights; among them Prince Louis Bonaparte afterward Napoleon III.—According to Ducange, the difference between a tournament and a Joust is that the latter is a single combat, while in the former a troop of combatants encounter each other on either side. But this distinction has not been always observed.

TOURNAY (Flemish, *Doornik*), a fortified t. of Belgium, province of Hainault, on both sides of the Scheldt, near the French frontier. It has a splendid cathedral with five towers (and pictures by Jordaens, Rubens, Gallait, etc.), several fine churches, particularly St. Quentin and St. Jacques, a gallery of art, an episcopal seminary, hos-

pitals, and a lunatic asylum. Although one of the oldest towns in Belgium, it has quite a modern appearance, with fine suburbs and beautiful broad streets. The chief manufactures are hosiery and linen, carpets, liqueurs, and porcelain; but there are few large workshops, most of the fabrics being executed by the people in their own houses. Pop. '95, 35,761. A little to the s.e. lies the famous village of Fontenoy (q. v.).

Tournay, the ancient *Tornacum* or *Turris Nerviorum* (''fort of the Nervii''), was in the 5th and beginning of the 6th c. the seat of the Merovingian kings, subsequently belonged to France, but at the peace of Madrid was included in the Spanish Netherlands. Subsequently, it was oftener than once taken by France, but again restored by treaty. During the month of May, 1794, it was the scene of several hotly contested fights between the French and Austro-English armies, the most important of which was that of May 19, in which Pichegru beat the duke of York.

TOURNEFORT, JOSEPH PITTON DE, one of the greatest botanists of the 17th c., b. at Aix, in Provence, in 1656. He exhibited an ardent love of botany from his youth, and devoted his whole life to this science. After having explored the flora of his native district, he was sent, at the king's expense, to Spain, Portugal, England, and Holland, and afterward to the east. He visited the Grecian archipelago and Thrace, the shores of the Black sea, and Asia Minor, and added a great number of species to the list of known plants. He lost his life in 1708, in consequence of a carriage running against him in Paris. He published several botanical works, and a *Voyage to the Levant* (1717). His botanical system, which maintained its ground till the time of Linnæus, was of great use in promoting the progress of botany; but he rendered still greater service to his favorite science by grouping plants in genera. He was the first to do so. Previous botanists had merely described them individually, as species.

TOURNIQUET, an instrument for compressing the main artery of the thigh or arm, either for the purpose of preventing too great a loss of blood in amputation, or to check dangerous hemorrhage from accidental wounds, or to stop the circulation through an aneurism.

The common tourniquet consists of three parts—viz., (1) a pad to compress the artery; (2) a strong band which is buckled round the limb; and (3) a bridge-like contrivance over which the band passes, with a screw whose action raises the bridge and consequently tightens the band. The best kind of pad is a small firm roller about an inch thick; it must be placed lengthways over the main artery so as to compress it against the bone, and must be secured in its place by a turn of bandage, over which the band of the tourniquet must be applied. This band must first be tightly buckled, and the pressure must be then increased to the necessary extent (namely, till the beating of the artery beyond the instrument ceases to be perceptible) by the action of the screw, which should always be opposite the buckle of the band. As the instrument arrests the venous blood, it should never be applied tightly in cases of amputation, until the surgeon is ready to make his incision, as otherwise there would be an excessive loss of venous blood.

The credit of the invention of this most useful instrument is usually ascribed to the French surgeon, Morel, who, in 1674, used a stick passed beneath a fillet, and turned round so as to twist it up to the requisite degree of tightness, as a means of preventing the undue loss of arterial blood in amputations of the limbs—a rough, but by no means ineffectual form of tourniquet, which may often be usefully extemporized in cases of emergency at the present time. Mr. Young, of Plymouth, in 1679, described a similar apparatus. A much improved screw tourniquet was invented by Petit early in the following century.

TOURO, JUDAH, 1775–1854; b. Newport, R. I., son of Isaac Touro, rabbi of the synagogue at Newport (1762), who emigrated from Holland. He went to the Mediterranean in 1798 as supercargo in his uncle's vessel, which on its passage had an engagement with a French privateer and gained the victory after a desperate battle. On his return he resided some time in Boston; removed to New Orleans, 1802, amassing a large fortune in trade, which he used beneficently, bequeathing much of it to public institutions in that city. The Touro almshouse, one of his gifts, used as barracks for colored troops during the civil war, was destroyed by fire. He was wounded in the hip at the battle of New Orleans, 1815, and never recovered from the ill effects. He was an Israelite, but gave liberally in money and land to other denominations and their enterprises. He gave \$10,000 to the Bunker hill monument association.

TOUROUKCHANSK, a small t. of e. Siberia, in the government of Yeneseisk, stands on the Yenesei, 4,122 m. e. of St. Petersburg, and only 50 m. s. of the arctic circle.

TOURS, a city of France, capital of the dep. of Indre-et-Loire, and formerly capital of Touraine, stands in the midst of a fertile but flat valley, 147 m. s.w. of Paris. Along its n. side runs the Loire, and along its s. side the Cher—these two rivers uniting about 25 m. s.w. of the city, between which and their point of confluence only a very narrow strip of land separates them. The bridge over the Loire, which continues the great highway from Paris s. to Bordeaux, is upward of 1400 ft. long. The cathedral is a stately Gothic edifice. Surrounding the choir—begun in 1170—there is beautiful old

painted glass. The Tour de St. Martin or d'Horloge, and the Tour de Charlemagne, are noteworthy as being the only remains of the cathedral founded by St. Martin in the 4th century. The church was pillaged by the Huguenots, and utterly destroyed, with the exception of the two towers mentioned, at the revolution. Tours has a town hall, a library, and a museum. A little to the w. of Tours are the remains of Plessis les Tours, in which Louis XI. died in 1483. Manufactures of silk stuffs, carpets, confectionery, painted glass, and pottery are carried on. Pop. '96, 83,267.

Tours, the ancient *Cæsarodunum*, dates from the time of the Gauls, and was visited by Cæsar and by Adrian. Here Clovis, having come to thank St. Martin for the victory of Vouillé, received the crown of gold and the purple robe presented to him by the emperor Anastasius. Henry IV. planted the first mulberry-trees known in France here, and here the first silk-factories were established. Under Richelieu, 40,000 hands were employed at Tours, in this branch of manufacture; but the industry of the town was ruined by the revocation of the edict of Nantes. In the Franco-German war of 1870-71, Tours was for a time the seat of the French provisional government, and was occupied by the German troops.

TOURVILLE, ANNE HILARION DE COTENTIN, Count de, third son of César de Cotentin, seigneur de Tourville, was born at Tourville in 1642. Entering the French navy when, about eighteen, it seems that his somewhat delicate and effeminate appearance caused him to be regarded as anything but a hopeful seaman. He became, however, almost immediately conspicuous for bravery and enterprise; and the first six years of his naval service, directed against the Turks and Algerians, established his reputation both in France and in the south of Europe. In 1667, he was received at Versailles with great distinction by Louis XIV. In 1669, he distinguished himself in the expedition sent by France to the relief of Candia, then besieged by the Turks; and again in 1671-1672, in the naval war waged by the combined fleets of France and England against the Dutch. In 1682, he was made lieut. gen. of the navy, and for the following two or three years he was engaged in suppressing the pirates of Algiers and Tripoli. In the war which broke out after the English revolution of 1688, between France on the one part, and England and Holland on the other, Tourville was put at the head of the French navy. In June 1690, he entered the English channel at the head of a powerful fleet, and inflicted a disastrous and ignominious defeat on the united English and Dutch armament near Beachy Head. "There has scarcely ever been so sad a day in London," says Macaulay, "as that on which the news of the battle of Beachy Head arrived." Tourville ranged the channel unopposed; and on July 22, his fleet cast anchor in Torbay (see Macaulay, *History of England*, vol. iii. p. 652-54, ed. 1855). In 1692, Louis XIV. having resolved to invade England on behalf of James II., an immense fleet was assembled at Brest under Tourville in order to protect the descent. On the 16th May of this year the French fleet was descried from the cliffs of Portland, and on the following morning the English and Dutch force stood out to give battle. From the morning of the 19th to the afternoon of the 24th, raged one of the greatest naval battles of modern times that of cape La Hogue. It ended in the complete defeat of the French, 16 of their men-of-war being utterly destroyed. In spite of this disaster, Tourville was graciously received at Versailles: "We have been beaten," said Louis to him, "but your honor and that of the nation are unsullied" (see *Memoirs of St. Simon*). On March 27, 1693, Tourville was made a marshal of France. Sailing from Brest harbor in the spring of this year, he attacked an English merchant fleet under inadequate convoy, and succeeded in inflicting a damage on English traders estimated at some millions sterling. Sir George Rooke, who commanded the convoy, had some difficulty in saving his own squadron from destruction. This was the last exploit of the great French admiral; his career ending with the peace of Ryswick in 1697. He died at Paris, May 28, 1701. It has been said of Tourville that he was competent to fill any place on board ship, from that of carpenter to that of admiral. It has also been said of him, that to the dauntless courage of a sailor he united the suavity and urbanity of an accomplished gentleman. But though a brave man, he was, during the earlier part of his career, a timid commander. Reckless of his life, he was often pusillanimously cautious where his professional reputation was at stake. Latterly, stung by the censures drawn on him by his natural disposition, he became bold even to rashness.

TOUS-LES-MOIS, a starch made in the West Indies, from the roots of a species of canna (q. v.); it is used as a substitute for arrow-root.

TOUSSAINT, ANNA LOUISA GERTRUDE, one of the most popular modern Dutch novel ists, was b. at Alkmaar, Sept. 16, 1812, where her father, a highly esteemed lecturer on chemistry, died in 1859. After the revocation of the edict of Nantes, her paternal ancestors fled from France, and took refuge, first at Hanau, and later in Friesland, where they ranked among the nobility, but were reduced in circumstances during the French usurpation. By the mother's side, she was also of a refugee family of the name of Rocquette, belonging to the higher class of merchants and manufacturers. Her first work, *Almagro*, published in 1837, was well received, and translated into German. Speedily followed *De Graaf van Devonshire*, an episode in the early life of Elizabeth Tudor; then *De Engelschen te Rome*, a historical novel of the times of Pope Sixtus V.; in 1840, the *Iluis Laurenessé*, a story of the reformation, which has gone through several

editions, and been translated into German and English. Her popularity was increased by a series of novels in 10 volumes, 1845-55, under the titles of *De Graaf van Leycester in Nederland* (The Earl of Leicester in the Netherlands), *De Vrouwen van het Leycestersche tijdperk* (The Women of the Times of Leicester), and *Gideon Florentz*. Her other works are numerous, including *Cardinal Ximenes*, *The Duke of Alba in Spain*, *The Princes Orsini*, *De Mauléon*, *Don Abbondio II.*, *Mother-joy and Mother-grief*, *The Orphan of Alkmaar*, *The Leyden Student in 1593*, *The Biography of the Landscape Painter Maria van Oosterwijk*, etc. She married the painter Johannes Bosboom in 1841.

TOUSSAINT, FRANÇOIS DOMINIQUE, surnamed L'OUVERTURE, was b. at Buda, in St. Domingo in 1743. His father and mother were both African slaves. When the French revolution broke out, it found him in the position of coachman to a M. de Libertat, who appears also to have employed him as a sort of sub-manager of an estate for which he was himself the factor. In 1791 the French convention passed the memorable decree, by which the rights of French citizens were given to people of color. In the revolutionary strife which followed in St. Domingo, Toussaint was, for the next three years, conspicuous for his adherence to the cause of royalty and Catholicism; but the decree of Feb. 4, 1794, which declared all slaves free, won him over to the side of the French republic. He joined their commander, Laveaux, by whom he was made a gen. of division. In 1793, in the midst of the troubles, the British had landed a force and taken partial possession of the island. Against them Toussaint now proved himself an able and indefatigable enemy, bringing the whole of the northern division of the island under the dominion of the French republic. In 1795, in consequence of a conspiracy of three mulatto generals, Laveaux was arrested at Cape Town; but Toussaint, assembling his negroes, and uniting himself to the French force, quickly effected the release of the governor. The gratitude of Laveaux was very great; and, in 1796, the commissioners of the directory appointed Toussaint chief of the army of St. Domingo. Shortly after this event, Gen. Maitland, the British commander, surrendered to him all the strong places which he had hitherto held in the island. This was followed in 1801 by the submission of the Spanish forts. The whole of St. Domingo was then under the rule of Toussaint. His sway was vigorous and upright; and the agriculture and trade of the island both flourished under him. He was now at the summit of his prosperity. He assumed great state, though still retaining habits of personal simplicity. But a more powerful despot now found himself at leisure to interfere in the affairs of the island. During the peace of Amiens, Napoleon Bonaparte issued a proclamation re-establishing slavery in St. Domingo. This was met by a counter-proclamation by Toussaint, issued on Dec. 18, 1801, in which, while professing obedience, he showed plainly that he meant resistance. A squadron of 54 sail of the line, under Gen. Le Clerc, very soon made its appearance to enforce the edict of the first consul. Toussaint was obliged to retire, was proclaimed an outlaw, and, agreeing to surrender, was received with military honors. He was afterward treacherously arrested, and sent to Paris, where, after 10 months of rigorous imprisonment, he died on April 27, 1803.—See *Vie de Toussaint l'Ouverture* by St. Remy (Par., 1850); and *The Life of Toussaint*, by Dr. Beard (Lond., 1853).

TOUT ENSEMBLE (Fr., "all together") is a current term denoting the general effect produced by a whole. In a work of art the *tout ensemble* is the effect of the work considered as a whole, without regard to the execution of the separate parts; of a face it is the impression, which the face produces, without regard to special or separate features; of a toilet it is the final effect, without regard to detail or arrangement.

TOWER HAMLETS, a parliamentary borough in Middlesex, lying in the e. of London, and having the city and Finsbury to the w. of it. It contains the parishes of St. George, Mile-End, Poplar, Stepney, Limehouse, Bow, Bromley, and Whitechapel. In Tower Hamlets are the Tower of London (q.v.), the mint, Trinity house, St. Katharine's docks, the East and West India, South and London docks, the London hospital, and various charitable institutions. Six members are returned to Parliament. Pop. '91, 451,931.

TOWER, ZEALOUS BATES, b. Boston, 1819; appointed to the engineers in the U. S. army in 1842, after graduating at West Point, where he was for a time assistant prof. of engineering. He served through the Mexican war, receiving several brevets for his conduct at Cerro Gordo, Contreras, Churubusco, and Chapultepec. At the beginning of the civil war he was chief engineer at Fort Pickens, Florida. He served in the campaign in northern Virginia in 1862, and was wounded in the second battle of Bull Run, where he commanded a brigade. He was chief engineer of the fortifications of Nashville, Tenn., 1864-65; and took part in the battle of Nashville. He was brevetted maj.gen. in 1865; made col. engineers 1874; retired 1883.

TOWER OF LONDON, in feudal days, a powerful fortress; then, and long after, a state prison of gloomy memories; now, a government storehouse and armory, and still, in some sense, a stronghold, is an irregular quadrilateral collection of buildings on rising ground adjoining the Thames, and immediately to the e. of the city of London. The space occupied is between 12 and 13 acres, and the whole is surrounded by a moat of fair width, but no great depth. Usually the moat is dry, but the garrison have the power of flooding it. Seen from without, the moat is bordered within by a lofty castellated wall, broken by massive flanking-towers at frequent intervals. Within this wall

risers a second of similar construction, but greater height; and within this, again, are the several barracks, armories, etc.; and in the center of all, the lofty keep or donjon known as the white tower. This last, which nearly resembles Rochester castle, and like it, was built by Gundulph, bishop of Rochester, in the time of William the Conqueror, is the center of interest and antiquity in the whole structure. Its walls are in parts 16 ft. thick, and of solid masonry. This tower was the court of the Plantagenet kings. The various other towers are principally noteworthy on account of the illustrious prisoners who have pined in them, or left them for the scaffold. In the n.w. corner of the quadrangle is St. Peter's chapel, now the garrison church. In another part is the jewel-house, containing the crown jewels, or *regalia*, comprising several crowns, scepters, globes, and jewels of enormous value. Near this building is the horse-armory a collection of ancient and mediæval arms and armor, the latter being exhibited in complete suits on wooden figures of men and horses. To the crown jewels and the armory, visitors are admitted on payment of a small fee.

Early writers have alleged that Julius Cæsar first built the tower of London as a Roman fortress; but there is no written evidence to prove the existence of any fortress on this site before the construction of the white tower by bishop Gundulph in 1078. Some earlier structure of the Saxon times appears to have been there, from the massive foundations which have been discovered in the course of subsequent erections; but of the nature of those buildings we know nothing. During the reigns of the first two Norman kings, the tower seems to have been used as a fortress merely. In Henry I.'s time, it was already a state prison. That monarch and his successors gradually increased the size and strength of the ramparts and towers, until the whole became a stronghold of the first class for feudal times. The kings frequently resided there, holding their courts, and not unfrequently sustaining sieges and blockades from their rebellious subjects. Of the long list of executions for political offenses, real or imputed, that of lords Kilmarnock, Balmerino, and Lovat, after the rebellion of 1745, was the last. Wilkes, Horne Tooke, and others have since been confined there; but happily, blood has ceased to flow since the existence of a living opposition has been found consistent with the safety of the government.

Not the least interesting memorials are the quaint and touching inscriptions cut by hapless prisoners on the walls of their dungeons.

In 1841 a very serious fire broke out in the bowyer tower, and extended to the armories, causing the destruction of numerous modern buildings and many thousand stand of arms. At present, the tower of London is a great military storehouse in charge of the war department, containing arms and accouterments for the complete equipment of a large army. The mint and public records were formerly kept in it, but have now been removed to other buildings more suitable. Flamsteed, when first appointed astronomer-royal, made his observations from the summit of the white tower; afterward, he removed to Greenwich. It is needless to say that, viewed as a fortress, the tower would be useless against modern arms.

The government is vested in a constable, who has great privileges, and is usually a military officer of long service and distinguished mark; the deputy-constable, also a general officer of repute, is the actual governor. He has a small staff under him, and the corps of yeomen of the guard, more commonly known as beef-eaters. In addition, a wing, and occasionally a battalion, of infantry is quartered in the barracks.—*Bayley's History of the Tower of London*, 2 vols. 4to; *Memoirs of the Tower*, by Britton and Brayley (1831); *Memorials of the Tower of London*, by Lord De Ros (1866); *Her Majesty's Tower*, by Hepworth Dixon, 4 vols. (1871).

TOWLE, GEORGE MAKEPEACE, b. Washington, D. C., 1841; educated at Boston public schools, the academies of Lawrence, Groton, and Wrentham, Mass., and Yale college; graduated, 1861; Harvard law school, 1863. He was admitted to the bar and practiced law in Boston, 1863-65. In 1865-66 he was on the editorial staff of the *Boston Post*; U. S. consul at Nantes, France, 1866-68; at Bradford, England, 1868-70. Returning to this country, he became managing editor for one year of the *Boston Commercial Bulletin*. In 1871-76 he was foreign editor of the *Post*, and was afterwards on the regular staff of *Appleton's Journal*, the *Art Journal*, and the *Youth's Companion*. He began his literary work by writing essays for the *North American Review*. Among his later publications are *The Principalities of the Danube*; *Modern Greece*; *Montenegro and Bulgaria* (1877). He edited *Harvey's Reminiscences of Webster* in the same year, and published *Vasco da Gama* (1878). He was engaged on the third volume of his *Literature of the English Language* at the time of his death, August, 1893.

TOWN, in law, a term of somewhat varying signification. In ancient times a wall seems to have been necessary to constitute a town, and the Anglo-Saxon word *tun*, from which *town* is derived, came from a verb meaning to inclose. This suffix *tun* is found with very many names of places. In Pennsylvania and some other states the word town may mean either a city or village. In New York and Wisconsin the town is a subdivision of the county, and so in most of the western states, though the name township is more commonly used. In the New England states the town has a distinctly different position, and is a political division of the state—the unit of civil organization, and, legally speaking, a *quasi* corporation. See MUNICIPALITY—MUNICIPAL CORPORA-

TOWNS. Town governments cover all organized New England territory except that occupied by incorporated cities; and, with the exception of Massachusetts and Maine, the towns are the basis of legislative representation. Thus in Connecticut, the town of New Haven, pop. 86,045, and the town of Wolcott, pop. 522, have the same number of representatives in the lower branch of the legislature. The town officers (usually a town clerk, selectmen, a treasurer, assessors, poor overseers, school committee, and constables) are elected by the "town meeting," which also lays the taxes, and in other ways legislates for the town. This peculiarly democratic institution has fallen into a mere form in the larger towns, where there is usually a city charter. A curious assertion of its legal existence as late as 1881 occurred in Boston. The city charter of 1822 requires the common council to call a town meeting when requested so to do by, we believe, 40 respectable persons. Such petition was made by members of a "labor reform" society, and on refusal of the authorities to call the meeting, an order was obtained calling upon the "City of Boston" to come into court and show cause why a *mandamus* should not issue to compel the city to obey its charter.

TOWN-ADJUTANT, TOWN-MAJOR, officers on the staff of a garrison. They are often veteran officers, too much worn for field-service. The pay depends on the magnitude of the trust. The town-major ranks as a captain, the adjutant as a lieutenant. The duties of these officers consist in maintaining discipline, and looking after the finding of the batteries, etc.

TOWN-CLERK is the clerk to a municipal corporation, elected by the town council. In England, he holds his office during pleasure, and his salary is paid out of the borough funds. His duties are: to take charge of the voting papers in the election of councillors, to keep the records of the borough and lists of burgesses, and to perform a variety of miscellaneous duties imposed by sundry acts of parliament.—In Scotland, he holds his office *ad vitam aut culpam*, is the advisor of the magistrates and council in the discharge of their judicial and administrative functions, attends their meetings, records their proceedings, is the proper custodian of the records of the burgh, and keeper of the registers of sasines and deeds within it. Various important statutory duties are also assigned to him in relation to the registration of voters, the conduct of municipal elections, the valuation of lands and heritages, the registration of births, marriages, and deaths, the licensing of public houses, etc. In the performance of a large proportion of these duties, he is independent of the town-council, who cannot make his appointment during pleasure, or attach to it any condition which might enable the council either to control him in the conduct of the business of his office, or withdraw from him any portion of his emoluments, so far as derived from fees. Being thus protected in the independent and impartial discharge of his functions as a public officer, he is bound to give extracts from the records in his custody without reference to the town-council, and is liable *personally* for the consequences of failure in any department of his duty. He is not, however, a magistrate in any sense, and cannot be held responsible for the obligations of the burgh, or for the omissions or neglect of the magistrates and council.

TOWNER, a co. in n.e. N. Dakota, organized 1883; 1044 sq.m.; pop. '90, 1450. Co. seat, Cando.

TOWNE SCIENTIFIC SCHOOL. See PENNSYLVANIA, UNIVERSITY OF.

TOWNLEY, CHARLES, 1737-1805; b. England; educated on the continent. He lived in Rome 1765-72, and bought a large collection of antique statues, coins, bronzes, marbles, and manuscripts. In the purchase of antiques he was able to utilize the taste and knowledge of Winckelmann and other connoisseurs. After his return to England he continued to add to his collection, which is now in the British museum.

TOWNS, a co. in n.e. Georgia, adjoining North Carolina; drained by the Hiawassee river; about 180 sq.m.; pop. '90, 4064, chiefly of American birth, with colored. The surface is rugged and mountainous; there are extensive forests; corn, oats, and pork are the chief products. Co. seat, Hiawassee.

TOWNSEND, GEORGE ALFRED; b. Del., 1841; educated in Philadelphia. He was connected with the *Inquirer* and *Press* of Philadelphia, and during the war sent to the New York *Herald* a series of letters, describing the Peninsular campaign. The closing events of the war were reported by him in interesting letters to the New York *World*. After the war he traveled in Europe; wrote for English papers, and was correspondent of several in this country. On his return he acted as Washington correspondent for several papers under the pseudonym, *Gath*; was connected with the Chicago *Tribune* for some years, and now resides in New York, still in newspaper work. He has published collected correspondence; a volume of poems; a volume of stories of Maryland life; the novels, *Lost Abroad*; *The Entailed Hat* (1884); *Katy of Catoctin* (1886); *Mrs. Reynolds and Hamilton* (1890); and a drama, *President Cromwell* (1885).

TOWNSEND, LUTHER TRACY, D.D.; born Me., 1836; graduated Dartmouth, 1859, and Andover theological seminary, 1862; professor of practical theology in the Boston university (Meth. Episcopal). He has published *True and Pretended Christianity*; *Credo*; *Sword and Garment*; *God-Man*; *The Arena and the Throne*; *Lost Forever*; *Outlines of Theology*; *The Chinese Problem*; *Bible Theology and Modern Thought*. In 1893 he became pastor of a church in Baltimore.

TOWNSHEND, CHARLES, Viscount TOWNSHEND, English statesman, b. 1674; was descended from a very ancient English family, which has been settled at Raynham, in Norfolk, since the reign of Henry I. His father, Horatio, had been a prominent member of the Presbyterian party before the restoration, and having been one of the most forward in restoring the monarchy, was, by Charles II., made baron in 1661, and viscount in 1682. He died in 1687, when his son was only eleven years old. When he was of age to take his seat in the upper house, he adopted his father's politics; but soon afterward became a disciple of lord Somers, and cordially co-operated with the whigs. He was named by the Godolphin administration one of the commissioners for arranging the union with Scotland, and was rewarded for his exertion by the captaincy of the yeomen of queen Anne's guard. He was then employed as a diplomatist; was joint-plenipotentiary with Marlborough at Gertruydenberg; and negotiated with the states-general the barrier treaty, which pledged the states-general to the Hanoverian succession, and England to procure the Spanish Low Countries for the United Provinces, as a barrier against France. In 1712, upon the formation of the Harley ministry, Townshend was dismissed from his places, and the barrier treaty was censured by the house of commons, which voted that Townshend and all who had been concerned in the treaty were enemies to the queen and kingdom. This persecution raised him from the rank of a follower to the station of a leader. He maintained a close correspondence with the court of Hanover, and obtained the entire confidence of George I., who on his accession to the throne of England, made him his chief minister. While George I. was still at the Hague, on his way to his new kingdom, he made Townshend secretary of state, with power to name his colleague. He selected General, afterward Earl Stanhope, and formed a ministry entirely whig in its party character. He strengthened it by the addition of Walpole, who, from being at first paymaster of the forces, was soon made chancellor of the exchequer and first lord of the treasury. The principal act of the government was the passing of the septennial bill, a bold and unconstitutional act. After the breaking up of the South Sea bubble, and the deaths of Sunderland (q.v.), and Stanhope Townshend (1721) again became secretary of state. But he was no longer the acknowledged leader of the whigs. The superior talent of Walpole, his financial abilities, and his influence in the house of commons, caused a change in the relative position of the two ministers, and converted those who had been so long friends and colleagues, and who were also connected by ties of marriage (for Townshend had married Walpole's sister), into rivals and enemies. An open and unseemly quarrel broke out between them. They seized each other by the collar, and then laid their hands upon their swords. The interposition of friends prevented a duel; and Townshend, resigning the contest, retired to Raynham, to cultivate his paternal acres. Walpole, on being asked the cause of his difference with his brother-in-law, replied, "As long as the firm was Townshend and Walpole, all did very well; but when it became Walpole and Townshend, things went wrong, and a separation ensued." Townshend introduced the turnip into Norfolk from Germany, and thus effected a most beneficial revolution in agriculture. He steadily refused to reappear in public life, and died at a good old age, in June, 1738.

TOWNSHEND, The Right Hon. CHARLES, English orator and statesman, was second son of the third viscount Townshend, and grandson of the foregoing. He was born in 1725, and entered the house of commons in 1747, as a supporter of the Pelham (whig) administration. His first great speech was against the marriage bill in 1753, which gained him a great reputation for eloquence. Upon the dissolution of the whig government, the earl of Bute gained him by the offer of the post of secretary at war. On Bute's resignation in 1763, he was appointed first lord of trade and the plantations. By this time, the versatility of his political career had obtained him the appellation of "the Weathercock." In the Chatham ministry of 1766, he accepted the post of chancellor of the exchequer, and leader of the house of commons. When lord Chatham, in a distempered state of mind, abdicated the post of first minister, Townshend broke loose from all restraint, and manifested the greatest vanity, ambition, and arrogance. George Grenville, smarting under the defeat of his favorite scheme of taxing America, on one occasion, in the middle of his harangue, turned to the ministers: "You are cowards," he said; "you are afraid of the Americans; you dare not tax America." Townshend's fiery temper was kindled, and he exclaimed: "Dare not tax America! I dare tax America." Grenville retorted: "I wish to God I could see it!" and Townshend replied: "I will, I will." He was not allowed to forget his pledge; and finding the notion of an American revenue agreeable to the court, and not unpalatable to the house of commons, he proposed and carried those measures that led to the separation of the American colonies. Townshend's wife was created a peeress, and he was about to be intrusted with the formation of a ministry, when he was carried away by a putrid fever (Sept. 1767) in this 42d year. The difference between his contemporary reputation and his fame is very striking. He was ranked as an orator with Pitt. He was far more popular than the great commoner with the house of commons; yet his name will not go down to posterity, save in the annals of his time. Burke called him "the delight and ornament of the house of commons." Macaulay speaks of him as "the most brilliant and versatile of mankind," who had "belonged to every party, and cared for none."

TOWNSHIP, in the older of the United States is a subdivision of a county, made without reference to population (as T. may be entirely uninhabited), and varying in size from five to ten m. square. In the territories and in the states that have been formed out of them, a T. is a division of land made on the more systematic plan introduced, 1802, by Col. Mansfield, then surveyor of the n.w. territory, as follows: the entire public domain is first divided into parts entitled land districts, which are further subdivided into squares, each 6 m. sq., and these again into 36 equal squares, called sections, of 640 acres each. The political status of a T. varies considerably with the locality. In the New England states it is the original political entity, possessing large faculties of self-government, and the county is simply an aggregation of townships, mainly for judicial convenience. See TOWN. In the Middle and Western states the T. has less powers of self-government, and is more subordinated to the county, and in most of the Southern states it is simply a geographical division of the county, with few or no separate powers.

TOWNSVILLE, a town and sea-port on the east coast of Queensland, Australia, situated on Cleveland bay at the mouth of Ross creek. It is the see of an Anglican bishop, has a cathedral, court house, technical school, meat-packing establishment, and manufactories for ice, soap, etc. It is the terminus for the railway to Hughenden, 236 m. inland, and has an extensive shipping-trade, although the harbor, recently improved by two large breakwaters, is still poor, large vessels having to lie three miles from shore. Pop. '91, 8563.

TOWSON, NATHAN, 1784-1854; b. Md.; capt. in the U. S. army in the beginning of the war of 1812. With the co-operation of the naval forces, he captured the British brig *Caledonia*, at Fort Erie; he was engaged at Queenstown, Fort George, and Stony Creek; wounded in a skirmish on the outworks of Fort George, N. C. He participated in the capture of Fort Erie under Scott, was prominent in the battle of Chippewa, and remained at the front to the end of the hard fought battle of Niagara. He rose by brevet through successive grades to be maj.-gen. for services in the Mexican war.

TOXICOLOGY is the term commonly employed in medical jurisprudence to designate the science of poisons. It embraces the physical and chemical history of all known poisonous substances, the methods of testing for them, their action on the living body, the *post-mortem* results which they occasion, and (according to some writers) the medical treatment that should be adopted. The word has a somewhat far-fetched origin. The Greek word *toxicon* signifies "anything relating to *toxon*, a bow;" hence, with the word *pharmakon*, a drug, it was used to designate "poison for smearing arrows," and finally, *poison* generally. See POISONS.

TOXINE. See DIPHTHERIA.

TOXODONTIA, an order of extinct mammals from the tertiary deposits of South America, the true position of which is still doubtful, as their fossils indicate affinities to the *ungulates*, the *edentates*, and the *rodents*.

TOY, CRAWFORD HOWELL, D.D., LL.D., b. Norfolk, Va., 1836. He graduated at the univ. of Virginia, 1856; was ordained a Bapt. minister, 1860; served in the confederate armies, 1861-64, and held professorships in Furman univ. and the Southern Bapt. theol. sem. In 1880 he became prof. of Semitic languages in Harvard univ. He has published *Old Testament Quotations in the New Testament*; *History of the Religion of Israel*; and *Judaism and Christianity* (1891). He is an independent though reverential critic in his study of the Hebrew Scriptures.

TOYNBEE, ARNOLD, 1852-83; social reformer; b. in London and graduated at Oxford. With the aim of improving the condition of the working classes, he went to live in Whitechapel, and by the organization of clubs and associations among the poor, tried to produce in them the spirit of self-help, and provide them with worthy aims and rational amusements. His work in this direction stimulated the movement known as University Extension (q. v.), and after his death, which occurred in consequence of the injury to his health from his incessant toil, the friends and followers whom his example inspired, founded the well-known Toynbee Hall in 1884. Among the purposes of this institution are the improvement of the masses by opening the way to educational work, and by supplying them with the means of intelligent enjoyment. See UNIVERSITY SETTLEMENTS.

TRACERY, the beautiful forms in stone with which the arches of Gothic windows are filled or traced for the support of the glass. These forms vary with every variety of Gothic architecture. Gothic windows were at first narrow, and were covered with a simple arch. Then two windows were grouped together, and an arch thrown over both. The space thus inclosed became part of the window, and was at first pierced with a circle, quatrefoil, or other opening. When three or more windows were grouped under one arch, the *shield* or space in the arch became larger, and was pierced with apertures of various forms. In the early pointed styles, these were usually circles filled with cinquefoils, trefoils, etc. During the decorated period the tracery became more varied in form, being composed of squares, triangles, and other forms, filled with foils, and having the appearance of being packed together. This kind of tracery is called "geometric." The windows of the transition from decorated to perpendicular had tracery of a more flowing character, while that of the perpendicular (q. v.) period became almost

entirely composed of vertical lines. The flamboyant (q.v.) or contemporary style in France had tracery of a very different description—being as free and graceful as the other was straight and stiff.

TRACHEA. THE, is sufficiently described in the article RESPIRATION. We have here only to notice those affections of this tube which require surgical or medical aid.

Foreign bodies occasionally pass through the larynx into the trachea. In cases of this kind, the patient who has had some foreign substance in his mouth which is supposed to have been swallowed, is seized with a convulsive cough, threatening suffocation, but subsiding after a time. The symptoms that then ensue vary with the weight and figure of the substance, and according as it is fixed or movable. A large and very irregular body may be impacted in the trachea, and may thus more or less obstruct the respiration on both sides of the chest; and this obstruction will probably soon be increased by the inflammatory products that are excited. A small heavy body will usually pass through the trachea into one of the bronchi (usually the right), or into one of its branches, obstructing respiration to a less extent.

“If the foreign body be allowed to remain, the progress of the symptoms presents much variety in different cases. Death may occur from spasm of the glottis, or, the foreign body being propelled upward into the rima, death may take place by its mechanically preventing the passage of air, or rupture of one of the cerebral blood-vessels may be produced during one of the fits of coughing. At a later period the lungs may become congested and emphysematous, or bronchitis, pneumonia, or pleurisy may supervene.”—Gray’s article on “Injuries of the Neck,” in Holmes’s *System of Surgery*, vol. ii. p. 306. Although inversion of the body, together with succussion and lateral movement of the larynx, has in some few cases been successful, it is now deemed advisable by the highest authorities to precede the attempt at removal by making an artificial opening into the windpipe. A free aperture is thus secured for respiration, spasm of the glottis is prevented, and the foreign body is commonly expelled through the artificial opening, or falls through the glottis into the mouth.

Rupture of the Trachea from external injury occasionally happens, and generally proves fatal in consequence of the rapid and extensive emphysema which usually ensues. It is too rare an accident to require a more special notice.

Wounds of the Trachea are sufficiently described in the article THROAT. With the exception of croup (q.v.), there is no special disease of the trachea; and indeed in croup the trachea is seldom exclusively affected. Hence the term *tracheitis*, used by some nosologists as synonymous with croup, is hardly warrantable. Similarly, in more advanced life, the trachea is doubtless often the seat of inflammation, but never the special and exclusive seat, and both the symptoms and treatment merge into those of bronchitis or laryngitis.

TRACHEOTOMY AND LARYNGOTOMY. The air-passages may be opened in three different situations—namely, through the crico-thyroid membrane (see LARYNX), when the operation is termed laryngotomy; through the cricoid cartilage and the upper rings of the trachea, the operation being known as laryngo-tracheotomy; and through the trachea, below the isthmus of the thyroid gland, constituting tracheotomy proper. Laryngotomy and tracheotomy are more commonly performed than laryngo-tracheotomy, to which no further allusion is required. Laryngotomy is more quickly and easily performed, especially in adult males, and is less dangerous; tracheotomy is a more difficult, tedious, and dangerous operation, but in some cases (as, for example, where there is any necessity for introducing the forceps) must be selected. It is unnecessary to enter into details regarding the modes of performing these operations. When the operation is completed, a large curved tube to breathe through is inserted in the aperture, and secured round the neck with a tape.

A double tube or canula possesses many advantages, as, by withdrawing the inner one, which should slightly project at its lower extremity, it may be cleared of any mucus or blood that may have accumulated in it, without disturbing the wound. The caliber of the inner tube should always be sufficiently large to admit as much air as usually passes through the chink of the healthy glottis. The after-treatment is much the same as that required for wounds in the throat (q.v.). “Opening of the air-passages may be required,” says Mr. Gray, “in any case of disease or injury which produces mechanical impediment to the passage of air from the mouth into the trachea; in cases of foreign substances in the air-passages; and in some cases of suspended animation where artificial intiation of the lungs cannot be performed by the ordinary means.”—Holmes’s *System of Surgery*, vol. ii. p. 317. In the case of a foreign body, its situation will determine the seat of the incision. Among the cases in which tracheotomy is, or may be, required, are cut throat, acute laryngitis, croup, diphtheria, chronic inflammation, and ulceration of the larynx, necrosis of the laryngeal cartilages; tumors, excrescences, or epithelial growth within the larynx; tumors (bronchocoele, abscesses, etc.) external to the larynx or upper part of the trachea, and impeding respiration by pressure, etc. It has also been recommended, but with little advantage, in hydrophobia, tetanus, and severe forms of epilepsy, with the view of relieving the suffocating spasms that occur in these diseases. Laryngotomy may advantageously be resorted to in cases of spasm of the glottis, in inflammation with cedema of the cellular tissue of the larynx, in inflamma-

tion of the tongue, in tonsillitis and pharyngitis, if the swelling is so great as to produce symptoms of suffocation, etc.

TRACHOMA (derived from the Greek *trachus*, rough) is the term employed in ophthalmic surgery to designate a granular condition of the mucous covering of the eyelids, often accompanied with haziness and vascularity of the cornea. It is one of the most serious *sequelæ* of purulent ophthalmia (q.v.).

TRACHYTE, a volcanic rock, principally composed of feldspar (q.v.), confusedly agglomerated in crystals, which are usually very small. Crystals of mica and hornblende are often also present, and more rarely crystals of augite, all imbedded in a feldspathic paste. The name is from the Greek *trachus*, rough; the rock being rough to the touch. *Trachytic porphyry* is a porphyry essentially composed of trachyte. By some geologists, trachyte has been made the name of a class of volcanic rocks, in which clinkstone, obsidian, and pumice are included.

TRACING-PAPER. See PAPER.

TRACTARIANISM, a remarkable and important movement in the English church during the second quarter of the present century, which consisted in an endeavor to revive and bring into prominence the principles of antiquity, catholicity, and authority recognized in some portions of the Anglican formularies, in contrast to the Protestant sentiments long and widely prevailing. The name is derived from a series of papers entitled *Tracts for the Times*, published at Oxford during the years 1833-41, hence called the "Oxford Tracts." The causes of this remarkable reaction it would be difficult to ascertain. The agitation of the question of Roman Catholic emancipation led, in some cases, to the study of Catholic theology, with a view to determine the real grounds of difference between the Roman and Anglican churches; and the religious and æsthetic tone of Wordsworth's poetry, still more developed in Keble's *Christian Year* (published in 1828), may have disposed some minds to sentiments to which it was akin. The lectures of Bishop Lloyd, when regius professor of divinity at Oxford about 1823, on the prayer-book and the council of Trent, are considered to have led the way to the teaching of the *Tracts*. But the immediate origin of the movement appears to have been the alarm aroused for the interests of the English church on the occasion of the suppression by the reform government of some of the Irish sees, and threatened alienation of Irish church property. It is said that about that time a meeting of clergymen took place at Hadley, in Suffolk, at which measures were concerted for opposing the alleged latitudinarian tendencies of the day, and restoring the high-church theology of the Anglican divines of the 17th century. The chief promoters of the movement were the Rev. John Keble (q.v.), author of the *Christian Year*, and formerly professor of poetry at Oxford; Rev. J. H. Newman (q.v.) and R. H. Froude, fellows of Oriel; the Rev. E. B. Pusey (q.v.), regius professor of Hebrew, and canon of Christ church; Rev. Isaac Williams, fellow of Trinity, author of the *Cathedral and other Poems*; Rev. Hugh Rose of Cambridge; and others. The *Tracts* were issued anonymously, and, together with articles in the *British Critic* by the same writers, produced a great effect, especially among the clergy. Protestant principles were openly discountenanced, and tenets closely resembling those of the church of Rome were boldly put forward. The doctrines of apostolical succession, priestly absolution, baptismal regeneration, the real presence, the authority of the church, and the value of tradition, which had long lain hid in the language of the prayer-book, were widely revived and taught, and caused much alarm in some quarters; though it must be admitted that those principles had always been held by a portion of the English clergy, and claimed to be only a fair exponent of the teaching of the church. The study of the Fathers and old divines, of church history and ancient liturgies, was greatly revived in the universities and among the clergy, and a host of publications inculcating with more or less extravagance the same views issued from the press. The movement proceeded, notwithstanding the general opposition of the authorities, till it culminated in the publication, by the Rev. J. H. Newman, of the Tract No. 90, which was designed to show that much Roman doctrine might be held consistently with subscription to the thirty-nine articles. This being held to favor a "non-natural" interpretation, was received with general condemnation, and led to the termination of the series, to the resignation by Mr. Newman of the vicarage of St. Mary's, Oxford, and subsequently to his secession, in 1845, to the church of Rome. In this step he was followed by many of his friends and associates, though the other leaders of the movement have continued in the English church. With Mr. Newman's secession the Tractarian movement terminated; but its effect remains in several visible results: 1. The first of these may be said to be the revival and strengthening of the high-church party, which still maintains to a great extent the principles advocated in the *Tracts*; and though checked by some judicial decisions, such as the Gorham (q.v.) judgment, in the endeavor to acquire exclusive power, has gained great and perhaps increasing influence in the church. 2. Side by side with the revival of Catholic doctrines there has been a great development of ritual. The tractarian movement was early marked by the introduction of various alterations in the mode of performing divine service, such as the use of the surplice instead of the gown, intoning the prayers and singing the responses, the elevation of the communion table into an altar, the substitution of low open benches for high pews—all of which, though claim-

ing to be a restoration of ancient usage, having the authority of the law, were regarded with alarm as approximating to the church of Rome (see RITUALISM). 3. Another effect of the tractarian movement was the remarkable impulse given to the building and restoration of churches, and the revival of Gothic architecture, which has been manifested in all parts of England, and given a character to the ecclesiastical buildings of the present century which will mark them for ages to come. 4. The tractarian movement has undoubtedly been the cause of the secession of many English clergy and laity, some of them men of considerable ability and distinction, to the church of Rome, which has greatly increased the strength and influence of that communion in the country, and caused great scandal to Protestants. Lastly, the movement may, however, be admitted to have produced a great increase of learning, piety, and devotedness among the clergy, and the establishment of colleges, sisterhoods, and other religious and charitable institutions. See Dean Church, *The Oxford Movement* (1891).

TRACTORS, METALLIC. See PERKINS, ELISHA.

TRACT SOCIETIES, organizations formed to increase the circulation chiefly of religious truth. Before the invention of printing great exertions were often made to multiply copies of religious writings. Wycliffe wrote more than 100 tracts which his disciples copied and circulated; some of them were sent as far as Bohemia, and brought John Huss to a knowledge of the truth. The invention of printing was exactly in time for the reformation. Luther employed the press with great energy, and his numerous tracts were powerful instruments in spreading the truth. In the 18th c. many associations were formed to advance the work, several of them by members of the church of England; in 1743 John Wesley sent forth many tracts and books; in 1750 different denominations united in forming a tract society; in 1790 the "cheap repository tracts" were issued in great numbers to counteract the diffusion of French infidelity; in 1799 the religious tract society was organized in London, since grown to be the largest in the world. Of its publications, in more than 100 languages, 1600 million copies have been issued. Each religious denomination in England also has a society of its own; and the opponents of religion adopt the same means for spreading their views. In the United States religious tracts and volumes early appeared in considerable numbers, and societies to circulate them were formed among the Methodists in 1789, and at the beginning of this century in Boston, New Haven, New York, Philadelphia, and Baltimore. The New York tract society, formed in 1812, became the American tract society, 1825. The New England society, formed 1814, changed its name to the American tract society, 1823, and in 1825, continuing the name, became a branch of the national society having the same name, at New York. This last, now known as the American tract society, is a union organization in which many different denominations join. For the first two years of the national society's work, only tracts were published; in the third year the first volumes appeared; in the fourth the monthly distribution was started; in the eighth the attempt began to send volumes into every family; in 1841 colportage was commenced; the next stage of progress was the establishment of periodicals, first the *American Messenger*; the *German Messenger*, 1847; the *Child's Paper*, 1852; the *Illustrated Christian Weekly*, 1871. During the civil war 172 new publications for soldiers were issued. From the organization of the society large grants of money have been annually made to aid in the distribution of books among foreign nations—amounting in 50 years to \$618,000. The society has provided more than 5,000 publications, of which 1100 are volumes. Of the home publications 1500 are in 11 foreign languages for immigrants, supplying them with almost their only Christian literature. Of the periodicals, 164 million copies have been sent forth; of the other home publications, 27 million vols. have been printed, and 2,000,000,000 pages of tracts. Of these, annual grants to the destitute are made to the amount of \$50,000. The work of colportage in 35 years circulated about 14 million vols. and made nearly 12 million family visits, chiefly in portions of the country where for the time book-stores, schools, and churches did not exist. The total amount of donations and legacies received and expended during 50 years was \$4,300,000, and the sales were nearly \$9,000,000. Besides this undenominational work, the leading denominations have their own publication boards, which are large and efficient agencies.

TRACY, BENJAMIN F., b. N. Y., 1830; was graduated at Owego Academy; studied law, and was admitted to the bar in 1851; in 1853 and 1856 elected district attorney of Tioga co.; in 1861 was elected to the assembly; at its close aided in recruiting several regiments, and became col. of the 109th N. Y. He was prominent in the battles of the Wilderness and Spottsylvania; took command of the 127th regiment of colored troops; later, had charge of the rendezvous and prison camp at Elmira. After the war he entered a law firm in Brooklyn; was from 1866-73 U. S. district attorney for the eastern district of N. Y.; in 1881 was nominated for mayor of Brooklyn, but declined; in Dec. of that year became temporarily associate judge of the court of appeals; in Sept., 1882, was nominated for supreme court judge, but was defeated; in 1886 was an unsuccessful candidate for district attorney of Kings co.; in 1889 became sec. of the navy in Pres. Harrison's cabinet. In 1897 he was nominated by the republicans for mayor of New York City, but defeated by the Tammany candidate, Van Wyck.

TRACY, JOSEPH, D.D., 1794-1874: b. Vt.; graduated, Dartmouth, 1814; pastor of churches of Thetford and West Fairlee, Vt., 1821-29; edited *Vermont Chronicle* 1829-34; *Boston Recorder* one year; New England secretary of American colonization society, 40 years. His publications are *The Three Last Things*; *The Great Awakening*; *History of the American Board*; *Refutation of Charges against the Sandwich Island Missionaries*; was associate editor with Dr. Henry B. Smith of *American Quarterly Review*; contributed to semi-centennial memorial volume of the American Board.

TRADE, BOARD OF, a department of government in England designated "the lords of the committee of her majesty's privy council appointed for the consideration of all matters relating to trade and foreign plantations." In 1660, Charles II. created two separate councils for trade and for foreign plantations, which, in 1672, were consolidated into one. The board of trade and plantations, after being abolished in 1675, reappointed in 1695, and passing through various modifications, was again abolished in 1782, when its duties were transferred to the secretary of state in so far as regarded the management of the colonies, and to a committee of privy-council as regarded the other business. In 1786 the presently existing department was established by order in council, being a permanent committee of privy-council for the consideration of all matters relating to trade and the colonies. The board, as now constituted, consists of a president, together with the lord chancellor, the archbishop of Canterbury, the first lord of the treasury, the principal secretaries of state, the chancellor of the exchequer, the speaker of the house of commons, the chancellor of the duchy of Lancaster, the paymaster of the forces, the treasurer of the navy, the master of the mint, and such officers of state in Ireland as are privy-councillors in England. Practically, none of the members of the board take part in its deliberations except the president and his staff. The clerks of the council are *ex officio* secretaries of the board, but their duties as such are performed by two assistant secretaries.

The functions of the board of trade are partly of a ministerial, partly of a judicial kind, and have of late years been greatly enlarged by a variety of statutes. The board is charged with the general superintendence of all matters relating to the mercantile marine. It requires and considers reports made to its inspectors and other officers, and orders returns of various kinds regarding trade and navigation.

TRADE-MARKS. The attaching of peculiar marks by which manufacturers seek to distinguish their own productions from those made by other persons, is an important privilege, both as concerns the producer and the consumer; because no honest manufacturer will invent and apply a trade-mark to his wares unless he is convinced that they possess some special excellence which he wishes thus to make known; and it is desirable the public should have the benefit of such direction in the choice of their purchases as is thereby afforded. Nevertheless, until 1862, the law in Great Britain was in a very unsatisfactory state upon this subject, and the marks of celebrated manufacturers were pirated with the most reckless audacity, both by British and foreign firms, in most cases to enable them to pass off upon the public articles of very inferior character. For such infringement, the only remedy was to proceed by injunction from the court of chancery—a process which was far too troublesome and costly for the class of inventors most likely to be injured. The "merchandise marks act" of 1862 has remedied this evil, and simplified the whole matter, by making it a misdemeanor to forge or counterfeit any trade-mark, or falsely to apply any such trade-mark with intent to defraud, whether applied to a cask, bottle, stopper, vessel, case, cover, wrapper, band, reel, ticket, label, or any other thing, in or with which any commodity is sold, or intended to be sold. It is henceforth an offense to sell or expose, either for sale or for any purpose of trade or manufacture, articles with forged or false trade-marks, under a penalty of a sum equal to the value of such articles, and a sum besides not exceeding £5, or less than 10s. Every addition to, or alteration and imitation of, any trade-mark made with intent to defraud—the intent being the essence of the offense in all cases—is to be deemed a forgery, and punished as such. It is further made obligatory on every person who shall sell an article having a false trade-mark to give information as to where he procured it, on a demand for such information being made to him in writing. In 1875 an act was passed to establish a register of trade-marks, and amended in 1876, to the effect that, after July 1, 1877, no steps can be taken to prevent infringement unless the trade-mark has been entered in the register established under the superintendence of the commissioners of patents.

To mark any false indication of quantity is also punishable with penalties. A conviction under the act is not to affect the civil remedy at law, nor need any indictment specify who is intended to be defrauded by the fraudulent use of spurious marks. The punishment for the misdemeanor may, at the discretion of the court, either be by fine or by imprisonment, with, or without hard labor; and in the event of fines not being paid, the offender may be imprisoned until they are. The vendor of an article with a trade-mark is to be deemed to warrant or contract with the purchaser that the mark is genuine, unless otherwise vouched for in writing. A similar obligation rests upon those who sell articles marked with specific quantities. In suits at law, or in equity against persons using forged trade-marks, the court may not only order the destruction of the articles fraudulently marked, but may by injunction prevent a repetition of the offense. The time during which proceedings may be taken is limited to three years.

Trade marks cannot, as a rule, be a proper name; but wherever any proper name is taken which does not denote the origin of the goods, but is merely historical or fanciful, it may be a good trade mark. But such fanciful name must not denote or attempt to denote the character of the article on which it is claimed as a trade mark. If such name really denote the character of the article, it is a label; and if not, it is void. A signature, or the *fac-simile* of a signature, may be a trade mark; and so may a pseudonym. The validity of a trade mark is entirely independent of its novelty; and the same mark, however frequently it may have been used, may be good as applied to a different article. See Hardington's *Trade-Marks* (1881).

TRADE PROTECTION SOCIETIES are associations composed of merchants, tradesmen, and others, which have been formed for the promotion of trade, and for protecting the individual members from losses in their business transactions with each other, and with the community at large. They began to spring up about the middle of the last century—one of the first started in this country being the "London association of guardians for the protection of trade," which was established in 1776. In 1871 the board of trade granted a license for incorporation to one under the companies acts, 1862-67. The operations of these societies used to be confined chiefly to the compilation of registers of bankruptcies, insolvencies, and private settlements with creditors. The registers were formed thus: Each member informed the secretary of his society of the name, occupation, and address of the customers who became insolvent, with the amount of dividend their estate yielded; and latterly, the circumstances connected with such insolvency, whether recklessness or extravagance on the part of the bankrupt, or innocent misfortune. These circumstances were carefully recorded, and the information thus collected having been found useful, means were taken to render the registers more complete. With this view, new sections were added to the registers, and special attention was directed to the exposure of swindlers, and persons who had been guilty of fraud or embezzlement. The information accumulated in the registers, though always accessible to such members as made inquiry at the offices of the society, was kept strictly private from all others. But the extraordinary development of commercial enterprise which took place in the early part of this century, added a new stimulus to the trade protection movement. The registers which the societies now printed and circulated among their members contained transcriptions from the following public records: viz., the records of the bankruptcy courts, registers of assignments and trust-deeds, bonds or warrants of attorney, bills of sale, judges' orders, protested bills, and decrees in absence. In addition to the diffusion of information of this description, the societies undertook to recover past-due bills and accounts for their members, to investigate the circumstances connected with bankruptcies and insolvencies, collect dividends, and perform the general agency business of their members—the whole being done under the direction of a committee appointed for this purpose. Committees were also appointed to scrutinize all measures affecting trade and commerce which might be introduced into parliament, and to promote legislation favorable to the commercial interest. The sphere of action of trade protection societies thus rapidly widened, and their utility kept pace with their growth. The older societies established offices and branches throughout the country; and new societies sprang up in the large provincial cities, which in their turn opened agencies and branches in other towns and villages; and the various societies being in communication, the machinery of the whole is available for the purposes of each.

TRADES-UNIONS, in their character of benefit and sick societies, do not fall within the range of this article. We have principally to consider them as associations of workmen against employers for the purpose of gaining, either in time or money, a larger share of the profits of their trade. A brief historical sketch of the growth of the principle of combination may fitly introduce the subject.

In one form or other combination has always existed ever since the employed and employing classes became distinguishable from each other. For a long time after the conquest the inhabitants of England were of two classes, freemen and slaves. These relations not permitting work for wages, there could be then no combination in the modern sense. About the middle of the 13th c. we find that wages had begun to be paid, so that for 600 years there have been laborers receiving a money price for their services, competing for employment, and arranging terms with employers. The power of legislation was, however, with men who believed their interests antagonistic to those of the workmen, and its complexion was always favorable to masters. When, after the great pestilence of 1349, the reduced number of laborers demanded better pay, it was enacted that carters, plowmen, and agricultural servants generally should be content with their previous rate of liveries and wages; they were to continue to be paid in kind where payment in kind had been customary; they were forbidden to hire themselves for the day, but must take service for a year or other fixed period; a rate of wages was fixed for weeders, haymakers, mowers, and reapers; and their hiring for the future was to be in public. A little later, in 1363, the diet and clothing of artificers and servants were fixed by act of parliament, and clothiers were required to make, and tradesmen to sell, cloth of a regulated quality at a regulated price. The rate at which labor should be purchased was fixed after this fashion for almost two centuries, and the practice declined solely because of the impossibility of preserving it. But even within the last 150 years a relie

of the old superstition revived, so characteristic as to be worth notice. A tariff of wages, drawn up in 1725 by the Manchester justices, declares that any workman conspiring to obtain more than the rate thereby fixed, should for the third offense stand in the pillory and lose an ear. Economical error, it will be seen, is by no means the monopoly of the poor.

One of the earliest forms assumed by combination is shown by the statutes, passed about 1400 A.D., which excluded from city labor all who had been trained to the plow up to the age of 12 years. The evasion of these acts was the subject of bitter complaints from the city inhabitants, whose practical union against agriculturists was defeated by the sending of country children into towns as apprentices before they reached that age. For generations this jealousy of corporation against corporation continued with more or less intensity.

In the more ancient forms of associated labor, such as guilds and chartered companies, combinations such as those which now prevail could not exist. There were no masters and workmen as separate and opposed classes. Producers were united as against the community, and they had no reason, so long as the guild was prosperous, for internal dissension. When, by the abuse of their power in prosperity, they incurred hostile legislation, they became disintegrated; workmen were employed who had never been apprentices; and ultimately the owners of capital and the owners of labor became distinct and often opposing camps. Instead of a guild or trade being any longer a compact monopolist body, acting for itself against the community, the tendency was thenceforward for combination of one section against the other. See GUILDS.

Trades-unions, organized for purposes such as those which contemporary unions content for, have existed for more than three centuries. So early as 1548 a statute of Edward VI. is directed, among other culprits, against certain "artificers, handicraftsmen, and laborers," who had "sworn mutual oaths" to do only certain kinds of work, to regulate how much work should be done in a day, and what hours and times they should work. The usual penalties of fines, pillory, and loss of ears were to follow a breach of its enactments. Add the regulation of wages to the objects enumerated in this statute, and we have in effect the trades-unions of the present day. Many fruitless acts were afterward passed to prevent combinations for raising wages. So long as a tacit bond existed, and unquestionably one did and does exist, among employers, reprisals on the part of workmen were certain, and the only question was, whether the right of combination should be recognized by the law, or whether the parties who had recourse to it should be driven into secrecy and illegality. But it was not till 1824 that the legislature had sufficient wisdom to repeal the numerous and vexatious acts of parliament by which it had been sought to prevent the union either of masters or workmen. By the celebrated act of that year the combination of either workmen or capitalists was legalized, so long as the unions refrained from violent interference with persons who might refuse to join them. This act was supplemented by another, passed in 1825, which in effect declared legal all combinations to settle rates of wages or hours of work, and illegal all such as aimed at other methods of controlling employers in the use of capital, or in processes of manufacture. The latest legislation (see COMBINATION) goes further still, declaring combinations legal even when acting (peaceably) in restraint of trade.

A modern trades-union is a rather complex organization. Perhaps the best definition of them is the one given by the social science "committee on trade societies," appointed at Bradford in 1859, and which published its report in 1860. The committee included Dr. Farr, Prof. Fawcett, Mr. W. E. Foster, and many other well-known names, and its investigations were very searching and valuable. Indeed, its report is even yet by far the best repertory of facts on the subject. A trade society is therein defined as "a combination of workmen to enable each to secure the conditions most favorable for labor." The capitalist's accumulations afford him an advantage which the laborer, without association, does not possess. The funds of the union are intended to supply this deficiency. As accessories, the unions collect funds for other purposes, such as benefit societies, insurance of tools, libraries, and reading-rooms; but their trade objects are those with which we are especially concerned. The following means of assisting and defending the trades associated are enumerated by the committee as now in general use—1. Publishing periodically the state of the trade in different parts of the country; 2. Keeping registers of men unemployed and of masters wanting men; 3. Assisting men from town to town in search of employment, and occasionally to emigrate; 4. Regulating the number of apprentices in the trade; 5. Maintaining men in resistance to employers; 6. Regulating number of working hours, and preparing trade rules; 7. Organizing strikes.

The advocates of the unions insist that they are the only means by which workmen can defend themselves against the aggression of employers. It is argued that the individual laborer has no chance of resisting the capitalist on equal terms; that starvation treads too closely on his heels to permit his successfully opposing a reduction of his wages, however arbitrary or unjust. It is urged that associations of employers are practically universal, and that their object is mainly to secure for themselves the largest possible share of the profits which are the product of capital and labor united. It is further said that in the event of any depression of trade, the masters invariably attempt to reduce wages; and that when trade improves, they defer as long as possible the restoration of the former rate. Thus, workmen are the first to feel commercial disaster and the last to

benefit by better times. Any attempt to remedy this state of things by individual action would, it is conceived, be abortive. The capitalist might easily do without the services of any single laborer, while to the latter the loss of employment might be ruin. Association on the part of the employed class becomes, therefore, a necessity, and their organization puts them at once much more nearly on an equality with employers when negotiating either as to rates of wages or terms of labor. That in both these matters there is a constant gravitation against the workman seems to be admitted by most who have considered the subject, and there is difficulty in suggesting any effective resistance to the downward tendency, except that of combination. Unionists point to many regulations in the interests of workmen which combination has enabled them to introduce, and while they freely admit that in numerous instances the contest between labor and capital has resulted in the apparent defeat of the former, yet they assert that, in the long run, most of the points contended for have been gained. They maintain that in very many trades, they have succeeded in preventing abuses, and that the unions have contributed, more than any other agency, to make "the workman's life regular, even, and safe." Further, it is contended that the necessity for strikes will become continually less as organization becomes more perfect and uniform; the just limits of their action will be more fully comprehended; the sufferings and losses of past strikes will act as a warning against too precipitate action in the future, either on the part of masters or men; and that, in the end, the main results of combination will be secured, without the necessity of having recourse to the arbitrament of force, either in the shape of strikes or lock-outs—the latter of which, indeed, is only a strike of the employers against the employed.

Yet it cannot be concealed that against this catalogue of uses may be set many and serious evils. Some unions dislike the exertion of special or superior ability by any of their members, deeming it an injustice to the rest that one should gain higher pay or win a loftier position. In many cases, as a matter of deliberate policy they set themselves against and discountenance any elevation of the standard of labor, and so act as an effectual bar to the industrial progress of their class. In other instances, strikes are determined upon by unions at times when the position of the market renders success impossible, resulting in severe and prolonged suffering; while in some "highly skilled and limited trades," a far higher rate of wages has been enforced for a time than the value of the labor performed would justify, in the end materially checking production, or transferring the industry itself to other countries. The same effect has been produced by the arbitrary enforcement, in some branches of manufacture, of obnoxious restrictions upon the hours and mode of working. Thus, Birmingham lost much of that portion of its hardware manufacture which is now carried on by machinery, in consequence of the resistance offered by the Birmingham artisans to the introduction of machine-labor; and the steel manufacture threatened at one time to migrate from Sheffield, on account of trades-union dictation. There is, moreover, another and serious class of objections. There can be no doubt that unions foster an unfortunate spirit of antagonism. Being constantly and consciously on the defensive, they come at last to suspect evil in every movement, and to put a sinister interpretation on every action of employers. The special interests of the trade affected are too often the only objects cared for; and narrow, selfish, and unjust regulations are enacted for its supposed benefit. One trade is isolated from another; one class of laborers fences itself off against incursions upon its peculiar territory and tries, by the limitation of the number of apprentices, the enforcement of objectionable terms of service, and other coercive methods, to remain a close monopolist corporation. It is needless to point out how injuriously such a policy affects the working-classes generally, and what a complete subordination it implies of the general well-being to the desired prosperity of a small and selfish number. In some trades, the practice of coercion has grown into systematic terrorism and crime. The Sheffield grinders and the Lancashire brickmakers began with merely refusing to work with non-unionists; but their methods of procedure have ended in frequent brutal and murderous outrage. The revelations of the special commissions of 1867 are among the saddest contributions to English history.

One of these special commissions—that of Mr. Overend and his colleagues at Sheffield—is of sufficient importance and interest to warrant rather special reference. Out of about sixty trades-unions in that town, thirteen are proved to have promoted or encouraged outrages of various degrees of criminality, from theft and intimidation up to personal violence and murder. The most ordinary method of coercion in use bears the name of "rattening," and is employed to enforce payment of contributions to the unions, and to compel obedience to their rules. If any workman fall into arrear with his payments, or infringe the rules of the trade to which he belongs, his wheel-bands, tools, or other materials of work are secretly removed, and held in pledge, until he submits to the requirements of the union. This is done most frequently under the direct orders of the union officers; but sometimes a private member "rattens" another, who is known to be in some way at issue with his society, and takes the risk of his action being adopted by the remainder. In the majority of cases, on due submission and a moderate payment, the property rattened is restored to its owner. The practice is defended on the ground that it is the readiest and most effectual means of compelling the regular payment of contributions to the union funds and of enforcing obedience to union orders.

So thoroughly is it understood that rattening is the work of a trade society, that a man whose tools are taken never thinks of applying to the police for restitution; he communicates with the secretary of the union which governs his trade. In cases of contumacy on the part of a member, it is sometimes attempted to saddle his employer with the cost of the rattening, even when he is no party to the dispute, on the ground, that he ought to compel his workmen to comply with the rules of the union. Rattening is generally successful in securing its ends; but if it fail, an anonymous letter is sent to the refractory person, threatening vengeance in the event of further resistance; and in only too many instances, the threats have been carried out to the last extremity. Thus, in 1854, a man named Elisha Parker had his house blown up by gunpowder, his horse was hamstrung, and he himself disabled by a pistol-shot, because he worked with non-union men, after being warned to leave his employment. In 1857, James Linley was shot at and wounded for changing his business of grinding scissors for that of grinding saws, and keeping a greater number of apprentices than the rules of the trade prescribed. As he still persisted, he was shot to death with an air-gun in 1859. At other times, powder has been mixed with filings or other materials near the working apparatus of obnoxious persons, who have often suffered serious injuries from its explosion. The list of outrages, fatal and other, might be largely extended; but those we have given are not unfair representatives of the whole.

The lowering of the franchise to household suffrage has lent a new significance to trades-unions. They have now become a great power in politics. There is the trades congress, which holds an annual conference in the different leading towns, and discusses questions affecting the interests of labor. They have not yet begun to publish transactions; but, no doubt, they soon will, for this congress is undoubtedly to be one of the controlling social powers of Great Britain. It appoints a committee every year, which sits in London, to look after the acts of parliament and other public movements affecting trade. Another object they contemplate is to get working-men returned as members of parliament; and this they have at last accomplished by the election to the parliament of 1874 of Mr. Alexander Macdonald for Stafford, and Mr. Thomas Burt for Morpeth.

By act of the United States Congress, 1886, the term national trade union signifies any association of working-men having two or more branches in the states or territories for the purpose of aiding its members to become more skilful and efficient workers, the elevation of their character, the regulation of their wages and their hours and conditions of labor, the protection of their individual rights in the prosecution of their trade or trades, etc., or for such other objects for which working people may lawfully combine, having in view their mutual protection or benefit. Such a union shall, on filing its articles of incorporation in the office of the recorder of the District of Columbia, have the right to sue and be sued, to grant and receive, in its corporate or technical name, property, real, personal or mixed, and to use it for the objects defined in its charter; provided that each union may hold only so much real estate as may be required for the immediate purposes of its incorporation. An incorporated national T. U. may establish branches and sub-unions in any Territory. The headquarters of an incorporated national T. U. shall be located in the District of Columbia. T. U. were introduced into the United States by English working-men, and have spread rapidly, until every trade has its "union." That of the railroad engineers is perhaps the most powerful and best organized. They have not succeeded in the United States as in England, in fomenting and sustaining differences between employers and employed; though they have organized important and costly strikes, and have materially deranged the system of labor by restricting the employment of apprentices in workshops, thus limiting the field for the education of the American mechanic. For many interesting details regarding the actual workings of trades-unions and trades-associations upon the condition of wage-earners and upon the rate of wages, the reader is referred to the following: Fawcett, *Manual of Political Economy* (1876); *Report of the Massachusetts Bureau of Labor Statistics* (1880); the *Report on Strikes in the United States*, by Mr. J. D. Weeks, which formed a part of the census literature of this year; Rogers, *Six Centuries of Work and Wages* (1884); id. *Work and Wages* (1886); Brentano, *Guilds and Trade Unions*; Gibbins, *The Industrial History of England* (1890); Webb, *History of Trades Unionism* (1894); Leroy-Beaulieu, *La Question Ouvrière au Dix-Neuvième Siècle*. TRADE-WINDS. See WINDS.

TRADITION. See RULE OF FAITH; INFALLIBILITY.

TRADUCIANISM (Lat., *traducianismus*; from *tradux*, a "vine-layer" for propagation) one of the theories adopted for the purpose of explaining the production of the soul in the procreation of the human species. The theory known as traducianism is ascribed to Tertullian as its first author; and is elaborately explained and defended by him in his

book *On the Soul*, written after he had lapsed into the Montanist heresy. In opposition to others who had held the theory of pre-existence of souls, of which pre-existing souls one is divinely infused, or, by some natural affinity, is attracted into each fœtus so soon as it has been formed by generation in the procreation of man, Tertullian taught that souls are propagated by souls as bodies by bodies, and by the same or a simultaneous process. In another place he describes this origin of soul from soul as generation, and even of a class analogous to corporeal generation; and this more gross and material exposition of the theory of traducianism is sometimes called *generationism*; which, however, is commonly looked upon as a totally distinct theory. A third hypothesis as to the origin of the soul suggested that, in the propagation of the human species, whenever a human body is formed by generation, the soul which is to animate that body is created and by divine power infused into it. This theory is called *creationism*. The discussion of these theories in the 4th and 5th c. was much promoted by the controversies on Manichæism. See MANICHÆANS.

TRAFALGAR, CAPE, a low promontory on the s. coast of Spain, about 29 m. w.n.w. of Tarifa (q.v.), on the straits of Gibraltar. It is memorable for the great naval victory obtained off its shores by the British fleet under Nelson, over the combined fleets of France and Spain, under the French commander Villeneuve and two Spanish admirals. The British force consisted of 27 sail of the line, 4 frigates, 1 schooner, and 1 cutter; the force of the French and Spaniards united amounted to 33 sail of the line, 5 frigates, and 2 brigs. It may be remarked that the largest of the enemies' ships carried 80 guns more than the largest of the British ships. The engagement resulted in a splendid victory for the British, who captured nineteen of the enemies' ships. The victory, however, was gained at the cost of the life of the greatest of English admirals. See NELSON.

TRAGACANTH. See GUM.

TRAGEDY. See DRAMA.

TRA'GOPAN, a genus of birds of the family *phasianidae*, having the head crested, but naked on the cheeks and around the eyes; a horn-like caruncle projecting backward from behind each eye; and a loose wattle, capable of being inflated, hanging beneath the bill. The tarsi are armed with a blunt spur in the male, unarmed in the female. The species are few, and are natives of Asia. They are birds of beautiful plumage, somewhat resembling pheasants, but of more bulky form, and with rounded tails of moderate length. The first known species (*T. satyrus*) has been called the *horned pheasant*. It inhabits the higher parts of the Himalaya, Thibet, and China.

TRAILL, a co. in n.e. N. Dakota, having the Red river of the North on the e. boundary; formed 1875. Pop. '90, 10,217. Area, 864 sq. m. Co. seat, Hillsboro.

TRAILL, HENRY DUFF, English author and journalist, b. 1842; graduated at Oxford in 1864 and became a member of the bar, but gave up the law for journalism and the literary profession. He wrote *Sterne and Coleridge in the English Men of Letters*; contributed to the series of *English Worthies*, *Twelve English Statesmen*, and *English Men of Action*; wrote *Recaptured Rhymes*; *Saturday Songs*; and a large number of contributions to newspapers and magazines. In 1893 he began to edit *Social England, a Record of the Progress of the People*, and in 1897 was made editor of a new magazine, *Literature*, to be published in London and New York.

TRAIN, GEORGE FRANCIS, b. Boston, 1830; merchant in Boston and in Australia, where he established the house of Caldwell, Train & Co.; went to England in 1860, and undertook to form street-railway companies in Birkenhead and London, but his plans were obstructed by legal opposition. He returned to this country in 1862. He has traveled extensively and addressed large audiences of laboring men, trades-unions, etc., in this country and in Europe. In 1857 he published *An American Merchant in Europe, Asia, and Australia*, and *Young America Abroad*. Collections of speeches followed: *Irish Independency* appeared in 1865, *Championship of Women*, in 1868. He is noted for eccentricity.

TRAINING, applied in a sporting sense, implies the acquisition of the most vigorous and perfect health, and is used alike in reference to men, horses, and dogs. An individual is said to be trained "in condition," when he has by certain processes rendered his frame as fit as it is possible for it to be, for performing some feat of strength or endurance—such as undergoing a pugilistic encounter, a wrestling match, or a trial of speed, or any other prolonged exertion. To accomplish this end, a long course of training is often gone through, in many instances of a very severe nature. It being necessary to divest the muscles of every particle of fatty tissue which can possibly be got off without direct injury to the health, it often happens that many pounds of flesh are required to be dispersed, and the most severe and continued exertion, the body being wrapped in thick suits of flannels, denominated "sweaters," is necessary. Constant hard and sharp exercise in this fashion, combined with rigid abstinence, and a strict regard to other established laws of the art, are a *sine quâ non* in getting the body into the height of condition. For example, however thirsty the person training may be, after perhaps ten miles' rapid walking in a triple suit of sweaters, he must drink but very sparingly, for although he may have taken off pounds of flesh by profuse perspiration, one glass of ale would undo the whole effect. Great attention to diet is necessary. Indeed, much of the system may, as a modern writer has aptly expressed it, be laid down in the resolute performance of the three cardinal virtues—temperance, soberness, and chastity. Almost

the same course is pursued toward animals; and whether for hunting or racing, horses and dogs have to submit to a course of training to bring them into condition. Lately, the Turkish bath, as a means of procuring the necessary reduction of flesh without such excessive labor, has been found a most efficient ally in training. Out of condition, the muscles are flabby, confused, and coated with fat; the skin dead and lifeless; the eye dull and heavy; the lungs laboring, and the movements slow. In condition, the muscles stand out hard, clear, and defined; the tendons show like cords; the skin is clear and ruddy; the eye bright; the lungs play with unrestrained freedom; and the whole frame is endued with vigor and perfect activity. Animals, from their less artificial existence, require far less training than men to bring them into condition.

TRAJAN'S COLUMN, a celebrated column at Rome, which was reared 114 A.D., by the Roman senate and people, in honor of the emperor Trajan. It is considered not only the greatest work of its architect, Apollodorus, but one of the noblest structures of its kind ever erected. The pedestal is covered with bas-reliefs of warlike instruments, shields, and helmets; and a very remarkable series of bas-reliefs, forming a spiral round the shaft, exhibits a continuous history of the military achievements of Trajan. These are in excellent preservation, and, independently of their beauty as works of art, they are invaluable as records of ancient costume. A spiral staircase in the interior of the column leads to its summit. The height of the entire column is 132 feet. It still stands erect in all its ancient beauty amid the ruins of Trajan's forum. The summit was originally crowned by a colossal statue of the emperor, which has been incongruously replaced by one of St. Peter.

TRAJAN'S WALL, a line of fortifications stretching across the Dobrudscha from Czernavoda, where the Danube bends northward, to a point of the Black sea coast near Kustendji. It consists of a double, and in some places a triple, line of ramparts of earth, from 8½ to 11 ft. in height on the average (though occasionally it attains an altitude of 19½ ft.), bounded along its n. side by a valley, which, being generally marshy, and abounding in small lakes and pools, serves admirably the purpose of a fosse. This valley was long erroneously supposed to have been at one time the channel by which the Danube emptied itself; and a scheme for utilizing it by the construction of a canal to provide a more commodious water-communication with the Black sea, in lieu of the long and troublesome navigation by the Sulina mouth, has been frequently mooted, and is undoubtedly quite practicable; but the cost of the undertaking has hitherto been a bar to its execution. During the war of 1854 Trajan's wall became an important line of defense on the invasion of the Dobrudscha by the Russians, and the invaders were twice defeated in their attempts to pass it—at Kostelli (April 10) and Czernavoda (April 20 to 22).

TRAJANUS, MARCUS ULPUS, Roman emperor, was born at Italica (Alcala), near Seville, Sept. 18, 52 A.D. He was descended from a family which was probably of Roman origin, and was early trained to arms, becoming a prominently successful leader in the Parthian and German campaigns, during the reigns of Titus and Domitian. He was rewarded for his valuable services by promotion to the offices of pretor and consul (91 A.D.), and was ultimately adopted (97 A.D.) by Nerva (q.v.) as his colleague and successor. Trajanus became sole ruler in January of the following year, and celebrated the event of his accession by the usual largess to the soldiers, which gift his liberality prompted him to extend also to the Roman citizens and their children; and he made large provision out of the imperial treasury for the upbringing of the children of poor freemen in Rome and other Italian towns, with the view of encouraging the increase of the population. In 101 A.D., Rome, for the first time, beheld its emperor leading forth his legions in person on a career of conquest, when Trajanus set out on his first campaign against the Dacians who had exacted tribute from Rome since Domitian's time. The struggle was long and destructive; the emperor's opponents were valiant warriors, and headed by an able leader, their monarch, Decebalus; but the Romans at last gained a decisive superiority; and in a subsequent campaign (104 to 105) completely subdued their opponents, whose country thenceforth became the Roman province of Dacia, and was secured by partial colonization. This conquest, the first since the death of Augustus, was celebrated, on Trajanus's return to Rome, by a triumph, and by games on a most extensive scale, which continued for four months. Thirst for dominion again impelled Trajanus to the east in 106 A.D. Landing in Syria, he marched northward, received on his way the submission of numerous princes, possessed himself of Armenia, which he made a province of his empire, and hugely gratified the Roman senate with long lists of monarchs, never before heard of, who had bowed to their sway. The record of the events of the next seven years of Trajanus's reign is extremely defective, the few notices in Dion Cassius and others being insufficient for the construction of a consecutive narrative. In 115 A.D., he again set out from Syria, directing his march this time against the degenerate Parthian empire; took Ctesiphon almost without a struggle; and descending the Tigris, and subduing the tribes on both banks, became the first and only Roman general who navigated the Persian gulf. On his return, he found that, like the bent reed which recovers its position when relieved from pressure, the peoples of Mesopotamia, north Syria, and Arabia required to be again and more thoroughly subdued. This being done, and Parthia again conquered, Trajanus, sinking under a combination of dropsy and paralysis, which had long afflicted him, attempted to reach Italy, but was overtaken

by death at Selinus, in Cilicia, Aug., 117. Though most of Trajanus's reign was spent in the gratification of his warlike ambition, the internal administration was far from being neglected; the administration of justice was vigorous and impartial; that of finance was equally acceptable; informers (*delatores*) were severely punished, and peculating governors of provinces rigorously prosecuted. The improvement and beautifying of Rome—a favorite occupation of the emperors—was carried on: the empire was traversed in all directions by new military routes, canals and bridges were constructed, new towns built, the Via Appia was restored, the Pontine marshes partially drained, the magnificent "Forum Trajani" erected, and the harbor of Centum Cellæ (Civita Vecchia) constructed. Even if there were not abundant evidence of the sincere desire of Trajanus to increase the comfort and happiness of his subjects, the customary wish formally uttered on the occasion of an emperor's accession, that he might be "happier than Augustus, better than Trajan" (*Augusto felicior, Trajano melior*), would of itself suffice for proof. During Trajanus's reign, a persecution of the Christians, of a mild character, took place; and taking into account that Trajanus almost necessarily shared the general belief that Christianity was a perilous species of fanaticism, his conduct toward them deserves, perhaps, to be entitled to moderation.

TRAJECTORIES, PHOTOGRAPHING. M. Marey has succeeded in photographing the path of a projectile. Using a very sensitive photographic plate, he wrapped a stone with a white covering, and throwing it so that it passed in front of a black screen, he succeeded in getting a photograph of its path. Also writing his name in air, he obtained a photograph of the letters. With a revolving shutter he cut off the light from the camera 100 times a second, so that he was enabled to measure the distance passed by the missile in the one hundredth part of a second.

TRAJECTORY, in mathematics, is any plane curve which cuts at a given angle a series of plane curves of the same species and having a common origin. In mechanics and astronomy, it denotes the path described by any body projected into space, and continuously acted upon by constant or varying forces; thus, the trajectory of a body projected obliquely for a little distance above the earth, is approximately a parabola (it would be accurately so, were space void, and the center of gravity of the earth infinitely distant), and the trajectories of the planets are approximately ellipses; the term, however, was long, in astronomy, exclusively applied to the paths of comets.

TRALEE', a sea port of Ireland, chief t. of the county of Kerry, stands on the river Lee, about a m. from the point at which it enters the sea, 207 m. w.s.w. from Dublin, with which it is connected by the Great Southern and Western and Killarney railways. Pop. '91, 9318.

TRALL, RUSSELL THACHER, b. Conn., 1812; studied medicine, but about 1840 ceased to prescribe drugs. In 1843 he began the supervision of a water-cure establishment, to which he afterward added a medical school for both sexes called the New York hygieio-therapeutic college. Among his numerous works are *Diseases of the Throat and Lungs*; and *The Scientific Basis of Vegetarianism*. He d. 1877.

TRAM. See SILK.

TRAMMEL-NET, a kind of net resembling the drift-net used in the herring-fishery (q.v.), but anchored and buoyed at each end, the back-rope supported by small cork-floats, and the foot-rope kept close to the ground by weights. The length varies from 20 to 300 yards. A variety of trammel-net, chiefly used in the west of England and in Guernsey, consists of three long nets fastened together at top, bottom, and ends. The two outer nets are each five meshes deep, the meshes ten inches square; the middle net is twice as long and deep as the outer ones, but the excess at the edges is gathered in and united all round with the other nets. The outer nets stand with their meshes square and opposite one another, and a fish, in passing through the first net, meets the second or middle net—which, being slack, yields to the pressure—and is carried through the opposite large mesh of the third net into a loose bag or pocket, from which it cannot escape. This net is much used for taking red mullet, and in some parts of Cornwall is called a *tumbling-net*.

TRAMPS. See BEGGAR; MENDICANCY.

TRAMWAY. See RAILWAYS.

TRANCE, or MORBID SLEEP, differs from natural repose in duration; in profound insensibility to external impressions; in following excitement and the exaltation of certain instincts, chiefly the religious and amative, rather than fatigue or exhaustion; and in being the concomitant or symptom of diseases of the nervous system. The attitude, aspect, lowered respiration, and circulation of the entranced, resemble those of the sleeper. But there are many exceptions to this observation. A girl who remained dormant for 13 years, although she grew from a child to a woman in that time, was corpse-like in appearance, had lock-jaw, and there was all but a total suspension of the signs of life. But while an individual cannot be roused from this condition by the most powerful stimulants, an electric shock, or even, it is affirmed, by a surgical operation, thought

or dream goes on uninterruptedly, and is more continuous and coherent in character than what takes place in ordinary sleep. So connected and real do these visions appear to the ecstatic, that they are generally accepted as true events, revelations, or impressions, received during a brief visit to another world. Trance has occurred epidemically during periods of great religious fervor and superstitions; and whole classes of persons are described as having preached while asleep, in the insurrection of the Cévennes. A similar phenomenon was observed in 1865 in those affected by hysteromania at Morzine, in Savoy. The affection has been divided, according to the intensity of the symptoms, into (1) *death-trance*, where neither the heart nor lungs act; where the temperature of the body falls; where no sustenance is taken, and the inner dream-life is the only vestige of vitality. Engelbrecht, who was subject to trance, wrote a book descriptive of this inner life, during which he believed himself to be transported to supernatural, if not to heavenly regions. (2) *Trance-coma*, where the breathing and action of the heart are feeble, but perceptible; the joints flexible; but where the external senses are not awake, and where the patient cannot be roused. (3) *Trance-sleep*, where, except in the insensibility to external stimuli, and in the length of the suspension of volition, little abnormal is noticed. As these states often succeed hysteria, nervous and other diseases, the bodies of the supposed dead are for a time, in certain countries, so placed as to be watched, and in circumstances favorable to resuscitation.—Mayo, *On the Truths contained in Popular Superstitions*, p. 88; Figuier, *Histoire du Merveilleux dans les Temps Modernes*, t. ii. p. 38; Dendy, *The Philosophy of Mystery*, p. 367.

TRANI, a maritime city of southern Italy, in the province of Bari, 27 m. n.w. of the town of Bari. Pop. '81, 25,173. It is surrounded by a wall with towers and moats, and entered by three gates. Trani is an archbishop's see, and has a handsome cathedral, convents, a court of appeal, a theater, and a strong castle. The streets are wide, well built, and paved with flagstones. There is a handsome square. A considerable trade in oil, wine, almonds, corn, and cotton, which last is also manufactured here, is carried on. Trani came first into notice when it submitted to the Normans in 1053. It was then the chief town of a vast county, and was an important harbor in the time of the crusades. Under the kingdom of Italy it has again begun to prosper, and promises once more to become an emporium of the commerce of the Levant, as it was in the middle ages.

TRANQUEBAR, a corruption of *Tallangambadi*, a sea-port t. on the e. coast of British India, 155 m. s. of the city of Madras. It stands on a small bay, and is backed by a well-wooded and cultivated country: is a healthy station, much cooler than Madras, and has therefore been made a convalescent depot. The town is surrounded by walls, with bastions, and is further protected by the fort of Dansborg. The territory of Tranquebar embraces 15 sq. m., and produces rice, the cocoa-nut and other palms, the mango, and a variety of fruits. The town with suburbs contains about 6200 inhabitants. The territory passed finally to the English—the Danes having been its former possessors—in 1845.

TRANSCASPIA (Russ. Sakaspijskaja), a province in central Asia, marked out by the Russian Government from what was formerly independent Tartary, and including the Turcoman region between the Oxus and the Caspian sea, with an area of 214,237 sq. m., and an estimated population of 340,000. The administrative center is Askabad. See **TURKISTAN**.

TRANSCAUCASIA, the tract of territory belonging to Russia, and extending between the Caucasus (q.v.) on the n., and Turkey in Asia and Persia on the south. It comprises the governments Tiflis (q.v.), Erivan, Yelisavetpol, Baku, and Kutais, the provinces of Daghestan and Kars, and Zakataly, giving a total area of 91,346 sq. m., and a pop. (1891) of 5,011,555.

TRANSCENDENTAL — TRANSCENDENT (*transcendentalis, transcendens*) words employed by various schoolmen, in particular Duns Scotus, to describe the conceptions that, by their universality, rise above or transcend the ten Aristotelian categories (see **CATEGORIES**). Thus, according to Scotus, *ens*, or being, because it is predicable of substance and accident alike, of God as well as of the world, is raised above these by including or comprehending them; it has the same relation to the sum of the categories, as the *summum genus* to the various genera within a single category—relation (*summum genus*) to the classes of related things (included genera). Further, the predicates assumed by Scotus to belong to *ens*, or simple existence; viz., the one, the true, the good—*unum, verum, bonum*—are styled transcendent, because applicable to *ens* before the *descent* is made to the ten classes of real existence. In later times, since Kant, the word transcendental has been largely used as equivalent to the philosophical meaning of *à priori*. See **COMMON SENSE**, **INSTINCT**.

Between the hitherto convertible terms, transcendental and transcendent, Kant himself drew a distinction, of considerable importance in understanding his own system. By the word "transcendental" he designates the various forms, categories, or ideas assumed to be native elements of human thought; implying that, although they are not products of experience, they are manifested only in experience; such as space and time, causality, etc. The word "transcendent," Kant reserves for those among the transcendental or *à priori* elements that altogether transcend experience. They may seem to be given in experience, but they are not really given. Such are the "ideas of the pure reason," God, an immaterial soul, etc. Transcendental elements, when legitimately applied to experience, as causality and relation, are called immanent.

TRANSEPT, the projecting wings on the n. and s. sides of a church, forming the smaller arms of the cross, in the ground-plan of cruciform churches.

TRANSFERENCE, in the law of Scotland, means the step by which a pending suit is transferred from a person deceased to his representative.

TRANSFORMER. When an alternating current dynamo is used to supply an electric current, a high voltage is generally used so that a large number of watts may be carried by a comparatively small-sized wire. In this case the pressure of the current is too high to be safely distributed for lighting etc., and an apparatus called a transformer or converter is interposed at the point where the current is consumed, which changes the primary or dynamo current into a secondary current of lower pressure and greater quantity. The transformer consists of an induction coil in which the iron core is wound with two windings; the primary wire is long and thin and makes a large number of coils about the core, and the secondary wire is short and thick and makes but a few turns. The iron core is generally built up of thin sheets of soft wrought iron, all separated by alternate sheets of paper and the whole solidly bolted together. This core acts as an electro-magnet and is analogous to the iron frame of a dynamo. The alternating current which circulates through the primary coil changes its direction many times per second, and the direction of the magnetism in the core is changed with each alternation of the current. This rapid change of magnetism of the core induces a current in the secondary coil (see **MAGNETISM**) whose voltage is proportional to the number of the turns of the secondary wire. With the best designed transformers the loss of electrical energy is but small in some cases, being as little as 4 or 5 per cent. If in a transformer the primary coil has 20 times as many turns as the secondary, then a secondary current will be produced whose voltage is about $\frac{1}{20}$, and whose amperes are about 20 times as great as the primary current.

TRANSFUSION OF BLOOD has been regarded as a recognized and legitimate operation in obstetric surgery since the year 1824, when Dr. Blundell published his well-known work, entitled *Physiological and Pathological Researches*. The operation had, however, been vaguely known to the medical profession for the last four centuries; and there are obscure allusions in the Roman poets, which would seem to indicate that it was practiced as early as the Augustan age:

Ut repleam vacuas juvenili sanguine venas.
Ovid.

The earliest authentic case on record is, so far as we know, that of pope Innocent VIII., who was unsuccessfully operated on in April, 1492. "The vital powers of Innocent VIII. rapidly gave way; he had for some time fallen into a kind of somnolency, which was sometimes so profound that the whole court believed him to be dead. All means to awaken the exhausted vitality had been resorted to in vain, when a Jew doctor proposed to do so by the transfusion, by a new instrument, of the blood of a young person—an experiment which had hitherto only been made on animals. Accordingly, the blood of the decrepit old pontiff was passed into the veins of a youth, whose blood was transferred into those of the old man. The experiment was tried three times, and at the cost of the lives of three boys, probably from air getting into their veins, but without any effect to save that of the pope."—Villari's *Life of Savonarola*. Although Libavius, in 1615, accurately describes the operation, there is no evidence that he ever practiced it. Passing over various experiments by Wren and Lower (both of Oxford) in the transfusion of blood from one animal to another, we find Denys of Montpellier, in June, 1667, injecting the blood of calves into the veins of a young man who had been much weakened, and had become torpid and slightly dropsical, in consequence of repeated bleedings. The first operation restored him to perfect health. Subsequent cases of his gave rise to a most virulent controversy, which ended with the decision, "that for the future, no transfusion should be made upon the human body but by the approbation of the physicians of the Parisian faculty." In November of the same year, Lower publicly made a similar experiment, which seems to have been successful; and in the following year Riva and Manfredi repeated the experiment in Italy. But the operation, although thus fairly started, soon fell into obscurity, doubtless from a want of success, due partly to the blood of calves and sheep, instead of human blood, being used, and partly to hopeless cases of old age and decrepitude being selected for its application.

At the present day transfusion is an operation which is almost always restricted* to cases of profuse hemorrhage in connection with labor; and as Dr. Playfair, in his excellent *Handbook of Obstetric Operations* (Lond. 1865), observes: "The benefits derived from it are probably twofold: 1. The actual restitution of blood which has been lost; and 2. The supply of a sufficient quantity of blood to the heart, to stimulate it to contraction, and thus to enable the circulation to be carried on until fresh blood is formed. Its stimulant action is probably of far the most importance; and if the operation is performed before the vital energies are entirely exhausted, the effect is most marked, and indeed may be said to be almost unailing."—Pp. 212, 213. Blundell was in error in believing that the blood of animals of the same species was essential; Dr. Brown-Sequard having since shown that the blood of various animals can be used indiscriminately, pro-

* A case has lately been recorded in which it proved successful in a case of coma from the fumes of carbonic oxide and carbonic acid; and it is not improbable that it may again come into more general medical use.

vided only certain precautions are taken; and the important discovery has been made by Panum that defibrinated blood is in every respect as well suited for the operation as pure blood.

TRANSIT-INSTRUMENT, one of the most important of astronomical instruments, consists of a telescope fixed to a horizontal axis, so as to revolve in the plane of the meridian, and is employed, as its name denotes, in the observation of the meridian transits of the heavenly bodies. The axis, which is the most important part of the instrument, and thus demands the utmost care in its construction, consists of a hollow sphere or cube, to opposite sides of which are tightly fastened the bases of two cones in whose apices the pivots are screwed; the sphere or cube is pierced for the admission of the telescope, which is firmly soldered at right angles to the axis. One of the pivots is hollowed so that a stream of light can be directed from a lantern half way along the interior of the axis, and through an aperture in the side, into the telescope tube, where, being received by an annular mirror, set at 45° to the axis and telescope tube, it is directed to the eye-piece, and brilliantly illumines the field of view, while the annular form of the mirror prevents any interference with the passage of rays from the object under observation to the eye. The pivots must be very carefully turned to a perfectly cylindrical form, and fitted into the instrument, so that their axis are accurately in line. One extremity of the axis carries one and sometimes two small graduated circles, each supplied with index, clamping screws, and vernier; these circles are capable of indicating angular measures to within $1'$ or $2'$. The pivots rest on massive blocks of stone or other stable material which is little affected by change of temperature, stability being the great mechanical essential of the instrument. This condition satisfied, there are three adjustments necessary before a transit can be observed; the axis must be horizontal; the line of collimation must be at right angles to the axis of motion; and the latter must be placed so as to point accurately e. and west. On the perfection of the first two of these adjustments depends whether the telescope sweeps over a great circle of the sphere, and the third is necessary to insure that this great circle shall be the meridian of the place of observation. These adjustments can never be made quite perfect, and the usual mode is to investigate the amount of error in each, and allow for it in the apparent result. To note accurately the instant of time by the astronomical clock at which the object (e.g., a star) is seen to pass the center of the field of view, is the essential part of a transit observation. The most effective method is to register the beats of the clock by an apparatus, which, at the end of each oscillation of the pendulum, marks a dot upon a uniformly moving slip of paper. This is effected by the agency of electricity, and is one of its most valuable contributions to astronomical science. At a certain point in each oscillation of the pendulum, it becomes part of a complete galvanic circuit, the contact being immediately broken by its progression in its oscillation; and it is at these points that the galvanic agency causes the dot to be made. The instant of a transit's occurrence is similarly noted by the observer, who, by a tap on a break-circuit key, fastened to the side of the transit-instrument, causes the graver to make an extra dot; and the distance of this dot from the previous seconds one, compared with the distance between two seconds dots, gives the time accurately almost to $\frac{1}{100}$ of a second. Various ingenious modes of registering have been proposed, all founded on the above principles. It is from the times of transit of the several heavenly bodies thus accurately observed, that their right ascensions are determined.

The transit-instrument was invented by Römer about 1690, and first described in 1700, in the *Miscellanea Berolinensia*, vol. iii. One was erected in Greenwich observatory by Halley in 1721; but it was little used till 1742. The present instrument in that observatory is by Troughton, and was erected in 1816.

TRANSITION, a term employed at first by Werner to designate rocks having a mineral character intermediate between the highly crystalline or metamorphic rocks and ordinary sedimentary deposits. As these rocks, in the region where the Wernerian classification originated, had a definite relation to the inferior and superior strata, and contained a uniform series of fossil remains, the term gradually came to have a chronological meaning. It was employed to designate similar deposits wherever they occurred. But a more enlarged view of the sedimentary deposits in the different countries of Europe, exploded the idea of a transition either in mineral structure or organic contents being characteristic of any set of beds, and caused the transition series to be more accurately classified as Cambrian, Silurian, and Devonian strata.

TRANSKEI TERRITORY, a dependency of the Cape Colony, between the Great Kei river (the boundary of British Kaffraria) and the borders of Natal. It includes Fingoland, the Galeka country, and No Man's Land. The coast districts from the Umlata to the Natal frontier are still independent, though surrounded, except to seaward, by British territory. Area, 2522 sq. m.; pop. 91, 153,563.

TRANSLATION OF MINISTERS, in the law of Scotland, means the removal of a minister from one parish benefice to another.

TRANSLEITHANIA, a division of the Austro-Hungarian monarchy lying e. of the Leitha river, and including Hungary proper, Transylvania, Croatia, and Slavonia, and Flume. The name is not in common use, and the division is approximately the same as the kingdom of Hungary.

TRANSMIGRATION, or the passing from one place, state, or condition into another, means, in the theological acceptation of the term, the supposed transition of the soul after death into another substance or body than that which it occupied before. The belief in such a transition is one of the most important phases in the religions of mankind. It was common to the most uncivilized and the most civilized nations of the earth; it was the object of fantastical superstition, as well as that of philosophical speculation, and it is the property of both ancient and modern times. Its basis being the assumption that the human soul does not perish together with the body, it could belong to those nations only which had already conceived an idea of the immortality of the soul; but in proportion as such an idea is crude or developed, as it is founded merely on a vague fear of death, and a craving for material life, or on ethical grounds, and a supposed casual connection between this and a future life, the belief in transmigration assumes various forms, and influences more or less the actions of men.

The lowest forms of this belief are probably those met with among several tribes of Africa and America, which hold that the soul, immediately after death, must look out for a new owner, and, if need be, enter even the body of an animal. Several negro tribes entertain this belief; they assume that the soul will choose with predilection the body of a person of similar rank to that of its former owner, or a near relation of his; and they frequently therefore bury their dead near the houses of their relatives, in order to enable the souls of the former to occupy the newly-born children of the latter, and the princely souls to re-enter the princely family; and until the soul is thus accommodated, milk, brandy, and food are placed on the grave of the deceased, to keep it, as it were, from starving; and sometimes holes are dug in the grave to facilitate the soul's egress from it. In North America some tribes slaughter their captives to feed with their blood such souls in suspense. The negro widows of Matamba are especially afraid of the souls of their husbands, for at the death of these they immediately throw themselves into the water, to drown their husbands' souls, which otherwise, as they suppose, would cling to them. The natives of Madagascar seem to have invented a kind of artificial transmigration, for in the hut where a man is about to die, they make a hole in the roof, in order to catch the outgoing soul, and to breathe it into the body of another man on the point of death. From these and instances of a similar kind, it will be seen that nations which entertain such a belief in transmigration, assume that the souls of the deceased must continue to dwell upon earth, and that one human being may be possessed of several souls. With them, the final destination of the soul is a matter of comparative indifference; its transition from one body into another a mere matter of chance, devoid—apparently, at least—of any ethical principle, and therefore without any moral effect on the living, except, perhaps, that of a stolid indifference to death, as often manifested in the plantations of the West Indies, where negroes hang themselves, in the belief that their souls will migrate into other countries, and there enjoy a happier life.

Another, more poetical, and in some respect also, more ideal form of this belief in transmigration, is that which occurs in Germanic mythology, and is still entertained in some parts of Germany and England. According to it, the soul, before entering its divine abode, assumes certain forms, or animates certain objects, in which it lives for a short period. Thus, it is supposed to enter some flower or tree, a rose, a vine, a plantain, a pine-tree; or to animate a butterfly, a pigeon, and sometimes also—if a person dies while enchanted or sleeping—a serpent, a weasel, or a mouse. The most popular form of these supposed transmigrations, however, is that of a pigeon, a representation of which bird, therefore, often occurs on the oldest tombstones. When the robber Madej, for instance, under an apple-tree confessed his crimes, one apple after another, transformed into a white pigeon, flew into the air. They were the souls of the persons murdered by him; only one apple remained, because he had not yet confessed the murder of his father; but when he did so, the last apple also—the soul of his father—assuming the shape of a gray pigeon, flew after the rest.

Different from this kind of belief in transmigration is that which is based on ethical grounds. It proceeds from the theory, that the human souls, being of divine essence, are originally pure, but during their earthly career, lose of their purity; being destined, however, to regain their original quality, are reborn again and again, until they have become free from fault, and thus worthy of re-entering the place of their origin.

A belief of this nature was entertained by the old Mexicans, and probably also the Druids. It is met with in a more developed form with the old Egyptians; but its real importance it obtained as a tenet of the religion and philosophy of the Brahmanical Hindus and the Buddhists, whence it passed into the doctrine of several philosophers of ancient Greece, and into that of some Jewish and Christian sects.

The ethical and philosophical value which such a belief may have, is necessarily relative. It will depend on what a religion or philosophy may call right or wrong, virtue or sin; it will likewise depend on the notions which religion or philosophy may entertain on the origin of the human soul, on the cause of its first birth, and on its ultimate destination, whether this destination is the merging of the soul into the essence of its creator, or a personal immortality; and again, the mode in which such a personal immortality is conceived will also necessarily influence the mode in which transmigration is supposed to take place.

Where the ideas on these questions have remained crude, the idea of transmigration,

too, is but of little ethical or philosophical worth. The old Mexicans imagine that the gods *Ometecutli* and *Omecihuatl* create in heaven the soul of a child destined to be born, and that by its acts on earth it will either ascend to the abode of the highest felicity, or remain in an intermediate heaven, or fall to hell. The highest goal, situated in the house of the sun with the god *Huitzilopochtli*, is full of pleasure and joy, and is attained merely by the souls of fallen warriors, or those who died in captivity, and women dying in childbirth. The second or intermediate heaven, cool and pleasant, but of moderate enjoyments, falls to the lot of men who are not wicked. The wicked, however, go to the abode of darkness; and in darkness consists their punishment. But those entitled to the second heaven may, if they like, also return to earth, in order to qualify themselves for the highest heaven, if such is their aspiration.

Of the Druids, it is told by classical writers that they believed in the immortality of the soul, and in its migration after a certain period subsequent to death. Little is known of the manner in which they imagined such migrations to take place; but to judge from their religious system, there can be no doubt that they looked upon transmigration as a means of purifying the soul, and preparing it for eternal life.

According to the doctrine of the old Egyptians, the human race originated after the pure gods and spirits had left the earth; and this they did because the demons, who inhabited the earth, had revolted against them, and therefore tainted it with guilt. But, in order to enable the demons to purge themselves of their guilt, the gods created earthly bodies, which the demons were sentenced to animate, so that by expiations they might regain their state of original purity. And these earthly bodies, united to the demons, are the human race; their souls were therefore created at the same time as that of the gods; and human life—the connection of body and soul—is merely intended as a means of purifying the soul, which had rebelled against its divine nature. All the precepts regulating the course of life are laid down by the Egyptians for this end; and the judgment passed after death, in the palace of Osiris, decides whether it has been attained or not. If it has not, the soul must return to the earth again, to renew its expiations; and according to the nature and measure of the guilt which it had contracted during its previous career, it must form a new union with a human body, or with the body of an animal, or even a plant. But if the soul is declared pure by the judge of the dead, it gradually ascends through the various regions of heaven, to the highest abodes of the gods and pure spirits, presided over by Phtah and Neith.

At the time when in *India* the dogma of transmigration became an integral part of the Brahmanic religion, the Hindus believed that the human souls emanated from a supreme being, which, as it were, in a state of bewilderment or forgetfulness, allowed them to become separate existences, and to be born on earth. The soul, thus severed from the real source of its life, is bound to return to it, or to become merged again into that divine substance with which it was originally one; but as its nature becomes contaminated with sin through its earthly career, it must, so long as it remains in this world, endeavor to free itself from all guilt, and thus to become fit for its ultimate destiny. Religion teaches that this is done by the observance of religious rites, and a life in conformity with the precepts of the sacred books; philosophy, that the soul will be reunited with Brahman, if it *understands* the true nature of the divine essence whence it comes. So long, therefore, as the soul has not attained this condition of purity, it must be born again, after the dissolution of the body to which it was allied; and the degree of its impurity at one of these various deaths, determines the existence which it will assume in a subsequent life. See *INDIA*, sec. *Religion and Philosophy*; and *UPANISHAD*.

Since there can be no proof of the soul's migrations, the detail in which these are described in the religious works of the Hindus, is merely fantastical, and interesting only so far as it affords a kind of standard by which, at various epochs, and by different writers, the moral merit or demerit of human actions was measured in India. Thus, Manu (in the 12th book of his code of laws) teaches: "The slayer of a Brâhman'a—according to the degree of his guilt—is reborn as a dog, a boar, an ass, a camel, a bull, a goat, a sheep, a stag, a bird, a Chân'dâla, or a Pukkas'a. A Brâhman'a, who drinks spirituous liquor, will migrate into the bodies of a worm, an insect, a grasshopper, a fly feeding on ordure, or some mischievous animal. A twice-born who steals (the gold of a Brâhman'a), will pass a thousand times into the bodies of spiders, snakes, and chameleons, of aquatic monsters, or of murderous bloodthirsty demons. He who violates the bed of his guru, will a hundred times migrate into the forms of grasses, of shrubs, and of creeping plants, of carnivorous animals and beasts with long teeth, or of cruel brutes. Those who inflict injury (on sentient beings), become flesh-eaters; and those who eat forbidden things, worms. Thieves become devourers of each other; and those who embrace women of the lowest castes, become ghosts. . . . If a man, through covetousness, has stolen gems, pearl, or coral, or whatever belongs to the precious substances, he is reborn in the tribe of goldsmiths; if he has stolen grain, he becomes a rat; if kânsya (a composition of zinc and copper), a *hansa* bird; if water, a diver; if honey, a gadfly; if milk, a crow; if juice (of the sugar-cane or the like), a dog; if clarified butter, an ichneumon; if flesh, a vulture; if fat, a shag; if oil, a cockroach; if salt, a cricket; if curds, the crane, called valâkâ," etc. A more general doctrine of the migration of souls is based by Hindu philosophers on the assumption of the three cosmic qualities of *sattva*, i.e., purity or goodness; *rajas*, i.e., troubledness or passion; and *tamas*, i.e.,

darkness or sin, with which the human soul may become endued. And on this doctrine, again, Manu and other writers build an elaborate theory of the various births to which the soul may become subject. Manu, for instance, teaches that "souls endued with the quality of *sattva* attain the condition of deities; those having the quality of *rajas*, the condition of men; and those having the quality of *tamas*, the condition of beasts." Each of these conditions, he continues, is, according to the acts or knowledge of the soul, threefold; the lowest, the middle, and the highest. "The lowest embodiment of the quality *tamas* is inanimate objects, worms, insects, fish, serpents, tortoises, tame and wild beasts; the middle state, to which the same quality leads, is (the state of) an elephant, a horse, a sūdra, a mlechchha or barbarian, a lion, a tiger, and a boar; the highest, that of a public performer, a bird, a cheat, a demon called rakshas, and a vampire-demon. The lowest condition to which the soul imbued with the quality *rajas* arrives is that of a cudgel-player, a boxer, a public dancer, a man who lives on the use of weapons, and one addicted to gambling and drinking; the middle condition, that of a king, a man of the kshatriya or military caste, a house-priest of a king, and a man fond of learned controversy; the highest, that of a gandharva or musician in Indra's heaven, a guhyaka or yaksha (two kinds of attendants on the god of riches) or another attendant on another god, or an apsaras or heavenly nymph in Indra's heaven. The lowest state procured by the quality of *sattva* is that of a vānaprastha—or a hermit of the third order of life—a religious mendicant, a Brāhman'a, or one of the demigods traveling about in palace-like cars, one of (the genii presiding over) the lunar mansions, or an offspring of Diti. The middle state, procured by the same quality, is that of a sacrificer, a rishi (q.v.), a god of the lower heaven (a deity personating one of the Vedas, 'a deity presiding over one of) the luminaries or years, one of the manes or progenitors of mankind, and of the demigods called Sādhyas. The highest condition to which the quality of *sattva* leads is that of the god Brahmā, that of a creator of the world (as Marichi, or another patriarch of the same rank), that of the genius of Dharma (virtue or right), of Mahat, or the intellectual principle of creation, and of Prakṛiti, or matter." See SĀNKHYA.

It is not necessary here to show that this detail regarding the migrations of the souls is more or less differently given by other authors at other periods of Hindu religion, according to the views which they entertained of right and wrong, of the value and rank of imaginary or created beings, and of the social conditions of men. For, since all orthodox Hindu writers agree in principle with Manu, the quotations alleged from his work suffice to illustrate the imaginary positiveness with which the doctrine of transmigration was propounded, and to establish the conclusion that this doctrine rested in India on ethical grounds.

It has been already pointed out that the belief in the soul's life after the death of the body must precede the doctrine of transmigration. As such a belief, however, may be traced in some hymns of the *R̥gveda* (see VEDA), it has been supposed that this doctrine, too, is as old as this Veda. But apart from the uncertainty which still exists regarding not only the age, but even the relative age at which the different hymns of the *R̥gveda* were composed, and setting aside the fallacy which therefore attaches to speaking of this Veda as a contemporaneous whole, it is necessary to observe that the only passage which has been adduced in proof of this important discovery does not bear it out. It is the 32d verse of the hymn i. 164, and, according to the translation of prof. Wilson (vol. ii. pp. 137, 138), runs as follows: "He who has made (this state of things) does not comprehend it; he who has beheld it, has it also verily hidden (from him); he while yet enveloped in his mother's womb, is subject to many births, and has entered upon evil." But the word of the text, *bahuprajāh*', rendered by Wilson, according to the commentator, "is subject to many births," may, according to the same commentator, also mean, "has many offsprings," or "has many children;" and as the latter sense is the more literal and usual sense of the word, whereas the former is artificial, no conclusion whatever regarding the doctrine of transmigration can safely be founded on it.

The Buddhistic belief in transmigration is derived from that of the Brahmanic Hindus; it agrees with the latter in principle, though it differs from it in the imaginary detail in which it was worked out.

Like the Brahmanic Hindus, the Buddhists believe that all souls have existed from the beginning; like them, they believe in the unreality and sinfulness of the world, in the necessity of the soul's freeing itself from the bondage of this world, and in the casual connection between the actions of man in this, and his condition in a subsequent, life. Like the Brahmanic Hindus, they hold, therefore, that sin is the cause of transmigration, and that, by a total expiation of sin, the soul ceases to be reborn, and attains its final resting-place. But since this resting-place is to the Buddhists Nirvāna (q.v.), or non-entity, whereas to Brahmanism it is Brahman, or the principle of entity; since they reject the institution of caste, which is the social foundation of Brahmanic life; since they do not acknowledge the authority of the Vedas, and the codes based on it, and therefore consider as morally wrong much that the Brahmanic Śāstras enjoin as morally right, the standard according to which the life of a Buddhist is regulated must differ in many respects from that which governs the conduct of a Brahmanic Hindu; and his ideas of reward and punishment, therefore, as reflected by his ideas of the mode of transmigration, likewise differ from those of the Brahmanic believer. To enlarge here

on this difference is not necessary, for, after the illustrations already afforded from Manu, it is easy to conceive that the *detail* of the Buddhistic doctrine of transmigration is as fanciful as that of the Brahmanic doctrine; that it is therefore partly devoid of interest, and partly intelligible only if taken in connection with the detail of Buddhistic religion and literature (see **BUDDHISM**; also **LAMAISM**). Yet it is not superfluous to point out one great difference which separates the notions of one class of Buddhists from those of the rest, as well as from those of the Brahmanic Hindus. According to the latter, and the great mass of Buddhists, it is always the same soul which ever from its first birth reappears in its subsequent births, until it is finally liberated from transmigration. But among the southern Buddhists, another idea has also taken root. In their belief, the succession of existences of a being is also a succession of souls; and each such soul, though the result of its predecessor, is not identical with it. According to this view, the body dies, and with it the soul, too, is "extinguished," leaving behind only the good and bad acts which it has performed during its life. The result of these acts now becomes the seed of a new life, and the soul of this new life is therefore the necessary product of the soul of the former life. Thus all the succeeding souls have to labor at the solution of the same problem, which began when their first ancestor entered this world, but no succeeding birth is animated by the same soul. This dogma is illustrated in their works by various similes. One lamp, they say, for instance, is kindled at another; the light of the former is not identical with that of the latter, but nevertheless without this the other light could not have originated. Or, a tree produces fruit; from the fruit another tree arises, and so on; the last tree is therefore not the same as the first, though the fruit is the necessary cause of the last.

In Greece, the doctrine of transmigration—or, as it is there called, *metempsychosis*—did not become the belief of the people, but was confined to the teaching of the mysteries and the tenets of philosophers, who probably derived it, either directly or indirectly from Egypt or India. According to some, Thales (q.v.) was the first Greek philosopher who propounded it; according to others, Pherecydes (q.v.) the teacher of Pythagoras (q.v.); but its importance in Greek philosophy it first obtained through the system of Pythagoras, who, it seems, became acquainted with it through Egyptian sources. After him, it was Plato (q.v.) who assigned to it a prominent place in his philosophy; and he probably was indebted to Hindu writers for his views on *metempsychosis*, as explained in his dialogues, especially in *Phædrus*. Plato's doctrine was refuted by Aristotle, but revived, though in a modified shape, by the Neoplatonists.

Since a belief that the consequences of the acts of man must follow their inevitable course, and can neither be averted nor stopped by the intercession of a divine power, is incompatible with a belief in divine grace, the doctrine of transmigration or *metempsychosis* could never gain a firm ground in the religion of the Jews and Christians. It deserves notice, however, that in both these religions it found adherents as well in ancient as modern times. Among the Jews the doctrine of transmigration—the *Gilgul Neshamoth*—was taught in the mystical system of the *Cabbala*, which pretends to divulge the secrets of creation and those of the nature of the divine and human soul. "All the souls," the *Sohar*, or the book of "light," the spiritual code of this system, says, "are subject to the trials of transmigration; and men do not know which are the ways of the Most High in their regard. They do not know how they are judged in all times, as well before they come to this world as after they leave it. They do not know how many transformations and mysterious trials they must undergo: how many souls and spirits come to this world without returning to the palace of the divine king." The principle, in short, of the *Cabbala* is the same as that of Brahmanism. The souls, like all other existences of this world, it teaches, must re-enter the absolute substance whence they have emerged. But to accomplish this end, they must develop all the perfections the germ of which is planted in them; and if they have not fulfilled this condition during one life, they must commence another, a third, and so forth, until they have acquired the condition which fits them for their reunion with God. On the ground of this doctrine, which was shared in by rabbis of the highest renown, it was held, for instance, that the soul of Adam migrated into David, and will come into the Messiah; that the soul of Japhet is the same as that of Simeon, and the soul of Terah migrated into Job. Generally, it was supposed by writers of this school, the souls of men are reborn in men, and those of women in women; but also the reverse takes place, as in the case of Thamar, who had the soul of a man, and in that of Judah, whose soul was in part that of a woman. And because Ruth had the soul of Thamar, she could not bear children until God imparted to her sparks of a female soul. If the soul of a man, however, is reborn in a woman, such a migration is held by some to be a punishment for the committal of great sins, as when a man refuses to give alms, or to communicate to others his wisdom. And it is by way of punishment, too, that the soul of a Jew is reborn in a heathen or in an animal—a clean or unclean beast, a bird, a fish—or even in an inanimate object. Of all these transmigrations, biblical instances are adduced—according to their mode of interpretation—in the writings of rabbi Manasse ben Israel, rabbi Naphtali, rabbi Meyer ben Gebbai, rabbi Ruben, in the *Jalkut Khadash*, and other works of a similar character. Modern *Cabbalists*—for instance, Isaac Loria—have imagined that divine grace sometimes assists a soul in its career of expiation by allowing it to occupy the same body together with another soul, when both are to supplement each other, like the blind and

the lame. Sometimes only one of these two souls requires a supplement of virtue, which it obtains from the other soul, better provided than its partner. The latter soul then becomes, as it were, the mother of the other soul, and bears it under her heart like a pregnant woman. Hence the name of gestation or impregnation is given to this strange association of two souls. That all these wild fancies have for their main object the explanation of obscure or mystical passages of the Bible, and the reconciliation of such as are or may seem contradictory, requires no remark; the philosopher, however, must look to their basis, which is purely ethical.

Among the early Christians, St. Jerome relates, the doctrine of transmigration was taught as a traditional and esoteric one, which was only communicated to a selected few; and Origenes, like the Cabbalists, considers it as the only means of explaining some biblical traditions, as that of the struggle of Jacob and Esau before their birth, or the selection of Jeremiah when he was not yet born, and many more events which would throw discredit on divine justice, unless they were justified by good or bad acts done in a former life. Of Christian sects the Manichæans (q.v.) especially adhered to this belief, but the church always rejected it as a heresy.

In concluding, at least one great philosopher of modern times may here be named as one whose views of the progress of mankind are based on the same doctrine; it is the celebrated German critic, G. E. Lessing, who endeavored to establish it on metaphysical grounds. His arguments are briefly these: The soul is a simple being, capable of infinite conceptions. But being a finite being it is not capable of such infinite conceptions at the same time; it must obtain them gradually in an infinite succession of time. If, however, it obtain them gradually, there must be an order in which and a degree to which these conceptions are acquired. This order and this measure are the senses. At present the soul has of such senses five; but neither is there any ground to assume that it has commenced with having five senses, nor that it will stop there. For, since nature never takes a leap, the soul must have gone through all the lower stages before it arrived at that which it occupies now . . . and since nature contains many substances and powers which are not accessible to those senses with which it is now endued, it must be assumed that there will be future stages at which the soul will have as many senses as correspond with the powers of nature. And "this my system," he concludes his little but important essay, *Dass mehr als fünf Sinne für den Menschen sein können*—in a fragmentary note discovered after his death—"this my system is certainly the oldest of all philosophical systems; for it is in reality no other than the system of the pre-existence of the soul and metempsychosis, which did not only occupy the speculation of Pythagoras and Plato, but also before them of Egyptians, Chaldeans, and Persians—in short, of all the sages of the east; and this circumstance alone ought to work a good prejudice in its favor, for the first and oldest opinion is in matters of speculation always the most probable, because common sense immediately hit upon it."

TRANSOM, a horizontal mullion or bar in a window, door, etc., chiefly used in late Gothic and Elizabethan architecture.

TRANSOMS, in artillery, the bars or bolts by which the two sides—technically called "checks"—of a gun-carriage are held together.—In a ship, beams across the sternpost, at right angles to that timber, fastened in the same way as the floors upon the keel.

TRANSPADANE REPUBLIC. See **CISALPINE REPUBLIC.**

TRANSPLANTING—the removal of a growing plant from one situation to another—is much practiced with many kinds of cultivated plants which are reared in a nursery and *planted out*. Many flowers and culinary plants are generally treated in this way, as well as ornamental shrubs and fruit and forest trees. It is desirable to have a ball of earth attached to the roots in every case, although this is often neglected. It is also desirable to shade the plant and water it for a few days after transplanting when possible. Young plants are easily transplanted, as their roots not having spread far are raised from the ground without much injury, and this is the thing of first importance in the operation. At a more advanced age transplanting becomes difficult, great part of the difficulty, however, being mechanical. No plant can be transplanted with safety when in flower or fruit; the plant may live, but the flowers or fruit will almost certainly perish. In like manner leaves often wither; and transplanting ought, if possible, to be performed in winter, when vegetation is least active.

The transplanting of large trees, in order to immediate effect in the neighborhood of a mansion, has been practiced for many years with success. Notwithstanding all the care that can be taken, the trees are *thrown back* for two or three years; but this in general is all the injury which they sustain, unless removed from a situation very different from that in which they are placed. It is of great importance in transplanting trees that they should be placed in their new situation in the same direction to the prevailing wind as in their former situation. This is often disregarded, and many failures are the consequence. It ought also to be borne in mind that trees taken from a thick wood and planted in a lawn, or along the sides of an avenue, cannot be expected to succeed there. They have neither roots nor branches adapted to their new situation, and suffer from unaccustomed exposure to wind and weather. Trees of quick growth, such as limes and poplars, succeed most readily when transplanted; oaks are particularly difficult. In every case, however, there is much hazard, because the roots of trees generally

spread far from the stem, and when the operation is unskillfully performed the principal roots are often cut off and the smaller ones torn by the violence, while all are injured by being laid bare. Trees thus treated seldom ever again assume a healthy appearance. The method is therefore now generally adopted of preparing the tree for transplanting by digging a trench around it at least two years beforehand, at such distance as is thought expedient, cutting the roots all round, except two or three which are left to hold the tree fast, and then filling up the trench with fresh soil of the best quality that can be procured, into which a vast number of young roots are speedily thrown out. When the tree is to be removed a new trench is made immediately on the outside of the former trench, and young roots sufficient for the nourishment of the tree are thus preserved. The ball of earth being generally too heavy for removal is reduced in size by a very careful picking away of earth, so that the rootlets shall be as little as possible injured or even laid bare. The tree is generally transported to its new situation by attaching it firmly to a pole fixed upon an axle with a pair of wheels, the ball resting upon the axle. Good soil is put into the pit dug for it, and the roots are spread out. The tree is stayed by sticks and ropes till it is well established, and heavy stones are also laid on the top of the ball, or large beams of wood are laid across it and firmly fastened to the ground at both ends. An improvement on this method has been effected by the use of a compost of vegetable mold, decayed leaves, etc., in preparing the tree for transplanting, not only in the trench dug around it, but on the top of the ball itself, so that the tree is encouraged to send out many new rootlets. A still greater improvement consists in the use of a machine by which a large ball of earth can be removed along with the tree, so that it is no longer necessary to pick away any part of the soil or to lay bare the young roots; while the tree being carried in a vertical instead of a horizontal position, all possibility of damage in this process is avoided. One of the machines used for this purpose consists of two pair of wheels about 15 ft. apart, each pair on a strong axle; the first pair smallest, and in a very large machine about $5\frac{1}{2}$ ft. in diameter; the second pair 7 feet. A strong frame rests on each axle to raise the horizontal bearers to a sufficient height. The front frame turns on a horizontal wheel, as in a carriage, for easy turning of the whole machine. Resting on the two frames are two strong horizontal beams of wood, above which are two short cross-beams with jack screws and strong chains for raising the tree. Beneath the roots and ball of earth when the tree is raised from the ground strong planks are placed, supported by chains from the beams. In order to raise the tree from its place a sloped cutting is made, and the tree is drawn gradually up the inclined plane.

TRANSPORT, MILITARY AND NAVAL. Without a powerful system of transport an army is helpless. To cross a sea a large fleet of vessels properly fitted for men and horses is requisite. When the English army of about 30,000 men crossed in 1854 from Varna to the Crimea, it took 600 vessels to carry them without any reserves of stores or food.

Not less important to the army moving by land is its transport. On entering battle infantry and cavalry usually carry three days' rations with them and 60 rounds of ammunition. The moment these are exhausted they become dependent on the transport department for their replenishment. The first reserves are immediately in rear. To bring up supplies from these, and to keep these reserves themselves supplied, is the duty of the military train as regards food, and of the field-train in respect of ammunition. Between the grand depot and the base the operation is generally intrusted to the wagons and beasts of the country, driven by natives, of course under proper military control. The amount of transport required by an army seems almost fabulous. The lowest computation must put one animal to four fighting-men. In addition to the transport of food and ammunition the wounded and sick have to be carried, both from the field to the hospitals and during a march.

In the British army the direction of the transport rests with the quartermaster-gen.; in the French army it is under the *intendant*, who is over all the administrative departments.

TRANSPORTATION, from the Latin for carrying across, means the removing of persons from one territory to another; and is thus distinguished from banishment, which is the mere driving of persons out of the country in which they live. Transportation, in this country, means a removal beyond seas, and has been in use to express the punishment of crime in that manner. The practice was known to the Romans; and transportation to Sicily will be found referred to in Cicero's charges against Verres. When the English monarchs had possession on the continent, there was much jealousy about their carrying off troublesome persons to these dominions, and thus bringing them under irresponsible power. The legal transportation of criminals from the British dominions began early in the 17th c., when they were removed to the plantations in America, and treated as slaves. This practice continued, under modifications, until it was stopped by the American revolution. Its unfitness as a punishment is obvious. The amount of infliction would depend, not on the extent of the criminal's guilt, but of his master's humanity. There were even worse evils; for young lads were kidnapped in Britain, and sold to the planters, and these victims were often unable to prove, even when they had an opportunity, that they were not legally transported for offenses. When this method

of getting rid of convicts ceased, there was great alarm that Britain would be overrun with crime, and it was hailed as a deliverance when the government resolved to establish a penal colony in Australia. The first convicts were conveyed thither in 1787. Such was the beginning of the famous colony of Sydney, or Botany Bay. Between the years 1820 and 1830, the system was at its full perfection; but though thousands were annually removed, crime did not appear to decrease. It was forgotten, that the predatory and fraudulent offenses, which are by far the greater number in this country, are trade as well as crime; and that where there is a large portion of the population, as there unfortunately is, prepared to have recourse to crime whenever it pays, the place of those removed is immediately supplied. When the criminals were sent to the antipodes, the mistake was made of supposing that they took the crime of the country with them, and that there was so much less need for precautionary measures at home. During thirty years, however, the greater proportion of the class of criminals who used to be transported, have been retained in this country, and liberated in it at the end of their punishment. This practice has been accompanied with two classes of precautionary measures—an improved police, and the reformation of juvenile delinquents. To these influences have been added free trade, and the consequence of all is, that crime is diminished to the extent of between a third and half of what it was 20 years ago. In 1838, a committee of the house of commons issued a celebrated report on the effect of transportation. It was shown to be still an extremely unequal punishment—in some instances giving rogues an opportunity of making their fortune, in other cases subjecting men less depraved, but more infirm in temper, to punishments of the most frightful kind. It was found to be accompanied by the prevalence of crimes which cannot be mentioned, and with a vast amount of general demoralization in the convict settlements. Yet it was found not to have much terror for the criminal classes, who heard more about the success than the hardships of transportees. In 1840, transportation to New South Wales came to an end; and by a succession of statutes, sentences to penal servitude were substituted for sentences to transportation. In 1868 transportation to western Australia also wholly ceased, to the great benefit of the whole continent. The practice of transportation cannot, it will be easily understood, be carried out by governments which have no colonies, though Russia manages it by possession of the desolate region of Siberia. It is a curious circumstance that the practice began in France just as this country was abandoning it.—See CONVICT; PENAL SERVITUDE; PRISONS; TICKET OF LEAVE.

TRANSPOSE, in music, is to change a piece of music in performance from the key in which it is written to another key. To play at sight an accompaniment for such an instrument as the pianoforte or organ, transposed from one key to another, requires considerable artistic skill. To the singer, transposal presents no difficulties.

TRANSUBSTANTIATION (Lat. *transubstantiatio*, change of substance, from *trans*, over, and *substantia*, a substance), a word used by the scholastic writers of the Roman Catholic church to designate the change which Roman Catholics believe to take place in the Eucharistic elements of bread and wine, in virtue of the consecration. Under the head **REAL PRESENCE** (q.v.), which is often loosely comprehended under the larger name of transubstantiation, the doctrine of Catholics as to the presence of the body and blood of Christ in the Eucharist after consecration, has been fully explained. There remains, however, beyond this doctrine as to the presence of Christ, a further inquiry concerning the elements of bread and wine which had existed in their natural condition before the consecration. For sacramentarians (q.v.), this question is easily resolved. But those Protestants who hold in common with Catholics the reality of Christ's presence, differ from them as to the copresence of the substance of bread and wine after consecration. Some Anglican divines, who hold the real presence of the body and blood, would appear to content themselves with remaining silent as to the mode of the presence. Dr. Pusey goes so far as to say that the dispute between Anglicans and Romanists is "probably a dispute about words" (*Eirenicon*, p. 229). The Lutheran views as to the mode of the presence have been explained under the heads **IMANATION**, **REAL PRESENCE** (q.v.). According to the Catholic doctrine, which has been explicitly defined as an article of faith (Council of Trent, Sess. xiii. Can. 2), "the whole substance of the bread is changed into the body of Christ, and the whole substance of the wine into His blood, the species alone remaining." What is the precise philosophical meaning of the word "species," called also "accidents," in this definition, is not declared; but in popular language it may be described as simply meaning the appearances, that is to say, those qualities or conditions of bread and wine which produce upon the senses the effects of the presence of bread and wine. It is not taught, however, that in the change called transubstantiation, the body and blood of Christ are formed out of the substance of the bread and wine, but that, in virtue of the Eucharistic consecration, the substance of bread and wine cease to exist, and that the body and blood of Christ take their place; nor that the body and blood of Christ become what the schoolmen call the "subject" of the "accidents" of the bread and wine, but merely that, by a miraculous suspension of the ordinary law, the senses still continue to receive from the Eucharistic elements all the same impressions which they had previously received from the bread and wine: viz., of color, taste, smell, solidity, extension, figure, etc.

The history of the controversy regarding transubstantiation is sketched in the article **LORD'S-SUPPER**. The objections to the doctrine have been chiefly drawn from the phil-

osophical difficulties which are involved in it; and the defenders of it have, for the most part, contented themselves with resting on the proofs which they profess to draw from Scripture and tradition, and a general demonstration that the doctrine, although mysterious, does not involve any philosophical repugnance or impossibility, and that the philosophical arguments against it are at least not conclusive. Some Catholic philosophers have even undertaken to demonstrate the possibility of transubstantiation by philosophical arguments; and it is especially remarkable that the celebrated Leibnitz (q.v.) has not only entered at great length, and in several portions of his works, into this philosophical discussion, but professes to prove, by strict philosophical principles—by the consideration of the properties of matter, of substance, of space, extension, and the like—that the essential principle of the body “may exist in many places at the same time, nay, under far-distant and distinct species.”

TRANSVAAL (i. e., across the Vaal'), or **SOUTH AFRICAN REPUBLIC**, bounded on the south by the Vaal River, on the north by the Lampopo river, on the east by Portuguese East Africa, and on the west by British Bechuanaland; is an independent Boer state with an area of 119,139 sq. m., and an estimated white population (1896) of 180,000. Estimates place the black population at 600,000.

The country is a high plateau, steppe-like in the west and northwest. There are good agricultural and pasture lands. It is estimated that 50,000 acres are under cultivation, and a certain amount of agricultural produce has to be imported, the production not being equal to the demand. Gold mining is largely carried on. In 1895 the total gold output amounted to 2,494,487 ounces, having a value of £8,569,555. Gold, wool, cattle, grain skins, liquors, ostrich feathers, ivory, and minerals, are exported. There were in 1895 424 miles of railways open, and 384 under construction. In the same year there were 1952 miles of telegraph line. The legislature consists of a parliament of two chambers of 24 members each, elected by the districts. The president is elected for five years, and is assisted by a council of five official and two non-official members. The revenue in 1895 amounted to £3,539,953, the expenditure to £2,679,095. The public debt was, in Sept., 1896, £2,690,579.

The English government, during the Zulu war, annexed the territory to the British empire under the Cape Colonial government, 1877. The people protested, sent a commission to England to ask for justice, which was not allowed to present its case. They then took up arms to maintain their independence; 5,000 Boers took possession of Heidelberg in Transvaal, and re-established the republic, with Paul Krueger, president. Feb. 27, 1881, the Boers attacked the British forces on Majuba mountain, and, after eight hours' severe fighting, drove them from their point. The Boers finally acknowledged the suzerainty of Great Britain, but were granted complete self-government. By a convention signed in 1884, however, the British government controls the foreign relations and is represented in Transvaal by a high commissioner. A peculiarity of the constitution, which has been often amended, is the division of the inhabitants of the republic into first-class burghers, comprising all the white citizens who were residents of the republic before May 29th, 1876, or who participated in the war of independence in 1881 or in the Malaboch war of 1894; and the second-class burghers, comprising the alien population who have taken out naturalization papers. Naturalization is granted only after a residence of two years, and the payment of £2, and a naturalized burgher cannot become a first-class burgher except by special resolution of the first chamber, twelve years after naturalization. These provisions have been the cause of great discontent among the alien element, known as Uitlanders, and efforts have been constantly made by them to secure equal political rights with the native Boers. Finally the Uitlander element planned a general uprising toward the end of the year 1895, but the date for the attempt was postponed to Jan. 6, 1896. In the meanwhile occurred the premature and ill-advised raid of the police of the British South Africa Company, under the leadership of Dr. L. S. Jameson (q.v.). The revolutionists were unprepared and unable to send aid to the invading force, which, being surrounded by the Boers, was obliged to surrender. The British high commissioner disclaimed all responsibility on the part of his government for the raid, and urged the Uitlanders to lay down their arms in order to save the lives of the leaders of the expedition. The Uitlanders acted on this advice, and President Krueger treated the captives with clemency. Thus the whole movement collapsed without any real trial of strength between the opposing parties. As to the points at issue between the government and the party of reform, something can be said on both sides. To the Uitlanders it has seemed a gross injustice that the government should be in the hands of what they regarded as a small and ignorant minority. They had resorted to peaceful agitation without avail and they held that the time had come for the exercise of force to redress a grievance which was as real and serious as that which had prompted the American revolution, for the principle for which they were contending was “no taxation without representation.” On the other hand, the Boers could retort that the new-comers had entered the country with a full knowledge of the nature of the constitution, that they had come for nothing but the acquisition of wealth in the gold fields, and that it was no more than right that the character and traditions of the republic as a Boer state should be maintained against aliens. Sixty years before, the Boers had fled from Cape Colony and founded their commonwealth in the wilderness; was it to be expected, they asked, that they should turn over their government to the hands of strangers whom they had not invited? Such were the most striking aspects of the internal political situation in

the Transvaal during the years 1896 and 1897. See Villiers, *The Transvaal* (1896), and James Bryce, *Impressions of South Africa* (1897). See BOERS; CAPE OF GOOD HOPE.

TRANSYLVANIA (called by the Hungarians *Erdély-Ország*—Walach, *Arja*—"the woody and mountainous country;" by the Germans *Siebenbürgen*, "seven castles," from the seven forts built by the Saxons on their establishment in the country, and which forts became nuclei of the walled cities of Hermannstadt, Klausenburg, Kronstadt, Bistritz, Mediasch, Mühlenbach, and Schäsburg; and by the Romans *Transylvania*, from its position *beyond* the forest range which stretches southward from the Carpathians, and forms its western boundary) is the s.e. part of the kingdom of Hungary, and is bounded on the n. by Hungary and Galicia, e. by Bukovina and Moldavia, s. by Wallachia, and w. by the Military Frontier, the Banat, and Hungary. It contains 21,518 Eng. sq. m., with a pop. '90 of 2,247,049, of whom 1,455,000 were Wallachs and eastern Romaines, 651,000 Magyars and Szeklers, 224,000 Germans, the rest being Slaves, gipsies, Armenians, Jews, Italians, etc. Classed according to their religious professions, 739,000 were Greeks Orientals, 606,000 Greek-Catholics and Armenians, 314,000 Calvinists, 269,000 Roman Catholics, and 224 Lutherans. Transylvania is an elevated plateau (its lowest parts being 530 feet above sea level) of an irregular form, somewhat resembling a triangle of which the upper part has been irregularly removed, and is bounded partially on the n., and wholly on the e. and s., by a high range of mountains—a continuation of the Carpathians—which sends out innumerable lateral ridges toward the center of the country, and along the western frontier, so that Transylvania is an almost perfect natural fortress. The soil is extremely fertile. The culture of fruits is extensively practiced, and immense quantities of apricots, peaches, plums, apples, pears, and walnuts are annually produced. The extensive forests, which cover nearly 5,139,000 acres of ground, contribute largely to the wealth of the country. The vine is extensively cultivated, and, in spite of the defective mode of preparation, the produce is excellent in quality. The mineral wealth of Transylvania is great, but has not been adequately developed. Among the minerals found are gold, silver, copper, iron, lead, mercury, manganese, antimony, arsenic, vitriol, etc.

Of the various races which now inhabit Transylvania the Walachs, the earliest possessors, though by far most numerous, were till recently subordinated to the other races of Transylvania, but since the revolution of 1848-49 have acquired a position in the country which, by all means, honest or dishonest, they are striving to improve; the Magyars entered as conquerors in the 10th c., and still constitute the nobility and gentry of the land; the Saxons were introduced in 1143 and 1247 from the Rhenish provinces of Lower Saxony by king Geysa II. and Bela IV. of Hungary, and received special privileges and immunities to induce them to settle in the country and improve the cultivation of the soil; and the Szeklers, or Szekhelyi, are believed to be the descendants of the once formidable Huns. The last three are the dominant races of Transylvania, and live apart from each other—the Magyars occupying the w. and center, the Saxons the s. and n.e., and the Szeklers the southeast. The Magyars, Bulgarians, and Armenians speak the Magyar language as used in Hungary; the Saxons employ Low-German in speaking, and High-German in writing, but with a considerable mixture of Magyar in both; the Szeklers speak a Turanian dialect; and the Walachs use their own language intermixed with corrupt Latin. Transylvania was conquered by the Hungarians about 1000, and was governed by voivodes till 1526, when the death of the Hungarian monarch at Mohacs prepared the way for the union of the two countries under the voivode John Zapolya; but the war which thence arose with the Austrians caused their complete severance, and Zapolya's sway was, in 1535, confined to Transylvania, of which he became sovereign lord, under the protection of the Turks. During the rest of the 16th c., the country was distracted by the bitter strife between the Catholic party, who were supported by Austria, and the Protestant party, who were allied with the Turks; the latter party, headed successively by princes of the houses of Zapolya and Bathory, generally maintaining the superiority. The next chief of the Protestant party was the celebrated Botskay, whose successes against Austria extorted from the emperor an acknowledgment of the independence of Transylvania in 1606. To him succeeded Bethlem Gabor, the determined foe of Catholicism and Austria, who did important service during the thirty years' war. Between his son and successor, Stephen, and Ragotski arose a contest for the crown, in which the latter prevailed; but on Ragotski's death, the civil war was resumed, till the complete rout of the Austrians by the Turks, under Kiupruli, placed the scepter in the hands of Michael Abaffi, who reigned, till his death in 1690, as a vassal of the Porte. The Austrians now again possessed themselves of Transylvania, despite the heroic resistance of Ragotski; and though Tekeli (q.v.) succeeded for a brief period in rolling back the invaders, the peace of Carlovitz, in 1699, again put them in possession; and after the death of Michael Abaffi II., in 1713, Transylvania was completely incorporated with Hungary. It was erected into a grand principality in 1765. During the insurrection in 1848 the Hungarians and Szeklers joined the insurgents, and forced Transylvania to reunite with Hungary, despite the opposition of the Saxons; and the Walachs, still little better than a horde of savages, were let loose over the land to burn, plunder, and murder indiscriminately; the prostration of the country being completed in the following year during the bloody conflicts which took place here between Bem and the Russian troops. In the same year Transylvania was again separated from its turbulent neighbor, and made a crownland; the portions of it which had, in 1835, been annexed to Hungary being

restored, as well as the Transylvanian military frontier in 1851. In 1867 Transylvania was again united with Hungary. It is now a province under the Hungarian crown, and is officially styled a grand-duchy. See *Transylvania, its Products and its People*, by C. Boner (Lond. 1865).

TRANSYLVANIA, a co. in s.w. North Carolina; about 335 sq.m.; pop. '90, 5881, with colored. The surface is mountainous, and most of it timber land. Co. seat Brevard.

TRAP or **TRAPPEAN ROCKS**, an important section of the igneous rocks (q.v.), associated with primary and secondary strata, so called from the Swedish *trappa*, a stair, because these rocks, having resisted, from their greater hardness, the abrading influences which have destroyed the softer sedimentary strata, stand out like huge steps on the faces of the hills and mountains in some places where they occur. Unlike granite, the trap rocks are free from silica crystallizing as a separate constituent of the rock; from the modern volcanic rocks the structural difference is very slight, consisting only of the manner in which the silicate of magnesia and lime, common to both, is crystallized—in the older rocks appearing as hornblende, while in the newer it exists as augite.

Trap rocks are composed of feldspar and hornblende, and the different varieties founded on the chemical composition of the mass depend on the relative proportion of these two minerals. When the feldspar predominates, the rock belongs to the feldspathic trap or feldstone series; and when the hornblende is abundant, it is a hornblendic trap or greenstone. This latter series contains the best-known trappean rocks. The dark hornblende preponderates, and gives to the rock a dull green color, from which it derives its well-known name of greenstone, a translation of the German *grünstein*. It has, however, been shown by Delesse that many trappean rocks owe their color to a dark variety of feldspar which exists in them, and such rocks belong rather to the feldspathic than to the hornblendic series. Some greenstones are very light green, others are so dark as to appear black, and all intermediate shades of color occur. These rocks vary also very greatly in texture: in some, the crystals are sufficiently large to be detected with the naked eye; while others are so fine-grained and compact that it is difficult to resolve the separate crystals even with the help of a lens. Experiments have shown that the size of the crystal in an igneous rock increases in proportion to the length of time during which the mass remains fluid, and so permits the continued crystalline segregation of its various ingredients. The vitreous trap and obsidian would accordingly represent a speedily cooled flow of liquid rock. In fine-grained basalt, the crystalline force has been slightly developed; while greenstones of different textures exhibit its more continued operations in proportion to the coarseness of their texture. The principal varieties of hornblendic trap are greenstone, whinstone, or trap proper. When the crystals are extremely minute, and there is a tendency in the rock to become columnar, it is a basalt. If the feldspar is a soda-feldspar, either albite or oligoclase, it is diorite. Euphotide, diallage rock, or gabbro, is a compound of Labrador feldspar and diallage, a variety of hornblende; it is a coarse, or sometimes fine-grained rock, with a granitic or porphyritic aspect. Hypersthene rock, or hyperite, is made up of Labrador feldspar and hypersthene, another variety of hornblende; it is also a granitic-looking rock, very tough, and of a grayish or greenish-black color: it is very abundant in the isle of Skye. Different varieties of hornblendic trap are based upon the structure of the rock, as well as upon its chemical composition. Trappean obsidian is not a common rock, but it is occasionally found. Porphyritic trap is more abundant; a very black variety has received the name of metaphyre. Amygdaloid is a trap with round or almond-shaped cavities, filled with agate, calcite, or other minerals, scattered through it. Trap tuff consists of fragments of scoriæ, volcanic dust, and pieces of other rocks, forming a coarse irregular mass, sometimes bound together by a calcareous cement.

The characteristic rock of the feldspathic series is feldstone, compact feldspar, or petrosilex. It is a light-colored, greenish, or bluish, very compact, homogeneous, and translucent rock, with a flinty-looking appearance. It forms a large proportion of the contemporary intruded trap rocks in the silurian measures of Wales. Clinkstone, or phonolite, is a variety found in layers or slabs which give a metallic ring when struck with the hammer. Aphanite, or cornean, scarcely differs from true feldstone, except that it is a more compact and tougher rock. Pitchstone, or retinite, is a vitreous feldstone, less glassy than obsidian, and of a green color and resinous luster: a dyke 30 ft. wide occurs on the eastern shores of the island of Arran, cutting through the sandstone rocks. When distinct crystals of one or more minerals are scattered through an earthy or compact base of feldstone, a feldspathic porphyry is formed. The ancient red porphyry of Egypt, known as *rosso antico*, belongs to this set of rocks; it consists of a red feldspathic base, in which are disseminated rose-colored crystals of oligoclase, with some plates of blackish hornblende and grains of oxidized iron ore.

As true igneous rocks come up from below, there is always a connection of some kind between the ejected mass and the inferior source of supply, except when the ejected materials have been subsequently arranged by atmospheric or aqueous agency. Pipes and dykes form such connections, and they are generally associated with tabular masses which have either spread themselves over the surface, or inserted themselves between the beds of the sedimentary strata. When the materials have been mechanically arranged,

the igneous rocks are contemporaneous with the deposits in which they occur; but in all cases where strata are cut through by dykes or pipes, or are covered by flows of liquid rock, the igneous rocks are newer than the sedimentary strata with which they are associated.

TRA'PA, a genus of plants, of the natural order *haloragiceæ* (q.v.), having a 4-parted calyx, a 4-petallous corolla, and a nut on which the altered calyx appears in the form of spines; the cotyledons very unequal in size. All the species are aquatic plants, with floating habit. *T. natans*, the **WATER CALTROP**, is the only European species. It is found in ditches and ponds in the s. of Europe, and is grown in ponds in Holland. The floating leaves are rhomboidal, toothed and smooth; those under water are cut into capillary segments. The fruit has four spines; the kernels are large and almond-like. They are good to eat, either raw or roasted, and somewhat resemble chestnuts in taste. They are often used in soups. The French name is *marron d'eau* (water chestnut). *T. bispinosa*, the **SINGHARA NUT**, affords a great part of the food of the inhabitants of Cashmere, and a tax laid upon it by Runjeet Singh yielded a large sum annually. *T. bicornis* is much cultivated in China, where the cultivation of aquatic plants is carried on to a degree unknown in other parts of the world, and its fruit is much used for food. In both these species, the nut has only two spines.

TRA'PANI (anc. *Drepanum*), one of the principal sea-ports of Sicily, on cape Trapani, in the n.w. of the island; capital of the province of that name, 40 m. w. of Palermo. Pop. '95, commune, 47,900. The town is walled, and defended by a fortress. The streets are wide, and well paved with flag-stones. There is a natural harbor, capable of admitting vessels of about 300 tons; a handsome town-house; a tower built by the Saracens; a cathedral; and many churches, some of which contain fine paintings. The inhabitants are engaged in the tunny, anchovy, and coral fisheries. The coral is brought from the coast of Barbary to Trapani to be cut and polished for exportation. Trapani is a busy town, and exports sumac, salt, soda, coral, alabaster, wine, tunny, and anchovies.

Ancient *Drepanum* was probably founded by the Carthaginians, under whom it became an important stronghold. Here took place a celebrated naval engagement between the Romans, under P. Claudius, and the Carthaginians, under Adherbal, 249 B.C., in which the former were completely beaten. In Roman history the name scarcely appears, but it seems to have flourished in obscurity both then and during the middle ages.

TRAPEZIUM (Gr. *trapezion*, a little table) is the general term for a four-sided plane figure, and is synonymous with "quadrilateral." But since all four-sided figures which have parallel sides possess distinctive appellations, the term trapezium is frequently restricted to quadrilaterals whose sides are not parallel. The trapezium in the restricted sense (exclusive of parallelograms), has some remarkable properties; thus, if its sides be bisected, and the adjacent points of bisection joined, the resulting four-sided figure is a parallelogram; the sum of the squares of its diagonals is equal to the sum of the squares of the sides, together with four times the square of the line joining the middle points of the diagonals; if it can be inscribed in a circle (i.e., if its four corners are in the circumference of any circle), the one pair of opposite angles is equal to the other pair, and the sum of the rectangles by each pair of opposite sides is equal to the rectangle by the diagonals; if it can be described about a circle (i.e., if a circle can be made to touch on the interior, each of the four sides), the one pair of opposite sides is equal to the other pair.

TRAPEZOID, a plane quadrilateral which has two of its sides parallel, and the other two not.

TRAPPIST ORDER, THE, celebrated among the religious orders of the Roman Catholic church for its extraordinary austerities, is so called from La Trappe, an abbey of the Cistercian order founded in the middle of the 12th century. The discipline of this monastery, in common with many others of the more wealthy monastic bodies, especially of those which, by one of the corruptions of the period, were held *in commendam*, had become very much relaxed; and in the 17th c. but little trace of the ancient religious observance remained. In the first half of that century the abbey of La Trappe fell, with other ecclesiastical preferments, to the celebrated Armand Jean le Bouthelier de Rancé. The circumstances which led this remarkable man to undertake a reform of his monastery, and in the end the establishment of what was equivalent to a new religious order, have been already detailed in the article Rancé (q.v.). It was in the year 1662 that he entered in earnest upon his duties, and commenced his reforms. At first he encountered decided, and even violent opposition from the brethren; but his firmness and vigor overcame it all. He himself, as an evidence of a complete change of life, entered upon a fresh novitiate in the year 1663; and in the following year made anew the solemn profession, and was reinstalled as abbot. From this time may be dated the introduction of the new austerities which have characterized the order. The monks were forbidden the use of meat, fish, wine, and eggs. All intercourse with externs was cut off, and the old monastic habit of manual labor was revived. The reform of De Rancé is founded on the principle of perpetual prayer and entire self-abnegation. By the Trappist rule, the monks are obliged to rise at two o'clock A.M. for matins in the church,

which lasts till half-past three; and, after an interval occupied in private devotion, they go at half-past five to the office of prime, which is followed by a lecture. At seven they engage in their several daily tasks, indoors or out, according to the weather. At half after nine they return to the choir, for the successive offices of terce, sext, and none; at the close of which they dine on vegetables dressed without butter or oil, and a little fruit. This meal is succeeded by manual labor for two hours, after which each monk occupies an hour in private prayer or reading in his own cell until four o'clock, when they again assemble in the choir for vespers. The supper consists of bread and water, and, after a short interval of repose, is followed by a lecture. At six o'clock they recite complin in choir, and at the end spend half an hour in meditation, retiring to rest at eight o'clock. The bed is a hard straw mattress, with a coarse coverlet; and the Trappist never lays aside his habit, even in case of sickness, unless it should prove extreme. Perpetual silence is prescribed, unless in cases of necessity. The minor practices and observances are devised so as to remind the monk at every turn of the shortness of life and the rigor of judgment; and the last scene of life is made signal in its austerity by the dying man being laid during his death-agony upon a few handfuls of straw, that he may, as it were, lay aside upon the very brink of the grave even the last fragment of earthly comfort to which the necessities of nature had till then compelled him to cling.

The reformed order of La Trappe scarcely extended beyond France in the first period of its institution. The inmates of La Trappe shared, at the revolution, the common fate of all the religious houses of France; they were compelled to quit their monastery; but a considerable number of them found a shelter at Valsainte, in the canton of Freiburg in Switzerland. In the vicissitudes of the revolutionary war, they were driven from this house; and a community numbering about 250, together with a large number of nuns, who had been established for purposes of education, found refuge at Constance, at Augsburg, at Munich, and eventually, under the czar Paul, in Lithuania and White Russia. Later in the course of the war, small communities obtained a certain footing in Italy, Spain, America, England, and, notwithstanding the prohibitory law, even in France, at Mont Genevre. After the restoration they resumed, by purchase, possession of their old home at La Trappe, which continues up to the present time to be the head monastery of the order, and numbers nearly 200 members. During the course of the last 50 years they have formed many establishments in France; a few in Germany; a very considerable one at mount Melleray, near Cappoquin, in the county of Waterford, Ireland; and others, with still more extensive territory annexed, in Kentucky, Illinois, and other states of North America. A modification of the Trappist order, called "Trappist preachers," was established about 30 years since, at Pierre-qui-Bire, near Avallon.—See Gaillardin's *Trappistes; ou l'Ordre de Cîteaux au 19 Siècle* (Paris, 1844).

TRASH. See SUGAR.

TRASIMENUS LACUS, the ancient name of an Italian lake (*lago Trasimeno*, or *lago di Perugia*) lying between the towns of Cortona and Perugia. It is about 10 m. in length by 8 in breadth; the greatest depth is not above 30 ft. The lake has no apparent outlet, and the margins are flat and overgrown with reeds. It is surrounded on all sides by hills, those on the north side, extending from Cortona to the lake, being known as the Gualandro hills—the *montes Cortonenses* of Livy—covered at the present day with oak, vine, and olive plantations. The lake contains three islands. **Trasimenus Lacus** is memorable chiefly for the great victory obtained by Hannibal in 217 B.C. during the second Punic war, over the Romans, under their consul, C. Flaminius. Hannibal, leaving Fæsulæ, passed close by the camp of Flaminius at Arretium, laying waste the country as he proceeded in the direction of Rome. This, as the Carthaginian general intended, induced the consul to break up his encampment, and follow in pursuit, Hannibal in the meantime taking up a strong position on the hills on the n. side of the lake, along which he was passing. The consul coming up early next morning, when the whole place was enveloped in mist, saw only the troops in front on the hill of *Tuoro*, with whom he was preparing to engage, when he found himself surrounded and attacked on all sides. The Carthaginians thus had the Romans completely in their power, and took such advantage of the opportunity that 16,000 Roman troops are said to have been either massacred or drowned in the lake, Flaminius himself being among the first who fell: 6,000 troops who had forced their way through the enemy, surrendered next day to Maharbal. It is said both by Livy and Pliny that the fury on both sides was so great as to render the combatants unconscious of the shock of an earthquake which occurred during the battle.

TRAS-OS-MONTES (beyond the mountains), a province of Portugal, forming the n.e. corner of the country, is bounded on the n. and e. by Spain, on the s. by the river Douro, and on the w. by the Portuguese province of Minho. Area, 4260 sq.m.; pop. '90, 418,917. It is in the main a cold plateau, with bare mountain masses, broken through by deep romantic ravines; but the port-wine district, known as the *Alto-Douro*, is very pleasant. Considerable quantities of wheat and rye are raised, but the chief products are wine and oil. In several places, the silk-worm cultivation is prosecuted with success. Fruits, especially oranges, are produced abundantly in the valleys, and sumach on the mountains, which are also rich in unutilized metallic wealth.

TRASS, a tufaceous deposit of the extinct volcanoes of the Eifel, near Coblenz, resembling the Puzzolana of Naples. Its base consists almost entirely of pumice, in which are imbedded fragments of basalt, burnt shale, slate, sandstone, etc., and even numerous trunks and branches of trees. Its formation is accounted for by supposing an eruption to have taken place, with copious evolution of gases, in a lake-basin, and a flood of the mud thus formed to have swept away whatever came before it. Large areas are covered by the trass, which has choked up valleys, now partially re-excavated.

TRAVANCORE, a protected state in the extreme s. of India, bounded on the e. by the states of Tinneveli and Madura, and on the w. by the Indian ocean. Area, 6,730 sq.m.; pop. '91, 2,557,736. At the southern extremity of the state is cape Comorin (properly Kumarin). On the elevations the soil is light and gravelly; in the valleys it is in general a deep black mold. Rice, the sago-palm, and vegetables, are the principal products. Formerly the capital was Travancore, a decayed and unimportant town; the present capital is the small town Trivandrum.

TRAVELERS, LAW AS TO. In the United Kingdom, entire freedom of traveling is one of the rights of the subject. The rights of travelers in regard to the use of roads are stated under the head of highway (q.v.). Other rights are noticed in connection with inn (q.v.). With regard to travelers by conveyances, whether by land or sea, if the party conveying is a public carrier, then the following are his liabilities: A public carrier having a stage-coach (and railway companies are on the same footing) does not engage or warrant to convey a traveler with absolute safety, as is the case with respect to goods, but merely to convey without negligence on his part; hence, if the conveyance meets with some accident, resulting in injury to the traveler, the right of the latter to recover damages depends on whether the carrier or railway company has been guilty of negligence. Considering that, in case of a dispute, it is always left to a jury to say whether there was negligence or not, it is a safe maxim, that there is scarcely anything in the form of an accident which is not resolvable by a jury into negligence on the part of the carrier or company; and an injured traveler has seldom much difficulty in throwing the burden on the carrier of proving that there was no negligence on his part; and this proof, for the reasons stated, is seldom successful, at least where the accident arose from a defect in guiding the carriage. In case of accidents not fatal, the party injured has almost always a remedy against the carrier, the chief dispute being as to the amount of damages, the amount legally demandable varying according to the position in life and injury to business caused by the accident. In case of death caused by blamable accident in traveling, there was formerly no remedy available to the executors or relatives, and there is none at the present day; but if the deceased party leave a wife, husband, parent, or child, then these, but no other relations, can sue for damages. In the case of a traveler's proceeding a great distance over several lines of railway, his remedy is entirely against the company with whom he contracted—that is to say, to whom he paid the lump sum, and from whom he obtained his ticket.

A noticeable difference between England and the U. S. in what is known as the "law of the road," is that in the U. S. vehicles and pedestrians meeting and passing on the highway go each to the right-hand side of the road, while in Eng. the rule is to take the left under similar circumstances. The law in the U. S. as to the liability of common carriers has been already noticed. It may be added that in analogy to the law of Eng. most of the state legislatures have enacted laws giving to representatives of persons whose death is caused by the negligence of carriers or others the right to recover damages to the amount of \$5,000. See PASSENGER, LUGGAGE.

TRAVELER'S TREE, or RAVENALA, *Urania speciosa*, or *Ravenala Madagascariensis*, a remarkable plant of the natural order *musaceæ*, a native of Madagascar, and forming a characteristic feature of the scenery of many parts of that island. The stem resembles that of the plantain, but sends out leaves only on two opposite sides, like a great expanded fan. The lower leaves drop off as the stem grows, and in an old tree the lowest leaves are sometimes 30 ft. from the ground. A tree often has 20 or 24 leaves, the stalk of each leaf being 6 or 8 ft. long, and the blade 4 or 6 ft. more. The blade of the leaf is oblong, bright green, and shining. The fruit is not succulent, but is filled with a fine silky fiber of the most brilliant blue or purple color, among which are about 30 or 40 seeds. Forty or fifty fruits grow in a bunch, and three or four bunches may be seen at once on the tree. The leaves are much used for thatch, and for many other purposes; and the leaf-stalks for the partitions, and often even for the walls of houses. The leaf-stalks always contain water, even in the driest weather, more than a quart being readily obtained by piercing the thick part of the base of a leaf-stalk, and this water is pure and pleasant; hence the name *traveler's tree*.

TRA'VEMÜNDE. See LÜBECK.

TRAVERSE, in fortification, mounds of earth, above the height of a man, and 18 ft. thick, placed at frequent intervals on a rampart to stop shot which may enfilade the face of such rampart. A fire of this nature, in the absence of traverses, would dismount the guns, and prove altogether ruinous. The traverses also give means of disputing the progress of an assailant who has gained a footing on the wall, for each traverse becomes a defensible parapet, only to be taken by storm.

TRAVERSE, a co. in w. Minnesota, adjoining S. Dakota; bounded w. by lake Traverse; drained by the Mustinka and Bois de Sioux rivers; 552 sq. m.; pop. '90, 4516, chiefly of American birth. The surface is prairie. Co. seat, Wheaton.

TRAVERSE CITY, city and co. seat of Grand Traverse co., Mich.; on Grand Traverse bay and the Chicago and West Michigan, the Grand Rapids and Indiana, and the Manistee and Northeastern railroads; 60 miles n.e. of Manistee. It is the seat of the Northern state hospital for the insane; has national and state banks, electric lights, ladies' library association, saw, planing, and flour mills, iron foundries, and daily and weekly newspapers; and, by its regular communication with the principal ports on lake Michigan, has large shipping interests, particularly of lumber. Pop. '90, 4353.

TRAVERSING PLATFORM, an arrangement for the more rapid and easy movement of cannon in battery. The gun is either mounted on an ordinary truck-carriage, or on rollers under its trunnions. The truck or rollers work in and out on two parallel iron rails, which rails are mounted on the traversing carriage, and are 16 ft. or more in length. Wheels at each end of this platform, or more frequently if the weight of the gun be very great, are placed at right angles to the direction of the rails, and run on circular tramways, which have their center in the embrasure through which the gun is fired. The rails incline upward toward the rear, to moderate the gun's recoil. The advantages are, that the leverage for turning the gun is increased by the platform's length, while the circular rails diminish the resistance; that the gun is easily run out for firing on the upper rails; that by its own recoil it runs itself in again for loading; and that a much smaller embrasure is required to give a good compass to the muzzle.

TRAVESTY (Fr. *travestir*, to disguise, particularly through the effect of *contrast*; e.g., to dress in another sex's or person's clothes; Ital. *travestire*) is a term applied in literature to denote a burlesque representation of something previously executed in a serious and lofty manner. It differs from parody (q.v.) in this respect: That while the latter changes the subject-matter and the *dramatis personæ*, but mockingly imitates the style of the original, the former leaves the subject-matter partially, and the *dramatis personæ* wholly, unaltered; producing a purely comic effect by the substitution of the mean, the frivolous, and the grotesque in action or speech, for the serious, the noble, or the heroic.

TRAVIS, a co. in central Texas, drained by Colorado river and Union creek; traversed by the International and Great Northern, the Houston and Texas Central, and other railroads; about 1040 sq. m.; pop. '90, 36,322. Co. seat, Austin.

TRAVNIK, a t. of Bosnia, and its capital, stands on the Lasva river, 45 m. w.n.w. of Bosna-Seral. Its numerous mosques and the castle, which dates from the middle ages, are the principal edifices. It contained (1885) 5933 inhabitants. The principal branch of industry is the manufacture of sword-blades.

TRAWLING, a mode of fishing by a net dragged along the bottom of the sea, behind a boat. It is much employed in deep-sea fishing on the coast of England, and by far the greater part of the fresh fish brought to the London market, herring and mackerel excepted, is now obtained by trawling. Trawling has long been practiced on some parts of the s. coast of England, but of late years this mode of fishing has been adopted much more extensively than before, and has been introduced where it was formerly unknown, particularly on the e. coast of England, not without great opposition on the part of line-fishers and others, who have loudly complained of injury done by it to the fisheries by destruction of spawn, and otherwise. The report of the commissioners on the sea fisheries of the United Kingdom, 1866, sets aside all complaints against it, however, as unfounded; while its great productiveness recommends it as advantageous to the public interest. The *trawl*, or *beam-trawl*, as it is often called, is a triangular purse-shaped net, about 70 ft. long, usually having a breadth of about 40 ft. at the mouth, and gradually diminishing to 4 or 5 ft. at the commencement of the *cod*, or smaller end of the net, which is about 10 ft. long, and of nearly uniform breadth. The upper part of the mouth is secured to a wooden beam about 40 ft. long, which keeps the net open; this beam is supported on two upright iron frames, known as the *trawl-heads* or *irons*. The under side of the net corresponds with the upper, except that instead of being fastened to a beam, it is made with a deeply-curved margin attached to the *ground-rope*, the whole length of it in contact with the ground. A trawl has also generally two *pockets*, one on each side, made by lacing together the upper and under parts, so that fish turning back from the cod may be caught in them. The meshes vary in size from 4 in. square at the mouth to an inch and a quarter square in the cod. Two stout ropes, of about 15 fathoms each, are fastened, one to the front of each of the trawl-heads, the other ends united to form a bridle, to which is shackled a warp 150 fathoms long. By this warp the trawl is towed, the quantity of rope paid out depending on depth of water, weather, and other conditions. Trawling is generally in the direction of the tide, sometimes across it, but never against it. The rate of progress is usually only from $\frac{1}{4}$ a m. to 2 m. an hour faster than that of the stream. The trawl can only be used with advantage on a sandy bottom or other smooth ground. On rough ground the net would be torn in pieces. The vessels employed in trawling on the Dogger bank and elsewhere near the English coast vary in size from 35 to 60 tons. Many of these trawlers, however, stay out

at sea for six weeks at a time in all seasons of the year; their fish being packed in ice collected by fast-sailing cutters, and so conveyed to market. Cod, haddock, and other *white-fish* are caught in great numbers by trawling; and some kinds of flat-fish, as soles, are scarcely to be obtained by any other means. Smaller trawl-nets than those above described are used in bays and estuaries. A kind of trawl called the *pole-trawl* was formerly in use in some parts of England, but is now used only in the s. of Ireland. It is much less effective than the beam-trawl. Instead of a beam, two poles of 25 to 30 ft. long are used, rigged out on the sides of the vessel, to keep the mouth of the net open.

The term trawling is commonly, although incorrectly, employed in Scotland to designate a particular mode of herring-fishing, which, however, is only seine-net fishing (see **NETS**) on the principle of encircling shoals of fish, as has been practiced in pilchard-fishing on the s. coast of England from time immemorial. It is of recent introduction in Scotland, and has been opposed by the drift-net herring-fishers, from interested motives, in the same way that beam-trawling has been opposed on many parts of the English coast. The legislature too hastily accepted the views of its opponents; but a royal commission having been appointed to inquire into the subject, made a report decidedly favorable to it in 1863; and the judgment of that commission was sustained by the report of the sea-fisheries commission of the United Kingdom in 1866.

TREACLE. See **SUGAR**.

TREAD-MILL, an appliance of prison discipline, much in use some years ago in the prisons of Great Britain, the invention of sir William Cubit, of Ipswich. It consists of a wheel in the form of a long cylinder, furnished with 24 steps round its circumference, and turned on its axis by the tread of prisoners, each of whom may be made to tread in a separate compartment, so boarded off that he can have no intercourse with the rest. The prisoners are assisted and supported by a hand-rail, and cause the wheel to revolve about twice in the minute. The tread-mill has sometimes been made productive by being used to grind corn or turn machinery. It has been found an objection to its use, that it does not admit of being modified to meet the varying strength of individual prisoners; and as an instrument of prison discipline, it has been generally supplanted by the *crank*, a small flaked wheel, like the paddle-wheel of a steamer, which, on the prisoner turning a handle outside, revolves within a box partially filled with gravel. The amount of strength necessary to each revolution can be regulated by the quantity of gravel used, and a register placed outside the prisoner's cell records the number of revolutions made. The crank is only used when hard-labor is part of the prisoner's sentence.

TREADWELL, DANIEL, 1791-1872; b. Mass.; invented a new form of the printing press in 1818. During a visit to England in 1819 he originated a power-press, and in 1826 he proposed the turnout system for single-track railroads. He invented in 1829 the first successful machine to spin hemp for cordage, and works for that purpose were put up in Boston in 1831. He invented what substantially is now known as the Armstrong gun at least eighteen years before sir William Armstrong, who added to the Treadwell gun rifling and breech-loading. Treadwell, with Dr. John Ware, founded in 1822 the *Boston Journal of Philosophy and the Arts*. He was Rumford professor of technology at Harvard college, 1834-45.

TREADWELL, JOHN GOODHUE, 1805-56; b. Salem, Mass.; son of Dr. John Dexter, graduated from Harvard university, 1825; studied medicine, established a practice in Salem, 1825; and devoted much time to farming by scientific methods, and making agricultural experiments. He founded a professorship of physiology and anatomy at Harvard university, bequeathing to it an estate valued from \$75,000 to \$100,000; and to the Essex county agricultural society he left his Topsfield farm for experimental purposes.

TREASON (Fr. *trahison*, Lat. *traditio*, from *tradere*, to give up or betray), in the law of the United Kingdom, is the highest civil crime which a member of the community can commit, being treachery against the sovereign. By the ancient common law of England, there was great latitude as to what was held by the judges to be treason, whereby, says Blackstone (b. iv. c. vi.), the creatures of tyrannical princes had opportunity to create abundance of constructive treasons, that is, to raise, by forced and arbitrary constructions, offenses into the crime and punishment of treason, which never were suspected to be such. Thus, the accroaching, or attempting to exercise royal power—a very uncertain charge—has been treated as treason; and killing the king's father or brother, or even his messenger, has also been so treated. The inconvenience of these constructive treasons led to the passing of the statute of 25 Ed. III. c. 2, which attempted to define treason, and it was defined in five forms: 1. When a man compasses or imagines the death of the king, queen, or their eldest son and heir. Under this clause it was held that the husband of a queen-regnant was not included; but it includes a king *de facto* without regard to his title. The phrase "compassing and imagining the death of a king," has given rise to much discussion, but it has been taken to mean the mere purpose or design, as distinguished from the carrying such design into effect; nevertheless, the purpose can only be proved by some overt act, such as providing weapons or ammunition for the purpose of killing the king, assembling and consulting on the means to kill the king, etc. The law has often, however, been strained, and in arbitrary reigns.

even a sermon unpreached was held to convict Peachum; and a paper found in a closet, to convict Algernon Sidney, though merely speculative in its character. 2. Another form of treason is the violating of the king's companion (i.e., wife), or his eldest daughter unmarried, or the wife of the king's eldest son and heir. 3. Another form is that of levying war against the king in his realm, either by taking arms to dethrone the king, or under pretense to reform religion or the laws; by resisting the king's forces; by joining an insurrection, with an avowed design to pull down all inclosures, all brothels, and the like; though such a conspiracy, if aimed at a particular house, would be only a riot. 4. It is also treason to adhere to the king's enemies in the realm by giving them aid and comfort, as by sending intelligence or provisions, or selling arms. 5. Lastly, it is treason to slay the chancellor, treasurer, or the king's justices of the bench, or in assize, while in their places administering justice. Besides these specific forms of treason, the statute of Edward III. enacted that, if there should be other cases not above specified, the judge should tarry without going to judgment, till the king and parliament should judge it treason or other felony—which was a safeguard against the judges indulging too much in refinements about constructive treason. At a later period, between the reigns of Henry IV. and queen Mary, the courts returned to the system of inventing constructive treasons, and actually included as such the clipping of money, burning houses to extort money, refusing to abjure the pope, etc. These and other new-fangled treasons were totally abolished by a statute of 1 Ed. VI. c. 12. By a subsequent statute of 1 Anne c. 17, whoever endeavors to hinder the next in the succession under the act of settlement, from succeeding to the crown, is to be held guilty of treason; and whoever maliciously affirms another to have right to the crown, otherwise than according to the act of settlement, commits treason. Moreover, by 36 Geo. III. c. 7, whoever compasses or intends death or bodily harm to the person of the king, is to be adjudged a traitor. One of the characteristics of an indictment for treason is, that a copy of the indictment, and a list of the witnesses and jurors, must be delivered to the prisoner. This information, which gives the names, and also the places of abode of all the witnesses, must be delivered to the prisoner ten days before the trial; and the prisoner is entitled to have counsel assigned to defend him. This right, which prisoners accused of other crimes have not in English law, was conferred by a statute of Will. III.

The punishment of treason was severe and even revolting. The traitor was to be drawn on a hurdle to the place of execution, hanged by the neck, his head then severed from the body, the body divided into four quarters; and the head and quarters to be at the disposal of the crown. But in 1870 these barbarities were repealed, and the sentence is now changed into hanging. The consequence of a conviction of treason was forfeiture and corruption of blood; the corruption of blood having the effect that the attainted person could neither inherit lands from his ancestor, nor transmit them to any heir. But this was altered as regards England and Ireland in 1870 by the statute 33 and 34 Vict. c. 23. The convict forfeits and is disqualified for any public office; the court may order him to pay the costs of his conviction, and his whole property is transferred to administrators named by the crown, who administer it and retransfer the surplus to his heirs and representatives.

There are certain minor offenses which are called misprision of treason, being those closely bordering on treason. Such are offenses which consist in the bare knowledge and concealment of treason, without any degree of assent thereto, for any assent makes the party a principal traitor. If a person, knowing of the treason, do not forthwith reveal it to some judge of assize or justice of the peace, this is the crime of misprision of treason. The punishment of misprision of treason was loss of goods and lands during life. Another offense closely related to treason is the willfully pointing a gun at, or attempting to strike, the person of the sovereign, with intent to injure him (or her); the offense being recently reduced, by statute 5 and 6 Vict. c. 51, to one punishable with three years' imprisonment. There is also a cognate offense created by 11 and 12 Vict. c. 12—that of intending to depose the queen, or levying war against her in order to intimidate her or the houses of parliament. The offense of *præmunire* (q.v.) was originally the introducing a foreign power into the country, and the name was extended to similar offenses. In the United States T. may be either against an individual state or against the United States. In the former case it is an offense at common law. By the constitution (art. 3, sec. 3) treason against the United States consists in levying war against them, or in adhering to, or giving aid and comfort to, their enemies. It is further provided that no person shall be convicted of treason unless on the testimony of two witnesses to the overt act or upon confession in open court. The penalty is death. A conspiracy to commit treason does not constitute the crime, unless followed by overt acts. In the meaning of the term "enemies" of the United States, pirates or robbers actually invading our territory are included.

TREASURER, LORD HIGH, the name given to the third great officer of the crown in England, who, in former times, was sole head of the king's exchequer. In the reign of William I. a separate board and court for matters of revenue was appointed after the model of the exchequer of Normandy, and a treasurer and other officers were appointed for transacting business relating to the royal revenue. Odo, earl of Kent, was the

earliest holder of this office; but the early treasurers were for the most part churchmen. The functions of the treasurer were often discharged by the chief justiciary, and the offices of justiciary and treasurer seem not to have been completely separated till the reign of Stephen. The office of lord high treasurer was for the first time put into commission by James I. in 1612; and from the accession of George I. down to the present time, it has been the practice to vest the office in a board of lords commissioners of the treasury. See TREASURY. In Scotland, a similar office existed prior to the union; and there were also lords high treasurers appointed in Ireland. On the union of 1707, the lord high treasurer of England became the lord high treasurer of Great Britain; and in 1816, by statute 56 Geo. III. c. 98, on the consolidation of the same offices in England and Ireland, he was constituted the lord high treasurer of the United Kingdom.

TREASURE-TROVE is the finding of hidden treasure in the earth, the word treasure meaning coin, gold or silver plate, or bullion. By the law of England, he who finds such things hidden in the earth is not entitled to them, but they belong to the crown. This is an exception to the general rule, that he who first finds a thing, whose owner is unknown, is entitled to keep it; and accordingly the exception is construed strictly, so that if the coin, etc., is not hidden in and covered by the earth, the finder, and not the crown, is entitled to it. If it is treasure-trove in the strict sense above described, then it is the duty of the finder to give notice to the crown; and to conceal it or appropriate it is an indictable offense, punishable by fine and imprisonment. In India, the importance of treasure-trove led, in 1878, to the passage of the Indian Treasure-Trove Act. By this act, the finder holds it, if no owner can be found; if he is found, he may have one-fourth, and the finder the remaining three-fourths. The Government, however, reserves the right of purchase by the payment of one-fifth more than the value of the material.

TREASURY, that department of the executive of the government of the United Kingdom which has the control of the revenue and expenditure of the country. The head of the treasury was in former times an officer called the lord high treasurer (see TREASURER, LORD HIGH), but his office has ever since the accession of George I. been executed by lords commissioners, who have become his permanent representatives. The treasury board now consists of the prime minister (generally styled first lord of the treasury), the chancellor of the exchequer, and three junior lords of the treasury, who have usually seats in parliament, as have also the two joint-secretaries of the treasury. The first lord being the head of the administration, his duties are not limited to the treasury, which is chiefly conducted by the other members of the board. The chancellor of the exchequer, who holds under a distinct patent the office of under-treasurer, is the effective head of the treasury, exercising the most responsible control over the expenditure of the different branches of the service, as also over all works demanding unusual outlay in the naval, military, and civil departments, either at home or in the colonies. He prepares an annual estimate of the expenses of the country, and of the ways and means by which they are proposed to be met; and this statement, known as the budget, is submitted by him to the house of commons. The prime minister, when a member of the house of commons, has occasionally held at the same time the office of chancellor of the exchequer. The duties of the junior lords are in a great measure formal: the heaviest portion of the executive functions of the treasury devolves on the secretaries.

The function of payment has ever since the restoration been completely separated from the custody of the public revenue, the former only being vested in the treasury, while the latter belongs to the exchequer. By an arrangement effected by 4 and 5 Will. IV. c. 15, the revenue flowing into the treasury is paid into the bank of England, to the credit of the comptroller-general of the exchequer, and all payments on the public accounts are made pursuant to a warrant or order of the treasury. No moneys voted by parliament can be drawn from the exchequer without the warrant of the treasury board, nor can any payment be made from the civil list without its authority.

The duties of the treasury board are numerous. The supplies for the army, navy, and civil service are issued under its authority. In virtue of various statutes, it has the regulation of the salaries of newly created officers in other departments, and of the number of officers in the establishments for new branches of the public service. The duties of the treasury also comprise the examination of the expenses of legal establishments, sheriffs, county courts, and criminal prosecutions. All payments for civil salaries, allowances, and incidental charges payable in England, and all payments for the army, navy, and ordnance, are made upon the special authority of the treasury by the paymaster-general. The boards of customs and inland revenue, and the post-office, are subject to its general authority. The office of woods and forests now discharges many of the duties which formerly devolved on the treasury, but is subject to its regulations. The establishments of colonial and other offices are also subject to the control of the treasury with regard to their expenses. The treasury may be appealed to against the decisions of subordinate departments in all cases connected with the receipt of revenue. The treasury possesses the patronage of the departments immediately subordinate to it. The church patronage of the crown—except that which belongs to the lord chancellor—is usually disposed of on the advice of the first lord of the treasury; and the foreign and colonial secretaries, in all important appointments falling under their patronage, are in the practice of consulting the first lord of the treasury.

TREASURY OF THE UNITED STATES, the department of the executive government in which is vested the management of the national revenues. Its principal officer is the secretary of the treasury, whose position, though commonly supposed to be inferior to that of the secretary of state is really more important and responsible, except in certain rare emergencies. Besides the secretary there are 2 assistant secretaries, a treasurer, a registrar, a solicitor, 3 comptrollers, 6 auditors, commissioners of internal revenue and of customs, and some 16,000 employees, of whom about 3,000 are at Washington, and the rest in the internal revenue department or the sub-treasuries and custom-houses. Among the most important of the 18 bureaus into which the treasury department is divided are the coast survey, the bureau of statistics, and the mint.

TREAT, ROBERT, 1622-1710; b. England; emigrated to this country with Saltonstall, and became a judge in Milford, Conn. In 1675, when Springfield was attacked by Indians, he headed a relieving party and defeated the enemy at Hadley, and took part in the battle at Narragansett fort. He was lieutenant-governor, 1676, and governor, 1683-98.

TREAT, SELAH B., D.D., 1804-77; b. Hartford, Conn.; d. Boston. He graduated at Yale coll., 1824; took up the practice of law, but gave it up to study for the ministry; graduated at Andover theol. sem., 1835, and became pastor of the Pres. church, Newark, N. J., 1836, resigning in 1840 to become editor of the *Biblical Repository and American Eclectic*. He was sect'y of the American Board, 1843-47, and corresponding sect'y, 1847-77, and was highly esteemed for faithful service.

TREATY, in public law, an agreement of friendship, alliance, commerce, or navigation, entered into between two or more independent states. Treaties have been divided by publicists into *personal* and *real*, the difference being that the former relate exclusively to the persons of the contracting parties—for example, treaties guaranteeing the throne to a particular sovereign and his family—and the latter are treaties for national objects, independent of the rulers of the state. While personal treaties expire with the death of the sovereign, or the extinction of his family, real treaties bind the contracting parties independently of any change in the sovereignty of the states. The constitution of each particular state must be looked to, to determine in whom the power of negotiating and contracting treaties with foreign powers resides. In monarchies, whether absolute or constitutional, it is usually vested in the sovereign. By the constitution of Great Britain, the exercise of this power is subject to parliamentary censure; ministers who advise the conclusion of any treaty which shall afterward be judged derogatory to the honor, or disadvantageous to the welfare of the nation, being liable to impeachment, a proceeding of which English history affords numerous instances; as the impeachment of De la Pole, earl of Suffolk, in 1451, for making a convention of peace without the assent of the privy council; of Wolsey, in 1529, by the house of lords, for making treaties without the king's knowledge; and of the earl of Orford by the commons, in 1701, for advising treaties for dividing the dominions of Spain. In republics, the chief magistrate, senate, or executive council is intrusted with the exercise of this sovereign power. The constitution of the United States of America (art. ii, sec. 2) vests it in the president, with the advice and consent of the senate. No special form of words is necessary for the validity of a treaty; but modern usage requires that an agreement which has originally been verbal, should as soon as possible be committed to writing. There are certain compacts between nations which are included in the exercise of a general implied power confided to certain public agents as incidental to their official position. Such are the acts of generals or admirals limiting hostilities by truces, capitulations, or cartels for the exchange of prisoners, which do not require the ratification of the supreme authority, unless there be a reservation making that necessary. In other cases, however, a public minister or other diplomatic agent is not entitled to conclude or sign a treaty with the foreign power to which he is accredited, without a full power independent of his general letter of credence. Even in the case of a treaty concluded with full powers, it is often considered expedient to have a special ratification by the sovereign, or other proper authority of the state contracting.

A treaty is considered to be extinguished when one of the contracting powers loses its existence as an independent state, when the internal constitution of either state is changed so as to make it inapplicable; and in case of war between the contracting parties, unless the stipulations of the treaty have been expressly with a view to the rupture. As there is often a difficulty in distinguishing stipulations perpetual in their nature from those that are extinguished by war, it is common to insert clauses in treaties of peace reviving and confirming the treaties formerly subsisting between the contracting parties.

A *Treaty of guaranty* is an engagement by which one state promises to aid another when it is disturbed, or threatened to be disturbed, in the peaceable enjoyment of its rights by a third power.

Treaties of alliance may be offensive or defensive: in the former, the ally engages generally to co-operate in hostilities against a specified power, or against any power with which the other may be at war; in the latter, the engagements of the ally extend only to a war of aggression commenced against the other contracting party.

The execution of a treaty is occasionally secured by hostages; as at the peace of

Aix-la-Chapelle, in 1748, when several peers were sent to Paris as hostages for the restoration of cape Breton by Great Britain to France.

TREBBIA, a small but famous stream of Italy, rises in the Ligurian Apennines, near Montebello, flows northward through a mountain valley for the greater part of its course, and joins the Po, two m. w. of Piacenza. Its entire length is about 60 miles. Here Hannibal decisively defeated the Roman consul Sempronius, 218 B.C.

TREBIGNE, a t. formerly in the Turkish vilayet of Bosnia, now belonging to Herzegovina; in the district of Mostar.

TREBIZOND, or **TREBISOND** (in Turkish, *Tarabezân*), is a Turkish vilayet in the n.e. of Asia Minor, stretching along the s.e. shore of the Black sea, for 240 m., with an estimated pop. of 1,047,000. The surface is mostly mountainous, the slopes toward the sea being thickly wooded. The eastern portion of the vilayet is known as Lazistan, from its inhabitants, the Lazi, a savage, vindictive race, distinguished among their neighbors for their barbarous manners and predatory habits. The port of Batoum and a part of Lazistan, on the Russian frontier, were ceded to Russia in 1878. Next to Trebizond, the most important places in Trebizond are Samsoun, Kerasun, and Gumish-Khaneh. The chief town of the vilayet is **TREBIZOND**, a flourishing sea-port city, on the Black Sea coast, about 110 m. n.w. of Erzerum. It is surrounded by walls of great extent, which inclose numerous gardens as well as the town itself, and is inhabited by a pop. (1889) of 45,000, chiefly Moslems. Outside the walls are various suburbs, where most of the Christian inhabitants reside, and in which the principal bazaars and khans have been established. The city is defended by several forts along the walls, and by a fortified citadel perched upon a high rock on one side of the town. It possesses an excellent harbor, which, however, is only considered safe during the summer months, the roadstead of Platena, 7 m. to the west, being employed for the rest of the year. There are numerous mosques and "medresses," churches for Greek Christians, copper foundries, dye-works, etc. The geographical position of Trebizond is, in a commercial point of view, rivaled only by that of Alexandria, and has made it the great entrepôt of the commerce between eastern Europe and central Asia, and the second commercial city of the Turkish empire. European goods are brought hither, since 1836, by regular services of steamers from Constantinople and the mouths of the Danube; and those of Asia by caravans from Erzerum, Tabriz, and Syria. The goods brought overland embrace silk, wool, tobacco, wax, gallnuts, oil, opium, drugs of various kinds, honey, timber, carpets, and shawls; and those arriving by sea are principally cotton cloths, glass, cutlery, fire-arms, as well as grain, iron, tin, spices, etc. Trebizond is the ancient *Trapezus*, and was founded by a colony from Sinope; it was a flourishing town under the Colchians, when Xenophon arrived there in his famous retreat from Persia. Conquered from Mithridates by the Romans, it rapidly rose in importance, became a free city, was made by Trajan the capital of Pontus Cappadocicus; and, by the same enlightened ruler, was provided with a larger and better harbor. On the capture of Constantinople by the crusaders in 1204, and the expulsion of the Comnenian emperors, one of the imperial family, Alexis, established himself at Trebizond, where he had previously exercised the functions of governor, and founded a state known as the *Empire of Trebizond*, which stretched from the Phasis to the Halys, and maintained its independence against the Turks till 1462, when the last emperor was defeated and captured by sultan Mohammed II.

TREBLE, the highest part in harmonized music, which in general contains the melody, and is sung by a soprano (q.v.) voice. The treble or G clef  is placed on

the second line of the staff, indicating that the note G occupies the line encircled by its lower curve. It is one of the two clefs in use in music for keyed instruments.

TREDEGAR, a market t. on the n.w. border of Monmouthshire, 18 m. n.w. of Newport. It stands in the midst of a district with extensive iron-works and coal-mines, which give employment to the great mass of the inhabitants. Pop. in '91, 17,484.

TREDGOLD, THOMAS, a celebrated English authority on architecture and engineering, was b. at Brandon, a small village $2\frac{1}{4}$ m. s.w. of Durham, Aug. 22d, 1788. At the age of 14 he was apprenticed for six years to a cabinetmaker; but devoted his leisure time to the study of the principles of architecture, and kindred subjects. In 1808 he went to Scotland, where he worked as a journeyman carpenter for five years; then removed to London to his relative Mr. Atkinson, the architect to the ordnance board, with whom he labored till 1823, by which period his private business had increased so much that he commenced business on his own account as a civil engineer. During the ten years of Tredgold's residence with Mr. Atkinson, he studied with redoubled zeal, and obtained a thorough acquaintance with mathematics, chemistry, mineralogy, and geology. He died from pure exhaustion of nature, Jan. 28th, 1829, at the early age of 40. Tredgold's scientific contributions to periodicals range over a wide field; but his great and valuable works are: *The Elementary Principles of Carpentry*, a *Treatise on the Pressure of Beams and Timber Frames*, *the Resistance of Timber*, *the Construction of*

1. *Pinus fastigiata*. 2. *Pinus fastigiata*. 3. Date palm (*Phoenix dactylifera*) and fruits. 4. Fig (*Ficus carica*).
 5. Brazil-nuts or Para-nuts (*Bertholletia excelsa*). 6. Flower of plantain (*Musa*

Floors, Roofs, Centers, and Bridges (4to, 1820; 2d ed., 1828); and the *Strength of Cast Iron* (1821; 2d ed., 1824; 3d ed., 1831). His other works, the *Principles of Warming and Ventilating Public Buildings*, etc. (1824); *Practical Treatise on Railroads and Carriages* (1825); a pamphlet entitled *Remarks on Steam-Navigation*, etc. (1825); and *The Steam-Engine* (1827), were also received with special favor; and of the first and last of them new editions were speedily required.

TREE, the name given to those plants which live for many years, and have woody stems and branches, the stem being generally single, and bearing a head of branches and twigs; whereas shrubs (q.v.) have generally a number of stems springing from one root. The terms tree and shrub are not, however, of very exactly defined signification; and many shrubs, under certain circumstances, assume the form of trees, either naturally or by the help of art; while trees are, in other circumstances, converted into shrubs. The common hawthorn, for example, is very often a mere shrub, but sometimes appears as a tree, with stem and head as perfect as the greatest monarch of the forest. The gooseberry bush is usually trained in our gardens in a tree-like habit, notwithstanding its small size, and the shortness of its stem; this, however, is entirely artificial, its natural habit being that of a shrub, to which, but for the gardener's knife, it would almost certainly relapse in a single year. The greater number of trees are exogenous. Palms are almost the only endogenous plants to which this name can be given. Very different from the ordinary exogenous trees are the gymnogens (q.v.) of Lindley—firs, pines, yews, etc. Trees are found in all climates except the coldest, but the number of species, as well as the luxuriance of the forests, is greatest in the tropics. As we advance toward the polar regions, or ascend high mountains, trees disappear before other forms of vegetation. The different characters of trees affect very much the landscape of the countries in which they grow; some countries, and particularly in northern parts of the world, being covered with somber pine forests, while others abound in ash, beech, and similar trees of verdant foliage. Every kind of tree has its peculiar character, not only in its foliage, but in its general form and its mode of branching. An ash is as easily distinguished from an elm, by a practiced eye, in winter, when destitute of leaves, as in the full foliage of summer. Some trees attain a very great age, but the ordinary duration of life is very different in different species. There are trees in England which are supposed to be more than a thousand years old, and are still healthful and flourishing. Oaks and yews are among the trees of longest life. The baobab of Africa is also regarded as a very long-lived tree.

No acotyledonous plant assumes the character of a tree, except a few ferns, known as tree ferns. See ARBORICULTURE.

TREE, HERBERT BEERBOHM. See BEERBOHM-TREE, HERBERT.

TREE-FERNS are ferns with tree-like woody stem, and a head of fronds resembling the leaves of palms. They are found only in tropical and sub-tropical countries, many of which, however, are quite destitute of them. One species, *Alsophila gigantea*, which has a thick black trunk surmounted by a feathery crown, is found in the Himalayas, at an elevation of 7,000 ft., and might be introduced with some probability of success into Britain. The soft central part of the stem of *Cyathea medullaris* is an article of food in New Zealand. Tree ferns are a characteristic feature of the vegetation of New Zealand.

TREE-FROGS, *Hyladæ*, a family of *batrachia* (q.v.) separated from the true frogs (*ranidæ*) on account of the dilated disks or suckers at the tips of the toes, which are covered with a viscid secretion, and enable the animals to climb trees. Most of them are arboreal; they are of small size, more elegant in form than the true frogs, of brighter colors and more active habits. They feed on insects, which they pursue on the branches and among the leaves of trees or shrubs, stealing toward them, and suddenly springing upon them. They deposit their spawn in water, like other batrachians—some of them on the edges of leaves hanging over water—and hibernate in mud. The day is their time of activity, although they shelter themselves among leaves from very hot sunshine. Their croaking is louder than that of true frogs, and the traveler is sometimes amused by hearing it from the tops of high trees. No species of tree-frog is found in Britain; one occurs in the middle and south of Europe; it is also found in Asia and the north of Africa; the warmer regions of the old world have numerous species, and in America they are still more abundant. Some occur in Australia. The TREE-FROG of Europe (*hyla arborea*)—*rainette* of the French—is found chiefly in moist woods, and in hedges near water. Although a small creature—one of the smallest of European frogs—it can make a spring of more than a yard in height to seize an insect. It becomes very noisy on the approach of rain, and is often kept in confinement to serve as a kind of barometer. Very similar to it is the COMMON TREE-FROG of North America (*H. versicolor*), which is abundant in the middle and northern parts of the United States as far w. as the Mississippi, but is replaced in the s. by the GREEN TREE-FROG (*H. viridis*), while other species are found in different parts of the country. See illus., BATS, ETC., vol. III.

TREES OF LIBERTY. The custom, common to almost all the nations of Europe, of celebrating the beginning of spring and various national and ecclesiastical festivals by setting up green boughs, led, during the war of independence in the United States, to the habit of planting poplars and other trees as the symbol of growing freedom. This

example was imitated during the French revolution. The Jacobins in Paris are said to have planted the first tree of liberty in 1790; and the custom spread rapidly through the whole of France. These trees, crowned with the cap of liberty, were soon to be found in every village, while the people danced round them, singing revolutionary songs, and regarded them as the rendezvous of the patriots. Poplars were at first employed, but afterward oaks were substituted in their place. This custom was regulated by a decree of the convention, and diffused over foreign countries by the republican armies. During the reign of terror, thousands lost their lives under the pretext of having injured a tree of liberty. During the empire, this custom, like all others that had originated during the republic, was completely suppressed. In the July revolution of 1830, trees of liberty were again set up, particularly at Paris. But the populace took no interest in the matter. During the February revolution of 1848, trees of liberty once more came into vogue at Paris and other places where the inhabitants held republican principles. They were generally hung with tri-colored ribbons, circles, and triangles, the symbols of unity and equality, and surmounted with the cap of liberty. In Paris, on the occasion of erecting a tree of liberty, a priest was frequently conveyed to the spot for the purpose of consecrating it. After most of the trees of liberty had fallen during the conflicts in the streets of Paris in June, 1848, government issued an order for their removal from all places where they impeded traffic. Before the end of the year they had entirely disappeared. Numerous trees of liberty were erected in Italy during the revolution of 1848 and 1849, but fell as the different insurrections were quelled. A learned and interesting treatise has been written on this subject by the Abbé Grégoire.

TREFOIL, a name given to many herbaceous plants with leaves of three leaflets, as clover (q. v.), lotus (q. v.), medick (q. v.), buckbean (q. v.), etc.

TREFOIL, in heraldry, is a frequent charge, representing the clover-leaf, and is always depicted as *slipped*, i. e., furnished with a stalk.

TREGELLES, SAMUEL, LL.D., an eminent New Testament critic and editor, was born at Falmouth in 1813. He did not receive a university education, and spent the early part of his life in secular occupation, yet at the age of 25 he had formed the plan of a Greek New Testament, on the principles which he afterward carried out. In preparing for his *magnum opus*, he visited the continent in search of MSS., and published, among other works, an edition of the *Codex Zacynthius*; an *Account of the Printed Text of the Greek New Testament* (1854); and an *Introduction to the Textual Criticism of the New Testament* (1856). His *Critical Edition of the Greek New Testament* was published in 1857-72, and stands, as to manner of treatment, between that of Lachmann and that of Tischendorf. Tregelles goes further than Tischendorf in his dependence upon ancient, and rejection of modern MSS. In 1862 Tregelles received a pension of £100, which was doubled in 1870. He died on April 24, 1875.

TREGG, a co. in w. central Kansas; 900 sq. m.; pop. '90, 2535. Co. seat, Wakeeney.

TREITSCHKE, HEINRICH GOTTHARD VON, German historian, 1834-96, educated at the universities of Bonn, Leipsic, Tübingen and Heidelberg. He became *privatdocent* in history at Leipsic in 1858, and professor at Freiburg 1863, resigning three years later, to become editor of the *Preussische Jahrbücher*, to which he had been for many years a diligent contributor. In the autumn of the same year he was appointed professor at Kiel, in 1867 was called to the chair vacated by Häuser's death, at Heidelberg, and in 1874 became professor at Berlin. During 1871-88 he was a member of the Reichstag, adhering to the national party. He resigned the editorship of the *Preussische Jahrbücher* in 1888. After Ranke's death he became Prussian state historian, in 1895. His principal work is *Deutsche Geschichte im 19. Jahrhundert* (Leipsic, 1879-94) covering the period down to 1848. Of his numerous other writings, may be mentioned *Zehn Jahre deutscher Kämpfe, 1865-74*; *Schriften zur Tagespolitik* (1874-79); *Der Sozialismus und seine Gönner* (1875); *Ein Wort über unser Judenthum* (1880); *Zwei Kaiser* (1888); and the posthumous volumes, *Reden im deutschen Reichstag*, and *Biographische und historische Abhandlungen* (1897).

TRELAWNEY, EDWARD JOHN, 1792-1881, author, especially known as the friend of Shelley and Byron. In 1821, while living at Pisa, he made the acquaintance of Shelley, and in 1823 accompanied Byron to Greece, where he took part in the war of liberation, marrying the daughter of the Greek chieftain Odysseus. In 1827 he returned to England. Besides articles for magazines, he wrote *The Adventures of a Younger Son*, but he is better known for his *Recollections of the Last Days of Shelley and Byron* (1858), which appeared in 1878 (new edition 1887) under the title of *Records of Shelley, Byron and the Author*.

TREMATO'DA, or TREMATODE WORMS, constitute, according to Dr. Cobbold's system; the second order of the sub-class *sterelmintha* (Owen), of the class *helmintha*. In ordinary zoological classification, the trematoda form a division of the group of *platyelmia* or "flat-worms," which group is in its turn included in the class *scolecida*—a division of *echinozoa* or *annuloida*. This order, as the Greek word *trêmátodes* indicates, is characterized by the possession of certain suckorial pores or openings. All the animals included in it have soft, roundish, or flat bodies, and their visceral organs are lodged in the parenchyma of the body. Most of the trematoda are hermaphrodites. They seldom attain to a large size (the greatest length is about 5 in.), but are usually visible to the naked eye. Like all *scolecida*, the trematoda possess a peculiar system of vessels ramifying through their bodies, and termed the "water-vascular" system.

The trematoda, or flukes, as they are popularly called, from their resemblance in form to small flukes or flounders, are not parasitic during the whole period of their existence; "for, while passing through the cycle of their life-development, they frequently change their residence, at times inhabiting either open waters, or the dewy moisture of low pasture-grounds. They perform active and passive migrations from parasitic to non-parasitic abodes; and during their larval wanderings in search of a final resting-place which should prove suitable to their adult condition, they provisionally occupy the bodies of different kinds of invertebrata."—Cobbold's *Entozoa*, 1864, p. 15. In his *Synopsis of the Distomida* (published in 1861), Dr. Cobbold recognizes 344 species of flukes, of which 126 belong to fishes, 47 to reptiles, 108 to birds, 58 to mammals, and 5 to the invertebrata. He now believes that, at the very lowest possible estimate, we must assume the order to contain 400 species, which may be divided into the five families of *monostomida*, *distomida*, *tristomida*, *polystomida*, and *gyrodactyla*—names which are based, except in the last case, on the number of their pores or oval suckers.

Van Beneden arranges these families into (a) *monogenea* and (b) *digenea*, the development in the former being simple, while in the latter there is an alternation of generation, the nurses and larvæ living chiefly in mollusks, while the adult animals chiefly live in the bodies of vertebrate animals. The *monostomida* and *distomida* belong to the latter, and the others to the former group. The family of *distomida* embraces the principal and best-known genera of the order *trematoda*, and its members are at once recognized by the presence of two pores or suckers; one, the anterior, being connected with the mouth; and the other, termed the acetabulum, being usually placed on the ventral surface, in the middle line.

The following members of this order are of special interest, as very liable to infest man: *Fasciola hepatica*, described in the article FLUKE, is not only common in all varieties of grazing-cattle, and especially the sheep, but has been found in the horse and ass, in the hare and rabbit, in the squirrel, beaver, kangaroo, etc., and is occasionally met with in man, not only in the liver and gall-bladder, but beneath the skin in various parts, as, for example, in the sole of the foot, behind the ear, and in the scalp. For an excellent account of the anatomy and development of this parasite, the reader is referred to Cobbold, *op. cit.* pp. 147–169. See ROT. *Distoma lanceolatum* is a species which is by no means uncommon in the sheep and ox, and has been found on at least three occasions in the human subject. *Distoma ophthalmobium* has been occasionally found in the lens of the human eye. *Distoma hæmatobium*, or *Bilharzia hæmatobia*, as Dr. Cobbold terms it, is the only known trematode which is not hermaphroditic.

The male is a cylindrical worm, measuring only about half an inch in length; while the female is filiform, longer, and much narrower than the male, being about $\frac{3}{4}$ of an inch in length. The first specimens were found by Bilharz of Cairo in the portal system, and the worm has since been found in the veins of the mesentery, bladder, and other parts. This parasite is common not only along the borders of the Nile, but in south Africa and the Mauritius. It is so common in Egypt that in 363 examinations of the body after death, Griesinger found it no less than 117 times.

The principal feature of the disease caused by this worm consists in a general disturbance of the uropoietic function. Diarrhea and hæmaturia occur in advanced stages of the complaint, being also frequently associated with the so-called Egyptian chlorosis, colicky pains, anæmia, and great prostration of the vital powers. The true source of the disorder, however, is easily overlooked, unless a careful microscopical examination be made of the urine and other evacuations. If blood be mixed with these, and there also be a large escape of mucus, a minute inspection of the excreta will scarcely fail to reveal the presence of the characteristic ova of *bilharzia*.—Cobbold, *op. cit.* p. 202. Dr. J. Harley has published several excellent papers "On the Hæmaturia of the Cape of Good Hope, produced by a *Distoma*," which is undoubtedly the *bilharzia*.

Several other trematodes occasionally occur in the human subject.

TREM'OLITE a mineral regarded as a variety of hornblende (q. v.). It is composed of silica, magnesia, lime, and a very little fluoric acid.

TREM'OLO, TREMAN'DO (Ital. trembling), in music, an expression indicating that a note or a chord is to be reiterated with great rapidity for an indefinite number of times, so as to produce a tremulous sort of effect.

TREMPEALEAU', a co. in w. Wisconsin; 732 sq. m.; pop. '90, 18,920, chiefly of American birth. Its surface is generally level, a large proportion woodland. Live stock is raised in great numbers. Co. seat, Whitehall.

TRENCH, RICHARD CHENEVIX, Archbishop of Dublin, divine and scholar of the church of England, belonged to an Anglo-Irish family of Galway, the Trenches of Woodlawn, and was born at Dublin, Sept. 9, 1807. He was educated at Harrow and Trinity college, Cambridge, where he graduated in 1829. After traveling for a few years he became a country curate; and in 1837 or 1838, published two volumes of poetry, which had at least the merit of imitating Wordsworth, and were favorably received. One of the poems, *The Story of Justin Martyr*, is even yet faintly remembered. In 1844, Trench was presented to the rectory of Ithen-Stoke; in 1847 he became theological professor and examiner in King's college, London; in 1856, dean of Westminster; and in 1864, on

the death of Whately, archbishop of Dublin. He resigned in 1884. He had a quick, keen understanding; his scholarship was varied and choice, though not sufficiently precise or scientific for philological purposes; his fancy, sometimes poetic, and always picturesque, enabled him to invest the dry discussion of words with a peculiar fascination; and if the results of his etymological inquiries were not always sure, the processes were invariably pleasant. As a literary critic, Trench was both acute and elegant. His principal works are: *Notes on the Miracles* (1846); *Notes on the Parables* (1841; 15th ed. 1884); *The Lessons in Proverbs* (1853), from all of which his professional brethren have borrowed liberally for the work of the pulpit; *The Sermon on the Mount, illustrated from St. Augustine* (1844); *Sacred Latin Poetry* (1849); *St. Augustine as an Interpreter of Scripture* (1851); *Synonyms of the New Testament* (1854); *The Epistles to the Seven Churches of Asia Minor*; *An Essay on the Life and Genius of Calderon*; *Deficiencies in our English Dictionaries*; *Glossary of English Words used in different Senses* (1859); *The Study of Words* (1851), of which last, 22 editions appeared in America before 1862; a Memoir of his mother (1862); and *Lectures on Medieval Church History* (1878). He d. 1886.

TRENCHARD, STEPHEN D., b. N. Y., 1818; became a midshipman in the navy, 1834; served with much credit during the civil war, rising to the rank of commodore, 1871, and rear-admiral, 1875. In both attacks on Fort Fisher he commanded the *Rhode Island*. In 1869 he was flag officer of the South Atlantic squadron. He d. 1883.

TRENCK, FRANZ AND FREDERICK VON DER, were German barons and soldiers, whose adventures, recorded in autobiographies, have secured for them a world-wide fame. They were cousins, descended from an ancient house of east Prussia, and although placed from infancy under circumstances altogether different, exhibited a striking similarity of character. Both were braggarts, both were subject to fits of uncontrollable passion, and both told premeditated lies.

BARON FRANZ was b. in Reggio, in Calabria, on Jan. 1, 1711, where his father was an Austrian general. When 17 he received a commission as a cavalry officer, fought duels, and cut off the head of a man who refused to lend him money. He had to flee in consequence, and he went to Russia, where he was made a captain of hussars. He was then a formidable young giant of 6 ft. 3 in.; and it is highly probable that he knocked down his commanding officer, as he says he did, for rebuking him. He adds that he was placed under arrest while an engagement was going on; that marshal Münnich happening to pass, he called out that if set free and pardoned he would bring back three Turks' heads in an hour; that he was set free and brought back four Turks' heads suspended from his saddle. The story may or may not be true; but certain it is that he was cashiered not long afterward, and returned to settle on his estates in Croatia. There it is we first meet with the Trench of history. The Turkish frontier was overrun with banditti. Trench armed and drilled 1000 of his tenants, whom he called Pandours, and by their means succeeded in restoring order. He then offered the services of his regiment to Maria Theresa, and his aid was accepted. In 1740 he took part in the Silesian war at the head of his men, and perpetrated the most atrocious deeds of rapine and cruelty. There had been no such monster, says Mr. Carlyle, since Attila and Gerghis. On Sept. 7, 1742, he attacked Cham, a fine trading town in neutral territory, this act being, of course, in defiance of all law and discipline; and he completely annihilated it. After the battle of Sohr, in Sept., 1745, he offered to capture Frederick the Great, and bring him a prisoner to the Austrian camp. He failed in the enterprise, with great loss of men, but he secured the king's tent and much valuable booty. Suspicions were, however, entertained of his being in communication with the enemy, and he was tried by court-martial. He was imprisoned at Vienna, but made his escape with the assistance of the Baroness Lestock, who bribed the jailers to allow him to be conveyed in a coffin as if dead, beyond the city walls, was again captured at Bruges, and re-imprisoned at Grätz, where he took poison, and died on Oct. 4, 1749.—See Carlyle's *Life of Frederick the Great*; and *Memoirs du Baron Franz de Trench* (Par. 1787), written by himself.

FRIEDRICH VON DER TRENCK, was born at Königsberg, in 1726, and was the son of a maj. gen. in the Prussian service. He distinguished himself at the university. At 16 he became a cornet in the guards; and two years afterward the Princess Amelia, who saw him at a ball, we are told, conceived a violent passion for him. To this he attributed the antipathy the king afterward entertained toward him. There was, however, a much better reason: he was detected in a correspondence with his Austrian cousin, not long before the attempt to capture the king, and arrested. Mr. Carlyle shows that the baron had been in prison three months, and was there when the battle of Sohr took place, although he vividly describes his own adventures in the fight. He was accused of this lie in his own time, and admitted that he must have made a mistake! "He had nothing but his poor agitated memory to trust to." He was released on Dec. 24, 1763, and afterward settled at Aix-la-Chapelle, where he married the burgomaster's daughter, and went into business as a wine-merchant. He published his memoirs in 1786. The book was translated into all languages, and Trench became the most famous personage of his time. The ladies at Paris, Berlin, and Vienna wore bonnets, dresses, and rings *à la Trench*; and no less than seven plays, founded on his adventures, were brought out on the French stage. In 1793 he went to Paris, and became a zealous adherent of the mountain party. He was, however, suspected, and thrown into prison. Soon after, rumors in circulation among the prisoners that the Prussians were advancing on

Paris, and carrying all before them, were traced to Trenck, who was in consequence condemned. He was guillotined near the Barrière du Trône, July 26, 1794. On the scaffold, although 69 years of age, he manifested the ungovernable passion which had characterized him through life. He harangued the mob; and at length the executioner had by force to hold his head by the gray hair on the block, to meet the fatal stroke.—See Chambers's *Book of Days*, vol. i. p. 260; Carlyle's *Frederick the Great*, vol. iv.; *Friedrich Trencks Merkwürdige Lebensgeschichte von ihm selbst beschrieben* (2 vols. Berl. 1787); and *Leben und Thaten der Trenke*, by Watermann (2 vols. Leip. 1837).

TRENDELENBURG, FRIEDRICH ADOLF, 1802–72; b. Germany; educated at the universities of Kiel, Leipsic, and Berlin; appointed professor extraordinary of philosophy in the university of Berlin, 1833, and full professor, 1837. This position he held until his death. During the greater part of this period he held a governmental office in connection with the public schools. In the university he lectured to large classes on psychology, logic, history of philosophy, ethics, philosophy of law, and theory of teaching. His criticism on Kant involved him in controversies, while his assault upon Hegel procured him great renown, and did much to break the hold of Hegelianism on the German mind. The foundation of his own philosophic doctrine is Platonic and Aristotelian. He derives the principle for a philosophic deduction of the sensible universe from Aristotle's conception of motion, as subject to the principle of design or to Plato's *idea*. The teleological view he held and developed as illustrated and confirmed by empirical fact. Mechanical causation he viewed as the servant of teleology, not its enemy. He calls his philosophy the “organic view of the world.” Each lower stage in existence is the basis of the higher stages, and is involved in them. The highest stage experimentally known to men is the ethical, or the development of man in his totality; where his supreme end is intellectually apprehended, and is realized by man's own action. The soul is the self-realizing idea of man; God is the unconditional; not directly demonstrable but logically implied in the whole fabric of the universe and of human thought.

TRENT, a river of the midland counties of England, rises on the n.w. border of Staffordshire, about 10 m. n. of Burslem, and at a height of about 600 ft. above sea-level. It flows first s.e. to the border of Derbyshire, and afterward in a general n.e. direction, through the counties of Derby, Nottingham, and Lincoln, to a point about 8 m. e. of the town of Goole, where it unites with the Ouse (q.v.) to form the Humber (q.v.). It receives the Derwent, Idle, and Tarn from the w., and the Soar from the s.; its length is 170 m., for 120 m. of which, from its mouth up to Burton-on-Trent, it is navigable for barges.

TRENT (Ital. *Trento*, Ger. *Trient*, Lat. *Tridentum*), a walled t. of Austria, in the southern part of the Tyrol, capital of the circle of the same name, is situated on the left bank of the Adige, in a beautiful and fertile valley, surrounded by high limestone hills, 46 m. n. of Verona. In its general aspect, as well as its architecture, Trent is quite an Italian town; and with its spires and towers, ruined castles and ancient embattled walls, it presents an imposing appearance from a distance. Its cathedral (1812) is a handsome edifice of white marble. The *piazza grande*, near the cathedral is adorned with a splendid fountain of red marble, surmounted by a colossal statue of Neptune with his trident. There are a number of manufactures and a considerable trade. Pop. '90, 21,486.

The ancient *Tridentum*, or *Tridente*, derived its name from the *Tridentini*, an Alpine tribe, whose capital it was, and has, in all probability, no connection whatever with the *trident* of Neptune (as is commonly supposed). Conrad the Salic bestowed on the prince-bishops of Trent the temporal rule of the valley of the Adige, and under them Trent rose to great prosperity and importance. It is still the see of a prince-bishop.

TRENT AFFAIR, THE. In the autumn of 1861, the Confederate government sent John Slidell (q.v.) and James M. Mason (q.v.) to France and England respectively as commissioners. They ran the blockade at Charleston and went to Havana, where they embarked for England on the British mail-steamer *Trent*. On November 8, Capt. Wilkes, of the United States steamer *San Jacinto*, boarded the *Trent*, arrested the commissioners, and carried them to Fort Warren in Boston Harbor as prisoners. This act was applauded by the people of the United States, and by many of the leading statesmen; but President Lincoln strongly disapproved it, and when a formal demand was made by the British Minister for their surrender, it was speedily complied with and an apology tendered. Without, however, waiting to know the result of this demand, or, if Wilkes was upheld by his government, the British government began active preparations for war. See *Diplomatic Correspondence for 1861–62*.

TRENT, COUNCIL OF, the most celebrated of the assemblies regarded by the Roman Catholic church as ecumenical or general, and the great repository of all the doctrinal judgments of that communion on the chief points at issue with the reformers of the 16th century. Very early in his conflict with Pope Leo X., Luther had appealed from the controversies, a general desire grew up in the church for the convocation of a general council, in which the true sense of the church upon the controversies which had been raised might be finally and decretorially settled. Another, and, to many, a still more pressing motive for desiring a council, was the wish to bring about the reform of the alleged abuses as well of the court of Rome as of the domestic discipline and government of local churches, to which the movement of the reformers was in part at least

ascribed. But the measures for convoking a council were long delayed, owing partly, it has been alleged, to the intrigues of the party who were interested in the maintenance of those profitable abuses, and especially of the officials of the Roman court, including the cardinals, and even the popes themselves; but partly also to the jealousies, and even the actual conflicts, which took place between Charles V. and the king of France, whose joint action was absolutely indispensable to the success of any ecclesiastical assembly. It was not till the pontificate of Paul III. (1534-49) that the design assumed a practical character. One of the great difficulties regarded the place of meeting. In these discussions much time was lost; and, without entering into detail, it will suffice to say that the assembly did not actually meet till Dec. 13, 1545, when 4 archbishops, 22 bishops, 5 generals of orders, and the representatives of the emperor and the king of the Romans, assembled at Trent, a city of the Tyrol. The number of prelates afterward increased. The pope was represented by three legates, who presided in his name—cardinals del Monte, Cervino, and Pole. The first three sessions were devoted to preliminaries. It was not till the fourth session (April, 1546) that the really important work of the council began. It was decided, after much disputation, that the doctrinal questions and the questions of reformation should both be proceeded with simultaneously. Accordingly, the discussions on both subjects were continued through the fourth, fifth, sixth, and seventh sessions, in all which matters of great moment were decided; when a division between the pope and the emperor, who, by the victory of Mühlberg, had become all powerful in the empire, made the former desirous to transfer the council to some place beyond the reach of Charles's arbitrary dictation. The appearance of the plague at Trent furnished a ground for removal, and in the eighth session a decree was passed (Mar. 11, 1547) transferring the council to Bologna.

This translation was opposed by the bishops who were in the imperial interest, and the division which ensued had the effect of suspending all practical action. Meanwhile, Paul III. died. Julius III., who had, as cardinal del Monte, presided as legate in the council, took measures for its resumption at Trent, where it again assembled May 1, 1551. The sessions 9 to 12, held partly at Bologna, partly at Trent, were spent in discussions regarding the suspension and removal; but in the 13th session the real work of the assembly was renewed, and was continued, slowly, but with great care, till the 16th session, when, on account of the apprehended insecurity of Trent, the passes of the Tyrol having fallen into the hands of Maurice of Saxony, the sittings were again suspended for two years.

But the suspension was destined to continue for no less than nine years. Julius III. died in 1555, and was followed rapidly to the grave by his successor (who had also been his fellow-legate in the council as cardinal Cervino), Marcellus II. The pontificate of Paul IV. (1555-59) was a very troubled one, as well on account of internal difficulties as owing to the abdication of Charles V.; nor was it till the accession of Pius IV. (1559-65) that the fathers were again brought together to the number of 102, under the presidency of cardinal Gonzaga, re-opening their deliberations with the 17th session. All the succeeding sessions were devoted to matters of the highest importance—communion under one kind; the sacrifice of the mass; the sacrament of orders, and the nature and origin of the grades of the hierarchy; marriage, and the many questions connected therewith. These grave discussions occupied the sessions 17 to 24, and lasted till Nov. 11, 1563. Much anxiety was expressed on the part of many bishops, to draw the council to a conclusion, in order that they might be enabled to return to their sees in a time so critical; and accordingly, as the preliminary discussions regarding most of the remaining questions had already taken place, decrees were prepared in special congregations comprising almost all the remaining subjects of controversy, as purgatory, invocation of saints, images, relics, and indulgences. Several other matters, rather of detail than of doctrinal principle, were referred to the pope, to be by him examined and arranged; and on the 3d and 4th of Dec., 1563, these important decrees were finally read, approved, and subscribed by the members of the assembly, consisting of 4 cardinal legates, 2 other cardinals, 25 archbishops, 168 bishops, 7 abbots, 7 generals of orders, and 39 proxies of bishops—making in all 252.

These decrees were confirmed, Jan. 10, 1564, by Pius IV., who had drawn up, based upon them in conjunction with the creeds previously in use, a profession of faith known under his name. See ROMAN CATHOLIC CHURCH. The doctrinal decrees of the council were received at once throughout the western church, a fact which it is necessary to note, as the question as to the reception of the decrees of doctrine has sometimes been confounded with that regarding the decrees of reformation or discipline. As to the latter, delays and reservations took place. The first country to receive the decrees of the council as a whole was the republic of Venice. France accepted the disciplinary decrees only piecemeal and at intervals.

It would be out of place here to enter into the question as to the merits of this unquestionably great and momentous assembly, which may be said to have practically decided the religious destinies of the western church. It is viewed with directly opposite impressions by opposing critics, and it is commonly even said that in the Catholic church itself the council of Trent has met its worst adversary in the person of one of the priests of its own creed, the Servite monk, Fra Paolo Sarpi.

It must be confessed, however, that the most candid of modern inquirers have shown that Sarpi cannot fairly be regarded as a Roman Catholic. His sympathies are all strongly anti-Roman, and there are abundant indications in his work of a rationalizing

tendency, which plainly ought to rank him among the partisans of that free inquiry which it has been the object of Trent to repress by judgment, pronounced once for all, and excluding all controversy. See SARPI. And although there are, perhaps, equal exceptions against the impartiality of his rival historian and antagonist, Pallavicino, the latter is admitted by Ranke, Raumer, and others to be far more reliable in the use of documents than his Servite adversary.

The canons and decrees of the council of Trent were issued in Latin, and have been reprinted innumerable times. They have also been translated into almost every modern language; the most approved English translation being that of the Rev. Jeremiah O'Donovan. One of the supplementary works assigned to the pope by the council at its breaking up was the completion of a catechism for the use of parish priests and preachers. This work has not all the authority of the council, but it is of the very highest credit, and is extensively used, having, like the canons and decrees, been very generally translated. Another similar work was the publication of an authentic edition of the Vulgate version of the Bible, as well as of the missal and breviary. All these have been accomplished at intervals; and there is besides at Rome a permanent tribunal, a congregation of cardinals, styled *Congregatio Interpres Concilii Tridentini*, to which belongs the duty of dealing with all questions which arise as to the meaning, the authority, or the effect of the canons and decrees of this celebrated council. See SARPI, PIUS IV.

TRENTON, city, capital of New Jersey, and seat of Mercer co.; on the Delaware river, the Delaware and Raritan canal, and the Pennsylvania and the Philadelphia and Reading railroads; 30 miles n.e. of Philadelphia. It contains several public parks, the state capitol, the state penitentiary, the state hospital for the insane, the state school for deaf-mutes, state arsenal, U. S. government building, Mercer, city, and St. Francis hospitals, industrial school for girls, Union industrial home, Odd Fellows' home, widows' and single women's home, Y. M. C. A. building, state normal and model schools, and Protestant Episcopal and Roman Catholic cathedrals. The principal manufactures are pottery, iron and steel, woolen goods, flour, rubber, wire and cables, and oilcloth. The city has gas and electric lights, street railroads, about 50 churches, national, state, and savings banks, city and state libraries, and daily, weekly, and monthly periodicals. Here was fought, on Dec. 25, 1776, the battle between the British and Americans which proved the most decisive engagement of the Revolutionary war, and the event is commemorated by a handsome shaft surmounted by a figure of Washington. Pop. '90, 57,458.

TRENTON, city and co. seat of Grundy co., Mo.; on the Grand river and the Chicago, Rock Island, and Pacific, and the Quincy, Omaha, and Kansas City railroads; 84 miles n.e. of St. Joseph. It is the seat of Avalon college (United Brethren), and has a public high school, the Jewett Norris public library, national and state banks, coal mines, flour mills, creamery, electric lights, street railroads, waterworks, and daily and weekly newspapers. The surrounding country is principally devoted to farming and stock-raising. Pop. '90, 5039.

TRENTON FALLS, a village in Oneida co., N. Y., on the West Canada creek (a branch of the Mohawk river), and the New York Central and Hudson River and the Rome, Watertown, and Ogdensburg railroads; 17 miles n. by w. of Utica. It is a summer resort, famous for its series of falls in a deep ravine. Pop. '90, 284.

TREPAN. See TREPHINE.

TREPANG. See BÊCHE-DE-MER.

TREPHINE AND TREPHINING. (The instrument in its original form was called a *trepan*, from Gr. *trupao*, allied to Lat. *tereo*, to bore; the now usual form is called a *trephine*.) The operation of trephining consists in the perforation of a bone by means of a trephine, which is a small cylindrical or circular saw, with a center-pin on which it works. It is practiced on the skull in cases of fracture: "1st, when a portion of the bone is depressed, and encroaches on the cavity of the skull, producing compression of the brain, and the fragment cannot otherwise be raised; 2dly, for punctured fractures by which the inner table is splintered, separated from the outer table, and lying loose on the dura mater; and 3dly, for effusion of blood, or of inflammatory products between the bones and membranes, or between the latter and the brain, when it is presumed that the effused fluid may be evacuated by the opening."—Holmes's *System of Surgery*, vol. iv. p. 1044. It has likewise been employed in epilepsy, with the view of removing an assumed local cause of disturbance; but it is not likely to be ever again used in that disease, as it is now an established axiom, that as the operation itself may destroy life, its application is not justifiable, except as the last resource of surgery in extreme cases.

Attempts have been made by various surgical-instrument makers to regulate the action of the trephine by means of a movable collar, so as to prevent the brain from being injured after the skull has been perforated.

TRESCOT, WILLIAM HENRY, b. S. Carolina, 1822; educated at Harvard univ. He was sec. of legation at London, under Pres. Pierce; assist. sec. of state under Pres. Buchanan; practiced law in Washington, 1876; and the following year was counsel for the U. S., before the Halifax fisheries commission. He assisted in negotiating a treaty with China, 1880, and was sent, 1881, to South America to arbitrate difficulties between Chile, Peru, and Bolivia. He has written a book on American diplomacy.

TRESPASS is a term used in law in two general senses. In one aspect, its comprehensive meaning is some transgression or offence, which, in fact or in contemplation of

law, causes injury to the person or property of another; while, in its other phase, it denotes a form of remedy allowed by the law for injury inflicted. It will be discussed in both of these aspects. Considered in the former of these senses, the act of trespass may be committed either against the person of another, or with respect to his personal property, or upon his land or real property. When the injury is done against the person by the use of force threatened or actually employed, it constitutes either the tort of assault and battery or that of false imprisonment. As applied to injuries inflicted upon the person, the word trespass is most frequently used in this sense. But it is sometimes employed with a broader meaning, to indicate any injury to the life, limb, body, health, reputation, or personal liberty of an individual. It then includes such torts as libel, slander, nuisance, etc.

Trespass to chattels is "a wrongful injury to, or wrongful taking of, another's personal property." Thus, if one injure or destroy a chattel which belongs to another without taking it from the possession of the rightful owner, or if he wrongfully deprive such owner of its possession without doing it any injury, or if he do both of such wrongs, in either case he is guilty of trespass. When force or violence is used to accomplish the result, as if the chattel be wrested from the physical possession of the owner against his will, the wrong-doer may be sued in an action for trespass *vi et armis*. There is no crime involved in thus forcibly taking property from the possession of its owner, unless the act be done *animo furandi*—i.e., with an intent to commit a felony. The mere wrongful retention of the personality of another, even though it follow a trespass in the taking thereof, is not in itself a trespass, but constitutes the tort of conversion.

Trespass to real property is an unlawful entry upon the land of another. Every man's land is regarded by the law as surrounded and separated from that of his neighbors by a *close* or boundary. This may be a visible, tangible object, such as a fence or a hedge; but if none such exist, there is thrown around the land, in contemplation of law, an invisible, ideal boundary which effectually separates it from the property of all other persons. Any unwarrantable breaking through this *close*, and thereby entering or sending upon the land which it surrounds, even though no actual injury be done to the property, constitutes a trespass, for which an action at law will lie in favor of any one rightfully in possession when such act is done. No crime is usually committed by such a wrongful entry; and this is so even when the owner or rightful possessor has put up notices upon the land, as is so frequently done, stating that "Trespassers will be prosecuted," or using other words to that effect. If, however, the trespasser wantonly injure the property, as by breaking down the trees or crops, he may be criminally prosecuted for malicious mischief. A person may commit trespass for which he will be liable in a civil action for damages, not only by his own entry upon land, but also by wrongfully sending his personal property upon it or permitting it to go there. Thus, if he unwarrantably drive his cattle upon his neighbor's soil or negligently permit them to go upon it, he becomes liable to an action in trespass for the resulting damages. The common law also gives to the injured land-owner, in such cases, another remedy by permitting him to distrain or impound the cattle thus *damage-feasant*, or doing damage, until their owner renders him satisfaction for the injury sustained. At common law, one cannot be held liable for trespass merely because his dog or cat goes upon the land of another. This is because such animals are not kept for utility, as are horses, cows, and other cattle. But if a dog, or cat, or other such animal be known by its owner to have vicious propensities, and because of his failure to properly restrain it, it injure the person or property of another, he will be liable in damages. The establishing in court of such knowledge on his part of the vicious character of the animal is technically called proving "*scienter*." There are some circumstances under which entry upon the land of another without his consent is justifiable or excusable, and so does not constitute a trespass. Thus, if a public highway be so obstructed as to be impassable, a traveler may rightfully go around the obstruction upon the private land of an individual; and a person who, by virtue of a contract with another, has become the owner of personal property upon the latter's land, may enter and take it from such land; and again, when a vendor of personal property has rescinded the sale because of fraud practised upon him, he may enter upon the land of the vendee, if not forbidden by the latter, and retake the property sold, and the same rule holds whenever an owner of land has wrongfully acquired possession of the personality of another and placed it upon his own land. It is generally the rule, however, with these few exceptions, that a person who goes or sends upon the land of another, and takes his own chattels without permission of such land-owner, however such chattels may have come to be there, is guilty of a trespass. If a trespass be attempted upon real property, or upon personal property which is in the actual possession of its owner, the person rightfully in possession of the same may properly use all the force that is necessary to prevent the commission of the wrong. But if he employ more force than is actually needed to repel the violence of the intruder, he makes himself liable to an action for assault and battery, and his act may constitute a crime. Growing out of this right to make use of so much violence as is requisite to prevent intrusion is the well-known common law maxim, that "A man's house is his castle." Yet there are a few cases in which even the privacy of a person's dwelling-house may be invaded without his permission. An officer of the law, when executing criminal process—as in seeking to apprehend a criminal or one charged with a crime—may use the needed force to enter a building in which such person is secreted.

And even in the execution of civil process an officer may break open inner doors after he has peaceably obtained entrance into the house; but no civil process can authorize him to employ force or violence to obtain ingress through the outer door of a dwelling. There are, moreover, many circumstances under which persons are invited, by implication, to go upon the property of others, and so do not become trespassers, if, not being expressly forbidden to do so, they so enter. Thus, it is ordinarily no act of trespass for a person to enter the house of his neighbor upon matters of business or to make a social call; so keepers of stores, theatres, hotels, etc., hold out to the public a general invitation to enter upon their properties for the purpose of dealing with them. But even in such cases those who enter or remain against the express prohibition of the owner or proprietor become trespassers in so doing. If one go upon the property of another rightfully, but abuse or make ill use of the privilege or authority under which he entered, as if he go into a tavern or theatre and refuse to leave within a reasonable time or when ordered to do so, he thereby becomes a trespasser *ab initio*, or from the time when he entered.

The remedies allowed by the law for the injuries above outlined are an action of trespass and an action of trespass on the case. The distinction between these two forms of remedy is that the former is the proper action when the injury is directly inflicted with the use of force or violence, while the latter is appropriate when the wrong is done without resort to such means. Thus, if one throw a log of wood upon another, while the latter is walking along a highway, the proper action of the person so injured is trespass; but if one place a log of wood in a path, and leave it so that another falls over it in the darkness, the remedy of the latter for his resulting injury is trespass on the case. Trespass on the case lies for such injuries as those caused by a nuisance, libel, slander, etc. The action of trespass assumes various forms, according to the nature of the wrong that is committed. When it is brought for an act of violence against the person, either in injuring him or wresting his goods from him, it is trespass *vi et armis*; when for wrongfully taking away chattels, trespass *de bonis asportatis*; when for a wrongful entry upon real property, trespass *quare clausum fregit*. Such actions may be sustained, even though no actual injury is suffered, the law deeming it in itself a wrong to threaten injury to a person, or, without his permission, to take away his goods or break through the close which surrounds his land.

TRESSURE, in heraldry, a subordinary, generally said to be half the breadth of the orle, and usually borne double, and flowered and counter-flowered with fleurs-de-lis. It forms part of the royal insignia of Scotland, which are: or, a lion rampant gules, armed and langued azure, within a double tressure flory counterflory of the second.

TREVELYAN, Sir CHARLES EDWARD, b. England, 1807; educated at the Charterhouse and Haileybury College; entered the East India company's civil service, and was employed under Lord W. Bentinck and Lord Auckland. Through his efforts in the cause of native education the government was led to engage in the promotion of European literature and science among the natives. In 1840 he was appointed assistant secretary to the treasury, and in 1848 made Knight Commander of the Bath; governor of Madras, 1859; and received from the queen's government thanks for his valuable services; was appointed, 1862, financial minister in India, resigning in 1865 on account of ill-health. Important reforms were made in the system of accounts during his financial administration, and the resources of India developed by a great extension of public works. He was created a baronet in 1874. He is the author of *Education of the People of India* (1838); *The Irish Crisis* (1848); *Christianity and Hinduism* (1881). He d. 1886.

TREVELYAN EXPERIMENT (so called from the person who first carefully studied the phenomenon). When a block of iron or copper is considerably heated, and laid on a block of cold lead, a sound of some intensity, and more or less musical, is often heard. Trevelyan, after many trials, adopted for the "rocker," as it is called, a form somewhat resembling a fire-shovel, with a thickish block of metal instead of the blade. This is poised delicately on the lead block, so as to bear nearly equal pressure on two points separated by a groove; and the rounded end of the handle is also supported. The rocker being heated, suppose it poised so as to touch the lead at one point. It heats the lead at this point and therefore suddenly expands the metal near it, since lead is a bad conductor of heat. Thus, the lead, as it were, swells up at one point and tilts the rocker over to the other. There the same process takes place, and so on; and as the rocker thus moves alternately from one point to the other, the successive impacts, occurring at nearly equal intervals, form a musical sound. This can be altered at pleasure by loading the rocker, or by altering its moment of inertia. By proper care, almost any conducting body may be made thus to rock upon another, though, in the majority of combinations, the effect is very slight. The explanation of the phenomenon, as given above, is due to Faraday.

TRÈVES (Ger. *Trier*, Lat. *Augusta Trevirorum*), a t. of Rhenish Prussia (pop. in '71, 21,442; in '95, 40,026), capital of the circle of the same name, lies on the right bank of the Moselle, in a lovely valley, between vine-covered hills, about 65 m. s.w. of Coblenz. The river is here crossed by a bridge of 8 arches, 730 ft. long, and 25 broad. Trèves is a decayed place, and covers an area large in proportion to its population, owing to the number and size of the open spaces where houses once stood. The cathedral of St. Peter and St. Helen is a very interesting structure of various antiquity, principally of the early German Romanesque style of the 11th c., but retaining considerable remains in the

interior of a previously existing Roman church of the age of Constantine. It has beautiful altars and tombs; rich old chasubles and missals; famous relics, among others the "holy coat" (q. v.). Adjoining the cathedral is the *Liebfrauen-kirche*, a very graceful specimen of early German Gothic architecture, finished in 1243. The only other ecclesiastical buildings of interest now remaining, are the chapel of the Benedictine convent of St. Mathias outside the town, and the church of the Jesuits. Trèves contains some beautiful old dwelling-houses of Romanesque architecture. No place in Germany is so rich in remains of the Roman period. Among these are the *Porta Nigra*, a colossal gateway, probably one of the five gates by which Trèves was entered in Constantine's time, the so-called Roman baths (more probably part of an imperial palace), and a basilica built of Roman brick by Constantine for a court of justice, which, after being successively the residence of the Frankish kings and archbishops, was in a great measure demolished to make room for an electoral palace erected in 1614; this has recently been removed, and the basilica restored and fitted up as a Protestant church. Beyond the walls are the ruins of an amphitheater. The piers of the already-mentioned bridge, consisting of enormous blocks of lava, are also of the Roman period.

Trèves is the seat of a bishop, and of a provincial council, has a chamber of commerce, a priestly seminary, gymnasium, a library of 100,000 vols. and numerous MSS., a museum full of valuable antiquities—including the famous *Codex Aureus*, or MS. of the Gospels in gold letters, presented to the abbey of St. Maximin by Ada, sister of Charlemagne—and various benevolent institutions; and it carries on manufactures of woollens, cottons, and linens, besides a trade in corn, timber, and Moselle wines.

Trèves derives its name from the *Treviri* or *Treveri*, a Gallic, or more probably, a Belgic people, who inhabited, in Cæsar's time, a large tract of country between the Meuse and the Rhine. Their capital, *Augusta Trevirorum*, probably became a Roman colony in the time of Augustus, and ultimately became the head-quarters of the Roman commanders on the Rhine, and a frequent residence of the emperors, particularly of Constantine. Under the Franks, into whose hands it fell 463 A.D., it continued to flourish. In 843 it passed to Lorraine; in 870, to Germany; in 895, back to Lorraine; and finally was united to Germany by the emperor Henry I. The archbishop of Trèves was, in virtue of his office of chancellor of Burgundy, one of the electors of the empire, a right which seems to have originated in the 12th or 13th c., and continued till the French revolution. The ambition and talents of some of these episcopal rulers obtained for them great political weight in Germany. Since 1814 Trèves has belonged to Prussia.—See Haupt, *Treves's Vergangenheit und Gegenwart* (2 vols. Trier, 1822); Steiniger, *Geschichte der Trevirer unter der Herrschaft der Römer* (Trier, 1845); and Braun, *Treue und seine Alterthümer* (Trier, 1854).

TREVISIO, a compartimento in Italy, adjoining Belluno, Friuli, Vicenza, Padua, and Venice; 960 sq. m.; pop. '92, 403,519. The surface is in most part an exceedingly fertile plain, that part only which lies n. of the town of Treviso being hilly. The province is drained by the Piave and Livenza rivers; silk, wool, wine, fruit, corn, and cattle are the staples; paper is manufactured. Besides Treviso, the capital, Asolo, Oderzo, Castilfranco, and Ceneda are the chief towns.

TREVI'SO, a t. of Italy, capital of the province of the same name, on the river Sile, in a very fertile country, 18 m. n.w. of Venice. It is the seat of a bishop, and has a handsome and but recently finished Duomo, with five cupolas, and having an altarpiece of the annunciation by Titian; and among the other buildings are the old Gothic church of San Nicolo (with a number of excellent pictures), the public library, and a fine theater. The town is surrounded by a wall of from 24 to 38 ft. in height, and strengthened by numerous bastions. Manufactures of hardware are carried on; there are also a sugar refinery, a bell-foundry, and a number of paper-mills. Pop. of town, '95, commune, 35,500.

TREVITHICK, RICHARD, 1771-1833; b. England; an engineer in the Cornwall mines. He made various improvements in steam engines, and introduced high-pressure steam in place of the condensing action. In 1804 a locomotive of his construction drew 10 tons at a rate of 5 m. per hour. His engine exploded, however, and no practical application of the invention was made. He afterward made many inventions and improvements in machinery, such as floating docks, a hydraulic-engine, and warming apparatus.

TREVOR, Sir JOHN, Knight, b. in 1633. In the parliament of James II. which met on May 19, 1685, he was elected speaker of the house of commons. "Trevor," says Macaulay, "had been bred half a pettifogger, and half a gambler, had brought to political life sentiments and principles worthy of both his callings, had become a parasite of the chief justice" (Jeffreys), "and could on occasion imitate not unsuccessfully the vituperative style of his patron. The minion of Jeffreys was, as might have been expected, preferred by James, was proposed by Middleton, and was chosen without opposition."—*History of England*, vol. i. p. 508 (ed. 1849). In the same year, he was made master of the rolls. He contrived to maintain his political and judicial position after the revolution of 1688, and was again elected speaker on the meeting of parliament on Mar. 20, 1690, on an understanding with the government that he was to take the management of what may fairly be called the bribery department. At the same time, he

acted as first commissioner of the court of chancery, in which position his integrity seems from the first to have been greatly suspected; and though he was deficient neither in learning nor in parts, his judgments were both long in being given, and contemptible when they were pronounced. For some years, he maintained both his power and position; but his greed and venality at length became so notorious that respectable gentlemen of all shades of political opinion were ashamed to see him in the chair. In March 1695, a committee of the house of commons was appointed to investigate into the truth of certain charges of bribery brought against their speaker. Within a week, the committee reported, that in the preceding session, sir John Trevor had received 1000 guineas from the city of London for expediting a local bill. As soon as the report had been read in the house, it was moved that the speaker had been guilty of a high crime and misdemeanor. He had himself to stand up and put the question. There was a loud cry of "aye." He called on the "noes." Scarcely a voice was heard. He was forced to declare that the "ayes" had it. Even his "callous heart and brazen forehead" were unable to stand the unspeakable ignominy of his position. Had he returned to the house on the following day, he would have had to put the question on a motion for his own expulsion; he pleaded illness, and shut himself up in his bedroom. A few days afterward, he was formally expelled. He still, however, retained the mastership of the rolls, "to the great encouragement," says North, "of prudent bribery forever after." "His profligacy and inscience united," says Macaulay, "had been too much even for the angelic temper of Tillotson, who had been heard to mutter something about a knave as the speaker passed him." There are anecdotes of him in Noble's continuation of Granger's *Biographical History*, vol. i. p. 172. He died May 20, 1717, and was buried in the Rolls' chapel.

TRIAD, HINDU. See TRIMŪRTI.

TRIADS (in chemistry). Until recently, the terms *equivalent number* and *atomic weight* were usually regarded by chemists as synonymous. Many recent writers, among whom Laurent (see his *Chemical Method*, translated by the Cavendish society) stands pre-eminent, have, however, shown that there is an essential difference between them; and this difference is fully recognized by prof. Miller, who, in the latest edition of his *Chemical Physics*, 1863, thus defines it: "The equivalent or combining proportion is an experimental constant which is independent of theoretical considerations; but the relative atomic weight is necessarily a matter of inference, and may be a number, often a multiple of the equivalent, and selected by the chemist from theoretical considerations, which, being based partly upon the law of gaseous volumes, partly on chemical grounds, partly on the phenomena of specific heat, seem to require that the atomic weights of a large number of the elements, if compared with the atomic weight of hydrogen, should be double of those commonly given.—P. 22. Most chemists of the modern school now agree in arranging the elementary bodies in four groups; namely, 1. *Monad* or *unequivalent* elements (or *monads*), one atom of which in combination is equivalent to H_1 , or one atom of hydrogen. In these, the atomic and equivalent numbers are identical. They are twelve in number, and include hydrogen, chlorine, bromine, iodine, silver, etc. 2. *Dyad* or *biequivalent* elements (or *dyads*), each atom of which, in combining with other bodies, is equivalent to H_2 , or two atoms of hydrogen. In these, the atomic number is double the equivalent number. This group embraces 25 elements, including oxygen, sulphur, selenium, iron, zinc, etc. 3. *Triad* or *terequivalent* elements (or *triads*), each atom of which, in combining with other bodies, is equivalent to H_3 , or three atoms of hydrogen. In this group, which embraces nine elements, including nitrogen, phosphorus, arsenic, etc., the atomic and equivalent numbers are regarded as identical, except in the case of aluminium and rhodium, when the atomic number is doubled. 4. *Tetrad* or *quadrequivalent* elements (*tetrads*), each of which, in combining with other bodies, represents H_4 , or four atoms of hydrogen. Their atomic number is double the equivalent number. They are eight in number, including carbon, silicon, tin, etc.

This arrangement of the chemical elements, which is being adopted in all the most recent text-books, has led to the insertion of what are termed *dashed symbols*, in which the number of dashes which are attached to the symbol for the atom of an element indicates its equivalency or interchangeable value for hydrogen. Thus, Ag is marked with a single dash, to show that silver is a monad, or, in other words, that the atom of silver may be substituted for an atom of hydrogen, so as to combine with an atom of chlorine, the resulting compound being $Ag^{\prime}Cl$ (chloride of silver); Cu is marked with two, Bi with three, and Si with four dashes, to indicate that they are dyads, triads, and tetrads respectively, or that the atoms of copper, bismuth, and silicon may be substituted for two, three, and four atoms respectively of hydrogen, so as to combine with two, three, and four atoms of chlorine, forming $Cu^{\prime\prime}Cl_2$ (chloride of copper), $Bi^{\prime\prime\prime}Cl_3$ (chloride of bismuth), and $Si^{\prime\prime\prime\prime}Cl_4$, or $Si^{\prime}Cl_4$ (chloride of silicon). These dashed symbols are rapidly coming into general use.

TRIAL, as a legal term, applies most frequently to trial by jury (q.v.), whether in a civil or criminal matter. See PROSECUTOR.

TRIAL AT BAR is a jury trial which takes place before the full court of four judges, instead of one judge only. It is seldom resorted to, and leave must be given in each case on special grounds.

TRIANGLE (*tres*, three, *angulus*, a corner), the most simple of geometrical figures, is a figure having three angles; but, oddly enough, it is generally defined by geometers as a figure of three sides, and its property of being three-angled is put in the subordinate position of a necessary consequence. It may be that this arises from Euclid's use of the word *tripleuron* (three-sided) in the definitions prefixed to his *Elements*; while *trigōnon* (three-angled) is employed in the work itself.

In plane geometry, a triangle is bounded by three straight lines; and triangles are classed according to the relative length of their sides, into *equilateral* or equal-sided; *isosceles*, or having two sides equal; and *scalene*, or unequal-sided, the equality or inequality of the sides carrying with it the equality or similar inequality (of *greater* or *less*) of the angles respectively opposite to these sides, though the *ratio* of inequality of the sides by no means corresponds to that of the angles. Considered with reference to the size of its angles, a triangle is *right-angled* when one of its angles is a right angle (90°); *obtuse-angled*, when it has one angle greater than a right angle; and *acute-angled* when it has no angle so great as a right angle; the well-known property, that the sum of the angles of a triangle is equal to two right angles, preventing the possibility of more than one of them being as great as a right angle. For the relations between the sides and angles of a triangle, see **TRIGONOMETRY**. The triangle being the fundamental figure of plane geometry, through which the properties of all other figures have been arrived at, the investigation of its properties has always been held to be of primary importance. Of the immense number of results obtained by investigation, we can notice only two or three in this place. The lines joining the angles of a triangle with the points of bisection of the opposite sides, intersect at the same point, as also do the perpendiculars from the angles on the opposite sides, the lines bisecting the angles, and the perpendiculars from the middle points of the sides. The point of intersection of the first series of lines is the center of gravity of the triangle; those of the third and fourth series are the centers of two circles, the former of which touches the sides internally, and the latter passes through its three angular points. Another remarkable property of triangles, known as Napoleon's problem, is as follows: if on any triangle three equilateral triangles be described, and the centers of gravity of these three be joined, the triangle thus formed is equilateral, and has its center of gravity coincident with that of the original triangle. See also **TRIGONOMETRY** and **HYPOTHENUSE**. The area of a triangle is half of that of a parallelogram which has the same base and altitude, and is thus equal to half the product of the base into the altitude; it may also be expressed by the formula

$\sqrt{S(S-a)(S-b)(S-c)}$, where a, b, c , are the lengths of the sides, and S is half their sum.

In the geometry of the sphere, a triangle is a figure bounded by three arcs of circles.

TRIANGLE, a steel rod bent into a three-sided figure open at one angle. It is hung by a string at the upper angle, and attached to the performer's left hand, to his desk, or to his drums. It is frequently used in the orchestra. Beethoven has a few strokes in his Ninth Symphony, and modern composers frequently use it in marches, dances, fantasias, etc.

TRIANGLE OF FORCES, in mechanics, is the name given to a proposition which is merely a formal modification of the *parallelogram of forces* (see **COMPOSITION OF FORCES**), and, as generally stated, is its converse. The parallelogram of forces enunciates that, if two forces, P and Q (fig.)—represented in direction and magnitude

by AB and AC —inclined at an angle to each other, act on a point A , their resultant, R , is represented in direction and magnitude by the diagonal, AD , of the parallelogram formed on the two lines AB and AC . Now, as the resultant, R , is equivalent to the combined action of P and Q , it would exactly counter-balance them if acting in the opposite direction AR , but would still be fully represented by the diagonal line AD , taken as from D to A . Also, instead of AB , CD may be taken to represent P . Hence as the sides of the triangle ACD completely represent the three forces, we have the proposition, that if three

forces in the same plane be in equilibrium on a particle, and if in that plane any three mutually intersecting lines be drawn parallel to the directions of the forces, the lengths of the sides of the triangle thus formed will be proportional to the magnitudes of the forces. Its proof rests upon the previously ascertained fact that R, P , and Q , three equilibrating forces at A , are proportional to AD, CD, AC , and on the geometrical theorem that a triangle whose sides are respectively parallel to those of another triangle, has its sides proportional to those of the latter; and consequently, the ratio and relative direction of the forces R, P , and Q are fully represented by ad, cd , and ac , the sides of the triangle

acd. Again, as the sides of a triangle are to one another as the sines of the opposite angles, so also are the forces which the sides represent. Hence

$$P : Q : R' :: CD : AC : AD :: \sin. CAD : \sin. ADC : \sin. ACD$$

(and substituting the sines of the supplementary angles)

$$:: \sin. QAR' : \sin. PAR' : \sin. PAQ;$$

that is, each force is proportional to the sine of the angle between the directions of the other two.

TRIANGULAR NUMBERS. See FIGURATE NUMBERS.

TRIANGULATION is the operation of dividing any portion of the earth's surface into triangles of as large a size as possible, which may be called primary, and which must be afterward subdivided into triangles of a smaller size, forming a great network of secondary or subsidiary triangles, which serve as a means of working down from great to less, and finally completing, by a system of scientific checks, an accurate map or delineation of the region covered by such triangles, forming the geodesical process called a trigonometrical survey. See ROY, WILLIAM; TRIGONOMETRICAL SURVEY. The same operation is used in the measurement of an arc of the meridian, for the purpose of ascertaining the length of a degree of latitude or longitude on any part of the earth's surface; but in this case, only primary triangles are necessary, as no topographical detail is required, and the positions of the apexes of the triangles are astronomically fixed in the most careful manner, which is not always done in the triangles of a trigonometrical survey.

In carrying out a system of triangulation, much judgment and an accurate local knowledge of a country are necessary; and it very often happens that a more extensive range of angles can be obtained from a comparatively low station than from the tops of the highest mountains. The angles of each triangle should be as near equal as possible, and, unless local circumstances render it unavoidable, very acute or obtuse angles should not be used. The sides of the primary triangles should be as long as can be conveniently observed, but in practice they vary from 80 * m. or more to 4 m., or even less. The angles are generally determined by a large theodolite, of as simple and strong a construction as possible, which is fixed on the most elevated points of mountain ranges, etc. When the apexes of the triangles are very distant, heliostats, or mirrors reflecting the sun's rays, are often used, and in dark or cloudy weather the Drummond light has been employed. The primary triangles being fixed on the spherical surface of the earth, certain formulæ, according to the rules of spherical trigonometry, must be applied to reduce them to the simple calculations for ascertaining, from certain known data, the sides and angles of plain triangles. The whole of those calculations are dependent on the accurate measurement of a base or fundamental line. The instruments invented by Capt. Drummond, R.E., with which he measured the base-line of the Irish survey at Lough Foyle, and which were afterward employed by sir T. Maclear in verifying Lacaille's base-line on the plains of Malmesbury, in the Cape triangulation, appear to have been as nearly perfect as possible. The length of base-lines used in modern surveys varies from 3 to 7 m.; Gen. Roy's original base-line of the English survey was 5.19 miles.

At the end of a large triangulation, a second or testing base-line is always measured at a distance from the original one; if the measured length of this agrees with that ascertained by calculation, it may be considered a proof of the accuracy of the work in general.

The triangles of the English survey have been extended to and connected with those of France, Russia, etc., as far e. as Siberia, and s. to Algeria; and it is not at all improbable that the triangles of the Russian survey will eventually be connected at one side with those of the great survey of India, which already has the apexes of many of its triangles on the summits of the Thibetan Himalaya, and to the eastward across Behring's strait, with those of British America and the United States.

TRIAS, the oldest group of the secondary strata, formerly associated with the permian rocks under the name of the new red sandstone (q.v.). The term trias, or the triple group, has been given to these beds by German geologists because they are separable into three distinct formations: the Keuper, Muschelkalk, and Bunter-sandstein; and the name has been generally adopted, as the beds are more fully developed in Germany than in England or France. The German beds have consequently been accepted as the types of the group, and the deposits in Britain and elsewhere are co-related with them.

The typical beds are divided into—1. Keuper (q.v.), with a maximum thickness of 1000 ft.; 2. Muschelkalk (q.v.), with a maximum thickness of 600 ft.; 3. Bunter-sandstein (q.v.), with a maximum thickness of 1500 feet.

In England the principal triassic deposit occurs in a great basin of the paleozoic strata in Lancashire, Cheshire, Shropshire, Staffordshire, and Leicestershire. The eastern base of the great central Pennine range of hills is composed of triassic beds, which, beginning in Leicestershire, run northward through Nottingham and York to the coast of Durham. From Staffordshire another series of these beds may be traced along the valley of the Severn, and crossing the Bristol channel, through Somerset and Devon, to the southern coast.

*In the survey of India, and also in the process of connecting the triangulation of Ireland with that of Great Britain, many of the sides of the triangles greatly exceeded this length.

TRIBE (Lat. *tribus*, a division, originally perhaps a third part, in reference to the three cantons whose coalescence formed the germ of Rome, q.v.), an aggregate of stocks—a stock being an aggregate of persons considered to be kindred—or an aggregate of families, forming a community usually under the government of a chief. The chief is possessed of despotic power over the members of the tribe. It is commonly said that he has “patriarchal” power—such power, that is, as fathers in early times exercised over their children. The tribe has been the earliest form of the community among all the races of men.

In a very large proportion of existing tribes the tribe is an aggregate of several stocks or distinct bodies of kindred. The persons of whom the tribe consists are included in stocks which are, or are accounted, distinct from each other. This organization is sustained by two tribal customs—(1) persons of the same stock are forbidden to intermarry; and (2) kinship is reckoned through females only, so that children are accounted of the stock of their mother. Persons of the same stock, too, owe duties to each other, and are to some extent sharers in each other's liabilities. Thus, an injury done by a man is an injury done by his stock, which may be avenged upon any member of it; an injury done to a man is an injury done to his stock, for which every member of it is bound to seek vengeance. In consequence of the customs above mentioned, a husband must be of a different stock from his wife or wives; he must therefore be accounted of a different stock from his children; and when he has wives of different stocks, their respective children are accounted of different stocks. More than one stock is thus represented in every household; and since a man owes duties to his stock—the duties of acknowledged blood-relationship—while to those of his family who are not of his stock, nothing but the accident of birth (only accident) unites him, the family among these tribes has necessarily little cohesion. The tribal customs which have been referred to ignore the family altogether; they are founded upon the idea of stock. They are the customs of people with whom the conception of stock was a powerful social influence, when that of the family was impotent—of people who must have been divided into stocks at a time when, possibly, they had no family system. It is inconceivable that such customs should have arisen in the face of a family system anything like that which prevails among civilized peoples, or even of such an approach to the family as many of those tribes now possess. And it follows that the family has *grown* among these tribes. It is obviously now growing among them. Now, in many cases, the only obstacle to its rapid development is the firm hold which the idea of stock has taken of the tribal life. On the other hand, the prevalence of customs founded upon the idea of stock proves a prior existence of stocks, or bodies of kindred. The separation into stocks must be older than the customs, at least as customs associated with the idea of stock. And keeping this in view, and considering how difficult it is to conceive of several stocks herding together at the early time when every stranger was an enemy, unless there was some natural connection between them—such a connection as the marriage-law and the system of kinship, when they arose, would establish—it may safely be concluded that each stock was originally a separate tribe. Into the tribe conceived of as a single stock the marriage-law and system of kinship would gradually bring a variety of neighboring stocks; and thus the tribe would become what it is—an aggregate of stocks. The progress of such tribes appears to have been from the tribe conceived of as a group of kindred to the tribe consisting of several stocks or groups of kindred; and now, though the family is not yet fully developed among them, they seem to be tending to become aggregates of families. The tribes of Australasia are the most perfect examples of the organization above described; but it also exists (or it existed) among the tribes of North, and most of those of South America, among a majority of the known tribes of Africa, and a large proportion of the ruder tribes of Asia.

Suppose male kinship (which must come with the growth of the family) introduced among tribes such as have been spoken of, containing different stocks. First, the stocks existing within the tribe would be fixed, stereotyped, within it; secondly, the growth of the family would be greatly promoted, and the influence of the idea of stock proportionately diminished. The family would in time rise to the importance originally possessed by the stock; and at length the tribe, still divided into stocks, would become, politically, an aggregate of families. The tribe would thus assume the exact shape which it had in the early ages of Greece and Italy, when it was an aggregate of families included in clans or bodies considered kindred (*gentes*); the exact shape which it now has among the most advanced of existing tribes. Since a tribe of the Australian type might thus develop into a tribe of the classical type, is it not probable that the latter really was the result of such a process of development? Regarded as a hypothesis, this view will be found to fulfill all the conditions of a good hypothesis. And if the circumstances of tribes which have what is popularly termed the marriage law of caste—among the greatest of which a division corresponding to the Roman *gens* prevails—can be reconciled with it, or with an extension of it, we shall have got a hypothesis capable of explaining the formation of tribes in general. The tribes above referred to, whether divided into clans or not, consider themselves of a common stock. They restrict marriage to the stock; but they always forbid marriage within certain degrees of relationship; and in numerous cases—among them, those of the most numerous caste peoples—they also forbid marriage within the clan or body considered peculiarly kindred. It will be convenient, for want of a

better word, to speak of this marriage law as caste. And by caste tribes, in what follows, are to be understood tribes which have this marriage law.

Seeing that the law forbidding marriage within the tribe, and the law restricting marriage to the tribe have both been widely prevalent among human races, both must be conventional, produced by circumstances; and if in their origin they are equally ancient, men, at the first, in respect of their circumstances, must long have been divided into two bodies very differently placed. This, however, is very improbable. There is no evidence for it; there is some evidence against it. The circumstances, too, capable of producing caste must have been isolating circumstances. The effect of an isolated position in producing an approach to caste may be seen in the case of the royal houses of Europe. Excepting, perhaps, mere physical isolation, it is difficult to conceive of isolating circumstances which could operate in the earliest times. Those which can be conceived of, and which are also known to have operated among caste peoples—the pride of conquerors, peculiarities of religion, the sentiment of an aristocracy or a priesthood, hereditary occupations—could only exist when society is somewhat advanced. It thus becomes highly probable that caste did not prevail in the earliest times—was not the original law of any tribes. There is strong corroboration of this in the fact, that it is found imperfectly established—in the course of being established—among not a few existing tribes; and in the fact, that it became the law of peoples—for example, the Hebrews—whose ancestors, according to tradition, followed a different practice. In connection with these considerations, there is conclusive reason for holding that caste was not an original law, in the law of incest which prevails among the greatest of caste peoples, by which marriage is forbidden, not only within certain degrees of relationship, but also within the clan or body of kindred denoted by a family name. The existence of any law of incest among a caste people requires explanation. But how could a prohibition of marriage within the clan arise among people, whose principle it was to marry within the kindred? This can only be referred to circumstances which preceded the origin of caste. Does it not, then, suggest the establishment, through the force of isolating circumstances, of caste—the restriction of marriage to the tribe, or to particular tribes—among tribes divided into stocks which had forbidden marriage within the stock? This would, at any rate, account for the facts. The original prohibition, upon this view, is still represented by the prohibition of marriage within the clan. But as tribes advanced, the family usurped the place of the stock; there sprung up a belief in the common origin of the tribe; and the law of succession to family property gave a new importance to near relationships. The law of incest would naturally tend to follow the practically important limits of relationships; and it might, being still applicable to the stock, be held specially binding within those limits; or it might be confined to them, for in the case of small and simply-constituted bodies, within which the differences of condition and of employment were few and slight, the stocks—pressed, on the one hand, by the growth of the family, on the other, by the growing belief in the common descent of the tribe—would be apt to disappear altogether. The absence of the stock or clan in the case of some of the smaller caste tribes, and the two laws of incest found among caste peoples—one of which, at least, seems otherwise inexplicable—can thus be accounted for consistently with the hypothesis of such peoples having progressed from the organization of the Australian tribe. And it having been shown that caste is not an original law, all other circumstances of caste tribes will be found consistent with that hypothesis. The belief which many tribes have had in their descent from one progenitor, is not corroborated in any case. It cannot prove its own truth. In many cases it can be shown to be a fiction; it is presumably so in all cases, and it does not afford an argument for or against any theory of the origin of tribes.

The hypothesis of development, as it may be called, is thus capable of connecting together all the varieties of the tribe, the simplest with the most advanced; and it gives us, as the earliest and simplest idea formed of the tribe, that it was a body of persons who conceived themselves to be of a common stock. It is in the favor of this hypothesis that it affords an easy and natural explanation of the peaceable political union and fusion into one people of neighboring tribes; and of the fact, that a population is divided into a greater or less number of tribes, according as it is less or more advanced. Neighboring tribes would contain the same stocks; they would thus be really homogeneous, and related; they would be ready for union as soon as their circumstances brought them into close contact, and made a political union desirable.

There are facts and arguments by which this hypothesis may be raised to so high a degree of probability, that its soundness can scarcely be doubted. A single example of them must suffice. It is the received opinion that among the advanced tribes containing gentes, property was originally vested in the gens, and was only by slow degrees wrested from it by the family. It is involved in this, that at one time the gens was everything, the family nothing, in the organization of the tribe; that the latter grew, and that as it grew, the former sunk in importance. The tribe, when property was exclusively vested in its gentes, must have been an aggregate of gentes, not an aggregate of families. All this is consistent with, and corroboratory of the hypothesis of development; in particular, it strongly corroborates the view that the tribe at an early period consisted of several bodies of kindred, accounted distinct from each other, and

sach of which held property in common. It has never been accounted for upon any other view.

The only other theory which has been formed of the origin of tribes—commonly called the patriarchal theory—is that a tribe consists in the main of the descendants of a single family, descent being chiefly, if not exclusively, reckoned through males; and that the gentes found within the tribe consist of the descendants of individual sons or grandsons of the common progenitor. It is evident that this theory does not explain the organization of the numerous class of tribes first considered. It has been formed upon observation of the advanced tribes of the classical type, but it does not consist with the history of property (to test it at a single, but a vital point) even among them. It might account for property being vested in the tribe; it does not account for it being vested in the gentes. It can only do so by the aid of the assumption that, though the sons and grandsons of the original progenitor had the desire for family property, and divided his property, or accumulated property of their own, their descendants suddenly lost that desire, and began to hold in common. But such a supposition is too improbable to be entertained. This theory is also excluded in the case of all polyandrous peoples, for it assumes that society began with monandric marriage, a perfect idea of the family and male kinship—all conditions the very opposite of those which must at one time have prevailed among such peoples. And polyandry can be shown to have prevailed so widely, that it is probable it has been the earliest practice of every human tribe. However this may be, a theory which is contradicted by a great proportion—much the greatest number—of the cases to be accounted for, and is in important respects not consistent with any class of cases, cannot be a good hypothesis; and therefore the patriarchal theory has no title to be accepted as explaining the normal history of the formation of tribes, or of any class of tribes. Its fundamental assumption, indeed—the segregation of individuals who became progenitors of tribes—seems to be at variance with the nature of man, which all experience has shown to be social and gregarious, and to be the most averse to separate and independent action, when society is the least advanced. It should also be stated that it fails to do what a sound theory of tribal formation must do—to account for the fusion of neighboring tribes, independently of conquest, into one people. To account for this, it has been customary to suppose that neighboring tribes, wishing to unite, adopted one another; but there is no evidence of such adoption having ever been practiced, and the supposition seems entirely improbable.

The patriarchal theory was, until recently, the received account of the formation of tribes. The theory which has here been styled the hypothesis of development was first propounded, though without elaboration, in a work published in 1865, *Primitive Marriage*, by J. F. McLennan. See also Reclus, *Primitive Folk* (1891)

TRIBONIANUS, a very eminent Roman jurist of the 6th c., of Macedonian parentage, but b. in Pamphylia. He held, under the emperor Justinian, the offices of quæstor, master of the imperial household, and consul. But he is famous chiefly through his labors in connection with the code (q.v.) of Justinian (q.v.) and the pandects (q.v.). Tribonianus died in 545.

TRIBUNE. See **ROME**.

TRICHECUS. See **MORSE**.

TRICHI'ASIS (Gr. *thrix*, gen. *trichos*, of a hair) consists in a growing inward of the eyelashes; three or four of them (sometimes only one) presenting their points toward the globe of the eye, while all the other hairs retain their natural position. The disease is exceedingly common among the lower classes, and especially the Irish. This affection causes great annoyance, by exciting a pricking sensation, and by the constantly irritable and watery state of the eye which it induces. The treatment consists in plucking out the offending hairs (if they are few in number) from time to time, each hair being removed by hair-forceps with a slow steady pull. If they form a little group, they must be removed by dissecting out the small portion of lid in which they are implanted, and uniting the wound with a suture. In other cases, it may be necessary to remove the entire margin of the lid.

TRICHI NA SPIRA LIS, the name given to a peculiar nematoid worm, which, in its sexually immature state, inhabits the muscles usually of the pig. It was discovered in 1835, Mr. Wormald, then demonstrator of anatomy at St. Bartholomew's, giving to Prof. Owen four microscopical specimens of speckled muscle from a subject that was then in the dissecting-rooms; and Mr. Paget, then a first year's student, simultaneously investigated the question. Prof. Owen, to whom the discovery of the trichina is generally referred, soon afterward communicated to the zoological society his "Description of a Microscopic Entozoon infesting the Muscles of the Human Body," in which he describes the speckles as capsules containing a spirally-coiled microscopic worm, to which he gave the generic name trichina (Gr. *thrix*, a hair), and the specific name *spiralis*, from its coiled arrangement. Mr. Paget had independently arrived at similar results, with the aid of Robert Brown of the British Museum, and read a paper on the subject to the Abernethian society a week before Prof. Owen's memoir was read to the zoological society; so that his name should always be at least associated with that of Owen, in reference to

the discovery of this worm. From the date of this discovery to the present time, the *trichina* has been a fertile source of discussion. In 1845 the idea was mooted by various naturalists that the trichina was the undeveloped or sexless form of some other worm; and in 1855 (after the transformation of the cysticercus into the tapeworm was discovered), various suggestions were made on this subject; but it was not till 1860 that Virchow and Leuckart, by feeding animals on flesh containing trichinae, arrived independently at the correct conclusion, that the parents of the encysted trichinae are small nematoid worms, which had never previously been described, Leuckart's experiments being made with human flesh containing these parasites.

The young trichinae, as they are seen in the human muscles, present the form of spirally-coiled worms, in the interior of small, globular, oval, or lemon-shaped cysts, which appear as minute specks scarcely visible to the naked eye. These cysts are more or less covered externally with calcareous matter, according to the length of time they have remained in a fixed position, and the degree of degeneration which their walls have undergone. The trichina measures, according to Cobbold, on an average $\frac{1}{8}$ of an in. in length, and $\frac{1}{16}$ of an in. in breadth. The cysts are sometimes altogether absent, and hence they must be regarded as abnormal formations, resulting from local inflammation set up by the presence of the worm, which in this larval condition of existence measures $\frac{1}{16}$ of an in. in length, and $\frac{1}{32}$ of an in. in breadth. These larval worms exhibit a well-marked digestive apparatus, and afford evidence of the presence of reproductive organs, which are often sufficiently developed to enable the observer to determine the sex of the organism. The number of larval trichinae that may simultaneously exist in the muscles of a single man or animal is enormous. In a cat on which Leuckart experimented, a single ounce of flesh was estimated to contain 325,000 trichinae; and if all the voluntary muscles of a human body of ordinary size were similarly affected, the number of worms would exceed 1950 millions. Dr. Cobbold believes that there can be no doubt that the number in a single "bearer" (as he terms the sufferer) may *actually* amount to at least 20,000,000.

We now proceed to the consideration of the mature worms. When an animal is fed with flesh containing the larval worm already described and is killed a few days afterward, a large number of minute worms are found mixed with the contents of the small intestines. On closer examination, they are found to be of two kinds—the larger and more numerous ones being the females, and the smaller and rarer ones the males. At the second day after their introduction, these intestinal trichinae attain their full sexual maturity; and in six days the females contain perfectly developed and free embryos in their interior.

The female is a slender round worm, varying in length from $\frac{1}{12}$ to $\frac{1}{8}$ of an inch. The anterior end presents a bead-like appearance, from which the intestinal canal proceeds. The posterior three-fourths are mainly occupied by the reproductive organ, which is filled partly with free embryos, and partly with eggs in various stages of maturity. When these embryos have attained their full size within the uterus of the parent, they pass out at the genital aperture, and commence life on their own account. They are little worms with rounded ends, and presenting no indications of any internal organs. Before entering into the history of their migrations, we may mention that the male worm is seldom more than two-thirds the length of the female. It presents the same bead-like arrangements as the female, and a reproductive organ whose aperture apparently coincides with the anus; while the female sexual aperture is comparatively near the head-end of the worm. The body terminates with two hooks which are doubtless subsidiary to the reproductive process. The males are less numerous and shorter lived than the females, and probably die after having discharged their natural function. The females continue bringing forth young for a period of two or three weeks. The embryos, according to Leuckart, Cobbold, and all our best helminthologists, penetrate the walls of the intestine, and pass directly into the muscles of their "bearers" or "hosts," where, if the conditions are otherwise favorable, they are developed into the form originally observed by Owen and Paget. In this way, by proceeding along the course of the intermuscular connective tissue, some of them reach the muscles of the extremities and other distant parts; but the majority of the wandering embryos (according to Virchow) "remain in those sheathed muscular groups which are nearest to the cavity of the body (abdomen and thorax), especially in those which are smaller and most supplied with connective tissue." These embryos penetrate into the interior of the separate muscular bundles, and in the course of 14 days acquire the size and organization of *trichina spiralis*. The surrounding tissues soon become disorganized, and the spot inhabited by the coiled-up worm is converted into a spindle-shaped widening, within which the previously described cyst is formed by a hardening and calcification of the exterior. A point of great importance in relation to the distribution of this parasite, and as having a practical bearing upon the disease known as *trichiniasis* (q.v.), has been established by the experiments of Davaine—viz., that while in the adult condition, trichinae perish in cold water in about an hour, and cannot survive the decease of their host for more than six hours, the larvæ remain alive in water for a month, and will live for a long time in flesh which has become putrid. In this way, "a carcass near a marsh or rivulet may communicate the parasites to the ruminants that drink the water, or to pigs."

In the same year (1860) in which Virchow and Leuckart proved that by feeding an

animal on flesh containing the *trichina spiralis*, intestinal trichinæ were produced, and watched the transformation of the young of the latter into muscular trichinæ, a very important corroborative medical case was observed and recorded by Zenker. In this case the patient was a servant-girl, aged 20, and the principal symptoms were loss of appetite, prostration, violent pains, and contraction of the limbs; and finally œdema, which, with a certain amount of phneumonia, terminated fatally in the course of a month. After death, numerous larval trichinæ were found in her muscles, while the intestinal canal contained sexually mature worms. Three weeks previously, before the girl had taken ill, she had assisted in killing pigs and making sausages. It was further ascertained that a few days before her illness commenced she had eaten some of the meat in a raw state. On examination it was found that the pork (both hams and sausages) contained numerous encysted trichinæ. It was, moreover, ascertained that the butcher and several members of the girl's family (to whom she had probably given sausages) were attacked with symptoms similar to those which, in her case, proved fatal. How the pig acquires its trichinæ is unknown; but that the larval trichinæ contained in putrid flesh, etc., may easily gain admittance to the pig's alimentary tract is a supposition at once feasible and of likely kind. Beet-root, earth-worms, moles, and rats have been suggested as their infectors; but on this subject see the advice given by the French commissioners in the next article. The adult trichina is liable to infest the intestinal canal of all animals in which the larvæ have been found in the muscles. In this category must be placed man, the dog, cat, rabbit, rat, mouse, mole, hedge-hog, and badger. Whether birds ever contain trichinæ is doubtful, and reptiles and fishes are quite free from this parasite. See illus., **WORMS, ETC.**, vol. XV.

TRICHINIASIS is the name of the diseased condition which is induced by the ingestion of food containing *trichina spiralis* in large quantity. The first recorded case, as occurring in the human subject, is that of Zenker, which has been already noticed in the article **TRICHINA**; but there can be no doubt that the disease has long existed, although its origin was previously unsuspected. The first symptoms of this disease, as it occurs in the human subject, are loss of appetite, followed by nausea and a sense of fatigue, prostration, and general indisposition. This stage lasts about a week. Pain and stiffness of the limbs, accompanied by swelling of the face, and fever of a peculiar type, characterized by a very frequent pulse, moderate thirst, and copious perspirations, now show themselves; the commencement of the second stage of the disease being thus synchronous with the migration of the trichina-brood into the muscles, there to become encysted. During this stage, pressure, or any attempt to move the parts under the control of the swollen muscles, is intensely painful, and even the normal respiratory movements cause such constant pain as to render sleep impossible. In severe cases the patient lies on his back like a paralyzed person. The tongue presents much the same appearance as in ordinary gastric fever. The bowels are most commonly constipated, but in some of the worst cases there is continuous diarrhea. The swelling which began in the face now disappears, and is replaced by swelling of the feet, which gradually rises to the trunk. In about the fourth week of the disease the trichinæ may be regarded as permanently settled, and as having completed their destructive action on the muscles. This is the beginning of the third stage, which is mainly characterized by extreme weakness. The gastric symptoms abate, the appetite returns, and, in favorable cases, the muscular pains and swelling gradually diminish, while in severe cases, this third stage is the most dangerous part of the disease; the diarrhea being severe, and accompanied with tenesmus, and often with the involuntary discharges of the feces and urine, while the skin exhibits extreme pallor, and is enormously distended with effused serum. Moreover, pneumonia often supervenes at this period. The fourth and last stage is that of convalescence. This may begin at the fifth week, or later, and may last from 3 weeks to as many months. In mild cases it is impossible to draw a definite line between this and the preceding stage. Death may occur at any period. It has been observed as early as the 5th, and as late as the 42d day of the disease. A single trichinous pig, if its flesh is eaten without being previously submitted to such culinary processes as to destroy the vitality of the larval trichina, may establish a local epidemic of this disease. The most important of those epidemics have occurred in Germany, and are noticed by a German physician, Dr. Thudichum, in "The Seventh Report of the Medical Officer of the Privy Council," 1865. Of these, the second or great epidemic at Hettstädt was the most severe. It commenced in the second half of Oct., 1863, and affected 158 persons, of whom 28 died. All these persons were found to have been eating trichinous pork, either perfectly raw, or in the form of smoked or fried sausage, meat-balls, brawn, black-pudding, etc.

As soon as a case of suspected trichiniasis comes under the notice of the physician, attempts should be made to remove the mature worms from the intestine by active purgation. For this purpose calomel, in scruple doses, is more serviceable than any other purgative. Two or three such doses should be given at intervals of 24 hours. No special directions can be given for the treatment of the fever. If there is any appetite, the diet should be light, and at the same time nourishing. Liebig's extract of meat has been found very serviceable in keeping up the strength. The most effectual remedy for the sleeplessness was found to be the cold wet sheet, in which the patient should be wrapped

repeatedly during the day. The preparations of opium only aggravate the discomfort. The other symptoms must be treated by the ordinary rules of therapeutics.

Considering the gravity of this disease, it would be of the greatest importance to be able to decide, during its life, whether a pig were trichinous or not. On this point there is some difference of opinion; but Profs. Delpech and Reynal, who were charged by the French government to report upon this disease, assert that "the animal, while living, shows no signs of the presence of trichinæ, nor can they be detected in the meat with an ordinary lens, but a powerful microscope renders them at once visible." In Hanover, out of 25,000 pigs, 11 were found trichinous; in Brunswick 16 were affected out of 14,000, while in Blakenburg 4 were diseased out of 700. The French commissioners assert that a temperature of 167° Fahr. is sufficient to kill the parasites, and that meat thoroughly salted is also perfectly safe; they advise that smoke-dried sausages, though probably safe, should be well boiled. They further attribute the spread of the disease among pigs to the fact that they are foul feeders, and will eat any offal, such as the dead bodies of rats and other animals, which are known to be liable to the disease. They recommend farmers to be very cautious in feeding their pigs to avoid giving them flesh without first boiling it; to destroy rats and small carnivorous animals, and never to leave human or other excrements in places where pigs can reach them. Finally, they advise all experimenters to burn trichinous flesh when their investigation is completed, and not to throw it away, for a fragment of it might possibly be eaten by a rat, the rat devoured by a pig, and the pig thus become the medium of the disease to man. This utter destruction of the parasites is a point on which our countryman, Dr. Cobbold, has long insisted. In 1863 a trichinous pig from Valparaiso, killed on board a merchant-vessel on the high seas, caused the death of two of the crew; and in 1864 there was a slight trichinous epidemic at Cheektowaga, New York. Probably trichina-disease is a common ailment in this and other countries; its symptoms, save in very severe cases, attracting no special notice, from their similarity to those of rheumatic disease and acute febrile attacks. The disease has been known to occur in the n.w. of England in a mild form; but helminthology, and the detection of parasites of all kinds, requires still much cultivation at the hands of the medical profession. In 1835 Mr. Wood, of Bristol, published, in the *Medical Gazette*, a case of acute rheumatism accompanied by pneumonia, in which trichinæ were discovered after death; thus *all but* anticipating Zenker in discovering a new disease.

TRICHINOPOLY (more correctly **TRICHINAPALLI**), the capital of a district of British India of the same name, on the right bank of the Kaveri, 30 m. w. of Tanjur and 56 m. from the sea. The fort which includes the old town, stands on the rugged slope of a steep granite rock, 500 ft. in height, which from some points resembles Edinburgh castle. The walls of the fort, which are now demolished, had a circuit of 2 m., and this area is inhabited by a dense population, dwelling in low, closely packed huts. The streets are tolerably regular, and are crowded at all hours of the day with multitudes of passengers, bullock-carts, and cattle. Beyond the walls is St. John's church, containing the tomb of Bishop Heber, who was buried here in 1826. The climate during eight months of the year is exceedingly hot, nevertheless Trichinopoly is the headquarters of the south division of the Madras army; there are several barracks, and the lines for the men and the officers' houses cover a large space of ground. Cheroots are manufactured in large quantity, from excellent tobacco grown in the vicinity. Manufactures of hardware, cutlery, and jewelry, especially gold chains, harness, and saddlery, are extensively carried on. A railroad to Madras was opened in 1875. Pop. '91, 90,609. Area of district, 3561 sq. m. Pop. of district, '91, 1,373,000.

TRICHIURIDÆ, a family of acanthopterous fishes, related to the mackerels, but distinguished by their elongated form and imperfectly developed anal fin. The slender tail is sometimes filiform, but generally is terminated by a caudal fin; skin naked; head compressed, eyes lateral; mouth with deep lateral cleft; teeth in jaws and palate; branchial apertures large; branchiostegal rays in seven or eight pairs; dorsal fin long, generally single, but often divided into two parts; anal fin represented by numerous concealed spines; caudal fin forked or wanting; pectorals well developed; ventral fins rudimentary; vertebrae numerous. There are only a few genera, inhabiting deep seas, one of which is *lepidopus*. See **SCABBARD FISH**.

TRICHOCEPHALUS (derived from the Gr. *thrix*, gen. *trichos*, a hair, and *cephale*, the head), is the name given to a genus of intestinal worms, of which one species *T. dispar* (described by the older writers, who mistook its head for its tail, as *trichurus* and *ascaris trichiura*), infests the human intestinal canal. Dr. Cobbold describes it as a small nematoid worm, the male measuring $1\frac{1}{2}$ in., and the female fully 2 in. in length; it is characterized by an extremely long hair-like head and neck, occupying about two-thirds of the entire length of the body. This parasite is comparatively rare in this country, while, according to M. Davaine, not less than one-half the inhabitants of Paris are infested by it. Its presence is attended with little or no inconvenience. Its development and mode of gaining access into the body are subjects to which much attention has recently been paid, but which are by no means as yet cleared up. Davaine finds that the eggs are not developed within the host's intestines, but are discharged *per anum*, in the immature condition in which they escape from the parent; and it further appears, that after their expulsion, a period of six months must elapse before embryonic formation commences. As in the more common instance of *ascaris lumbricoides*, it is probable that they complete

their development in open water, from which they are transferred to the human stomach.

For further information on the genus *trichocephalus* generally, we may refer the reader to Part I., chap. v. of Dr. Cobbold's *Entozoa*; while the species considered in this article is fully discussed in Davaine's *Traité des Entozoaires*.

TRICHOPTERA. See CADDICE.

TRICK, a term used in heraldry to denote a mode of representing arms by sketching them in outline, and appending letters to express the tinctures, and sometimes numerals to indicate the repetition of changes.

TRICOLOR means literally no more than a flag in three colors, which is the case of almost every national ensign; but the applied sense limits it to flags having three colors in equal masses. The principal European tricolor ensigns are: France—blue, white, red, divided vertically. German empire—black, white, red, divided horizontally. Italy—green, white, red, divided vertically. Belgium—black, yellow, red, divided vertically. Holland—red, white, blue, divided horizontally. The tricolor took its rise at the commencement of the French revolution as the badge of the national guard. The red and blue were selected as the arms of Paris, and the white was added, as the color of the army, to show the intimate union which should subsist between the people and the armed force.

TRICOUPIS, CHARILAOS, Greek statesman, son of Spiridion Tricoupis (q. v.), born at Nauplia, July 23, 1832. After pursuing courses in law at Paris and Athens, in 1850 entered the diplomatic service as attaché to the legation at London, where in 1863 he became chargé d'affaires. Elected to the Boulé in 1865, he became an adherent of the radical party, was in 1867 minister of foreign affairs, premier during 1875-6, again minister of foreign affairs under Canaris, in the coalition ministry of 1877, and premier during 1882-85, 1886-90, and 1895, when owing to the financial embarrassment of the government, he met with a crushing defeat, losing even the seat in the Boulé, which he had held for thirty years. While on his death-bed he was re-elected by the district of Valtos. He died at Cannes, France, April 11, 1896.

TRICOUPIS, SPIRIDION, a modern Greek statesman and author, son of a primate of Missolonghi, was born in that town in 1788. After completing his studies in France and England, he went to the Ionian isles, where he aided lord Guilford in the foundation of the university of Corfu (1820); but on the outbreak of the war of independence in the following year, he hastened to enroll himself among the patriots, and played an important part in the great struggle. From 1821, except during the presidency of Capo d'Istria, he was continually employed in administrative and diplomatic business. During the reign of king Otho, he was thrice sent to London (1835-38, 1841-43, and 1850-55) as envoy-extraordinary; he was minister of foreign affairs and of public instruction (1843); vice president of the senate (1844-49); and envoy-extraordinary to Paris (1850) on the occasion of the blockade of the ports of Greece by England. In the grave political vicissitudes he had his share, and in 1862 declined to form a ministry on account of ill health. He died in 1873.

Tricoupis enjoyed a great reputation in his own country as an orator and historian. His funeral oration on lord Byron (whose friend and comrade he had been), delivered in the cathedral of Missolonghi, some days after the poet's death, has been translated into most European languages. Many other orations, partly religious and partly political, spoken by Tricoupis in the course of the revolution, have been collected and published (Paris, 1836). Besides these, we must mention a martial poem on the Klephts (*Poëma Klephtikon*, Par. 1820); but his masterpiece is his history of the Greek revolution (*Historia tes Hellēnikēs Epanastaseos*, Lond. 1853-54), a work which is praised for its accuracy, impartiality, and style.

TRICYCLE, a three-wheeled velocipede propelled by the feet and guided by the hands. It is constructed in a great variety of ways. Generally the two large wheels between which is the seat are in the rear, with a small guiding wheel in front, though these positions are varied.

TRIDACNIDÆ, a family of lamellibranchiate mollusks, having the shell open, the valves equal, the foot small, and furnished with a byssus. *Hippopus maculatus*, the bear's-paw clam, is prized for its beauty. *Tridacna gigas* is remarkable for its great size, exceeding that of any other bivalve. The shell of a single specimen has been known to weigh more than 500 lbs. The valves are sometimes used in Roman Catholic churches for holy-water vessels. They are also used as an ornament for grottoes and fountains. They are deeply furrowed and beautifully grooved. This great mollusk is a native of the East Indies, and is found in shallow water. It is used for food, and one suffices for a number of persons.

TRIDENT, in classic mythology, is used as the symbol of Neptune's sovereignty over the sea. It consisted of a staff, armed at one end with three short prongs, with double barbs at the points, resembling the *fuscina* used by the Italians in catching large fish, particularly the sword-fish, from which we may perhaps infer that Neptune was originally the god of fishermen. It was customary among the Grecian states to place the figures of their patron deities, or their appropriate symbols, on coins; hence, we fre-

quently meet with the trident on ancient coins, such as those of Saguntum, etc.; likewise on the Sicilian coins of Hiero, etc.

TRIDENTINE PROFESSION. See TRENT, COUNCIL OF.

TRIDYMITE (Greek, triplets), so called because the crystals are compounds of threes, is a modification of silica. The crystals are hexagonal in form, somewhat like quartz, but differing from it in that they possess double refraction; colorless and transparent; vitreous, pearly on the base. Tridymite was first discovered in the trachyte of San Christobal near Pachuca, in Mexico, in 1868, by the distinguished mineralogist, Von Rath. It has also been discovered in the Drachenfels, in Germany, and in Hungary. It has been identified elsewhere, and is thought by some to be a common mineral in some eruptive rocks, having been mistaken for quartz.

TRIENNIAL ACT, a statute of William III. (q.v.), ordaining that no parliament should last longer than three years. This period was extended to seven years by the Septennial Act of George I. (q.v.).

TRIEST, or TRIESTE (Slav, *Térsst*), the most important seaport of Austria-Hungary, and the most considerable trading town on the Adriatic, stands at the head of the gulf of Triest, an arm of the gulf of Venice, 90 m. s.w. of Laibach, on the Vienna and Triest railway. The city of Triest, in which the population of the district is almost wholly massed, the other places being only small villages, consists of the old town, the new town, or Theresienstadt, and the two suburbs, Josefstadt and Franzensstadt. The old town, built on the slope of a steep hill, surmounted by a castle, forms about a fourth of the whole city, and is distinguished by its narrow streets and black walls. It contains the cathedral, an early Byzantine edifice of uncertain date, into the walls of which stones bearing Roman inscriptions and carving have been built, and the tower of which is said to rest on the foundation of a temple of Jupiter. The new town, with broad streets built in regular parallelograms and handsome houses, occupies the plain that fronts the sea. Between these two divisions runs the *Corso*, the chief thoroughfare of the city. The *Tergesteum*, in the new town, is a splendid modern edifice, built in 1842, and containing a bazar, a grand concert and ball room, exchange and reading rooms, and the offices of the Austrian Lloyd's, the largest establishment in Europe for sea steamers. To the n., on the sea-shore, is the new and magnificent lazaretto, with a harbor in which 60 vessels can perform quarantine at once. There are numerous churches for Greeks, Jews, Roman Catholics, and Protestants. The population includes Germans, Americans, Italians, Greeks, Jews, Armenians, Dalmatians, etc.; but Italian is the prevailing language. Triest is a free port; and the harbor, the entrance to which is uninterrupted by islands or sandbanks, is well protected. The manufactures carried on here are very extensive. There are many establishments for shipbuilding, and great soap and rope-works. Rosoglio, white lead, and leather are manufactured, and wax-bleaching is carried on. Extensive operations have been gone through, giving nearly two miles of quays, which are protected by a pier built at a distance of 1000 feet from the shore and running parallel to the shore for 3600 ft. The value of the imports is about \$66,000,000; that of exports, \$62,000,000. Pop. in '90, including the suburbs, 157,648.

Triest, the ancient *Tergeste* or *Tergestum*, was of importance under the Romans, and first receives historical mention 51 B.C., when it was overrun and plundered by neighboring tribes. It was much improved by Augustus; and, in 1382, finally passed into the hands of Austria. It owes its prosperity chiefly to the emperor Charles VI., who constituted it a free port, and to Maria Theresa. Since the year 1816, Triest has borne the title of "the most loyal of towns." A new harbor was opened, 1883.

TRIFO'LIUM. See CLOVER.

TRIFO'RIUM, the arcade over the arches of a church between the central and side aisles. It is usually a dark gallery, being the wall-space against which the lean-to roof of the aisles rests. In the later styles, the side aisles were covered with independent roofs, so as to allow the triforium arches to be filled with glass.

TRIGG, a co. in w. Kentucky, drained by the Cumberland and Tennessee rivers, the latter its n. boundary; about 425 sq.m.; pop. '90, 13,902, chiefly of American birth, inclu. colored. The surface is hilly, and in great part covered by forests. The valleys are fertile and produce corn, wheat, tobacco, and pork. Iron ore is found. Co. seat, Cadiz.

TRIGGER. See LOCK.

TRIG'LA. See GURNARD.

TRIGLYPH, the ornament in the frieze of the Doric order (q.v.). It is supposed to represent the ends of the beams in the original wooden temples. It is always divided into channels or flutes, with guttæ or drops below.

TRIGONIA, a genus of mollusca, represented at the present day by only three species, natives of Australia, but remarkably abundant in the secondary rocks. Upward of 100 species have been described from strata between the trias and the chalk inclusive,

but not a single species is known from any tertiary deposit. The shell is trigonal (whence the name), thick, and tuberculated, or ornamented with radiating or concentric ribs. The interior is nacreous. The external ligament is small and prominent, and the huge teeth are large, diverging, and transversely striated. The animal has a long, pointed, and powerful foot, with which it is able to make considerable leaps. The gills are ample, and united behind the body to each other and to the mantle.

TRIGONOCARPON, a common fruit in the coal-measures, occurring in all the strata except the underclays and limestones. Some six or eight species have been established, which differ from each other in size and shape—some being as small as a pea, and others as large as a walnut. They are marked, when preserved in the round, with three longitudinal ridges, and from this character the name was derived. They have never been found attached to any plant. From their shape, and their occurring in such quantities in some localities that they might be gathered by the bushel, it was at first thought that they were palm-fruits; but Dr. Hooker, from the examination of several specimens which exhibit structure, has shown that they are not unlike the structure of *salisburia*, a drupe-bearing coniferous tree, a native of China and Japan. He found that they were composed of four distinct integuments, and a large internal cavity filled with carbonate of lime, but which, he supposed, originally contained the albumen and embryo. The determination of the affinities of this fruit is the more important, as the existence of conifers in the coal-measures was known from the occurrence in them of disk-bearing woody tissues; and the absence of linear leaves and cones makes it the more likely that they belonged to the drupe-bearing division of the order. It is probable that the trunk, to which the generic name *dadoxylon* has been given, and the casts of the large pith of which is known as *sternbergia*, had for its leaves the fern-like fossils named *noggerathia flabellata*, and *trigonocarpus* for its fruit. Dr. Dawson has, however, recently referred some *trigonocarpa* to *sigillaria*, and he considers the anomalous organism called *antholites* to be the bud-form of the fruit. He has never found them in contact with *sigillaria*, and it is much more probable that this was a cryptogamous tree, and consequently had spores, and not seeds, for its fruit.

TRIGONOCEPHALUS, a genus of extremely venomous serpents, of the family *crotalida*, nearly allied to rattlesnakes, but having the tail terminated with a spine instead of a rattle. The head is covered with plates or shields; the dorsal scales are keeled. *T. rhodostoma* may be mentioned as an example. It is found in Java, and preys chiefly on frogs. *Cenchris*, *craspedocephalus*, and other genera have recently been separated from *trigonocephalus*. The moccasin snake of the southern states of North America belongs to the genus *cenchris*. One of the most dangerous serpents of the West Indies is *craspedocephalus lanceolatus*.

TRIGONOMETRICAL SURVEY. Trigonometrical surveying is that higher branch of measurement of the earth's surface in which the use of angular instruments, such as the theodolite, altitude, and azimuth instrument or sextant, is indispensable in forming the network of triangles, on the accuracy of which the correctness of the survey depends. In the article **TRIANGULATION**, the necessary operations have been briefly adverted to, and in **SURVEYS, NATIONAL**, will be found notices of some of the principal modern trigonometrical surveys executed, or now being made. See also **GEODESY**.

In the *Aide Mémoire of Military Sciences*, conducted by officers of the corps of royal engineers, a very full and complete article will be found on this subject; and the government blue-books, from time to time issued on the surveys both of this country and India, afford much valuable information on the internal economy and arrangements necessary for carrying on such vast works.

When it is necessary to fix the astronomical position of the stations, of course, the transit, zenith sector, and other instruments used in the observatory, must be transferred to situations very often difficult of access, exposed to strong winds, etc., which adds much to the difficulty of getting correct observations. Meteorological and magnetic observations are often taken simultaneously with the astronomical; and, indeed, are now considered as nearly indispensable in modern operations. See **SURVEYING**, **TRIANGULATION**, etc.

TRIGONOMETRY (Gr. *trigōnon*, a triangle, *metria*, measurement), the measurement of triangles. This definition, though expressing correctly enough the scope of trigonometry in its early stages, is now wholly inapplicable, as trigonometry, like geometry, has far exceeded its primitive limits; and though the original name is, for convenience, retained, the science may be more properly defined as the "consideration of alternating or periodic magnitude." Trigonometry, within the limits of its earlier definition, is geometrical; its advance beyond these limits is due to the introduction of purely algebraic methods. The quantities with which geometrical trigonometry has to deal are certain lines definitely placed with respect to an angle, and consequently varying with it. These lines, generally denominated *trigonometrical functions* of the angle, are the sine, cosine, tangent, cotangent, secant, and cosecant, and are represented in the accompanying figure. The angle BAC is placed at the center of a circle, called the circle of reference; its *sine*,

CD, is the perpendicular let fall from the extremity of one radius upon the other; the *cosine*, DA, is that part of the radius between the foot of the sine and the center; the *tangent*, BE, is drawn at right angles to one radius to meet the other produced; the *secant*, AE, is the radius produced to meet the extremity of the tangent; the *cotangent*, FG, is drawn from the extremity of a radius at right angles to one of the former, to meet the other produced; and the *cosecant*, AG, is the radius produced to meet the extremity of the cotangent. Other functions, as the *versed sine*, DB, which is the distance from B to the foot of the sine, and its counterpart, the *covered sine*, FH, have been occasionally introduced and defined, but they are of no practical use. EAF, the angle which must be added to BAC to make up a right angle, is called the *complement* of BAC; and CAL, the defect of BAC from two right angles, is called its *supplement*; and by inspection of the figure we can see at once that the sine of BAC, CD, is equal to AH, the cosine of its complement; that the cosine of BAC, AD, is equal to CH, the sine of its complement; and that generally any function of an angle is the co-function of its complement, and *vice versa*; also, that CD, the sine of CAB, is also the sine of its supplement; AD, the cosine of CAB, is the cosine of its supplement; and that generally the function of an angle is the function of its supplement. If a right angle be added to BAC, then we have the triangles ADC, ABE, shifted so as to be situated in the same relative position to AF as they now are to AB, and each line is consequently at right angles to its former position; hence the sign of BAC is the cosine of $(90^\circ + \text{BAC})$, and similarly of the others. By an extension of this process of investigation we arrive at the general conclusions that *if an angle be added to or taken from one or an odd number of right angles, the function of the original angle is the co-function of the one so derived; and that if an angle be added to or taken from an even number of right angles, the functions of the original angle are the functions of the derived one.* But since a function of an angle is the same function of its supplement, a knowledge of the function would not enable us to determine to which of the two angles it belonged, unless we possessed some knowledge of more than the mere magnitude of the function. This desideratum is supplied in the following manner: B is taken as the zero-point of reckoning, the radius BA, which is thus supposed to be fixed, is one of the bounding lines of every angle, the other side being supposed to move in the direction BFL, as the angle increases. Let the radius AC be supposed to sweep round the circle in a left-hand direction (viz., toward F), then, as it approaches F, the sine CD increases, till, on reaching F, the sine coincides with the radius; passing F, and moving toward L, the sine diminishes, till, on reaching L, it becomes zero. Continuing its progress round the circle, the angle BAC becomes *re-entrant* (viz., greater than two right angles); and its sine again increases, becoming equal to the radius at M, and diminishing in the fourth quadrant till it becomes zero at B. While the angle increased from B to L, the sine was drawn *downward*; for the other half of the revolution, it was drawn *upward*; hence, in the first and second quadrants, the sine is said to be *positive*, and in the third and fourth, *negative*, the position of a function in the first quadrant being adopted as the standard. The following table shows the variation (increase or decrease, and between what limits, as well as the sign affecting it) of each of the functions as the angle increases:

FIG. 1.

Angle. Sine. Cosine. Tangent. Secant. Cotangent. Cosecant.

| | | | | | | |
|-------------|---------------|---------------|---------------|---------------|---------------|---------------|
| 0° to 90° | inc. 0 - R, + | dec. R - 0, + | inc. 0 - ∞, + | inc. R - ∞, + | dec. ∞ - 0, + | dec. ∞ - R, + |
| 90° " 180° | dec. R - 0, + | inc. 0 - R, - | dec. ∞ - 0, - | dec. ∞ - R, - | inc. 0 - ∞, - | inc. R - ∞, - |
| 180° " 270° | inc. 0 - R, - | dec. R - 0, - | inc. 0 - ∞, + | inc. R - ∞, - | dec. ∞ - 0, + | dec. ∞ - R, - |
| 270° " 360° | dec. R - 0, - | inc. 0 - R, + | dec. ∞ - 0, - | dec. ∞ - R, + | inc. 0 - ∞, - | inc. R - ∞, - |

We here observe that all the functions increase and decrease alternately as the angle of which they are the functions passes from one quadrant to another; also that the sine and cosecant are affected by the same signs, as also are the cosine and secant, and tangent and cotangent.

Again, from fig. 1, we obtain, from the properties of right-angled and of similar triangles, the following relations between the functions: $\text{Sin.}^2 + \text{cos.}^2 = R^2$, $\text{tan.}^2 + R^2 = \text{sec.}^2$, $\text{cot.}^2 + R^2 = \text{cosec.}^2$, $\text{tan.} : R :: \text{sin.} : \text{cos.}$, $\text{sec.} : R :: R : \text{cos.}$, $\text{cot.} : R :: \text{cos.} : \text{sin.}$, $\text{cosec.} : R :: R : \text{sin.}$, and $\text{cot.} : R :: R : \text{tan.}$. From these eight relations we can easily obtain any one function in terms of any other, both as regards its magnitude and sign.

The reason why the circle and its radius are employed in the definition of the functions is that we may obtain some invariable standard by which to estimate them, for

while, as the angle increases from 0° to 360° , its functions are in a state of constant change, their standard of reference, the radius, remains the same. For greater simplification the radius is taken as unity, and the relations become $\sin.^2 + \cos.^2 = 1$, $\tan.^2 + 1 = \sec.^2$, $\cot.^2 + 1 = \text{cosec.}^2$, and (by the reduction from the proportional to the divisional form of the other five relations) $\tan. = \frac{\sin.}{\cos.}$, $\sec. = \frac{1}{\cos.}$, $\cot. = \frac{\cos.}{\sin.}$, $\text{cosec.} = \frac{1}{\sin.}$, $\tan. =$

FIG. 2.

$\frac{1}{\cot.}$; the various functions being expressed in terms of the assumed unit. Thus, in the right-angled triangle ABC (fig. 2), if AC be radius, BC = sin., and AB = cos., of the angle A; but if the radius be assumed as unity, $\sin. A = \frac{BC}{AC}$, $\cos. A = \frac{AB}{AC}$, and similarly from the above relations, $\tan. = \frac{BC}{AB}$, $\sec. = \frac{AC}{AB}$,

$\cot. = \frac{AB}{BC}$, and $\text{cosec.} = \frac{AC}{BC}$; and in algebraic trigonometry these latter are the definitions of the trigonometrical functions.

The only angular functions which geometry enables us to determine with accuracy are those belonging to the angles of an equilateral triangle (Euc. I. 1), an isosceles right-angled triangle (Euc. II. 9), and an isosceles triangle which has each of the angles at its base double of the third angle (i.e., base angles each 72° , vertical angle, 36°) (Euc. IV. 10); and from these, by means of a proposition (demonstrated in all text-books on the subject) which determines the functions of the angle $(A + B)$ from a knowledge of the functions of A and of those of B; and also, as a corollary to the preceding, the functions of $2A$, $4A$, $8A$, etc., and inversely of $\frac{1}{2}A$, $\frac{1}{4}A$, etc., from a knowledge of those of the angle A, have been obtained and tabulated the functions of all angles from $1'$ to 45° , the functions of angles from 45° to 360° being, as is evident from the above remarks respecting complementary and supplementary angles, merely repetitions of these.

The relations between the angles and sides of a triangle are three in number, and are obtained from simple geometric considerations; they are —(1) $AB : AC :: \sin. C : \sin. B$; (2) $\cos. B = \frac{AB^2 + BC^2 - AC^2}{2AB \cdot BC}$; (3) $AB + AC : AB - AC :: \tan. \frac{1}{2}(B + C) : \tan. \frac{1}{2}(B - C)$. From these relations in conjunction with the fact that the three angles of a triangle collectively amount to 180° , it is possible, having given any three (one being always a side) of the six elements (three sides and three angles) of a triangle, to determine the other three. It is this that constitutes trigonometry in its primitive and elementary form. If the triangles be right-angled, only the first relation and the property of the sides of a right-angled triangle, are necessary for the complete solution. Further information on this subject will be found in any text-book.

Algebraic trigonometry is one of the most important branches of analysis, but it is too extensive and varied to be even sketched here; suffice it to say, that in it the trigonometrical functions are not considered as geometrical magnitudes, but as numerical quantities having certain relations to each other, and that the circle as well as the angular functions are treated as multiples or sub-multiples of the radius. Many important results, such as the approximate estimation of the circumference of a circle, the completion of the solution of cubic equations, etc., have been obtained by its means; and a thorough knowledge of its modes and results is absolutely necessary to an acquaintance with higher mathematics.

Spherical trigonometry is plane trigonometry applied to spherical triangles. See any text-book.

TRIKHALA, or **TRIKALA**, a t. in Greece, situated 33 m. w. of Larissa. It is built on the slope of a hill, manufactures cotton and woolen stuffs, and has a large transit-trade. The neighboring plains which are watered by the Salambría (anc. *Peneus*), are rich in all sorts of fruits. Pop. - '89, 14,820. Trikhala is the *Trikka* of Homer, and was celebrated in the classic ages for its temple of Æsculapius.

TRILL. See **SHAKE**.

TRILLIA'CEÆ, a small natural order of plants, belonging to the class dictyogens (q.v.) of Lindley. They are herbaceous plants, with tubers or root-stocks, whorled leaves, hermaphrodite flowers; perianth of six leaves, the three inner leaves sometimes colored: six, eight, or ten stamens, the filaments extending beyond the anthers in awl-shaped points; the ovary free, 3 to 5-celled, with numerous ovules; the fruit succulent. The order is characterized by narcotic properties. The genus *paris* (q.v.) belongs to it.

TRIL'LIUM, a genus of herbaceous perennial plants of North America, of the lily family; embracing about a dozen species, growing in moist and shady (not marshy) grounds from Maine to Florida. They have a naked stem, 10 to 15 in. high, terminated by three ovate, pointed, broad, beautifully netted-veined leaves. The *T. grandiflorum*, or wake-robin, is one of our most beautiful wild flowers, growing in rich woods (preferably alluvial) from Vermont to Kentucky, Wisconsin, and northward. The

flowers, which appear in June, at first nearly white, but changing with age to rose-color, are borne on a peduncle from 2 to 3 in. long.

TRILOBITES, an order of fossil crustacea entirely confined to the paleozoic rocks. They are specially abundant in the Silurian period, and disappear in the lower members of the coal-measures. See illus., **CRUSTACEANS, ETC.**, vol. IV.

The body was covered with a chitinous shield, which consisted of a large united cephalic shield, a variable number of body segments, and a tail or pygidium, composed of a number of joints, more or less anchylosed. The eyes were sessile and compound. The lenses are frequently beautifully preserved, and in some species are so large that they can easily be seen with the naked eye. In *asaphus caudatus*, each eye had at least 400 facets; and in the large *A. tyrannus*, it is estimated that there are about 6,000. In some species, a bifurcated plate has been found in the region of the mouth, which is believed to be a labrum, but no antennæ or limbs have been yet detected in any specimen. They may have been entirely destitute of antennæ, as in some living animals to which they are nearly related these organs are very rudimentary; and their feet were probably soft and leaf-like appendages, bearing the gills, which would speedily perish, and leave no traces in a fossil condition. The sexes are believed to be indicated by variations in the length of the cephalic and caudal spines, and in the prominence of the head lobes. The members of the order varied greatly in size, some species being scarcely larger than a pin's head, while others, like *asaphus gigas*, attained a length of 18 inches. It is probable that many named species may be only larval or transition forms of others. The minute *agnosteus* is frequently found in such quantities as to indicate that it lived in shoals, as if it were the larval form of some large trilobite. Burmeister considers that trilobites have their nearest allies in the minute phyllopoda, a section of entomostracous crustacea, which live in stagnant water, and are never at rest, but continually swimming at various depths on their backs, some being so near the surface of the water that their feet touch it. He consequently supposes that trilobites lived gregariously in shallow water close to shore, moved only by swimming near the surface, and could not creep at the bottom; that they swam in an inverted position, with the belly upward; that they made use of their power of rolling themselves into a ball as a defense against attacks from above; and that they lived on smaller water-animals.

Above 400 species have been described, and grouped into 50 genera. Of these, 46 are Silurian, 22 Devonian, and 4 carboniferous.

TRIOLOGY, the name given by the Greeks to a group of three tragedies, either connected by a common subject, or each representing a distinct story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a *tetralogy*. Every tragic poet that wished to take part in a poetic contest had to produce a trilogy along with a satyric drama at the Dionysiac, Lenæan, and Anthesteriac festivals. We possess only one perfect specimen of the classic trilogy—the *Oresteia* of Æschylus, which embraces the *Agamemnon*, the *Choëphoræ*, and the *Eumenides*.—See Welcher, *Die Aeschylische Trilogie* (Darmst. 1824); Franz, *Des Aeschylus Oresteia* (Leip. 1846).

TRIMBLE, a co. in n. Kentucky, separated from Indiana by the Ohio river; about 155 sq. m.; pop. '90, 7140. Co. seat, Bedford.

TRIMBLE, ISAAC RIDGEWAY, 1802–88, American military officer, graduated at West Point in 1822, but resigned his commission in 1832 in order to follow the profession of civil engineer. When the war broke out he received a commission as colonel of engineers from the state of Virginia, and served with distinction on the Confederate side throughout the war, rising to the rank of major-general. He rendered good service in many important engagements, and took part in General Pickett's charge at the battle of Gettysburg, where he lost a leg and was captured. From the surrender to the time of his death he was a resident of Baltimore.

TRIMETHYLAMINE, or **TRIMETHYLIA** (C_3H_9N , or $3C_2H_5N$), is a very remarkable organic base, with an extremely powerful and disagreeably fishy odor. It is obtained as a colorless gas, readily soluble in water, and having a strong alkaline reaction. With acids, it readily forms soluble salts. It occurs in large quantity in the pickle in which herrings (especially their roes) have been lying, and in the spirit in which old anatomical preparations have been long suspended; and (strange as it may appear) it imparts to the leaves of *chenopodium olidum* their atrocious odor, and to the flowers of *cratægeus oxyacantha* (the common hawthorn) their agreeable fragrance. It is obtained by distillation from ergot of rye, from guano, the juice of the leaves of red beet-root, and from putrid yeast, and has been detected in small quantity in human urine and in the blood of the calf. It may be formed artificially by the action of iodide of methyl on dimethylamine; but the source from which it may most readily be derived is herring-brine.

TRIMMER, a political term in use in the reigns of Charles II. and William III., originally applied to certain politicians of Charles's time, of whom the chief was Charles Montagu, earl of Halifax, who held opinions half-way between the extreme whigs and tories. Halifax adopted the name trimmer as a title of honor, maintaining that everything good was a medium between extremes.—The same term was applied more generally by Dryden and other writers of the same period to all who, professing to be friends to monarchy, were at the same time enemies to the duke of York, and who were equally obnoxious to the court and to the fanatical republicans.

TRIMURTI (from the Sanskrit *tri*, three, and *mūrti*, form), is the name of the Hindu triad, or the gods *Brahman* (masculine), *Vishn'u*, and *S'iva*, when thought of as an inseparable unity, though three in form. The *Padma-Purān'a* (see *PURĀN'A*), which, being a *Purān'a* of the *Vaishn'ava* sect, assigns to Vishn'u the highest rank in the *Trimūrti*, defines its character in the following manner: "In the beginning of creation, the great Vishn'u, desirous of creating the whole world, became three-fold: creator, preserver, and destroyer. In order to create this world, the supreme spirit produced from the right side of his body himself as *Brahman*; then, in order to preserve the world, he produced from the left side of his body Vishn'u; and in order to destroy the world, he produced from the middle of his body the eternal *S'iva*. Some worship *Brahman*, others Vishn'u, others *S'iva*; but Vishn'u, one, yet three-fold, creates, preserves, and destroys; therefore, let the pious make no difference between the three." And the *Matsya-Purān'a*, where speaking of *Mahat*, or the intellectual principle of the *Sāṅkhya* philosophy (see *SĀṆKHYA*), says that "*Mahat* becomes distinctly known as three gods, through the influence of the three qualities, goodness, passion, and sin; being one person and three gods—viz., *Brahman*, Vishn'u, and *S'iva*." Apart, therefore, from sectarian belief, which makes its own god the highest, and gives him the attributes also of the other gods, *Trimūrti* implies the unity of the three principles of creation, preservation, and destruction, and as such belongs more to the philosophical than to the popular belief. When represented, the *Trimūrti* is one body with three heads: in the middle, that of *Brahman*; at its right, that of Vishn'u; and at its left, that of *S'iva*. The symbol of the *Trimūrti* is the mystical syllable *om*, where (*o* being equivalent to $a + u$) *a* means *Brahman*; *u*, Vishn'u; and *m*, *S'iva*. See *OM*.

TRINCOMALEE, a sea-port t. and magnificent harbor on the n.e. coast of Ceylon, in 8° 33' n., and 81° 14' east. The town is built on a bold peninsula, which divides the inner and outward harbors. It is a place of great antiquity, but its ancient renown was due more to religious than political or geographical considerations, for it was here that the Malabar invaders of Ceylon built one of their most sacred shrines—the "Temple of a Thousand Columns," to which pilgrims flocked from all parts of India. This celebrated shrine was demolished by the Portuguese, who fortified the heights with the materials derived from its destruction, 1622 A.D. It was next held by the Dutch; but in 1672, during the rupture between Louis XIV. and the United Provinces, the French took Trincomalee, which was abandoned by the Dutch in a panic. In 1782 the French admiral, in the absence of the British commander, took possession of the fort, and the English garrison retired to Madras. It was restored to the Dutch the following year, and they retained it until the capture of Ceylon by the British in 1795. The modern town is in no way remarkable, and, with the exception of the official buildings, makes a poor appearance. There are Hindu temples in barbarous taste, and religious festivals and processions to which a similar epithet may be applied. The bay of Trincomalee is land-locked, and presents a scene of tranquil beauty; its fine expanse of water is still as an inland lake, and equally sheltered. "On comparing this magnificent bay," says sir J. E. Tennent, "with the open and unsheltered roadstead of Colombo, and the dangerous and incommodious harbor of Galle, it excites an emotion of surprise and regret that any other than Trincomalee should have been selected as the seat of government and the commercial capital of Ceylon. As a harbor, Trincomalee is renowned for its extent and security; but its peculiar superiority over every other in the Indian seas consists in its perfect accessibility to every description of craft in every variation of weather." The mean temperature for the year at Trincomalee is 81°.4. Pop. '91, 11,411.

TRING, a t. of Hertfordshire, Eng., 32 m. n.w. from London, near the right bank of the Ouzel, a branch of the Ouse. It is a neatly built town; has manufactures of silk, canvas, and straw-plait, and is a station on the London and North-western railway. The Grand Junction canal passes not far from it. Pop. '91, 4525.

TRINGA. See *SANDPIPER*.

TRINIDAD, an island belonging to Great Britain, and the most southerly of the West India islands, being in lat. 11° north. It is about 50 m. long, varying in breadth from 30 to 35 m., and the area amounts to 1754 sq. miles. It is separated from the mainland (Venezuela) by the gulf of Paria, and the extreme points on the w. coast are only 13 and 9 m. respectively from it. The Dragon's Mouth entrance, to the n., is the deepest channel to the harbor; and the southern, or Serpent's Mouth, is shallow, owing to the deposits brought down by the Orinoco. The gulf itself is shoaling up from the same cause. The aspect of the island of Trinidad is different from that of the Caribbean islands generally: the mountains are not so lofty, and they extend in an e. and w. direction along the northern coast, clothed with stately forests, and their margins fringed with overhanging mangroves, dipping into the sea. From the double-peaked mountain called Tamana, are seen the lovely and fertile valleys and plains with which the other part of the island abounds. The island has several good harbors, and some tolerably large rivers.

The chief town, Port of Spain, is one of the finest towns in the West Indies. It was originally built of wood, but was burned down in 1808, and the town has since been re-

built of the good stone procured in the neighborhood. The streets are long, wide, well paved, clean, and shaded with trees. It had a population (1891) of 33,782.

A remarkable phenomenon is a pitch lake near the village of La Brea, composed of bituminous matter floating on the surface of fresh water, about 3 m. in circumference, and 80 ft. above the sea. The mineralogy of the island is but little known. The soil is very rich and productive. The climate is hot and moist; the thermometer ranges from 75° to 85°, sometimes 90°; and the rainfall is about 75 inches.

The most important products are cocoa, sugar, rum, molasses, coffee, cotton, arrow-root, cocoa-nut oil, hides, etc. The value of the exports in '95 was £2,065,104; imports, £2,276,864. The pop. of the island in '95 was estimated at 237,934, being an increase of \$1,806 over that shown by the census of '81. Trinidad is a crown colony, ruled by a governor, an executive council of 7 and a legislative council of 9 official and 11 non-official members. The revenue in 1895 was £552,275; the expenditure, £549,771. The first railroad in Trinidad, extending from Port of Spain to Arima, a distance of 16 m., was opened for traffic in '76, and in 1891 there were in operation a length of 54 m. Tobago was annexed to Trinidad, Jan. 1, 1889. It has an area of 114 sq. m. and a pop. (1894) of 20,039.

Trinidad was first discovered by Columbus in 1498, and thus named by him because three mountain summits were first seen from the mast-head when discovered; but no permanent establishment was founded there until 1532 by the Spaniards. In 1595, its chief town, San José de Oruña, was burned by Sir Walter Raleigh; but the island remained a Spanish possession till 1797, when it fell into the hands of the British, who obtained possession by treaty in 1802. Its productiveness dates from 1781, when foreign immigration began. The administration of Lord Harris, 1846-51, was of great assistance in the regulation of the labor question consequent upon emancipation, and in the equalization of duties on free and slave-grown sugar.

TRINITY, DOCTRINE OF THE, is the highest and most mysterious doctrine of the Christian religion. It declares that there are three persons in the Godhead, or divine nature—the Father, the Son, and the Holy Ghost, and that “these three are one true, eternal God, the same in substance, equal in power and glory—although distinguished by their personal properties.” The most elaborate statement of the doctrine is to be found in the Athanasian creed, which asserts that “the Catholic faith is this: That we worship one God as Trinity, and Trinity in Unity—neither confounding the persons nor dividing the substance—for there is one person of the Father, another of the Son, and another of the Holy Ghost. But the Godhead of the Father, and of the Son, and of the Holy Ghost is all one; the glory equal; the majesty co-eternal.”

It is admitted that the doctrine is not found in its fully-developed form in the Scriptures; but it is supposed to be clearly revealed in its elements in the New Testament, and also to be indicated in many of the statements and revelations of the Old Testament. The form of expression in speaking of God in the Old Testament Scriptures—the plural *Elohim*, coupled with a singular verb; the apparent distinction recognized in the revelations to the patriarchs and Moses between Jehovah and “the angel of Jehovah;” the mode in which “the Spirit” and “word” of God, and “wisdom” (Proverbs viii.) are spoken of; and the gradual unfolding of the doctrine of a “Messiah,” are all supposed to be indications from the earliest times of the truth of a plurality of persons in the Godhead; and in the New Testament Scriptures the doctrine is represented as clearly taught in the Trinitarian formula of baptism—the general character of the claims and prerogatives of Jesus Christ, especially the ascription to Him of the designation “the Son of God,” and in the functions attributed to the Holy Spirit. The evidence is held conclusive of the equal divine nature and yet distinct personality of the Son and the Spirit along with God the Father. It is generally conceded, however, that the Christians of the 2d, and even of the 3d c., were far from having a clearly understood and recognized doctrine on this high subject. They were content for the most part to use Scriptural expressions in speaking of the Father, and the Son, and the Spirit, without defining articulately their relation to one another. It was not till the progress of opposing heresies sought, on the one hand, to degrade the divine dignity of Christ (Ebionitism in its various forms, and Arianism); or, on the other hand, to confound the personality of Christ with God the Father—a heresy known in its special form as Patripassianism—that the church was led to define in the Nicene creed the relation of the Son to the Father; and further, in the Nicæno-Constantinopolitan creed, the relation of the Spirit to the Father. This creed was specially directed against the opinions of Arius. A further clause was afterward added, known as the *filioque* clause, which determined the procession of the Spirit from the Son as well as the Father; but this clause, and the doctrine which it embodies, was never accepted by the eastern church, to whose finer speculative genius is owing the determination of the controversies which began in the 3d c., regarding the divine nature. The western or Latin church had a far less refined genius for such speculations; and in so far as it meddled with them, has imparted to them a coarser and more contradictory aspect. What is known as the “Athanasian creed,” which is now well understood to be of Latin, and not of Greek origin, is a sufficient illustration of this.

It is not our part here to criticise the evidence for the doctrine of the Trinity, or the validity of the doctrine itself; it is enough to say that the evidence which we have briefly

sketched in outline, has been accepted as satisfactory, not only by the Roman Catholic and oriental communions, but also by all the great Protestant communions. The only exception in modern times to the reception of the doctrine is in the case of the Socinians or Unitarians, who occupy in their teaching very much the position of the ancient Humanitarians (Ebionites). They reject the doctrine of the Trinity as incredible, and regard Christ merely as a higher prophet. There have, however, been various thinkers within the Christian church, such as Dr. Samuel Clarke in the beginning of last century, who, while accepting generally the doctrine of the Trinity, have rejected the special terms in which it is defined in the creeds, and whose views have been known as semi-Arianism. The doctrine of the Trinity, as a *doctrine* has reference only to the fact as revealed; while *theories* respecting it are attempts to state the mode, which is unrevealed and unknown. A man may have faith in the doctrine without attempting to form any theory concerning it; his faith may rest on evidence appropriate and sufficient for the fact, while his theory may appear to other minds irrational or inconsistent with faith; his faith may be steadfast, while his theoretical views may change with his years, studies, and associations with other minds. Prof. Edwards A. Park writes thus, in *Bibliotheca Sacra*, April, 1881: "A theologian may adopt the following definition of the Trinity: The Father is God; the Son is God; the Holy Spirit is God; the three are distinct from each other by a necessity of their very substance; neither is God without the others; and there is only one God. Here is the doctrine, stated without using technical terms. A theory of the doctrine is, that God is only one person in the psychological sense of that word, but exists in three distinct modes—ontological and necessary modes of subsistence, and not modes of mere action or manifestation. The first of these modes is the ground on which it is distinctively proper for him to perform one class of official acts; the second is the ground on which it is distinctively proper for him to perform another class of official acts; the third is the ground on which it is distinctively proper for him to perform a still different class. As each mode is distinct from the other two, each is called a *distinction*. As each is the ontological basis of a distinct property, each is called a *subsistence*, an *hypostasis*. As each is the ontological basis on which personal acts ultimately depend, each is called a *person* in a technical, not in the philosophical sense of the word. As each of these modes is relative to the other two, each is called an *internal relation*. God is said to exist in the three modes, distinctions, persons, relations; and the three are said to exist in him; and the three are said to *be*, as well as to be *in*, the one God. On this theory the different *ὑποστάσεις* have only one consciousness, one will, one set of attributes; the unity being plain, the trinity being mysterious. A different theory is that the three divine Persons have each a distinct consciousness, a distinct will, a distinct set of attributes; the unity being mysterious and the trinity plain. A modification of this theory is that the Godhead consists of three minds, each one of which has a consciousness of the other two, and is thus one with them. A not uncommon theory is that the infinite mind differentiates itself from itself, and then unites itself with itself; the subject projecting itself into an object of consciousness is the first Hypostasis; the object being known by the subject is the second Hypostasis; the knowledge identifying the object with the subject, or the love uniting the two, is the third Hypostasis. This general proposition in diversified forms lies at the basis of theories which do not exhibit it on the surface. In the earlier period of his life Melancthon said: 'These mysteries (the doctrines of God, the Trinity, the person of Christ) are better revered than inquired into.' At a later period he defined the Trinity as 'the eternal necessary process of the divine self-consciousness, in which God, whose thoughts are realities, eternally sets himself over against himself, but also again unites with himself.'"

TRINITY, a co. in n.w. California, drained by Trinity and Mad rivers; traversed by the Coast range of mountains in the e.; about 3000 sq.m.; pop. '90, 3719, chiefly of American birth. The surface is mountainous and little cultivated. Gold is found in large quantities. Co. seat, Weaverville.

TRINITY, a co. in e. Texas, drained by the Trinity and Neches rivers—its n.e. and s.w. boundaries; about 710 sq.m.; pop. '90, 7648, chiefly of American birth, incl. colored. The surface is level, heavily wooded, and fertile; cotton, cattle, corn, and pork are the staples. Co. seat, Groveton.

TRINITY, a river of California, rising near the Coast range, and flowing through a country of rich gold mines into the Klamath river; about 130 m. long.

TRINITY, a river of Texas, is formed by the union of two streams, West Fork and Elm Fork, which rise near the northern boundary of the state, and unite 150 m. s.e., the main stream flowing thence 550 m. in the same general direction to Galveston bay, about 40 m. n. of the city of Galveston. It is navigable 300 to 500 miles.

TRINITY CHURCH, New York. The charter was granted to the corporation in 1693, and the first church building was begun in 1696. This building was enlarged in 1737, and destroyed by fire in 1776. The next church was built in 1788, and pulled down in 1839 to make room for the present edifice, which was completed in 1846. In 1705 Lord Cornbury, the gov. of N. Y., acting for Queen Anne, made a lease to the corporation of Trinity church, whereby was granted to them forever, at an annual rental of 3 shillings a year, the land called the queen's farm and the queen's garden. This rent

was commuted and satisfied in 1786. The land so granted was a large tract at the lower end of Manhattan island, and being the business centre of New York, is now of immense value. The state at one time attempted to get possession of the property, on the ground that it was crown land, and the title had not been properly conveyed. It has also been claimed that, at the time the queen made the grant to the Trinity corporation, the title was not in her, it having been previously patented by the Dutch government to Anneke Jans (q.v.). The parish now contains 7 church buildings: Trinity church, St. Paul's chapel, St. John's chapel, Trinity chapel, St. Chrysostom's chapel, St. Augustine's chapel, and St. Cornelius's chapel. They all, except St. Cornelius, have parish and industrial schools, some of which are doing large and successful work among portions of the population not otherwise reached by Christian or moral influences.

TRINITY COLLEGE, Dublin. See DUBLIN, UNIVERSITY OF.

TRINITY COLLEGE, Cambridge, was founded by king Henry VIII., in 1546, upon the site, and partly out of the revenues of several more ancient foundations. The names of these were King's Hall, Michael House, Fyswicke's Hostel, Hovinge Inn, Gregory's, Margaret's, Catherine's, Gerard's, and Tyler's Hostels. Of these, the first two deserve special mention. King's Hall (*Aula regis*) was so called after its founder, Edward III., whose father, Edward II., had maintained 32 scholars, called king's scholars, but had died before completing his intentions. The hall was founded in 1337. The master's stipend was 4d., and that of each scholar 2d. per day, with two robes at Christmas. The revenues of King's Hall at the time of its surrender to Henry VIII. amounted to £214 per annum.

Michael House was founded 1324 A.D. by Hervey D. Stanton, who was chancellor of the exchequer to Edward II. He dedicated his college to the Trinity, the Virgin Mary, St. Michael the Archangel, and All Saints. When Henry VIII. united these smaller foundations into the one great college, henceforth called TRINITY COLLEGE, besides other endowments, he added the estates of 27 dissolved monasteries, which made up the gross revenues to about £1700 per annum. Queen Mary added very largely to these benefactions, and provided for 20 additional scholars, 13 poor scholars or sizars, 4 chaplains, and a choir. Queen Elizabeth gave to the college a new set of statutes, by which the college was governed until the reign of Queen Victoria, when these statutes were revised. Subsequently, under the Cambridge university commission (1859-60), new statutes have again been given, by which several important changes have been introduced. Such fellows as fill the office of bursar, tutor, or lecturer in the college, or professor in the university, are exempt from the necessity of taking holy orders, which must otherwise be done by all fellows within seven years of taking the degree of master of arts. Marriage also is permitted to fellows in a few exceptional cases, and to the chaplains and librarian. The master of the college must be in holy orders, and the appointment is in the gift of the crown. The following are some of the more eminent names in the list of masters: John Whitgift, who was raised to the see of Worcester; Thomas Nevile, dean of Canterbury, who built the greater part of the cloistered court known by his name; he died 1615. To Dr. Barrow, who was made master in 1672, the college owes the finishing of Nevile's court, and the erection of the library, for which the designs were furnished by sir Christopher Wren. The famous Dr. Bentley was master from 1700 to 1742. The late William Whewell was one of the most distinguished men that this college has produced, and one of the best of its masters. He was a munificent benefactor to the college, to which he added one new court during his life; and at his death bequeathed his large fortune to the building of another, and to the founding of a professorship of international law. See **WHEWELL**. To these may be appended the following few names of popular interest, with the dates of their death: lord Bacon, 1626; sir Edward Coke, 1634; Cowley, the poet, 1667; lord William Russell, executed 1683; John Dryden, 1701; Samuel Pepys, the diarist, 1703; sir Isaac Newton, 1727; Richard Porson, 1808; lord Macaulay, 1859; while among the names of graduates who have died more recently is that of Alfred Tennyson, the poet laureate, 1892.

The foundation now consists of a master, 60 fellows, and 74 scholars. The present master is the Rev. William Hepworth Thompson, D.D.

With the exception of the hall and the library, the college buildings are not of any architectural pretensions. The statue of Newton by Roubillac, in the ante-chapel, is one of the finest modern statues.—See Cooper's *Annals and Memorials of Cambridge*; Dyer's *History*; and the *University Calendar*. The judges when on circuit have the right of being entertained at this college.

TRINITY COLLEGE, Oxford. In 1290 Richard de Hoton, prior of Durham, founded Durham college, at Oxford, for the education of the student-monks of Durham. At the dissolution of the monasteries, the property of this institution was transferred by Henry VIII. to the newly erected chapter of Durham cathedral. Its site and buildings, however, passed into the hands of sir Thomas Pope, who, in 1554, obtained a license from Philip and Mary to found a college on the spot, to be called Trinity college, for the maintenance of 20 scholars, of whom 12 were to be fellows, and 8 scholars, properly so called. The scholars were to be elected from the founder's manors, and the fellows from the scholars. In 1557 sir Thomas Pope added four scholarships; and about the same time another was added by a Mr. Blount. There are also two exhibitions. By the ordinances issued by the commissioners under 17 and 18 Vict. c. 81, the fellowships and

scholarships are thrown open without restrictions; the latter are tenable for 20 terms, value £80 a year, besides rooms. This is the first college, after Balliol, which was founded by a layman, as were all colleges subsequent to this date. It is also remarkable as having been, like St. John's, founded by a Roman Catholic after the Reformation. It presents to 11 benefices.

TRINITY COLLEGE, Hartford, Conn., under the control of Protestant Episcopalians; founded 1823 under the name of Washington college, which it bore until 1845. The old buildings were on the site now occupied by the state capitol. In 1878 the college was removed to its present location on a bluff in the southwest part of the city, where the western side of a great quadrangle, 600 feet in length, including two blocks of buildings and central towns, has been erected. There are also an observatory and a fine laboratory building on the south campus, and a gymnasium with alumni hall and a president's residence on the north campus. The courses of instruction, making ample provision for alternative and elective studies, lead to degrees in arts, science, and letters; and arrangements are also made for special students. The faculty numbered 20 in 1897, and the students 128. There is a library of over 37,000 volumes and a good museum. Geo. Williamson Smith, D.D., president.

TRINITY HALL, Cambridge. This college, which is distinct from Trinity college, was founded 1349-50 A.D. for scholars of canon and civil law, as well as for the education of clergy, by William Bateman, bishop of Norwich, who was also co-founder of Gonville and Caius college. It appears that the bishop was induced to found the college in consequence of the great pestilence which had recently swept away most of the clergy of his diocese, so that there could not be found sufficient to supply the parochial cures. In a bull of pope Clement VI., dated at Avignon, 1349, it is stated that there were at that time no less than 1000 parishes in the diocese void of incumbents. The first master was Robert de Stratton. There are thirteen fellowships, of which ten may be held by laymen for ten years, and are not vacated by marriage. There are also five law student-ships, sixteen scholarships, and two exhibitions.—See Cooper's *Memorials and Annals*, and Dyer's *History of Cambridge*; also the *University Calendar*.

TRINITY HOUSE (properly called, The Corporation of the Elder Brethren of the Holy and Undivided Trinity), a corporation intrusted with the regulation and management of the light-houses and buoys of the shores and rivers of England. In 1518 a society under the above name was founded at Deptford by sir Thomas Spert, knight, and incorporated by Henry VIII. Its privileges were confirmed in 1658; and in 1680 its first light-house was erected; all the light-houses which had previously existed on the English coast having been built by private individuals under patents from the crown. By 6 and 7 Will. IV. c. 79, and the merchant shipping act, 1854 (17 and 18 Vict. c. 104), private rights in light-dues were abolished, and the exclusive right of lighting and buoying the coast committed to the board of Trinity House. The power of Trinity House to appoint and license pilots for the English coast is also regulated by this last-named statute. The Cinque ports pilots, who had formerly been under control of a separate society, were, by 16 and 17 Vict. c. 129, and the merchant shipping act, 1854, placed under the jurisdiction of Trinity House. Trinity House was in the practice of distributing certain funds arising from light and pilotage dues, and from the sale of ballast, for certain charitable purposes; but the right which the society possessed to the surplus of light-dues was done away with by the merchant shipping act, 1854. This same act gave Trinity House a general supervision over the commissioners of northern lights and the ballast board of Dublin, the corporations which have the charge of the light-houses and buoys of Scotland and Ireland respectively, subject to an appeal to the board of trade, to whose general superintendence Trinity House is also subject in matters relating to England. The light-houses of the isle of Man are, by special arrangement, under the charge of the commissioners of northern lights.

TRINITY SUNDAY, the Sunday immediately following Pentecost Sunday, so called as being set aside for the special honor of the blessed Trinity. The date of the origin of this festival has been a subject of much controversy. No such festival as Trinity Sunday was known to the fathers of the early centuries. The most decisive evidence of its non-acceptance by the general church up to the 9th or 10th c., is the absence even to this day of any corresponding festival in the separated Greek church; and although it seems quite certain that the festival was introduced in certain particular churches of the west, at earlier and varying dates, the general establishment of Trinity Sunday as a common festival of the whole western church dates from a decree of John XXII., who died in 1334. Nevertheless, the mass and office peculiar to the day are of much greater antiquity, and may be traced, at least in part, in several sacramentaries and other liturgical books of the earlier centuries.—See Benedict XIV., *De Festis*, i. 2, 10; Binterim, *Denkwürdigkeiten Christ-katholisch. Kirche*, vol. v. part 1.

TRINO DA NECESITAS, three species of contributions, to which, in Anglo-Saxon times, all the lands of England, whatever their tenure, not excepting those of the church, were subject; viz., *bryge-bot*, for keeping the bridges and highways in repair; *burg-bot*, for keeping the fortresses in repair; and *fyrð*, for maintaining the military and naval force of the kingdom.

TRIO, in music, a composition for three voices or for three instruments. The same term is also applied to a movement in $\frac{3}{4}$ time in a different key, which follows a minuet

or other movement, and always leads back to the previous movement in the original key.

TRIPE. A term originally applied to the entrails in general; but in gastronomy used of the large stomach of any ruminating animal when prepared for food.

TRIPE DE ROCHE, a name originally given by the Canadian hunters to certain lichens, species of *gyrophora*, which they are often forced to use as food, and now very generally in use as the designation of these plants. They are nutritious, but bitter, nauseous, and purgative. They have a leafy peltate thallus, variously lobed and notched—in *G. proboscidea* of a smoky-brown color, and in *G. erosa* almost black; the shields are round, without stalks, covered with a black membrane, and marked with circles and plaits upon the surface. These lichens grow on rocks in northern regions or on high mountains. See *illus., Mosses, ETC., vol. X.*

TRIPIT'AKA. See **PIT'AKA.**

TRIPLE ALLIANCE, the name by which three different treaties are known in history; viz., 1. A treaty concluded in 1668 at the Hague between England, Holland, and Sweden, having for its object the protection of the Spanish Netherlands, and the checking of the conquests of Louis XIV. 2. An alliance concluded in 1717 between Britain, France, and Holland against Spain, which included among its stipulations that the pretender should quit France, and that the treaty of Utrecht should be carried into effect as regards the demolition of Dunkirk. The Protestant succession was guaranteed by this treaty in England, and that of the duke of Orleans in France. 3. The so-called *Dreibund* or *Dreikaiserbund* between Germany, Austria, and Italy. It was originally a dual alliance between Germany and Austria alone and was first formed Oct. 7th, 1879, as a safeguard for the two empires against the possible designs of Russia and France. The original compact was to run for five years, as was the second union formed in 1882, in which year Italy entered the alliance in spite of the opposition of republicans and Irredentists (see **IRREDENTISM**). It had been supposed that on the death of Signor Depretis, Italy's policy would be so changed as to lead to the severance of the Austro-German league; but Signor Crispi, who succeeded Depretis, even strengthened the alliance, and again on Crispi's fall from power in 1891, the Marquis di Rudini adhered to the *Dreibund* as being a guarantee of European peace. In July, 1891, the Emperor of Germany publicly stated that the alliance had been again renewed and for a period of six years. The general agreement of the three nations is to combine for mutual defense in case either of them is attacked by any two powers, and to guarantee the integrity of each other's territory. At the same time, a semi-official statement was made, that England had agreed to aid the objects for which the *Dreibund* was formed, by undertaking to aid Italy in case of a naval attack by France.

TRIPLET, in music. When a note is divided into three in place of two parts, as when a minim is divided into three crotchets, a crotchet into three quavers, etc., the group is called a triplet, and it is usual to place the figure 3 over it. Thus—

TRIPOD (Lat. *tripos*, Gr. *tripous*, three-footed), any article of furniture supported on three feet. Three-legged caldrons and bronze altars more especially came under this denomination in classical times; many of them are of exquisite workmanship, and richly decorated. The sacrificial tripod in its earliest form resembled the caldron, with the addition of three rings at the top to serve as handles. Of this description seems to have been the tripod at Delphi, from which the Pythian priestess delivered her oracles, with the addition, however, of a round flat plate on the top, on which the priestess sat while giving the response, while a laurel wreath lay on it at other times. Tripods of a similar form were given as prizes at the Pythian games; and at Athens, a tripod was considered an appropriate reward for a successful choragus. Some beautiful tripods were found at Pompeii; and there are several very interesting specimens in the British museum. Analogous to the classic tripod is Thor's *kettle* in Scandinavian mythology, which was probably the origin of the witches' caldron.

TRIPOLI, a mineral substance employed in polishing metals, marble, glass, etc., so named because it was originally brought from Tripoli in Africa. It is a siliceous rock, composed of very minute particles, somewhat loosely held together, so as to yield readily to the nail, and to crumble down in water like rotten-stone. It has a coarse, dull, earthy fracture, is rough to the touch, and is of a gray, yellow, or red color. The particles which entirely compose it are the siliceous frustules of *diatomaceæ*, which occur unaltered in it, and are united together without any visible cement. Ehrenberg estimated that every cubic inch of bilin tripoli weighing 220 grains, contained 41,000,000,000 of these minute water weeds. Deposits of tripoli occur in the tertiary rocks in every quarter of the world.

TRIPOLI, one of the 38 vilayets or provinces of Turkey, n. Africa, is bounded on the w. by Tunis, on the s. by the Libyan desert and Fezzan, on the e.—if we include the plateau of Barca (q.v.)—by Egypt, and on the n. by the Mediterranean. Area roughly estimated at 200,000 sq.m.; pop. uncertain, but believed to be about 800,000. Tripoli is less mountainous than the rest of Barbary, the Atlas range terminating here in a couple of chains running parallel to the coast, and never exceeding 4000 ft. in height. There are no rivers in the country, and rain seldom falls during the long hot summers, but the dew is copious, and supports vegetation in favored spots. The coast region (about 1100 m. in length) is very fertile about Tripoli and Mesurata, where all sorts of tropical fruits, grain, wine, cotton, madder, etc., are produced; but further e., along the shores of the gulf of Sidra, sandy desolation reigns. The interior yields senna, dates, and galls; the carob and lotus are indigenous. Sheep and cattle are reared in great numbers, and Tripoli is also noted for its small but excellent horses, and its strong and beautiful mules. The commerce of the country consists in exporting, principally to Malta, and the Levant, the products of the country and of the interior of Africa (gold-dust, ivory, natron), which are brought hither in caravans across the desert. The imports (which consist chiefly of European manufactures) have been declining gradually of late years, owing mainly to two causes. The *first* is the new direction which the trade of central Africa is assuming. By the Niger and its great tributary—the Benue—European manufactures are more rapidly and more economically conveyed to the northern intertropical regions than by the tedious overland route of the great Sahara. The *second* cause is the abolition of the slave-trade, which, of course, has stopped the demand for all the commodities that alimented the traffic.

The industry is not important but includes the manufacture of woolen and cotton cloths, mats, leather goods and essences of roses, jasmynes and geraniums. The Bedouins are largely engaged in the rearing of cattle. The Moors, for the most part, conduct the caravan trade. Commerce consists chiefly of a carrying trade to and from the Sudan, the imports being meal, grain, tobacco, cotton and woolen goods, colonial wares, etc., and the exports ostrich feathers, cattle, sponges, and ivory. The trade with foreign nations goes through the ports of Tripoli and Benghazi, while Murzuk is an important center for the inland traffic. Formerly the slave-trade was active, but efforts to suppress it have been partly successful and now a comparatively small number of slaves are brought to the coast. The natives of the cities are chiefly Moors, while the country districts are peopled largely by Arabs, Berbers and Negroes. All of these races profess Mohammedanism. It is estimated that the Jews in the country number 10,000 and there are some Europeans in the city of Tripoli.

In ancient times Tropoli (when we first read of it) appears to have formed the most westerly portion of the territory of Cyrenaica (Barca), or at least to have been tributary to the Cyrenæans, from whom, however, it was wrested by the Carthaginians. It next passed to the Romans, who included it within the province of Africa, and gave it the name of *Regio Syrtica*. About the beginning of the 3d c. A.D. it became known as the *Regio Tripolitana* (on account of its three principal cities, Cæa, Sabrata, and Leptis, which were leagued together; whence its present name Tripoli), and was probably raised to the rank of a separate province by Septimius Severus, who was a native of Leptis. Like the rest of n. Africa, it was conquered by the Arabs (see BARBARY), and the feeble Christianity of the natives was supplanted by a vigorous and fanatical Mohammedanism. In 1552 the Turks got possession of it, and have ever since been the rulers of the country, though the authority of the sultan, up till 1835, had been virtually at zero for more than a century. In that year, however, an expedition was dispatched from Constantinople; the ruling dey—Karamanli—in whose family the sovereignty had continued uninterrupted since 1714) was overthrown and imprisoned; a new Turkish pasha, with vice-regal powers, was appointed, and the state made a vilayet of the Ottoman empire. Several rebellions have since taken place (notably in 1842 and 1844), but they have always been suppressed. See *illus.*, AFRICA, Vol. I.

TRIPOLI, called by the Turks *Tarabûlûs*, and probably the *Cæa* of antiquity, the capital of the foregoing state, lies on a bit of rocky land projecting into the Mediterranean, and forming a bay in lat. 32° 54' n., 13° 11' e. It is surrounded by high walls, with bastions, and is irregularly built, but has beautiful gardens. Pop. 20,000–30,000. Though the majority are Moslems, nearly all the trade is in the hands of Jews and Christians. The overland trade to Sudan has greatly fallen off.

TRIPOLI, *Tarabûlûs*, a sea-port of Syria, is 40 m. n.n.e. of Beyrout. The houses are mostly of stone. In and around the town are many remains of antiquity and traces of middle-age architecture. Originally an important maritime city of Phenicia, the ancient *Tripolis* was besieged and taken by the crusaders in 1109. The harbor is small and shallow. Much fruit is exported; also oil, grain, silk, tobacco, and sponges. Pop. (chiefly Greek), about 17,000.

TRIP'OLI, or **TRIPOLIS** (in its modern Arabic form, *Tarâbulus*), the ancient *Tripolis*, a sea-port, and one of the chief commercial towns of Asia Minor, is situated near the coast, in the vilayet of Trebizond and 48 m. w. of Trebizond, on the eastern border of a small triangular plain running out into the Mediterranean, and on both sides of the river Kadisha. The town is substantially built of stone, with many remains of mediæval architecture, and is supplied with excellent water by an aqueduct. It is surrounded by

gardens of orange, lemon, mulberry, apricot, and other fruit trees, which are planted also in the town itself, and give the place a rich and picturesque appearance; but the low marshy neighborhood renders the place unhealthy. On the left side of the river stands the castle built by count Raymond of Toulouse, in the 12th c. when the city was taken by the crusaders. At the n.w. apex of the plain already mentioned lies the port of Tripoli, called El-Mina (the landing-place), or the Marina, a small fishing-village about $1\frac{1}{2}$ m. distant from the town. The harbor—like other harbors on the Syrian coast, scarcely deserving of the name—is formed by a line of low rocky islets stretching n.w. from the point. The trade of the place has of late much declined, being superseded by that of Beirût; its exports now consist chiefly of silk, sponges, and tobacco; there are also manufactures of soap. Pop. stated at 8000, and consisting of Mohammedans and Greek Christians. It is the see of a Greek bishop.

The ancient city of Tripoli was situated on the plain where immense numbers of granite shafts and other relics of antiquity are still found. Its name (the *Three Cities*, or the *Triple City*) was derived from the circumstance of its being founded by the cities of Tyre, Sidon, and Aradus, as an entrepôt for trade, and a point of federal union. It was for many centuries a place of great commercial importance.

TRIPOLIT'ZA ("three cities"), a t. of Greece, under the Turkish rule, capital of the Morea, now the chief town of the government of Mantinea, lies 22 m. s.w. of Argos. It derives its name from being near the sites of the three ancient cities, Tegea, Mantinea, and Pallantium. In 1821 it was stormed by the Greek insurgents; and in 1828 razed to the ground by the troops of Ibrahim Pasha; it has since, however, been rebuilt. Previous to 1821 it had 20,000 inhabitants; the pop. in '89 was 10,057.

TRIPP, a co. in S. Dakota, bordering on Nebraska, formed, 1873; 1800 sq. m.; pop. not given in census of '90.

TRIP PANT, in heraldry, a term analogous to passant (q.v.), but applied to animals of chase.

TRIPTOLEMUS, in Greek legend, the son of Celeus, king of Eleusis. Ceres taught him to plant corn and make bread, and he introduced agriculture into Attica. Ceres also gave him her chariot drawn by dragons, and he went over the earth feeding the inhabitants and teaching them agriculture. On his return to Eleusis he began festivals in her honor. He was worshiped with divine honors after his death.

TRIPTYCH (Gr. *tris*, thrice, and *ptycho*, I fold), a set of tablets consisting of three leaves, each painted with a distinct subject, but joined together by hinges, and capable of being folded so as to present a new face. The general character of such tablets has been explained under diptych (q.v.), the difference of name, "triptych," "polyptych," being taken from the number of the leaves. In ecclesiastical use, the diptych has been already explained as commonly meaning rather the register of names inscribed on the tablets than the tablets themselves. The triptych, on the contrary, generally speaking, contained sacred pictorial representations rather than written registers or records.

TRIQUETI, HENRI, Baron de (1802-1874), b. at Conflans, Loiret, France, painter and sculptor; studied at the Paris academy of art, and later, finding that he possessed a greater talent for sculpture than for painting, devoted himself to the former. He worked for some time on the interior decoration of the Madeleine. The best known of his works are *Dante, Jesus Feeding the Birds, The Holy Family, and Bacchus*.

TRI'REME (from *tres*, three, and *remus*, an oar) is the designation given in ancient times to a galley having three banks of oars. It is said to have been first employed by the Corinthians in their war with Corcyra, 664 B.C. In the Persian and Peloponnesian wars, triremes were the largest vessels employed; but at the time of Alexander, we find that galleys with four and five banks had gradually come into favor. In the Punic wars, the Carthaginians generally employed quinqueremes; and as the Roman triremes could have no chance against vessels with such high bulwarks, the Romans henceforth constructed their war-vessels after the model of the Carthaginian quinquereme.

The banks of oars were elevated above each other, but not perpendicularly; and the lowest rank of rowers having the shortest oars and easiest work, had the least pay. The trireme or quinquereme was also provided with a square sail, which was used when the wind was favorable for voyaging, to relieve the labor of the rowers, but it was not employed in action. The crew consisted of about 200 men; and on a smooth sea, in speed and accuracy of maneuvering, the trireme was little inferior to a modern steamboat. In the earlier times, before the Persian war, and even later, victory depended more upon the number and valor of the soldiers on board, than upon the skill of the seamen. Herodotus mentions that besides the crew there were 40 marines serving on board each Ionian trireme. The Athenians improved this system by decreasing the number of fighting men, and trusting more to the skillful management of their vessels. In a fight, the aim of each trireme was not as before, to grapple with its opponent, but to dash with the greatest momentum possible with its beak against the enemy's vessel, and strike it amidship, or, at any rate, disable his banks of oars on one side. Fighting men were not so much wanted for these tactics; and so we find later on, in the Peloponnesian wars, the number of marines in each ship reduced to ten. It is singular to see this system of ram-fighting coming once more into vogue. A contrivance for strengthening the prow of the trireme, and increasing its efficiency as a ram, gave the Syracusans their final victory over the Athenians in the harbor of Syracuse.

TRISA'GION, or **TRISHAGION** (Gr. *tris.*, thrice, and *hagios*, holy; Lat. *tersanctus*, thrice holy), one of the doxologies in use in the Greek church, which is repeated in the form of versicle and responses by the choir in certain parts of the liturgy. The words of the trisagion are: "*Hagios O Theos, Hagios Ischuros, Hagios Athanatos, eleison hemas!*" (O Holy God, O Holy Mighty One, O Holy Immortal, have mercy on us!) This doxology, in its original Greek form, is one of the few fragments of the Greek liturgy which (like the *Kyrie Eleison*) are retained in the original language in the Roman mass. It occurs in the service of Good Friday in the procession and veneration of the cross. See **GOOD FRIDAY**.

TRISMEGISTUS (Gr. thrice-greatest), an epithet applied to the Egyptian Hermes (q.v.), or Thoth (q.v.), by the Neoplatonists and the devotees of magic, alchemy, and mysticism generally, who looked upon him as the source of all mysterious doctrines. See **HERMETIC BOOKS**.

TRISMUS NASCENTIUM is a form of lockjaw occurring in newly born children, in consequence mainly of impurity of the atmosphere. In Iceland, this disease annually carries off a large proportion of infants between the fifth and twelfth days after birth; in some parts the mortality being nearly *two out of three*. It is also very frequent and fatal in the West Indies, where it is known as the "ninth-day disease." Another of its names is "the jaw fall," from the circumstance of the jaw relaxing and dropping on the breast shortly before death. The complaint used to be common in hospitals when ventilation was less attended to than at present; but with the introduction of a better system of ventilation, the mortality has been very much reduced."

TRISSINO, **GIANGIORGIO** (1478-1550), b. at Vicenza, Italy, a noted poet and scholar; he went to Rome when twenty-four years of age and was received by Leo X. There he published *Epistola a Clementi VII.*, *Canzone a Clemente VII.*, the *Sofonisba* (a drama), and the *Ritratti*. A ban of exile which had been placed upon him in 1508 was removed. Among his other works are *Alfabeto*, the *Grammatices Introductionis Liber Primus* (1540), the *Italia liberata dai Gata* (1548), and *I Simillimi* (a comedy).

TRISTAN DA CUNHA, an island in the s. Atlantic ocean, lies midway between the coast of South America and the cape of Good Hope, in 37° 3' s. lat., long. 12° 18' w. In 1816 a company of British artillery was stationed on the island for the purpose of keeping a watch on Napoleon, at that time a prisoner in St. Helena, from which Tristan da Cunha is distant about 1300 miles. On the death of Napoleon in 1821, the soldiers were withdrawn, with the exception of a corporal named Glass, and one or two companions, who were left in charge of the small fort that had been erected. These men finding the soil very fertile, proceeded to cultivate the island, and their efforts were attended with marked success; inasmuch that they were enabled to carry on a brisk trade in the produce with any passing ships that might stand in need of fresh provisions. The colony flourished, and in 1829 numbered 27 souls. When visited by H.M.S. *Challenger* in Oct., 1873, the place was found to be still thriving; the inhabitants numbered 80, and the cattle had increased to 600, with an equal number of sheep. In the vicinity of Tristan da Cunha are two other islands—one of them, Inaccessible Island, 20 m. distant, possessing a special interest from the circumstance of its having harbored two Germans of the name of Stoltenhoff, who underwent a kind of Robinson Crusoe experience there. They were landed on this desolate island Nov. 27, 1871, when making their way to the larger island of Tristan da Cunha, and determining to settle there, experienced many privations, being sometimes reduced to great extremities; though, unlike Robinson Crusoe, he had more than one opportunity of quitting the island in the course of their two years' sojourn. They were at length, however, fain to take advantage of the opportunity afforded them by the *Challenger* of leaving the island, which they accordingly did on Oct. 16, 1873. Pop. '93, 52.

TRISTRAM is the hero of a British legend, which originally had no connection with the stories of king Arthur and the round table, although later minstrels sought to interweave them. Briefly, the legend goes as follows:

Tristram, son of Rouland Rise, lord of Ermonie, and Blanche Fleur, sister of Mark, king of Cornwall, having lost both parents at the period of his birth, is brought up for the first 15 years of his life at the court of the monarch who had slain his father, after which he proceeds to Cornwall, and is acknowledged by his uncle, who appoints him his heir and successor. Having received a severe wound in a duel, he is cured by Ysolt or Ysonde, daughter of the queen of Ireland; and, on his return to Cornwall, informs his uncle of the marvelous beauty of the Irish princess. Mark is charmed, and sends his nephew to Dublin, at the head of a select body of knights, to solicit her hand in marriage. The king's suit is successful, and Tristram escorts her on her voyage to England, but both having unwittingly partaken of a love-potion (which was intended for Mark), they are immediately inflamed with a criminal passion for each other, which is the source of all their subsequent misfortunes. Ysolt is married to the king of Cornwall; but, by the help of her clever maid, Brenkwain, she contrives to have numerous secret interviews with her lover, and for some years succeeds in allaying the jealousy and suspicions of her husband. At last, however, Tristram is banished from Cornwall, and goes to Wales, where he performs prodigies of valor. His uncle again becomes reconciled to

him, and invites him back to his court, where the amours of the incorrigible lovers are renewed. A renewed banishment is the consequence, and Tristram goes abroad to Spain, Ermonie, Brittany, in the last of which countries he marries another Ysolt, called, for distinction's sake, Ysolt *with the white hand*, daughter of the duke of Brittany. In one of his exploits he is desperately wounded, and can only be cured by Ysolt of Cornwall. He dispatches a messenger to the princess, telling him that on his return he is to hoist a white sail as he approaches the coast of Brittany, if Ysolt accompanies him; but if not, a black sail. The queen of Cornwall hastens to save her lover; and as the vessel nears the shores of France, Tristram's wife, Ysolt *with the white hand*, recognizes the white sail, and, fired with jealous hate at the thought of a rival's approach, hurries to her husband's chamber, and tells him the messenger's ship is coming in with black sails spread. Tristram, in an agony of disappointed love, sinks back and expires. When the queen of Cornwall lands, and hears of his death, she rushes to the castle, throws herself on his corpse, and dies beside him. King Mark subsequently learns the story of the love-potion, and buries the twain in one grave, planting over Ysolt a rose-bush, and over Tristram a vine, which grew up so inextricably intertwined that no man could ever separate them.

The popularity of the story in the middle ages was unbounded. The scene of the principal exploits, and the residence of the principal personages, is Cornwall, from which one is disposed to claim a British or Welsh paternity both for the legend and the literature; and this is the view that underlies sir Walter Scott's argument in behalf of the purity of the metrical version of *Sir Tristram* which he published (ed. 1806) from the Auchinleck MS., and which is considered to be the composition of Thomas the Rhymer (q.v.). As early as the middle of the 12th c., however, the legend had become a favorite throughout the whole of France; and it subsequently found its way into Spanish, Italian, German, Scandinavian, Slavic, and Greek literature. *Tristan und Isolde* is the subject of one of Wagner's operas. See Michel's *Tristan* (1835), and Bossat's (1865).

TRITICUM. See WHEAT and COUCH GRASS.

TRITON, in Greek mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He usually figures as an attendant on his father, riding over the Mediterranean on a horse or other sea-monster, and soothing the turbulent waves by blowing his shell-trumpet—his "wreathed horn," as Wordsworth calls it. The later poets speak of Tritons, in the plural, as a race of subordinate sea-deities, who are described by Pausanias as having sea-green hair and eyes, gills below the ears, human noses, broad mouths with the teeth of animals, scales on their bodies, and, instead of feet, a tail like that of a dolphin. They were frequently represented in works of art. See *illus.*, MYTHOLOGY, vol. X.

TRITON, a genus of water-salamanders belonging to the second section of the order *urodela*. The land-salamanders also belong to this section. The tritons, water-salamanders, or newts, are distinguished from the land-salamanders by having a compressed, fish-like tail, and by being strictly oviparous. The larvæ are tadpole-like, having external branchiæ which they retain till about the third month. The adults are without gills, breathing wholly by lungs, but they retain the larval tail throughout life. The tongue is small, free, and pointed behind, and there are two rows of palatine teeth; fore-feet 4-toed, hind-feet 5-toed. The males have a crest on the back and tail. The development of the newts is much like that of the frogs, with the following two points of difference: 1. The embryonic tail is not cast off in the adult; 2. The fore-limbs appear externally sooner than the hind-limbs. The name triton is also applied to several univalve mollusk shells, commonly called conch-shells.

TRIUMPH (Lat. *triumphus*) was the name given in ancient Rome to the public honor bestowed on a general who had been successful in war. It consisted in a solemn procession along the *Via Sacra* up to the capitol, where sacrifice was offered to Jupiter. The victor sat in a chariot, drawn by four horses—his captives marching before, his troops following behind. Certain conditions had to be fulfilled before a triumph could be enjoyed, and it was the business of the senate to see that these were enforced. Under the empire generals serving abroad were considered to be the emperor's lieutenants, and, therefore, however successful in their wars, they had no claim to a triumph. They received instead *triumphal decorations* and other rewards.

The appearance that Rome presented on the occasion of a triumph, especially in later times, was joyous in the extreme. All work was suspended; the temples were thrown open, and decorated with flowers; the populace were clad in holiday attire, and crowded the steps of all the public buildings in the *Via Sacra*, and the forum, or mounted the scaffoldings erected for the purpose of viewing the procession; banquets were spread before every door. As for the *imperator* himself, after having pronounced a eulogy on the bravery of his soldiers, he ascended his triumphal car, entered the city by the *porta triumphalis*, where he was met by the senate, and now the procession began. First marched the senate, headed by the magistrates; next came a body of trumpeters; then a train of carriages and frames laden with the spoils of the vanquished; then a body of flute-players, followed by the oxen doomed to be sacrificed, and the sacrificing priests, etc.; then the distinguished captives with bands of inferior prisoners

in chains; after whom walked the lictors of the emperor, having the fasces wreathed with laurel. Next came the hero of the day—the emperor—in a circular chariot, attired in an embroidered robe (*toga picta*) and flowered tunic (*tunica palmata*), bearing in his right hand a laurel bough, in his left, a scepter, and having his brows garlanded with Delphic laurel. He was accompanied by his children and his intimate friends. His grown-up sons, the legates, tribunes, and equites, rode behind; and the rear was brought up by the rest of the soldiery, singing or jesting at their pleasure, for it was a day of carnival and license. When the procession had reached the capitoline some of the captive chiefs were taken aside and put to death; the oxen were then sacrificed, and the laurel wreath placed in the lap of Jupiter. In the evening the emperor was publicly feasted, and it was even customary to provide him a site for a house at the public expense.

The *ovation*, or lesser triumph, differed from the greater chiefly in these respects: that the emperor entered the city on foot, clad in the simple *toga prætexta* of a magistrate; that he bore no scepter, was not preceded by the senate and a flourish of trumpets, nor followed by his victorious troops, but only by the equites and the populace, and that the ceremonies were concluded by the sacrifice of a sheep instead of a bull, whence, doubtless, the name *ovation* (from *ovis*, a sheep).

TRIUM VIRATE (Lat. a union composed of *three* men) is the name given in Roman history to the private league entered into between Pompey, Crassus, and Cæsar—the three most powerful men of their time; the object of which was to carry out their own schemes of political aggrandizement, in spite of the opposition of the senate. This compact was not a triumvirate, in the proper sense of the term: it had no legally constituted existence: it was, in fact, only a treasonable conspiracy of three men against the legitimate authority of the state. The term is less incorrectly applied to the division of government between Octavian (Augustus), Mark Antony, and Lepidus in the civil wars that followed the murder of Cæsar—an arrangement sanctioned, and, therefore, legalized by the senate. The former is usually called the *first*, the latter the *second* triumvirate.

TRIVIUM, Three Roads, the name given to the lower section of the seven liberal arts (see **ART**), constituting the circle of study in the middle ages. It embraced grammar, logic, and rhetoric.

TROCHA. A Spanish military term denoting a fortified line of considerable length defended by stockades, earthworks, and occasional small forts.

TROCHIDÆ, a family of gasteropodous mollusks, of the order *pectinibranchiata*, section *asiphonata*. The shell has the aperture entire, closed with an operculum; spiral, and very generally top-shaped, as in the genus *trochus*, the species of which are popularly known as top-shells. The species are very numerous, and widely distributed. They feed on sea-weeds, and some of them are found on rocks between high and low water mark. Many of them are very beautiful, and some of the small kinds are often employed to adorn head-dresses, and for other ornamental purposes, the epidermis and outer layer being removed. Several species are frequent on the British shores. Some of the tropical ones attain a comparatively large size. The trochidæ are very closely allied to *turbinidæ*.

TROCHILUS AND **TROCHILIDÆ**. See HUMMING-BIRD.

TROCHU, LOUIS JULES, b. France, 1815; received his education at the military academy of St. Cyr, and in 1837 entered an artillery regiment as lieutenant. He fought in the Crimean war, was made a general of division, and in this capacity received a command in the Italian campaign of 1859. In the crisis which followed the battle of Sedan, during the Franco-German war of 1870–71, Gen. Trochu was made governor of Paris and commander-in-chief of all the forces destined for the defense of the capital, which position he held until the city surrendered. In Oct., 1871, he was elected president of the council-general for Morbihan, but he afterward resigned that post, and lived in retirement since 1873. His pamphlet on *L'Armée Française en 1867*, reached its 20th edition in 1870. In 1873 he published *Pour la Vérité et pour la Justice*, in justification of the government of the national defense. He died Oct. 7, 1896.

TRÆZEN, or **TRÆZENNE**, an ancient city in s.e. Argolis, Greece. It was supposed to have been founded by Ionians, and is mentioned by Homer. After the Dorian invasion of the Peloponnesus it became a Doric city. After Thermopylæ the Greek naval forces met at Træzen and were aided by the people of that place, who sent 1000 men and five ships to Artimisius and Salamis. In the Peloponnesian wars the city sided with the Spartans, and later came under the rule of Macedonia. The city is described by Pausanias as flourishing in the 2d c. of our era.

TROGLODYTES (Gr. *Trōglodytai*—Gr. *trōgle*, a hole, and *dyo*, to get into; hence cave-dweller), the name given by the ancient Greeks to various tribes or races of uncivilized men, who dwelt either in natural caverns, or in holes which they had dug for themselves in the earth. They are mentioned by Strabo as existing as far w. as Mauretania, and as far e. as the Caucasus; but perhaps the best-known troglodytes of ancient times were those of southern Egypt and Æthiopia, where a considerable district of country was called *Regio Troglodytica*. They could not speak articulately, but shrieked or screamed like the lower animals; though it ought always to be remembered that the Greeks, from

whom we have such statements, are not very trustworthy authorities in the matter of language, accounting every dialect which they did not understand a barbarous jargon. The chief occupation of the troglodytes was herding cattle, though we also read that they were hunters and robbers. They are likewise mentioned as serving among the light troops in the army of Xerxes. Their habits of life were rude and debased; they are reported to have eaten not only the flesh, but the bones and hides of their cattle; their drink is said to have been a mixture of milk and blood; and they had a community of wives. The wives tattooed their bodies; and the men, if not clothed in cattle-skins, went about *in puris naturalibus*. But the most revolting and unnatural of their practices was their treatment of the dead. They are reported to have bound the corpse neck and heels together, affixed it to a stake, pelted it with stones, amid shouts of laughter; and buried it beneath a cairn of missiles.

TROGONIDÆ, a family of birds, ranked by some naturalists, on account of their habits, in the order *insectivores*, and tribe *fissirostres*; but more generally, on account of the formation of the feet—two toes before, and two behind—placed in the order *scansores*. The trogonidæ are remarkable for the beauty of their plumage, which is soft, full, and brightly colored. The bill is short, strong, with a wide gape; the tail generally long, in some species very long; the feet small, and in many, feathered almost to the toes. All the trogonidæ are tropical: they belong chiefly to the south-eastern parts of Asia, the Indian archipelago, and South America. They abound most of all in South America. See *illus.*, LARKS, ETC., vol. VIII.

TROIZK, a t. of e. Russia, on the border of Siberia, in the government of Orenburg, stands on the Oug, 420 m. s.w. of Tobolsk. It is the seat of considerable commerce, especially during the summer months, at which season a large trade is carried on with the Kirghis and the Bokharians. Pop. '93, 20,871.

TROLLEY. A word first coined in England, and there used in the sense of a hand-cart, and then of a truck. In the United States it means a sort of pulley in contact with an overhead wire, and connected with a rod or flexible conductor, by which an electric current is transmitted to the motor of a street-car. The word is from a Celtic root meaning to roll or turn.

TROLLOPE, ANTHONY, second son of Mrs. Frances Trollope, and one of the most popular novelists of his day, was b. in 1815. He was educated at Winchester, and subsequently Harrow. While filling a responsible official situation in the post-office, he obtained, or made, leisure to amuse the public with a long series of novels, of very remarkable merit. The first work which decisively drew attention, *The Warden*, was followed by a continuation, *Barchester Towers*, which remains, perhaps, the cleverest of all his books. In rapid succession to these, came *Doctor Thorne*, *The Bertrams*, *The Three Clerks*, *Castle Richmond*, *Framley Parsonage* (originally published in the *Cornhill Magazine*), *The Kellys* and the *O'Kellys*, *Orley Farm*, *The Small House at Allington* (contributed to the *Cornhill Magazine*), *Rachel Ray*, *Miss Mackenzie*, *Can You Forgive Her*, *Ralph the Heir*, *Phineas Finn*, *Phineas Redux*, and other works. Besides these, Trollope published several pleasant volumes of travels about *The West Indies* and *the Spanish Main*, on *North America*, on *Australia*, and on *South Africa* (1878), a life of *Cicero* (1881), sketches of Thackeray (1879), and Palmerston (1882). He d. 1882. He does not go very deep; but he sketches the superficial aspects of society with a charming lightness and facility of touch, and is unfailingly agreeable and amusing. His autobiography appeared after his death. See the sketch by Henry James in *Partial Portraits*.

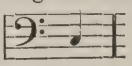

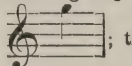

TROLLOPE, MRS. FRANCES, a novelist and miscellaneous writer of some eminence, was b. in the year 1780. Her father was an English clergyman. In 1809 she was married to Mr. Anthony Trollope, a barrister-at-law. In 1829 she went to America; and during a three-years' residence in the United States, amassed the materials of her first book, *Domestic Life of the Americans*, published in 1832. This work attracted great attention; and the severity of certain of its strictures was much resented by the sensitive inhabitants of this country. It was republished in 1896 with an introduction by H. T. Peck. From this time forward, the literary activity of Mrs. Trollope was nearly uninterrupted, and her name became one of the more notable of the time. Novels of society and impressions of travel make up the sum of her works. Of her novels, the most successful is, perhaps, *The Widow Barnaby* (3 vols., 1839); with its sequel, *The Widow Married* (3 vols., 1840); followed by *The Barnabys in America*, or *Adventures of the Widow Married*. Mrs. Trollope was a woman of strong talent, and her works are full of shrewd observation, and true, if at times somewhat coarse, humor. They were popular in their day, and very well deserved their popularity; but already they are well-nigh forgotten. No list of them in detail seems needed. During the life of her husband, Mrs. Trollope resided chiefly at Harrow. During her later years, much of her time was passed in Italy, where her eldest son, Thomas Adolphus, had taken up his abode. She died at Florence, Oct. 6, 1863.

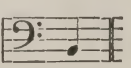

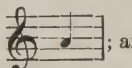

TROLLOPE, THOMAS ADOLPHUS, English *littérateur*, b. April 29, 1810, was the son of Mr. T. A. Trollope and Frances Trollope, the well-known English authoress, and brother of Anthony Trollope, the English novelist. He was educated at Winchester, Eng., and at Alban hall, Oxford. He published two volumes upon Brittany about the year 1840, and they were followed by two on Western France, in 1841. Then he took up his residence in Florence, Italy, and produced a series of works connected with the history of that country. *Impressions of a Wanderer in Italy* appeared in 1850;

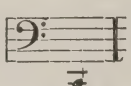

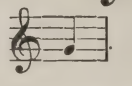

Girlhood of Catherine de' Medici, a Tale; A Decade of Italian Women, and Tuscany in 1849, in 1859; *Filippo Strozzi, a History of the Last Days of Old Italian Liberty*, and a volume entitled *Paul V. the Pope and Paul the Friar*, in 1860, with *Lenten Journey in Umbria and The Marches*, in 1862; *History of the Commonwealth of Florence to the Fall of the Republic in 1831*, 4 vols., was published in 1865, and *The Story of the Life of Pius IX.*, in 1877. He wrote novels also, with Trollopean fecundity, eleven being catalogued up to the year 1887. He died Nov. 11, 1892.

TROLLS, in mythology, misshapen dwarfs, inhabiting hills and mounds, having abnormal thieving propensities; stealing children and substituting their own offspring for them. They were peculiarly sensitive to noise, which was their especial aversion, reminding them of the hammer of Thor, which he was accustomed to throw after them. They were called the hill-people. Though strong, they were easily outwitted by men.

TROMBONE (Ital. great trumpet), a large, deep-toned brass instrument, of the trumpet species, but consisting of two separate parts, so constructed that the two ends of one fit into those of the other, and consequently, by sliding the one part in or out, the tube through which the air passes may be shortened or lengthened, and the pitch changed at pleasure. Three kinds of trombone are in general use, differing in pitch; the *alto trom-*

bone, with a compass extending from  to ; the *tenor trombone*,

with a compass from  to ; and the *bass trombone*, whose compass

extends from  to . The music for these instruments is written

on the alto, tenor, and bass clefs respectively. There is also a *double-bass* trombone, which is but rarely used. The trombone, if judiciously employed, is a very effective instrument in an orchestra—the tone is grander and more powerful than that of the trumpet.

TROMP, a blowing-machine actuated by a current of falling water. It is used in mountainous districts for supplying air to furnaces. A large pipe, usually about 2 ft. in diameter, leads from an upper reservoir of water to a cistern 25 or 30 ft. below it. A few feet beneath the reservoir the pipe is contracted to a funnel shape, and immediately below this, where it widens, there are a number of holes for the admission of air, which rushes in to supply the partial vacuum created by the descending water, which, together with the air, is carried to the lower cistern, where separation is effected, the water passing out at the bottom and the air out at the top, at a pressure regulated by the rate of exit of the water.

TROMP, CORNELIS, 1629–91; b. Rotterdam, Holland; son of Martin Harpertzoon. When but 21 years old he was made a vice-admiral, as a reward for his success in fighting African pirates and the English. In 1666 he fought with distinction in the first battle with the English, but in the contest of July 25 his conduct did not meet with De Ruyter's approval, and he was removed. In the war of 1673 he again served with distinction; and, after De Ruyter's death, succeeded him in command. He was afterward at the head of the Danish navy.

TROMP, MARTIN HARPETZOOM, a celebrated Dutch admiral, was b. at the Briel in 1597. When a boy he went to sea with his father, a commander in the Dutch navy. In an engagement off the coast of Guinea with an English cruiser, his father was killed, and young Tromp made prisoner. His captors compelled him to serve as a cabin-boy for two years and a half, after which his history becomes for some time obscure. In 1622 we find him a lieutenant on board a Dutch ship-of-the-line; and two years afterward prince Maurice gave him command of a frigate. In 1629 the famous Admiral Peter Hein took command of Tromp's ship, and was killed by his side. Disgusted by some real or imaginary slight, Tromp about this time retired from the service. In 1637 he returned, and was created lieutenant-admiral by the stadtholder Frederick Henry. He was appointed to the command of a squadron of eleven ships. He now prosecuted a vigorous naval war against the Spaniards, taking in one celebrated action, fought on Oct. 21, 1639, 13 richly-laden galleons. But the events which were to render the name of Tromp immortal did not occur until the commencement of hostilities between England and Holland in 1652. On May 19 of that year he encountered the English fleet under Admiral Blake. The Dutch were defeated with the loss of two ships-of-war. Tromp was for a while superseded in command by Ruyter and De Witt, but he was soon afterward reinstated. On Nov. 29, same year, he again encountered Blake in the strait of Dover. This time success was decidedly with the Dutch. The English fleet was obliged to retire; and Tromp sailed up the channel with a broom at his masthead, to denote that he had swept his foes from the seas. They were, however, not long in returning. On Feb. 18, 1653, Monk and Deane having been united in command with Blake, they attacked Tromp near Portland, and defeated him, though only after a contest memorable for its obstinacy. It lasted three days, at the close of which Blake had

taken or destroyed 11 ships-of-war and 30 merchantmen, killed 2,000 of the enemy, and captured 1500. On June 2 and 3 following, another terrific battle took place off n. Foreland, in which six Dutch vessels were captured, 11 sunk, and the remainder driven into Calais roads. On July 31 the warfare was again renewed off the coast of Holland. On this occasion the Dutch lost 30 men-of-war, and Admiral Tromp was killed.

Tromp was a thorough seaman, homely in manner, benevolent in disposition, and enthusiastic in his calling. He was buried at Delft, with great pomp and solemnity.

TROMSÖ, a small island on the n.w. coast of Norway, in Finmark, lies between the island Kvalö and the main-land. It is 4 m. long and about 1½ m. broad. On the eastern side of the island is the small but thriving town of the same name, the seat of a bishop. Russian vessels from Archangel and the White sea visit this town, and bring corn, which they exchange for dried fish. Pop. '91, 6080.

TRON, or **TRONE**, weight, the most ancient system of weight used in Scotland, is so called from *trone*, a species of heavy beam or balance set up in the market-place and employed for the weighing of heavy wares. The weights employed in the public markets formed the most convenient reference, and consequently tron weight became the standard. The tron lb. contained 20 oz., but from the custom of giving "one in" to the score, was always reckoned at 21 oz.; this was the most general value; but it varied in the different market-towns between this and 28 oz. The later tron stone or standard weight contains 16 tron lbs., each lb. 16 tron oz., and each tron oz. 16 drops; the tron lb. is estimated to be equivalent to 1.3747 lbs. avoirdupois.

TRONDHEJEM. See **THRONDHEJEM**.

TROON, an important sea-port in the county of Ayr, Scotland, 8 m. s.w. of Kilmarnock, and 6 m. n. of Ayr. The greater part of the town (which is not older than the present century) occupies a bare and level promontory; but along the broad and beautiful strand of Ayr bay, known as the "south beach," stretches, for nearly half a mile, a row of handsome villas and cottages, built chiefly for the accommodation of summer visitors. The place is yearly becoming more attractive as a sea-coast residence, partly on account of its extreme salubrity, and partly on account of the ample scope afforded by its wide stretch of sands for the simple amusements of the sea-shore. The harbor, which occupies the extremity of the promontory, is secure and spacious, and is much frequented. The principal exports are coal and iron, of which Ayrshire yields an abundant supply. Pop. in '91, 3315.

TROOP, in cavalry, the unit of formation, forming the command of a captain, consisting usually of 60 troopers, and corresponding to a company of infantry. The officers of a regular troop are the captain and two lieutenants. Two troops form a squadron.

TROOPIAL, *Molothrus*, a genus of birds of the family *sturnidæ* (see **STARLING**), having a short, thick, conical bill; long, pointed wings; and a slightly rounded tail. The cow troopial (*M. pecoris*), also called cow black-bird, cow-pen bird, etc., is common in North America, passing the winter in southern parts of the continent, and migrating northward in spring. Its plumage is of a shining black color except the head and neck, which are blackish-brown. It is very generally to be seen in attendance on cattle, picking up the insects which they disturb, or which are attracted by their droppings. Like the cuckoo, it makes no nest of its own, but deposits its eggs in the nests of other birds.

TROOST, GERARD, 1776-1850; b. Holland; educated at the university of Leyden; captured by a privateer in 1809, while on his way to Java, on a scientific expedition under the patronage of Louis Bonaparte, king of Holland; he became a resident of Philadelphia, where he founded the Academy of Natural History, of which he was the first president. He was for a time professor of chemistry in the Philadelphia college of pharmacy, and afterward a member of Robert Owen's New Harmony community. In 1827 he became professor of chemistry, geology, and mineralogy in the university of Nashville.

TROPÆOLUM, a genus of plants of the natural order *tropæolaceæ*. This order is allied to *balsaminaceæ* and *geraniaceæ*. The species are not numerous, and are all natives of South America. They are smooth herbaceous plants, somewhat succulent, with an acrid or pungent taste, trailing or twining stems, and alternate simple or divided leaves, destitute of stipules. The species of the genus *tropæolum* form the greatest part of the order, and have usually simple peltate leaves. *T. majus* is the well-known INDIAN CRESS of our gardens, the unripe fruit of which is often used to give pungency to pickles, under the name of *nasturtium*. It is a native of Peru, and has long been much cultivated in the U.S. as an ornamental plant, climbing among bushes or on trellises, and taking hold by the curving stalks of its leaves; its stems from 6 to 10 ft. long, its foliage abundant, and its flowers large, orange, or dark red. The young leaves are used in salads. The Indian cress is really a perennial, although it flowers within a few months from the time of sowing, and in Britain is always treated as an annual, not being able to endure the winter. *T. minus* is very similar, but of weaker growth, and its flowers smaller. *T. peregrinum*, although much more recently introduced into America than the Indian cress, has now become almost equally common, and is a great favorite in flower-gardens. It is popularly called the CANARY PLANT.

Its stems are long and slender, and it speedily covers a high trellis. Several other species are frequent and fine ornaments of gardens and green-houses. The tubers of *T. tuberosum* are eaten in Peru. Their taste is peculiar.

TROPE (Gr. *tropos*, a "change," a "turning") is the name of a figure of speech which does not appear to differ from metaphor (q.v.). See **RHETORIC**, **FIGURES OF**.

TROPHONIUS, in Greek legend, was the most skillful architect of his day, and was the son of Erginus, king of Orchomenus, or of Apollo. Along with his brother, Agamedes, he built the temple of Delphi and the treasury of king Hyrieus in Bœotia, which the two are said afterward to have plundered. After his death he was worshiped as a hero, and had a celebrated oracle at Lebadeia (Livadia) in Bœotia. "The entrance to the oracle was a very narrow aperture on the summit of a mountain, protected by a marble parapet about two cubits in height, and by brazen spikes above it." The votary who wished to enter the "cave of Trophonius," in order to consult the oracle, after preparing himself for several days previously by purification and sacrifice, lay prone on his back, and put his feet into the cave, when he was caught by some unseen force, and violently pulled inside.

TROPHY (Lat. *tropæum*, Gr. *tropaion*, from *trepo*, to put to flight—the letter *h* in the English word being an intrusive letter) was a memorial of victory erected on the spot where the enemy had turned to flight. Among the Greeks (with the exception of the Macedonians, who erected no trophies), one or two shields and helmets of the routed enemy, placed upon the trunk of a tree served as the sign and memorial of victory. After a sea-fight, the trophy consisted of the beaks and stern ornaments of the captured vessels, set up on the nearest coast. It was considered wrong to destroy such a trophy, and equally wrong to repair it, when it had fallen down through time, for animosity ought not to be perpetual. In early times, the Romans never erected trophies on the field, but decorated the buildings at Rome with the spoils of the vanquished. Of this practice, we have a familiar instance in the *rostra* or beaks set up in the forum. In later times, pillars and triumphal arches were employed to commemorate victories. Besides these, in modern times, the humiliation of an enemy is rendered lasting by such devices as the bridge of Jena, of Waterloo, and by the distribution of captured cannon. Morally considered, this practice is no improvement upon the simple and perishable trophies of the ancient Greeks.

TROPIC-BIRD, *Phaeton*, a genus of birds, ranked by some in the family *pelecanidae*, by others in *laridae*. The bill is strong, pointed, and almost arched; the head completely feathered; the wings long; the tail short, except two feathers, which are very long and slender. Only two species are known, both tropical, and often seen very far from land. The **COMMON TROPIC-BIRD** (*P. æthereus*) is about the size of a partridge, white, with curved lines of black on the back; some of the quill-feathers black, tipped with white. It is found in the Atlantic ocean; while in the Indian and Pacific oceans, the other species (*P. phœnicurus*) appears, which is of a pale rose-color, with black wing coverts, and the long feathers of the tail red. The tropic-birds breed on high cliffs.

TROPICS (Gr. turning-points or limits) are two parallels of latitude on the terrestrial globe, passing through the most northerly and southerly points on the earth's surface at which the sun is vertical. On the armillary sphere (q.v.), consequently, the ecliptic (the representation of the sun's path) touches but does not cross the tropics. The tropics include between them all those points on the earth's surface at which the sun is ever vertical. The tropic north of the equator is called the tropic of Cancer, because the sun at the summer solstice (at which time he is vertically over that tropic) enters the constellation of Cancer; and the southern one is, for a similar reason, denominated the tropic of Capricorn. The tropics are not absolutely fixed at a uniform distance from the equator, but the limits of their variation are extremely narrow. For Jan. 1, 1882, the *Nautical Almanac* gives their position in 23° 27' 16.60" n. and s. respectively.

TROP PAU, the capital of Austrian Silesia, on a tributary of the Oder, is a well-built town, 184 m. n.e. of Vienna by railway. It is the seat of the provincial government, and has a castle, cathedral, several palatial buildings, churches, and public schools, a library, a museum of Silesian antiquities, important manufactures of machinery, cottons, linens, liqueurs, and beet-root sugar, and an active transit trade. Pop. '90, 22,867. A diplomatic congress was held here in October and November, 1820, which was subsequently removed to Laibach (q.v.).

TROUBADOUR (Provençal, *trobar*; Fr. *trouver*, to find, of unknown derivation). In Provençal poetry (see **ROMANTIC LANGUAGES**), a troubadour was a polished and cultivated poet—what the Germans call a *Kunstdichter* (art-poet)—who did not make a trade of his muse in opposition to the musician and jongleur, who wandered about the country singing for money. Yet this distinction only gradually showed itself. At first, all classes of the community were nearly equally rude, and what pleased the peasant in the shape of song, pleased the prince also; but by degrees, a superior refinement and sensibility manifested themselves in the tastes and manners of courts, and this superiority found poetical expression in a more artistic kind of verse than had hitherto prevailed. Great nobles, princes, and kings who practised verse-making for their pleasure, or out of chivalrous gallantry, were always called troubadours; while inferior knights, court-attendants (M.

Lat. *ministeriales*; hence *menestrels*, minstrels), and even citizens and serfs who lived by their art, or at least took money for the exercise of it, were sometimes called troubadours, and sometimes jongleurs. Under this last name were classed the musicians, singers, jugglers (a word, in fact, which is only a corruption of *jongleur*), etc.; all, in short, who did not themselves make or invent (*trobar*) poems, but only recited or chanted them, or whose business it was to accompany the singer on some musical instrument. The more celebrated troubadours had one or several such jongleurs in their service, as it was considered *infra dig.* for a poet to be his own fiddler. This new troubadour poetry (*art de trobar*), which it may be remarked was *lyrical*, while the popular minstrelsy was mainly of the *epic ballad* sort, exercised a considerable influence on the advancement of literature and culture generally; yet those who practiced it never formed themselves into a guild, or into special schools, but preserved a certain free individualism, which gives a fine picturesqueness to the outlines of their history. At all the courts (great and small) in s. France, n. Spain, and Italy, they were esteemed a brilliant ornament of society; princes and fair dames (often themselves troubadours, as has been remarked) were proud of their praise, and their service of gallantry, or dreaded the biting railery of their satiric muse; while, on the other hand, the majority of the troubadours gladly attached themselves to the court of a great prince or noble, sometimes praising their master in *sirventes* (service-songs), sometimes censuring him, but at any rate, always selecting some lady as the "mistress of their heart," to whom they, under a general or allegorical name, addressed their love-songs (*cansos*), whose cruelty they bewailed in songs of lamentation (*planes*), or whose death they mourned in sorrowful threnodies. Although the "love-service" of the troubadours was often nothing more than an artificial gallantry, having more *esprit* than heart in it, yet not unfrequently the sport passed into fatal earnest, and adultery, murder, and revenge were the consequences.

Further, when, as often happened at great court-festivals, several troubadours were present, the latter used to indulge in competitions or verse-battles (*tensons*) among themselves, for the gratification of the high society assembled there; mostly on questions selected by the ladies from the "Laws of Love;" one or more of these ladies sitting as umpires at such poetic jousts, and deciding who were the victors. But although the troubadours as a rule monotonously confined themselves to themes of gallantry, yet sometimes their muse, especially in its satiric moods, ventured into higher regions, and glanced at the general conditions of society, or the graver evils of the times—as the wars between the English and French armies in southern France; the persecution of the Albigenses; the degeneracy of the clergy; the diminishing zeal for the crusades, etc.; or they even descended to depict the life of the peasantry, and sang their adventures with shepherdesses, etc., in *pastoretas* and *vaqueyras*. The most illustrious patrons of the troubadour poetry were the counts of Provence, particularly Raimund Berengar III. (1167–81), Alphonse II. (1196–1209), and Raimund Berengar IV. (1209–45); the counts of Toulouse, as Raimund de St. Gilles, who joined the ranks of the crusaders in 1096, Raimund V. (1143–94), and Raimund VII. (1222–49); Richard *Cœur de Lion* of England, himself a troubadour; Eleanor, wife, first of Louis VII. of France and afterward of Henry II. of England; Ermengarde, viscountess of Narbonne; the kings of Aragon, as Alfonso II. (1162–96), Pedro II. (1196–1213), and Pedro III. (1276–85); the kings of Castile, as Alfonso IX. (1188–1229), and more especially Alfonso X. (q.v.), surnamed the Wise; several Italian princes, as Bonifacio, count of Montferrat, and after 1204 king of Thesalonica, and Azzo VII. of Este (1215–63). These names also indicate the extent of territory on which the troubadour poetry was cultivated—viz., Provence, Toulouse, Poitou, Dauphiné, or briefly France s. of the Loire; Catalonia, Valencia, and Aragon in Spain; and part of Upper Italy. It lasted for about 200 years (1090–1290), and one can distinguish three periods in its history: (1) The period of its genesis or birth, or its development out of mere popular minstrelsy into artistic poetry (1090–1140); (2) its golden age (1140–1250); (3) the period of its decline (1250–90). The first of these periods is marked by a conscious striving after something finer and more poetic than the rude simplicity of the earlier verse; the second, by the loftiest expression of ideal chivalry and gallantry, and the most perfect development of artistic form; the third, by an ever-increasing serio-didactic tendency, and a degeneracy in poetic art. Thus the poetry of the troubadours rose, and ruled, and fell with that courtly chivalry which was at once its inspiration and its soul.

The long list of troubadours begins with GUILLEM IX. count of Poitiers (1087–1127), the earliest of whom we have any knowledge, and whose verses exhibit partly the popular ballad style, and partly a more elaborate mode of poetic conception. His life and works appear to have been equally immoral.—After him comes BERNARD DE VENTADOUR (1140–95), one of the first poets of the golden age of troubadour-minstrelsy. He was the son of a poor serf of the vicomte Ebles II. of Ventadour. Recognizing the talent of young Bernard, his master encouraged and assisted him; but his poetic enthusiasm was more excited by his passion for Ebles's wife, Agnes de Montluçon, than by Ebles's own commendations, and by the favor shown him by later patronesses, queen Eleanor, Joanna of Este, etc., all of whom he celebrated in fiery and delicate strains.—MARCABRUN (1140–85), a foundling, was much feared for his power of satire, and was, in fact, murdered by the castellan of Guian for an exercise of his fatal gift. He is reckoned the inventor of the art-song (*cansós*).—JAUFRE RUDEL, prince of Blaya (1140–70), is equally

famous for his languishing love-songs, and his romantic passion for the countess of Tripoli, whom he never saw till he was at the point of death.—PEIRE D'AUVERGNE (1152-1215), son of a citizen of Clermont, called himself "master of the troubadours;" yet his songs are more remarkable for their artistic finish than for their poetic inspiration.—GUILLEM DE CABESTAING (1181-96), son of a poor knight, has become famous through his tragic love for the wife of his lord, Raimon de Roussillon.—RICHARD THE LION-HEART'S song composed during his captivity in Austria, is widely known; and the songs of GUIRANT DE BORNEIL (1175-1220) have a manly and earnest ring about them; but perhaps the most celebrated of the whole fraternity was PEIRE VIDAL (1175-1215), a man wondrously endowed with poetic gifts, but who led so mad, wasteful, immoral a life, and committed such extravagant follies, that one doubts whether he was altogether sane. He was the terror of husbands.—BERTRAND DE BORN (1180-95), equally celebrated as warrior and poet, played an important part in the wars of Henry II. of England with his rebellious sons, and was a zealous French patriot. His songs are for the most part of a political cast, full of martial ardor and the love of fatherland. In his lifetime, men dreaded his sharp tongue no less than his keen sword.—FOLQUET DE MARSEILLE (1180-1231) was the son of a Genoese merchant established at Marseilles. After wasting his youth in amorous gayeties, in a fit of grief for the death of one of his many mistresses, he entered the church, rose to the dignity of bishop of Toulouse, and signalized himself by the fanatical zeal with which he persecuted the Albigenes. Folquet's songs, twenty-five in number, are of an impassioned nature.—RAMBAUT DE VAQUEIRAS (1180-1207), a native of the co. of Orange, in the s. of France, was the son of a knight, and so great a favorite with Bonifacio II., marquis of Montferrat, that the latter positively tolerated his sister's intimacy with the poet. He accompanied his patron to the East, and probably fell with him fighting against the Bulgarians. Some of his songs have found their way into different Romanic tongues.—PEIROT (1180-1225), in his condition and fortunes, curiously resembled his contemporary just mentioned. His pieces rank among the finest love-songs of the troubadours.—THE MONK OF MONTAUDON (1180-1200) is a poet whose proper name is not known. He was sprung from a noble family belonging to Auvergne, and became prior of Montaudon, but, notwithstanding, led the free life of a wandering poet. Finally, he betook himself to the court of Aragon; Alfonso II. made him prior of Villafranca, where he died. He was more renowned for his satire than for his sentiment, and his songs are full of personalities directed against his brother troubadours—very cynical and very caustic.—ARNAULT DANIEL (1180-1200), a nobleman of Riberac, in Périgord, whom love made a troubadour. His powers of invention have been highly praised. Petrarch calls him *il grande maestro d'Amore*. Dante also celebrates his genius.—GAUCELM FAIDIT (1190-1240), son of a burgher of Uzerche, in Limousin, led at first, with his wife Guillelma Monja, the free and pleasant life of a jongleur; but subsequently left her, and became enamored of the countess Marie of Ventadour, who made him her troubadour. He would fain have been her paramour also, but she was too prudent; and so, to revenge himself, he carried on intrigues with other women; but his sweetest songs were those he sang in his lady's praise.—RAIMON DE MIRAVOL (1190-1220), one of the most lovable of the troubadours, although the women—his spouse not excepted, who was herself a poetess—abused him so bitterly, that for two years he was out of his mind.—SAVARIE DE MAULEON (1200-30), a French baron, became grand seneschal of Aquitania, and took part with Raimund of Toulouse against Simon de Montfort. His political career was marked by great vacillation. As a poet, he is noted for his *Tenzone*.—PEIRE CARDINAL (1210-30), son of a knight, was intended for the church, but preferred the life of a troubadour, and traveled with his jongleur from court to court. Jago I. of Aragon was his great patron. He was a master of the moralistic *Sirventes*, and assailed—but only with a sort of generalized satire—the nobles and clergy.—The last representative of the troubadours was GUIRAUT RIQUIER (1250-94), a native of Narbonne. Although he had in his time many patrons, of whom the most distinguished was Alfonso X. of Castile, he was often in sore need; and his poems, full of complaints of the disrepute into which his order had fallen, may be regarded as the swan-song of troubadour poetry.—See Diez, *Leben und Werke der Troubadours* (Zwickau, 1829); Fauriel, *Histoire de la Littérature Provençale* (3 vols., Par. 1846); Galvani, *Osservazioni sulla Poesia de' Trovadori* (Modena, 1829), and *Fiore di Storia letteraria e cavalleresca della Occitania* (Milan, 1845); De Laveleye, *Histoire de la Langue et de la Littérature Provençale* (Brüss. 1845); Mahn, *Die Werke der Troubadours* (Berl. 1846); and *Die Biographien der Troubadours* (Berl. 1853); Brinckmeier, *Blumenlese aus den Werken der Troubadours* (Halle, 1849), and *Rügelieder der Troubadours* (Halle, 1846); Kannegiesser, *Gedichte der Troubadours* (Tüb. 1852), and *Ungedruckte Provenzal. Lieder* (1853); Bartsch, *Grundriss zur Geschichte der Provenzalischen Literatur* (1872); Bayle, *La Poesie Provençale au Moyen Age* (1876).

TROUP, a co. in w. Ga., bordering on Alabama; 493 sq.m.; pop. '90, 20,723 of American birth, incl. colored. Co. seat, Lagrange.

TROUP, GEORGE MCINTOSH, 1780-1856; b. near the Tombigbee river, Ala.; graduate of the college of New Jersey, 1797; studied law; resided in Georgia; member of the legislature, 1800-3; member of congress, 1807-15; U. S. senator, 1816-18 and 1829-34;

governor of the state, 1823-27. He was a popular speaker of extreme views in regard to state rights and state sovereignty, and with principles of unswerving integrity.

TROUP, ROBERT, LL.D., 1757-1832, b. N. Y.; studied law, but in 1776 joined the revolutionary army as lieutenant. After the battle of Long Island he was confined in the Jersey prison-ship, and after his exchange became aid to Gen. Gates, and was in the battles of Saratoga and Stillwater and at the surrender of Burgoyne. In 1778 he was made secretary of the board of war. After the war he was a member of the N. Y. legislature, and a judge of the U. S. district court.

TROUSDALE, a co. in n. Tennessee, formed in 1870; intersected in the s. by the Cumberland river; 166 sq. m.; pop. '90, 5850, chiefly of American birth. Co. seat, Hartsville.

TROUS-DE-LOUP, or **WOLF-HOLES**, are hidden holes about 6 ft. deep, and $4\frac{1}{2}$ in diameter at the top. They are funnel-shaped, and have one or more pointed stakes at the bottom. They are placed often thickly about the glacis and approaches to a fortress; the object being to break the ranks and otherwise disorganize an attacking force.

TROUT (Fr. *truite*, from M. Lat. *tracta*, which, according to Diez, may be from Gr. *trok-tes*, the name of a voracious sea-fish, derived from *trago*, to eat), the popular name of many species of the genus *salmo*, as characterized by Cuvier, some of which are referred by Valenciennes to his restricted genus *salmo*, some to *fario*, and some to *salar*. See **SALMON**. The name is given to some of the silvery species, migrating to the sea, and to all the yellow species, which constantly inhabit fresh waters. The former are noticed in the article **SALMON**; the present article is devoted to the latter.

Trouts are found in almost all the lakes and rivers of the temperate and colder parts of the northern hemisphere. The **COMMON TROUT** (*salmo fario* or *salar Ausonii*) is widely diffused in the eastern hemisphere, abounding in almost all the lakes and rivers of the British islands and the n. of Europe. It is found even in very small streams, and almost to their mountain sources, but attains its largest size where there is considerable depth of water and abundance of food. An instance is on record of a trout caught in England, in a branch of the Avon at Salisbury, weighing 25 lbs.; but such a size is very rare, and even in ponds where the trout are regularly fed, they seldom exceed 10 lbs. A trout of 1 lb. or $1\frac{1}{2}$ lbs. is reckoned by the angler a very fine fish; and many a stream swarming with trout produces none nearly so large. The head of the common trout is large; the eye large; the general form symmetrical, stouter than that of the salmon, the convexity of the outline of the back nearly similar to that of the belly; the tail is slightly forked, except in old fish, in which it becomes almost square, and sometimes even slightly convex. The teeth are numerous, strong, and curved; two rows of them extending along the whole length of the *vomer*, with no marked group at its front. The color is more or less yellow, but the tint varies much in the trout of different waters, sometimes passing into greenish black or violet. The color is brightest in the trout of clear streams. On the back and upper part of the sides there are numerous spots of black and red; the belly is silvery white. The spots on the sides vary much. The fins are light brown; the dorsal fin and tail with numerous darker brown spots. The varieties which the common trout exhibits in tints and spots has led to the supposition that several distinct species have perhaps been confounded as one, and attempts have been made to point out their characters; but these have not proved satisfactory to the greater number of naturalists. It is certain that the appearance of the trout is much affected by the character of the water in which it lives, and the food with which it is supplied. The trout of a river with a muddy bottom are very different from those of a clear stream, and those of a stream darkly colored by moss are easily distinguished. The tint of the flesh varies as well as the external colors, being pink in some—the finest for the table—and white in others. It has been found that trout transferred from one locality to another soon change their tints.

The trout is very voracious, and readily devours almost any kind of animal food. Worms and slugs washed into rivers by rains are very acceptable to it. Small crustaceans are supposed to be the chief food of trout in some lakes and streams which are noted for the excellence of their produce. Small fresh-water shell-fish are also a favorite food of trout. Small fish of any kind which they can capture are their prey, and multitudes of salmon-fry thus perish. A gentleman well known to the writer of this article caught a large trout which had a very young viper in its mouth, bitten into three pieces; not yet swallowed, probably, because there was not room for it in the over-gorged stomach. The leaping of trout for flies in a summer day or evening adds to the charm of any a rural scene. Small trout often throw themselves quite out of the water; the larger ones in general merely rise to take struggling flies from its surface. The angler adapts his lures to the season and the weather. In spring and summer, when the weather is fine, the artificial fly is very successful; bait, generally the worm, is used in wet weather, or when the streams are much swollen by rains. The minnow is a good bait for large trout. No bait is more deadly than salmon roe, but the use of it is prohibited by law in Britain, for the sake of the salmon fisheries.

The trout generally spawns in the end of October, when the lower jaw of the male becomes elongated but not so much as in the salmon. The spawn is deposited in the same manner as that of the salmon, in gravelly beds, in running streams; and the trout

of lakes ascend streams for this purpose. Where trout have no access to proper spawning-ground, recourse must be had to artificial means to increase the stock (see PISCICULTURE); but in many small streams their numbers seem incapable of being diminished by any amount of angling. The best feeding-grounds are often where there is no good spawning-ground within reach of the fish. The trout grows rapidly when it has abundant food. From instances of individuals kept in wells and ponds, it is known to attain an age of 30 or even 50 years.

Among the varieties of the common trout, one called the GILLAROO TROUT is found in rough Neagh and other lakes of the n. of Ireland. It attains a large size, is very thick in proportion to its length, and has much smaller teeth than the ordinary trout.

The LOCHLEVEN TROUT (*salmo Levenensis* or *S. cæcifer*) is found in Lochleven in Scotland, where the common trout is also found, and is distinguished from it by the more pointed pectoral fins; the much longer rays of the tail-fin, which is also more pointed at its extremities; and particularly by the number of the caecal appendages, which are from 60 to 80 in the Lochleven trout, while they do not exceed 46 in the common trout. The flesh of the Lochleven trout is not white or pink, but red. It attains a large size.

The GREAT LAKE TROUT (*salmo ferox*) is the only other British species. It is found in some of the larger British and Irish lakes, and in the lakes of Scandinavia, seldom, if ever, ascending rivers, except for a short distance at the spawning season. It attains a size of almost 30 lbs., is a very powerful, active fish, and tries the skill of the angler in no small degree. It differs from the common trout in the longer muzzle, in the position of the fins, in having the tail square in all stages of growth, and in other characters. Its color is generally deep purplish brown, passing into greenish or grayish yellow on the belly. The spots are large, and not numerous. The great lake trout feeds much on small fishes, and is as greedy as a pike. It is taken by night-lines, or by trolling with strong tackle and a small trout or other small fish for bait. Young fish are taken with the artificial fly. The flesh of this species is very inferior in quality to that of the common trout.—Very different from it is the LAKE TROUT of the lake of Geneva (*salmo* or *fario Lemanus*), which is a fish of excellent quality, and nearly allied to the salmon trout. See SALMON. It ascends the rivers which fall into the lake, as the salmon trout ascends rivers from the sea.

North America has numerous species of trout. One of them, the COMMON BROOK TROUT, or SPECKLED TROUT (*salmo fontinalis*), is so similar to the common trout of Britain, that it may also be regarded as a variety rather than as a distinct species. It abounds in the streams of Canada and the more eastern British provinces, and in the northern and middle parts of the United States.—The NORTH AMERICAN LAKE TROUT (*salmo confinis*) inhabits the deepest waters of the great lakes, and sometimes attains a weight of more than 60 lbs. It is dark-colored, mottled with grayish spots. Its flesh is dirty yellow, and of very poor quality. It never takes the fly, but may be caught with the minnow, or a bait of fat pork. It is more sluggish than its congeners, and affords poor sport to the angler. There are several species of lake trout in North America. The finest in quality, as well as largest in size, is the MACKINAW TROUT or NAMAYCUSH (*Salmo amethystus* or *namaycush*). It is not found in lake Erie, nor in lake Ontario, but in lake Huron, lake Superior, and the more northern lakes, even in those of the arctic regions. It inhabits the deepest parts of them, except in autumn, when it resorts to shallow water for spawning.—The SISKIWIIT TROUT (*salmo* or *salar siscowet*) of lake Superior is of large size, stout, thick, and of rich flavor, but so fat as to be almost unfit for food.—The RED-BELLIED TROUT (*salmo* or *fario erythrogaster*) of the lakes of New York and Pennsylvania, sometimes $2\frac{1}{2}$ ft. in length, is deep greenish on the back, lighter on the sides, which are spotted with red, the belly orange red.

The n.w. of America has its own peculiar species of trout, one of which, the OREGON TROUT (*salmo Oregonensis*), is found in almost every stream from the snowy peaks of the Rocky mountains to the sea, and is very similar to the common trout of Europe.

Within the last ten years several new species of native trout have been brought to the notice of American scientists; and a number of foreign varieties, selected with reference to their tendency to acclimatization, and their value as a probable source both of

THE GREEN-BACK TROUT (*S. mykiss stomia.*.)

sport and food supply, have been imported into the United States. The native species include the yellow-fin and green-back trout of Colorado, inhabiting the basin of the

Upper Arkansas, and especially associated with Twin Lakes, near Leadville. Of these the yellow-fin trout was recognized in 1889 as a distinct sub-species by Dr. David S. Jordan, President of Stanford University, and named by him *Salmo mykiss Macdonaldi*, in honor of the United States Commissioner of Fisheries, Marshall McDonald. It

THE YELLOW-FIN TROUT (*S. mykiss Macdonaldi*).

attains a weight of seven or eight pounds, and is regarded as a desirable food-fish. The color of the flesh is pale in consequence of its fish diet ; while the flesh of the green-back trout (*Salmo mykiss stomias*) is of a brilliant salmon tint, conditioned by the red pigments of the crustacea upon which it subsists. The latter has for a number of years been known as native to the tributaries of the Arkansas and the Platte.

Another species of trout, whose presence in the United States was unsuspected, made its appearance, in 1881, in Sunapee Lake, New Hampshire, a large and deep body of water situated at an elevation of 1100 feet above the sea, on the watershed which separates the Connecticut and Merrimac river-basins. This trout, or more properly charr, is now scientifically known as the *Salvelinus alpinus aureolus*, from its golden hue and its identity with the Alpine trout of Europe. Three specimens were taken in 1881 ; but it was not until 1885 that large schools of this stranger fish were found on a mid-lake spawning-bed by the fish and game commissioners. Individuals were at once submitted to scientists for classification ; but great differences of opinion prevailed in regard to its species and origin until in November, 1890, Professor Garman of the Museum of Comparative Zoology at Cambridge, Mass., unhesitatingly pronounced it a form of European saibling, and therefore an introduced variety. The fish has since been discovered in a lake belonging to the Ossipee system, on the Maine divide, and the claim has been advanced that it is an American representative of the saibling. But Professor Garman's classification is confirmed by the fact that this trout was wholly unknown in Sunapee waters until 1881, the only trout native to the system being the common brook-trout ; and there is no trustworthy evidence that it has existed for a longer period on the Eastern watershed. The slight structural differences between the Sunapee charr and the European saibling are fully explicable on the ground of change of habitat and climate. It is admitted that German saibling reached New Hampshire at least as early as 1879.

The distinguishing characteristics of the Sunapee charr are the presence of a broad band of teeth on the hyoid bone, the absence of mottling on the back, so marked in the brook trout, a nearly square tail, prominent fins, a small and delicate mouth, and a

THE SUNAPEE TROUT (*S. alpinus aureolus*).

phenomenally brilliant nuptial coloration. The fish, which is silver white in summer, with pale or hardly perceptible olive spots, is metamorphosed at the October spawning season into a dazzling orange-colored beauty, richly decorated with flecks of blazing yellow or vermillion. The females, usually cream-tinted, or of a delicate green tempered with violet, are occasionally as highly colored as the males ; the back in each sex is of a deep steel blue. Those who have seen these graceful creatures on the spawning beds, in all their glory of color and majesty of action, pronounce it a spectacle never to be forgotten. The presence of this charr in Sunapee Lake has not as yet been satisfactorily accounted for. Young fish now swarm in the depths, and specimens have been

taken up to seven pounds in weight. Like all charr, the Sunapee trout affects cold water, and is angled for in summer, with a live minnow or smelt, in water sixty to seventy feet deep.

Among imported varieties the common brown trout of Europe (*Salmo fario*) has adapted itself readily to our climate, and rapidly attains great size in our waters. Its beauty, fighting qualities, and delicious flavor render it an important addition to our *Salmonidae*, and it is now propagated artificially to a considerable extent in the United States. The Loch Leven trout (*Salmo levenensis*), a graceful, silvery fish, with round or X-shaped black spots, takes its name from Loch Leven, Kinross-shire, Scotland. Originally a sea-going or anadromous fish, it is now non-migratory, having become land-locked in this lake. Justly celebrated throughout Great Britain as the gamiest of her trout, it has proved a most desirable form to cultivate, growing rapidly and to a greater average size when transplanted from its native waters, and under favorable conditions attaining a weight of seven to eight pounds. It crosses readily with the common trout and the salmon, both hybrids being fertile. The Loch Leven trout has been exported from the Howietoun Fishery, near Stirling, to New Zealand and South Africa, and has become acclimated in the streams of Madras. The first purchase for American waters, by a private party, was made in June, 1886, by Professor John D. Quackenbos, of Columbia College, New York, who went to the loch for the purpose of studying the life-history of the fish. The 30,000 eyed ova shipped to Professor Quackenbos were hatched at Plymouth, New Hampshire, and planted in Sunapee Lake. The State of New York and the U. S. Government have since made extensive importations of the Loch Leven trout. It has been introduced into Adirondack waters, into Lake George by A. N. Cheney, of Glens Falls, into the waters of Dutchess Co., New York, and into certain ponds and streams on Long Island. Specimens of 2½ lbs. weight have already been taken from Woodhull Lake in the Adirondacks. The sea-trout (*Salmo trutta*) of North Britain, a fish which ranks next to the salmon in the estimation of English anglers, was introduced into this country in 1890 by the Shooting and Fishing Publishing Co., of Boston, but with what result is not yet known.

TROUVÈRE. See TROUBADOUR.

TRO'VER, in American law, is an action brought to recover goods from a person to whom they do not belong, but who has in some way obtained possession of them. It was founded on the old fiction, that the rightful owner had accidentally lost the goods, and the party in possession had found them, and would not give them up to such owner. It is practically an action to try the title to the goods, and therefore is of extensive application in the law of contracts, as well as other branches of law. The plaintiff, if successful, recovers the value of the goods as a satisfaction. The defendant is said to have illegally converted or appropriated the goods, and it is by the conversion of the goods that the damage is done, and for which the remedy is given.

TROWBRIDGE, a market-t. of Wiltshire, stands on a rocky eminence in the valley of the river Biss, 10 m. s.e. of Bath. In the church of St. James, which dates from the 14th c., Crabbe the poet officiated as clergyman from the year 1814 to 1832, and his remains repose under a monument in the chancel. The town has long been the seat of woolen manufactures, and these, within recent years, have been carried on with much spirit and success. Cassimeres, kerseys, tweeds, and woolen cloths of the best qualities are manufactured. Many handsome villas have been erected outside the town by the wealthy manufacturers. Pop. '81, 11,041; '91, 11,717.

TROWBRIDGE, EDMUND, 1709-93; b. Mass.; graduated at Harvard, 1728. He was called to the bar, where he rose to eminence. He became attorney-general of the state in 1749, was a member of the council, and in 1767 was appointed chief-justice. His attitude in regard to the disputes between Great Britain and the colonists was too judicial to suit the latter, and he resigned from the bench in 1772.

TROWBRIDGE, JOHN, American scientist, b. 1843, educated at the Lawrence scientific school of Harvard university, where he afterwards taught. In 1880 he was made professor of experimental physics and in 1888 was appointed to the Rumford chair of the Application of Science to the Useful Arts. He has made a number of important discoveries and inventions. Among the latter is his closed magnetic circuit transformer. Many of his papers have been issued under the title of *Contributions from the Physical Laboratory of Harvard College*. Besides these he has written *The New Physics* (1884), and was an editor of the *Annals of Scientific Discovery for 1869* (1870), and of the *American Journal of Science*.

TROWBRIDGE, JOHN TOWNSEND; b. N. Y., 1827; settled in Boston in 1847, and became a writer for the press and of stories. Among his many works are *Neighbor Jackwood* (1857); *Cudjo's Cave* (1864); *The Three Scouts* (1865); *Neighbors' Wives* (1867); *Fast Friends* (1874); *The Lost Earl and other Poems* (1888), etc.

TROWBRIDGE, WILLIAM PETIT; b. Mich., 1828; graduated at West Point, 1848, standing first in his class. During the civil war his scientific attainments were of great value in the construction and repairing of forts and bridges, and he had charge of the New York branch office of the engineer department. After the war he was connected for some time with the New York Novelty iron works; from 1870-80 held the professorship of mechanical or dynamic engineering in the Sheffield scientific school of Yale college, and later a similar chair in Columbia college. He died in 1892.

TROY. The earliest traditions of the Greek people, as contained in their oldest poetry and history, represent the country on both sides of the *Ægean* as peopled by various races, either of genuine Hellenic, or of closely affiliated tribes. Among those who peopled the eastern or Asiatic coast are specially named the Pelasgi, the Leleges, the Caucones, the Carians, the Lycians, and the Trojans. These last, to whom Homer's poem has given a celebrity that throws all the rest into the shade, occupied the small country in the n.w. corner of Asia Minor, best defined, perhaps, as the region of mount Ida, with its topographical dependencies. That the Trojans were either a Greek race, or some non-Hellenic people under a Greek dynasty, seems probable, from the absence in Homer of any such decided national contrast between Greeks and Trojans, as we find in mediæval poetry between Christians and Saracens. Local legends represented them as closely connected with Crete; and Homer in the *Iliad*, xx., makes Priam the sixth in descent from Dardanus, the first of the dynasty, who was supposed to have come from Crete. The story of the Trojan war, which forms the subject of Homer's great poem the *Iliad*, is extremely simple. The Trojans, in the person of Paris, or Alexander, the son of the reigning monarch, Priam, are represented as having had certain dealings with the Achæans, or Greeks of the Peloponnesus, in the course of which the gay young prince carries off from the palace of Menelaus, king of Sparta, his spouse Helen, the greatest beauty of her age. To revenge this insult, the Greeks banded themselves together, and sailed against Troy with a large fleet. All the Greek tribes afterward famous in history took part in this expedition; but the most notable were the Argives or Achæans—Greeks of the e. and n. part of the Peloponnesus, and adjacent isles; the Spartans—Greeks of the s.e. district of the Peloponnesus; the Neleids—Greeks of the w. coast of the Peloponnesus; the Boeotians, and the Thessalians. Of the Thessalians, the most prominent captain was Achilles; and the general command of the whole expedition was committed to Agamemnon, king of Mycenæ, as the head of the most numerous contingent, and at the same time the brother of the royal person whose hospitality had been so grossly violated. This well-appointed European army is represented as having spent nine years in besieging the god-built walls of the city of Priam without making any impression on its strength. A violent quarrel between Achilles and Agamemnon, breaking out in the tenth year, so weakened the invading force that the Trojans, under Hector, pushed the Greeks back to the very verge of the sea, and almost set their ships on fire. This quarrel forms the subject of the *Iliad*. At the critical moment, however, the Thessalian captain is reconciled to the head of the expedition; and with his return to the field, the fortune of war changes; Hector, the champion of Troy, falls, and the impending doom of the city is darkly foreshadowed. The siege and sack of Troy did not fall within the plan of Homer's poem, but are narrated at length in the *Post Homericæ*, a Greek poem by Quintus Smyrnaeus, a poet of the decadence. The Greeks possessed a long series of popular poems called the *Cyclic poems*, in which the whole sequence of the Trojan story was narrated, giving completeness to the brilliant fragment, which has been adorned by the genius of Homer. From these poems—of which the abstracts are still preserved—Virgil derived those materials which he has used with such effect in the second and third books of his great poem. The *Cyclic poems*, besides the events in the Trojan war after the death of Achilles, contained an account of the various colonies in Italy and elsewhere believed to have been founded by the scattered chiefs of the expedition after their return home. Of these, the settlements of Diomedes, Philoctetes, and Indomeneus, on the s.e. coast of Italy, and that of *Æneas* on the banks of the Tiber, are the most famous. The chronology of the Trojan war, depending as it does mainly on artificial construction from genealogical data, is not, of course, trustworthy; but there are good reasons for believing that the generally received date 1184 B.C. is not far wide of the mark. After the fall of the kingdom of Priam, the future story of Troy is short and uneventful. Under the Lydian kings, whose dynasty culminated in Cræsus, a new Troy—*Ilion Novum*—began to creep into notice, which, from the glory that belonged to its name, and the favor of Alexander the Great, Julius Cæsar, and other influential visitors, grew into some significance. The interest which attached to it, however, in its most flourishing estate was more antiquarian than political.

How far the events of the Trojan war, as found in Homer and the *Cyclic poems*, are to be taken as historical, depends upon the view which is taken of the general character of the materials of popular ballad poetry in all countries. That there is in the general case an under-stratum of historical reality, out of which the earliest popular poetry grows, may be assumed as certain. But how strong the tendency is, in early uncritical ages, to erect on this foundation a purely imaginary superstructure, need scarcely be mentioned. At the same time there is a very great difference to be observed in the popular poetry of different nations, in respect of the greater or less amount of trustworthy historical matter which lies embedded in the imaginative conglomerate. The excess of the imaginative, fanciful, and altogether improbable element is found in our own Arthurian and Carolingian romances. In Homer, on the other hand, there is a sobriety of tone, a geographical clearness, and a general air of verisimilitude, which incline the reader to accept the historical reality of the main facts. In the first chapter of Herodotus we find the Phenicians practicing the very same act of abduction, though in a more violent form, which the poet represents as having kindled the famous ten

years' warfare between Greece and Troy; and, even in the most general view, the war of Troy between rival peoples on the opposite sides of the Ægean may be looked on as the natural overture of those great struggles, by which, on the same theater afterward, the fate of the world, indicated by the preponderance of the European over the Asiatic element, was more than once decided.

The PLAIN OF TROY is formed by the débris of the great chain of mountains which terminates the peninsula of Asia Minor on the n.w., where it is separated from Europe by the sea of Marmora and the narrow strait of the Dardanelles. This chain of mountains is called Ida by Homer (*ide*, wood); and its highest peak toward the s. side of the Troad, overhanging the bay of Adramyttium, is celebrated by the same poet as Gargarus. Westward from this chain the land slopes gradually down by a series of undulating ridges to the s. coast of the Dardanelles. The plain included between these ridges and the sea is the plain of Troy. It is surrounded on all sides by elevated ground, by hills and mountains toward the e. and s.e., and by rocky ridges or cliffs along the coast. At one place only does it open to the sea, and this is at the extreme n.w. corner, where it meets the s. end of the Dardanelles. Here there is a stretch of sandy shore about two m. in length, beginning behind the Turkish fort of Koumkale, and trending eastward. This is the only place where a fleet such as that described in the *Iliad* could effect a permanent landing; and here, accordingly, by general consent, the encampment of the Greeks is placed. The promontory which bounds this bay to the e. is universally acknowledged as the Rhætan promontory of the ancients, while that on the w. is the Sigeon. Here, also, as the natural mouth of the plain, the principal river, by whose action mainly it was formed, finds its way into the sea. This river is the Mendereh, obviously a corruption of the Homeric Scamander, called also by the poet Xanthus, from *xanthos*, that is, the *yellow* river, from the color of its waters; a quality which has been noticed by most modern travelers. Looking up the plain from any of the heights about the mouth of the river in a south-easterly direction toward Gargarus, its course can easily be traced to a distance of about nine m., where it emerges into the plain through a defile in the mountains. This distance of nine m., therefore, is the extreme length of the plain of Troy. Its breadth is about three miles. It presents the appearance of "a long tract of meadow-land, inclosed within a girdle of low, round-backed hills, and prettily garnished by many lines of trees, which skirt the water-courses." These waters, with the single exception of the Scamander, are not large enough, according to our usage, to deserve the name of rivers, but are mere mountain-torrents or brooks, generally dry in summer, some of them nothing better than a sort of natural drains or ditches. Those deserving of mention are three: the first flowing from the chain of Ida westward into the plain, about three m. from the sea, called the *Dombrek*; the other in the same direction, about five m. further up, called the *Kimaiir*. The third streamlet rises at the head of the plain, near the Turkish village of Bunarbashi, and creeping along the bottom of the slope toward the Archipelago, forms the boundary of the plain on the w., and empties itself into the Mendereh, about two m. above its mouth. One of these streams must be the Homeric Simois.

The topography of a plain so famous in the history of human civilization has, of course, occupied the attention of the learned both in ancient and modern times; and a considerable library could be formed of volumes in which this region has been described, and its most famous localities discussed. The topographical result of these voluminous discussions can, however, now be given in a very few sentences. In the first place, after seventy years of confusion and hallucination, it may be regarded as certainly established, that the Mendereh is the Scamander. It is also universally allowed that *Novum Ilium*, or New Troy, occupied the site of Hissarlik, on an eminence about four m. from the mouth of the river, on its right bank, near the bend of the Dombrek. It is also a matter of general consent, that the great tumulus or barrow, near the Sigeon promontory, where the Dardanelles broaden up into the wide Ægean, is the veritable monument of Achilles, described by Homer in a famous passage of the *Odyssey*; but beyond these three points, it cannot be said that any part of the classical topography of the plain has been ascertained with certainty. The great point to determine, of course, is the site of the Homeric Troy, the capital of the empire of Priam; but this is a matter which, in default of inscriptions, can be ascertained only by previously deciding which of the three streamlets above mentioned is the true heir to the legendary glories of the Homeric Simois; for between the Scamander and the Simois the tide of battle rolled to and fro, as Homer expressly tells us; and at the head of the plain between these two rivers the town of Troy must certainly stand. Those who hold with Strabo among the ancients, and Maclaren among the moderns, that the Dombrek is the Simois, have strong grounds for maintaining that New Troy was built upon the site of Old Troy, and that no further search is necessary; while they who look on this point as suspicious, must recognize the Simois in the river of Bunarbashi, and the site of the Pergamus of Priam on the plateau at the great bend of the Scamander, about a m. to the eastward of the village of Punarbashi, where the substructions of an ancient city have been lately excavated. Those who wish to see this nice topographical question discussed in the most masterly style, will read *The Plain of Troy Described*, by Charles Maclaren (Edin. 1863), on the one side; and *Ueber das Homerische Ilium*, by Prof. Welcker, in his collected tracts (Bonn, 1845), on the other. A succinct exposition of the arguments on

both sides will be found in Prof. Blackie's notes to the *Iliad*, Book xxi. The literary history of this topographical question, commencing with the work of Le Chevalier, a Frenchman, translated into English by Prof. Dalzel in 1791, is extremely curious; but the most distinguished scholars and topographers being now agreed that the Mendereh and the Scamander are identical, it is not necessary to make any allusion to the wonderful discovery of "the wells of the Scamander," by which Le Chevalier imagined he had made himself immortal. Dr. Schliemann, who had carried on a systematic investigation of the supposed neighborhood of ancient Troy, believed he had found, at Hissarlik, its veritable site.

The result of Schliemann's labors, in which he was assisted ultimately by other trained observers and skilled architects, shows that on, around, and near the hill of Hissarlik there are piled up the remains of seven successive towns or cities. Deepest beneath the many yards of superimposed rubbish and ruins are traces of a town of small size on the hill, of absolutely unknown date. The next above it is greatly larger, the hill having simply been its citadel, and shows traces of grandeur. This city, also prehistoric, seems to have been overthrown by some great catastrophe about the 12th c. B.C., certainly not later than the 10th c.; and it is this that Dr. Schliemann ultimately came to regard as identical with the Troy of Priam and of Homer's poetry. In *Ilios*, Dr. Schliemann was inclined to identify with the Homeric city that whose traces are found third in order from the bottom. The last and highest of the series is the fifth historic one, the *Novum Ilium*, above mentioned, which disappeared from history about the 4th or 5th c. A.D. Enormous quantities of prehistoric and other pottery were exhumed, as also some gold ornaments and vessels, and numerous weapons of bronze and stone. Into the questions of the artistic value of the remains successively brought to light, of the relation of Greek to Phrygian art, of the Greek people to the Asiatics, and of the Trojan race to other races (Dr. Schliemann believed the Trojans to have had Indo-European or even Germanic affinities), we cannot here enter, but must be content to refer to Dr. Schliemann's works, and the discussions provoked by them. See his *Ilios*, 1880, and *Troja: Results of Latest Researches and Discoveries on the Site of the Homeric Troy* (1883).

TROY, city and co. seat of Rensselaer co., N. Y.; on the east bank of the Hudson river, at the head of tide-water and steam navigation; 151 miles north of New York and six miles north of Albany, in latitude 42° 44' north, and longitude 73° 41' west. The site now occupied by Troy was included in the Van Rensselaer grant of 1629, and one of the first settlers was Van der Heyden, who owned a farm of sixty-five acres, which was regularly laid out in streets sixty feet wide in 1787. It bore various names until 1789, when the classic one of Troy was adopted. The city charter was granted in 1816. The first newspaper was issued in 1791, and a Presbyterian church was organized the same year. The inhabitants numbered about fifty, and were mostly from New England. Troy is built partly on a plain which stretches along the river for about three miles, and partly on a range of hills at the east, from the higher peaks of which, Mt. Ida and Mt. Olympus, fine views far up and down the Hudson may be obtained. A steam railroad, belt-line, connects this city with Albany, half-hourly, and electric cars traverse the streets in every direction and connect with the suburbs; there are several bridges across the Hudson. Troy has suffered severely by fires, one of which, in 1862, destroyed property worth \$3,000,000. Among the prominent public buildings are the city hall, county court house, the new granite custom house and post office, an elegant new music hall, the Young Women's Association home, and the Alumni building of the Rensselaer Polytechnic Institute (q. v.), one of the best in the country. There are also the Marshall infirmary and insane asylum, Troy orphan asylum, Troy male orphan asylum, Church home, Day home, Home for the aged poor, Troy hospital, House of the Good Shepherd, a Young Men's Association, a public library, a Roman Catholic theological seminary, and the Emma Willard seminary, founded in 1821, the oldest school in the country devoted to the higher education of women. The institution was enlarged in 1895 by a gift of \$150,000 from Russell Sage and the erection of Gurley and Plumb memorial buildings. Other noteworthy institutions are the Lasalle institute and St. Peter's academy. Troy has several public parks and a beautiful cemetery, Oakwood, overlooking Cohoes Falls, and containing monuments to major-generals Thomas and Wool, and the Earl memorial chapel and crematory. There is a fine soldiers' and sailors' monument in Washington square. Troy has an excellent high school and many public schools, about 70 churches, national and savings banks, daily and weekly newspapers. The city is well drained and supplied with water from Piscawen creek, and lighted with gas and electricity.

Troy forms, with West Troy, Lansingburg, Waterford, and Cohoes, one of the great manufacturing centers of the United States. Both steam and water-power are used, the latter being obtained from a dam across the Hudson, and from Wyanant's and Potsenkill creeks. In Troy alone 840 establishments were reported in 1890, with a combined capital of \$24,030,753, and an output valued at \$29,248,750. The first Bessemer steel works in America were established in Troy in 1865, and there are now many steel-working plants. A single establishment employs from 2200 to 2400 workmen, with wages of \$1,250,000. Tens of millions of the Burden machine-made horseshoes are produced annually, and the principal European nations have purchased the right to manufacture them. Meneely's church bells vibrate all over the world, and passenger and freight cars are ex-

ported in large numbers. Thousands of tons of boiler rivets, nails, spikes, files, axles, bolts, besides stoves, ranges, steam-engines, hot-air furnaces, machinery, scythes, and other manufacturing implements are produced annually. Troy shirts and collars and cuffs and Troy laundries are known in every quarter of the globe. The Hudson river and the Erie canal afford fine opportunities for commerce, besides the railroads entering the city. On the opposite side of the river is a United States arsenal with large workshops. The New York Central and Hudson River, the Delaware and Hudson, and the Fitchburg are the principal railroads. Population, 1810, 3895; '40, 19,334; '60, 39,235; '80, 56,747; '90, 60,956.

TROYES, a t. of France, formerly capital of the province of Champagne, and now of the department of Aube, on the left bank of the river Seine, 103 m. e.s.e. of Paris by railway. It is a very old-fashioned place, and most of the houses are of wood. The principal buildings are the cathedral, dedicated to St. Peter, a splendid specimen of *flamboyant* Gothic, founded in 872, and rebuilt between the 13th and 16th centuries; the churches of St. Urban, the Madeleine, St. Pantaleon, and St. Remi, the Hôtel de Ville, a public library, containing 110,000 vols. and 2500 MSS.; a museum, the palace of justice, the exchange, merchant's hall, and various educational institutions. Troyes is not so populous or important as it was in the middle ages. Even as late as Henry IV.'s time, it had more than 60,000 inhabitants; in 1896 the pop. was 52,998. It carries on numerous cotton and woolen manufactures, and, as the center of a rich agricultural region, it has a large transit-trade.

Troyes, anciently the capital of the Celtic Tricassii, was called by the Romans *Augustobona*; later, *Civitas Tricassium*; and then *Treca* (a corruption of Tricassii), whence the modern Troyes.

TROYON, CONSTANT, 1810-65; b. Sèvres; first employed as decorator of china in the porcelain works; became an eminent painter of landscapes and animals; began to exhibit, 1836, and was soon afterward presented with medals of the first-class, and acquired an immense fortune. His "*Vallée de la Tongue*" first brought him into notice. He painted pictures illustrating St. Cloud and Sèvres, which gained the popular favor. His "*Osier Bed*" sold in Paris for 24,200 francs; his "*White Cow chased by a Dog*," 10,400 francs; and "*Pastures near Trouville*," 1200 francs.

TROY-WEIGHT. The origin of the term "troy" is unknown; some consider it to be a corruption of *le roy*, as the troy pound was, till recently, the standard pound (*pondus regis*); some derive it from *Troy novant*, the monkish name for London; while the majority of philologists and lexicographers profess to see the origin of the name in the town of Troyes, in France, an important center of commerce during the middle ages, which hence *may*, like the towns of Cologne, Toulouse, and others, have had its own special system of weights; though why the term should have migrated to Britain, and been exclusively employed there for so long, is not at all evident. A troy pound (of what value is unknown) is first mentioned in Britain in 1414, long before which period the standard pound of 12 oz., as well as another pound (the tower pound) of 12 oz., was in use. The term "troy" was first applied to the standard pound in 1495, but at the same time no change seems to have been made in its value, and it continued, as before, to be exclusively employed by the dealers in the precious metals, gems, and drugs. See POUND. The troy pound contains 12 oz., each ounce 20 penny-weights, and each penny-weight 24 grains; thus the pound contains 5,760 grains and is to the avoird. pound as 144 to 175; while the troy ounce is to the avoird. ounce as 192 to 175. For medicines other subdivisions of the troy pound were formerly employed; but now medicines are weighed by the avoirdupois (q.v.) standard. The old English pound, to which the term troy was afterward employed, was doubtless the pound of silver; and the tower pound of 12 oz. differed from it only by $\frac{1}{4}$ of an ounce.

TRUCE, a suspension of hostilities between two armies or states for a period specially agreed upon. During a truce it is dishonorable to occupy more advanced ground or to resort to any act which would confer advantage. A truce requires ordinarily to be confirmed by the commander-in-chief to become binding. It is lawful to break it before the prescribed period, on notice previously agreed on being given to the opposite party. This is called denouncing a truce.

TRÜBNER, NICOLAS, b. Germany, 1817; removed to London, where he became the head of the publishing house of Trübner & Co. He published a translation of Conscience's *Sketches from Flemish Life* (1845), and a *Bibliographical Guide to American Literature* (1855). He was a good oriental scholar, also familiar with Basque. He d. 1884.

TRUCE OF GOD. See GOD'S TRUCE.

TRUCK-FARMING. See AGRICULTURE.

TRUCK-SYSTEM (French *troquer*, Scotch *trock*, to barter or exchange) is applied to the practice of paying workmen in goods instead of current money.

TRUE CROSS, or HOLY ROOD, THE, said to have been discovered at Jerusalem, 326 A.D., through the exertions of Helena, the mother of Constantine, who had determined

to commemorate his conversion by building a church on the spot where the cross of Christ had stood. Helena went to Jerusalem, had the whole place cleared and extensive excavations made. The holy sepulcher was discovered, as was claimed; the three crosses found, with the nails, and the tablet of inscription, not, however, attached to any of the crosses. A noble lady of Jerusalem, sick unto death, touched two of them without effect; but, touching the third, was healed. Part of this cross having been framed in silver and placed in the new church, splinters of it were soon extensively sold. Yet, although "the whole world was at length filled with these splinters, the cross itself miraculously remained entire."

TRUFFLE, *Tuber*, a genus of fungi of the section *gasteromycetes*; globose, or nearly so; of a fleshy substance, with a distinct skin, the whole substance pervaded by a network of serpentine veins, which are the *hymenium*, and bear the spore-cases in minute cavities. The species are not numerous; they are very generally diffused in temperate parts of the world; they are subterranean, often found at the depth of a foot or more in the soil. Some of them are among the most highly valued of esculent fungi. The **COMMON TRUFFLE** (*T. cibarium*) is of a black color, and has a watery surface. It varies in size from that of a large plum to that of a large potato. On account of its agreeable flavor, it is used in the preparation of many dishes. It is common in the central and southern parts of Europe, chiefly in loose soils, in woods and pastures, as in the chestnut woods of France and Italy. In England, it occurs, pretty abundantly, in the downs of Wiltshire, Hampshire, and Kent. Other species, as *T. aestivum*, *T. rubum*, and *T. moschatum*, are found in some parts of France, Italy and other countries of Europe, and are sought after and used in the same manner as the common truffle. It has recently been discovered that the English species are more numerous than was formerly supposed; truffles have also been discovered in localities in the s. of England where their existence was formerly unknown. The gathering of truffles is the occupation of many persons in the places where they abound. They are dug up with a kind of hoe or pick. Dogs are trained to seek them, and readily discover by the scent the spot where they grow underground. The stirring of the soil in the gathering of truffles seems to increase its productiveness. No particular kind of dog is specially employed for truffle-seeking; but one of which the parents are truffle-dogs is preferred, as it is said to be more easily trained. In some parts of France, pigs are also trained to seek truffles. In Germany, the name **BLACK TRUFFLE** is given to the common truffle, and that of **WHITE TRUFFLE** to *rhizophagon album*, a species of a nearly allied genus, which has also been found in England. It grows half above ground, is of a whitish-red color, and is generally of the size of a large walnut. It is less aromatic than the common truffle, but is used in the same way. See *illus., MOSSES, ETC., vol. X.*

TRUJILLO. See **TRUXILLO**.

TRUL'LAN, the name (derived from the hall—*Gr. troullos*)—of the palace in which the fathers assembled) given to the council also called *quiniseat* (q.v.).

TRUMBULL, a co. in n.e. Ohio; 625 sq.m.; pop. '90, 42,373. Co. seat, Warren.

TRUMBULL, BENJAMIN, D.D., 1735-1820; b. Conn.; graduated at Yale, 1759; studied under Dr. Wheelock, founder of Dartmouth college; pastor of the Congregational church at North Haven, Conn., 1760, until his death. He served in the revolutionary army as chaplain and volunteer soldier. He published *A Plea in Vindication of the Connecticut Title to the Contested (Western) Lands*; *History of the United States to 1765*; *Twelve Discourses on the Divine Origin of the Scriptures* (1790).

TRUMBULL, HENRY CLAY, b. Conn., 1830; studied at Williston seminary, East Hampton, Mass.; missionary of the American Sunday-school union for Connecticut, 1858; ordained a Congregational minister, 1861; chaplain in the army for three years; missionary secretary of the American Sunday-school union for New England, 1865; removed to Philadelphia, 1875, and became editor of the *Sunday School Times*. He has published *The Sabbath School Concert*; *The Knightly Soldier*; *Childhood Conversion*; *The Captured Scout of the Army of the James*; *The Blood Covenant* (1885); *The Sunday School* (1888); *Principles and Practice* (1889); *Friendship the Master Passion* (1891); *Studies in Oriental Social Life* (1894).

TRUMBULL, JAMES HAMMOND, LL.D., b. Conn., 1821; educated at Yale college in the class of 1842. Feeble health prevented his entering professional life, and since 1847 he has been a resident of Hartford. From 1847 to 1852 and 1858-61 he was assistant secretary of state, and from 1861-65 secretary. He was among the foremost of American philologists, and a well known writer on historical subjects of local interest. He made a thorough study of the Indian tongues. Mr. Trumbull was the state librarian 1854-56; from 1849 to 1863 was secretary of the Connecticut historical society, and from 1863 its president until his death, Aug. 5, 1897. Among his many published writings are *The Public Records of Connecticut prior to the Union with New Haven Colony, May, 1665*; *Roger Williams's Key to the Indian Language*; *True Blue-Laws of Connecticut*; and many papers in *Notes and Queries*, in *The New England Historical and Genealogical Register*, and in other periodicals.

TRUMBULL, JOHN, 1750-1831; b. Conn.; passed his examination at Yale college at 7 years of age, though ill-health prevented his entering until 1763 graduated, 1767. In 1769, associated with Timothy Dwight, he wrote essays in the "Spectator" style for newspapers in Boston and New Haven. While a tutor in Yale college, 1771-73, he wrote the *Progress of Dullness*; was admitted to the Connecticut bar in the latter year; entered the office of John Adams in Boston; wrote political essays and *Elegy on the Times*. In Philadelphia, 1775, he published the first part of *M'Fingal*. He married the daughter of Col. Leverett Hubbard of New Haven; resided in Hartford, 1781; and completed *M'Fingal*, 1782. He published *Poetical Works* (2 vols., 1820, latest ed., 1864, with notes by B. J. Lossing). *M'Fingal* has been republished in a cheap edition (New York, 1881). Associated with Humphreys, Barlow, and Dr. Lemuel Hopkins he wrote *The Anarchiad*. He was in the legislature, 1792 and 1800; judge of the superior court, 1801-19; judge of the court of errors, 1808; treasurer of Yale college for several years. His daughter married Gov. Woodbridge of Michigan, and he resided with her in Detroit from 1825 till his death.

TRUMBULL, JOHN, American painter, son of Gov. Jonathan Trumbull (said to have been the original "Brother Jonathan"), of Connecticut, and brother of Gen. Jonathan Trumbull, aide-de-camp to Gen. Washington, was b. in Lebanon, Conn., June 6, 1756, was educated at Harvard college, and devoted himself to painting. He had completed two pictures, the "Battle of Cannæ," and the "Judgment of Brutus," at 19, when the war of the revolution broke out, and he joined the provincial army before Boston as adjutant of the 1st Connecticut regiment. The execution of drawings of the British works procured his appointment as aid to Washington, and soon after that of brigade-major. In 1776-77 he served under Gates and Arnold as adjt.gen.; but, offended with the action of congress respecting the date of his commission, he resigned and resumed the palette. In 1780 he came to London, via France, where he was making rapid progress under the instructions of sir Benjamin West, when, during the excitement occasioned by the execution of Maj. André, he was thrown into prison. The king, George III., promised West that his life should be spared, but he was kept eight months in prison, and then released on condition of leaving the kingdom. After the war he returned and resumed his studies. His "Priam receiving the Body of Hector," painted at this period, is in the gallery of the Boston Athenæum. In 1786 he produced the first of a series of modern historical and military works, the "Battle of Bunker Hill," followed by the "Death of Montgomery," "Sortie of the Garrison from Gibraltar," exhibited in London in 1789, and engraved by Sharp. He, this year, returned to America, painted several portraits of Washington, and secured likenesses of many of the prominent actors in the revolution; and in 1796 returned to England as secretary of legation to Mr. Jay. He was in England again from 1808 to 1815, painting industriously, but with little success. Returning then to America he was employed by congress to paint four large national pictures for the rotunda of the capitol at Washington—the "Declaration of Independence," "Surrender of Burgoyne," the "Surrender of Cornwallis," and the "Resignation of General Washington, at Annapolis, Dec. 23, 1783." These pictures are chiefly valuable as collections of portraits. He afterward completed a gallery of all his historical pictures, 57 in number, on a smaller scale, which became the property of Yale college, and has great historical value. He was the president of the American Academy of Fine Arts from its foundation in 1816, until the formation of the National Academy in 1825; and died in New York, Nov. 10, 1843.

TRUMBULL, JONATHAN, LL.D., 1710-85; b. Conn.; graduated at Harvard in 1727. He studied theology, but in 1731 went into business with his father. In 1733 he entered the Connecticut assembly, of which he was elected speaker in 1739. He was assistant judge of the superior court; chief judge 1766-69. He was deputy governor in 1767-68; and governor, 1769-83, when he resigned. He was active in the cause of the colonists in the disputes which led to the revolution, refused to take the oath to execute the stamp act, and during the revolution was a constant and trusted adviser of Washington, whose familiar reference to him as "Brother Jonathan" may have originated the application of that name to the personification of America—a typical American.

TRUMBULL, JONATHAN, 1740-1809; b. Conn.; graduated at Harvard, 1759. He was speaker of the Connecticut legislature at the beginning of the revolution; paymaster in the army, 1775-78; and, later, secretary and aid to Washington. He served in congress from 1789 to 1795, and as speaker for the last four years; was U. S. senator in 1795; and lieutenant-governor of Connecticut, 1796-98.

TRUMBULL, JOSEPH, 1782-1861; b. Conn.; graduated at Yale, 1801; studied law and began practice in Hartford, 1804, retiring in 1828. He was for some years a member of the legislature; member of congress in 1834; and was elected governor of Connecticut in 1849.

TRUMBULL, LYMAN, b. Conn., 1813; educated at Colchester academy; principal of an academy at Greenville, Ga.; studied law, and admitted to the bar, 1837; settled at Belleville, Ill.; member of legislature, 1840; secretary of state, 1841-42; justice of supreme court of Illinois, 1848-53; member of congress, 1854; senator of United States, 1855; re-elected in 1860 and 1866. Formerly a leading Republican, he voted against the impeachment of President Johnson, and thenceforth acted with the Democratic party. He died June 25, 1896.

TRUMPET, a musical instrument of great antiquity, which, in its present form, consists of a tube 8 ft. long, less in diameter than the horn, doubled up in the form of a parabola, and sounded by a mouth-piece. It produces the following progression of sounds:

which the common truss fails to support a rupture comfortably, and in these cases various instruments, for the most part the property of special instrument-makers, are often serviceable; and the surgeon should be acquainted with the peculiarities of the pieces of apparatus known as the Mocmain lever truss, Coles's truss (with a spiral spring acting on the pad), Salmon and Ody's self-adjusting truss, Eggs's truss, etc. The patient must expect to find the truss somewhat uncomfortable for a week or two, but will soon get used to it. The skin of the part upon which it presses should be regularly washed and bathed with eau de Cologne or spirit, as, without this precaution, boils are apt to form on it.

TRUSS. See **CONSOLE**. Also the framework, composed of tie-beam, rafters, struts, etc., forming one of the principal supports of a roof.

TRUSSING, in ship-building, diagonal timbers or iron plates crossing the ribs internally, and consolidating the whole together. Iron is preferred to wood, as being less heavy and less bulky.

TRUST, in the law of England, is a confidence reposed in some other person touching land or goods for which the *cestui que trust*, or beneficiary, has no remedy except in the chancery division of the high court of justice. It means a species of divided proprietorship, whereby the trustee acts as a custodian or strong-box; and yet the benefit of the property is not his, but belongs to the *cestui que trust*. The person who creates the trust is sometimes called the *celui que trust*. As a general rule, all property, whether real or personal, may be made the subject of a trust, provided some policy of the law or statute does not prevent it. Trusts are most frequently created by a will; but they may be declared by word of mouth as regards personalty; while as to land, some writing is necessary. No particular words are necessary, but the intention of the party making the trust must be clear. Thus, in wills, a testator sometimes uses words which do not amount to an express trust, but speaks of his "wish and desire," or his "confidence" that the executor or trustee shall do certain things. These words are called in the law precatory trusts, but are enforced in the same way as more direct language, if no uncertainty exists as to the purposes or mode of carrying out the trust. But if a testator merely recommends an executor to "consider certain persons," "to be kind to them," or "to do justice to them," or "to make ample provision for them," etc.—such expressions are treated as too vague to be binding, and therefore the executor may disregard them, or use his own discretion. A trustee's is not a compulsory office, but gratuitous, and therefore he need not accept the office unless he pleases. But if he once accept, he is not at liberty afterward to renounce, unless the trust-deed contain a provision enabling him to do so, or the court of chancery for good reasons discharge him. A trustee cannot delegate the office to a third person, but continues personally bound to do his duty. Where there are several trustees appointed, the office is considered joint, so that if one dies, the survivors continue to exercise the office. As a general rule, all must join in doing any act; but if the trust is of a public nature, a majority may bind the minority. Each trustee is liable only for his own acts or defaults, and this is so even though, for form's sake, he join his co-trustees in signing a receipt, if he can show that he never received the money in point of fact. Nevertheless, when money lies in the hands of one trustee, the others ought not to be satisfied with his mere statement that the money has been invested by him, but should see that it is actually done. Another rule is, that a trustee is not allowed to make a gain of his office; and so jealous is an English court of this rule, that the trustees of a large estate are not even allowed to sport over the estate—at least so as thereby to keep any valuable right of that kind for their own pleasure. Hence, a trustee is personally liable if he trade with the trust funds, or buy shares in a joint-stock bank; for even though the trust-deed authorize this to be done, he will be liable to pay the debts of the trading concern, though far exceeding the amount of the trust funds. So, if a trustee is a solicitor, and does legal business for the estate, he will not be allowed to charge for his professional labors, but at most will be allowed only the costs out of pocket. It is seldom, therefore, that a trustee can get any benefit to himself from the trust estate, except in the rare case where the *cestui que trust* is dead without heirs, in which case the property will become the trustee's. This is, however, only so as to real estate; for if the trust estate consist of chattels, then, on the death of the *cestui que trust* without heirs or executors, the property goes to the crown, and not to the trustee. It is the duty of a trustee to keep the trust funds safe: and if they consist of moneys, then he ought to invest them in government stock, and not let the money lie unproductive. He is not entitled to lend the money on personal security, or in the shares of any private company; but he may invest in mortgages, unless he is forbidden by the deed or will. If there is, therefore, no power to invest in mortgages, the trustee must invest in three per cent consols, and a few other government securities. The trustees, as a general rule, must pay interest whether they invest the funds or not (if they have had time to invest) to the *cestui que trust*; and they must account for all the profits they make with the trust funds, whether rightly or wrongfully. If a trustee has grossly misconducted himself as to the trust funds, he will be charged 5 per cent interest, and sometimes with compound interest. A trustee is entitled to be indemnified for all the reasonable expenses or outlay attending the execution of the trust, but he must in general bear the loss of any mistake as to the law; but if there is any peculiar difficulty in carrying out the trust, he is entit-

led to take the opinion of, or even to throw the chief management upon, the court of chancery, as the only safe protection.

TRUST. In the United States within the last few years the term Trust has come to designate a form of commercial association between individuals or corporations engaged in manufacturing or producing the same commodity for the general purpose of regulating the amount of production, of establishing a uniform price, of diminishing the expense of competition, and of controlling the markets. The first important trade combination of this kind formed was the Standard Oil Trust (1881); this was followed in rapid succession by a Cotton-Seed Oil Trust, a Sugar Trust, a Tobacco Trust, a Lead Trust, and many others, until soon seventy-five or more of these Trusts sprang into existence. In the minor details of their plans and methods of operation these differed greatly; in more important features they also differed to some extent; but a typical plan, and that most generally adopted, may be described as follows: If any of the parties to the proposed transaction are not originally corporations their separate business concerns are severally incorporated; the stock of all the corporations is then handed over to trustees; these trustees issue in exchange for the stock thus deposited trust certificates; they also elect directors who have complete control of the affairs of the concerns associated in the Trust. The trust-certificates are transferable; dividends are issued *pro rata* according to the proportion of trust-certificates held by each party; the trustees are elected annually by the holders of certificates; the trustees, through the directors, possess almost unlimited power over the individual concerns—thus they may cause one concern to stop manufacturing altogether, or may limit the amount of its production; they may fix prices binding on all concerned; and they may regulate the manner of sales and the amount that may be put on the market at any given time. A somewhat similar method of organization has existed in England for many years, especially in mining operations, but its intention and operation have been less sweeping, and designed rather to facilitate mutual transactions than to destroy competition.

Very important questions connected with the subject of Trusts at once arose for the consideration both of legislatures and of courts. It is obvious that the main object sought by these associations is to prevent unlimited competition. The question at once occurs whether this object is so sought as to make the Trust a combination in restraint of trade so far as to become a proper subject for legal restriction or abolition. It is unquestioned that associations in restraint of trade are illegal if they constitute in fact a conspiracy against the public. The early English statutes on this subject were narrow, arbitrary, and quite ignored sound principles of political economy. Since these statutes have been rescinded the common law has more and more recognized the idea that a combination is not illegal which is only in a partial or limited sense in restraint of trade, and it has come to be held that a deliberate intent to injure the public must be shown to make such a combination illegal. Prof. Theodore W. Dwight in a careful article on the legality of Trusts (*Political Science Quarterly*, vol. 3), argues that such a combination is really a partnership, and that there is an undoubted right for individual producers to combine to regulate prices and diminish the expenses of unfair competition, provided that their union does not amount to a conspiracy to create a monopoly against the public welfare. He holds that a State cannot, by the mere assertion that such a combination is injurious, deprive those concerns of their constitutional right to combine, and that if state legislation so stigmatizes the Trusts the courts of highest resort will require direct proof that the agreement amounts to a conspiracy against the public welfare. Legislation by the United States Congress can, of course, affect the matter only when the element of foreign or of inter-State commerce is involved. The final appeal is to the provision of the United States Constitution that "no person shall be deprived of life, liberty, or property without due process of law." Those who hold that a Trust does form a conspiracy in restraint of trade, such as to make it the proper subject of legislation, argue that it tends to build up monopolies, to drive competitors out of business, to destroy fair competition, to increase the price of commodities unduly, to accumulate large fortunes in the hands of a few individuals and thus to build up an oligarchy, to corrupt legislation, and to throw large numbers of producing laborers out of employment. On the other hand, it is urged that Trusts will make cheaper production possible, will do away with multiplicity of officers and superintendents, will encourage invention, will prevent over-production, and—just as production by machinery has not only vastly increased the output of manufactures, but in the end has benefited those employed—so this higher form of organization will in the end tend to benefit all workers as well as the commercial public. Courts and legislatures, as well as popular opinion, have so far sustained the view that Trusts tend to monopoly, are a proper subject of legislation and are intended in the end to raise prices. Several states have passed laws bearing on the subject, and many important decisions have been made by the courts. Thus, in the case against the Chicago Gas Trust, the Supreme Court of Illinois laid down the following principle: "Whatever tends to prevent competition among those engaged in a public employment of business, impressed with a public character, is opposed to public policy, and, therefore unlawful. Whatever tends to create a monopoly is unlawful, as being contrary to public policy. . . . To create one corporation for the express purpose of enabling it to control all the corporations

engaged in a certain kind of business, and particularly a business of a public character, is not only opposed to the public policy of the State, but is in contravention of the spirit, if not the letter, of the Constitution."

The same principle has been maintained by other courts of last resort, and has been embodied in the legislation of several states. National legislation was adopted in 1890 on the subject. So great was the public interest in the topic that probably a dozen bills were before the two houses of Congress at that time; the bill which finally was accepted deals, of course, only with Trusts which attempt to control the manufacture and sale of articles that are the subject of inter-State commerce. It provides broadly "that every contract, combination in the form of Trusts or otherwise, or conspiracy in restraint of trade or commerce among the several States, or with foreign nations, is declared to be illegal," and that "every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons to monopolize any part of the trade or commerce among the several states or with foreign nations, shall be deemed guilty of a misdemeanor." Such an offense is made punishable by a fine of not more than \$5000 or imprisonment of not more than a year, or both. Furthermore, any person injured by such a combination may obtain exemplary damages to the amount of threefold the loss sustained. Any property owned by such a combination, which is in the course of transportation from one state to another, may be seized by and forfeited to the United States. It will be seen that, after all, under this Act, it is ultimately necessary for the courts to define what does and what does not constitute such a conspiracy in restraint of trade as the Act forbids. So that in the end the question really turns upon the point we have already mentioned, as to how far a particular Trust is a legitimate partnership and when it becomes an illegal conspiracy. A quite different and very important point against the principle of the Trust was brought forward in the Sugar Trust case in New York state. Suit was brought by the Attorney-General against one of the corporations concerned in the Trust for the forfeiting of its charter. The decision of the trial judge—fully confirmed by the general term of the Supreme Court, and finally by the Court of Appeals, the highest court of resort in the state—held that the charter was forfeited because of the relinquishing by the corporation in question of its corporate responsibilities; by the passing of its stock to a body of "trustees" unincorporated and not responsible to the state the corporation had, it was affirmed, renounced its own legal duties as defined by its charter. The court also held that it was clearly shown that the purpose of the Trust was to make money by avoiding competition, by controlling the product and regulating the price, and that this was a conspiracy against the public interest. The importance and bearing of the first principle laid down will at once be seen; it is quite apart from the question of what is in restraint of trade and is based on the proper responsibilities of chartered corporations to the state and the irresponsibility of the unincorporated Trust, which nevertheless assumes enormous arbitrary power while claiming to be beyond the reach of the state authority. The decision was immediately followed by applications for the appointment of receivers for several of the concerns connected with the Sugar Trust. The establishing of these principles in connection with Trusts would seem to be a fatal blow to their continued existence, at least in New York state, and it would also seem to be probable that the principle of corporate responsibility here declared will be reiterated by the courts of other states. Indeed, a decision in Louisiana had previously declared that the American Cotton-Oil Trust was illegal and incompetent to transact business within that state, on the ground that it was really an unincorporated joint-stock association, while at the same time it improperly assumed the powers, privileges, and name of a corporation. This is not exactly on the lines of the New York decision, but still it shows the same distrust of an anomalous body with enormous powers, which cannot properly be classified either as a corporation or as a true common-law trust, and if we refuse to follow the opinion of the Louisiana court in considering the Trust as an unincorporated joint stock association, its anomalous character is only made still clearer. It is, however, true that the provisions of some of our States in regard to the granting of charters to corporations are lamentably loose, and there are already indications that the Trusts may still continue to hold their own when organized under the laws of such states. Action of this kind has already been taken in the States of New Jersey and West Virginia, and there is a decided popular demand for the revision in those states of the laws governing the incorporation of mercantile enterprises. Many economists who do not admit the right or desirability of the absolute prohibition of Trusts by legislation, yet admit that the relations to the public of such vast combinations of capital are such that careful supervision and judicious restriction are demanded. The responsibility of these combinations of producers has been well described by one writer on the subject, who says that the Trust "is neither a corporation nor a well-defined common law trust; it avoids the checks and safeguards which a wise public policy has thrown around corporate acts; its articles of agreement are secret and jealously guarded even from the investor himself; no charter nor statements need be filed for public inspection; no reports need be made or published; it may carry on any business it desires; the principles of *ultra vires* acts do not check it; no limit is placed by statute on its capital stock; no law prevents an increase or decrease of its trust-certificates; no qualifications are prescribed for its trustees; no tax is laid on its charter or fran-

chises or capital stock ; no limit is placed by the public on the powers and discretion of its trustees ; no publicity is given to its acts. It may move from state to state ; it may evade taxation and defy the powers of courts ; it wields vast sums of money, secretly, instantaneously, and effectively to accomplish its ends."

TRUST, CHARITABLE, differs from a private trust in that the beneficiaries under the former are either not exactly specified, or are a specified class whose individual members are unascertained. The statute 43 Eliz. gave the chancellor jurisdiction over charitable trusts, which he regulated not as a chancery judge, but as the representative of the crown. The statute named lawful objects of charity. Among the general classes of charitable trusts may be distinguished as supported by the courts, such trusts as are created for the public benefit, e.g., a part; and for the same reason trusts for the creation, endowment, etc., of institutions of education and science. Other good charitable trusts are for the benefit of the Christian religion, for the relief of the poor, the diseased, etc. The English courts, in their desire to carry out the wishes of the donor, applied what is called the *cy pres* doctrine; i.e., when the donor's scheme could not be carried out they would construct another scheme as near the original one as possible. The *cy pres* doctrine does not obtain in this country, where the statute 43 Eliz. has not been re-enacted. In some states the whole system of charitable trusts has been repudiated, and such a trust can take effect only through a corporation.

TRUSTEE, a person who has the legal estate in property, real or personal, for the benefit of another who has the equitable estate. In its widest sense the word is applied to any person who has an interest or power affecting any kind of property for the benefit of another, so that executors, administrators, assignees, directors of corporations, etc., are to a certain extent trustees. The power of a trustee cannot be delegated unless authorized by the instrument creating the trust; and when one trustee dies, the trust, as a rule, devolves upon the survivor or survivors. Trusts are cognizable only in equity; at law the trustee is regarded as the owner of the property. A trustee cannot become the purchaser of the property if it be sold, or make profit out of its use, or speculate with it. A new trustee will be appointed by the court. The trustee is chargeable with the trust fund and its income, and also for such income as he might have derived from the property by proper management. Trustees must act jointly, and cannot act separately like executors.

TRUSTEE PROCESS, established by statute in Massachusetts and some other New England states, whereby an attaching creditor may reach the goods, property, or credits, of a debtor which are in the hands of a third party. The process is by original writ, and the trustees, after service and entry, may testify as to the property alleged to be that of the debtor. The process is the same as that known at common law and in the statutes of most states as garnishment and garnisheeing. See GARNISH.

TRUXILLO, or **TRUJILLO**, a t. of Spain, province of Cáceres, on the great highway from Madrid to Badajoz, and 80 m. n.e. of the latter place. There are several churches and convents here. Pop. '87, 10,773, who are engaged chiefly in agricultural work. Truxillo is the birthplace of Pizarro, who was also buried here in the church of Santa Maria de la Concepcion.

TRUXILLO, a t. of Peru, province of Libertad, near the sea-coast, about 300 m. n.n.w. of Callao. The port of Truxillo is Huanchaco, about 8 or 9 m. to the n.w., from which considerable quantities of rice and spices are exported. Pop. '89, about 11,000. Truxillo was founded in 1535 by Pizarro, who named it after his birthplace in Spain.

TRUXTUN, THOMAS, 1755-1822; b. N. Y.; was capt. of a privateer during the revolution. He was appointed capt. in the U. S. navy in 1795, and four years later, in command of the frigate *Constellation*, captured the French frigate *L'Insurgente*, which lost 29 killed and 41 wounded. The *Constellation* lost but 1 killed and 3 wounded. In 1800 the *Constellation* fought the French frigate *La Vengeance*, which was disabled, with a loss of 50 killed and 110 wounded. The *Constellation* lost 14 killed and 25 wounded. He was high sheriff of Philadelphia, 1816-19.

TRYGON. See STING RAY.

TRYON, WILLIAM, LL.D., 1725-88; b. Ireland; an officer in the British army. He was made lieutenant-governor of North Carolina in 1764; and governor on the death of Gov. Dobbs the next year. During his administration he put down the revolt of the so-called "regulators." He became governor of New York in 1771, and resigned in 1778. He was made a maj. gen in 1777. He made himself generally detested by his severity, and by the ravages committed during his expedition to Connecticut, where he burned Danbury and other towns.

TSARITSINE. See ZARITZIN.

TSARSKOË SE'LO (i.e., imperial town), a t. of Russia, in the province of St. Petersburg, and 15 m. s. of the city of that name. It is the royal residence and favorite resort of the imperial family. The carriage road from the capital to this town was constructed by the empress Catharine II., but the *route* now preferred is that of the railroad—the first laid down in Russia. The population is about 16,000.

TSCHAIKOWSKY, PETER ILJITSCH. Russian composer, born at Wotkinsk, in the district of Perm, Russia, Dec. 25, 1840. After studying law in St. Petersburg, he served in the ministry of justice, from 1859 on, until, yielding to his musical tastes, he resigned his office, and entered the recently established conservatory of Rubenstein. He completed his studies in 1866, and after gaining a prize medal for a cantata on Schiller's poem *An die Freude*, taught composition at the conservatory of Moscow until 1877, since which time he lived alternately in Italy, Switzerland and Russia, supported by his musical compositions and by an honorary pension from the czar. His most noteworthy works are: the operas *Wakula the Smith*; *The Maid of Orleans* (1881); *Mazeppa* (1882); *The Enchantress* (1887); *Piquedame* (1890); *Iolanthe* (1893); 6 symphonies, the most familiar of which is the so called *Pathétique*, 3 string quartets, 2 piano concertos, a violin concerto, sonatas, songs, etc. He died of cholera in St. Petersburg, Nov. 6, 1893.

TSCHIGORIN, MICHAEL IWANOVITCH. Russian chess-player, was born in Russia, Oct. 31, 1850. Long ago he was considered the chess champion of his native country, having beaten Schamoff, Alapin, and others. His first appearance in an international tournament was at Berlin, Germany, in 1881, when he tried for third and fourth prizes with the great master, Winawer, and astonished the chess world by his bold and brilliant play. In 1882, Tschigorin competed in the Vienna tournament, and although he failed to secure a prize, he won even games with Steinitz, Winawer, Blackburne, Zuckertort, and Mackenzie. In 1883, in London, he won fourth prize, having defeated Steinitz twice, in their personal encounter. The victory of St. Petersburg over the British Chess Club in their correspondence match, almost exclusively due to Tschigorin, was one of the greatest feats of chess. His match with Steinitz in Havana, Cuba, and his success in the Sixth American Congress, were also notable triumphs. He was beaten in England in 1895, and in St. Petersburg in 1896.

TSCHUDI, an ancient and noble family in the Swiss canton of Glarus, several members of which have distinguished themselves as authors, statesmen, and warriors. The two following are the most notable of the Tschudi: GILLES, or AEGIDIUS (b. 1505, died 1572), who was active on the Catholic side during the struggles of the reformation in Switzerland, and in consequence was forced for a time to leave his native canton (1562), but was permitted to return two years afterward. He was a prolific writer, not less than 166 works of his, in print or in MS., being known. The most valuable is a *History of Switzerland* (Basel, 2 vols., 1734). See Fuch's *Aegid. Tschudi's Leben und Schriften* (2 vols., St. Gall, 1805). To the same family belongs JOHANN JAKOB VON TSCHUDI, the eminent traveler and naturalist, b. at Glarus, July 25, 1818. After completing his studies at Leyden and Paris, he undertook (1838) a voyage round the world; but circumstances restricted his design to an investigation into the natural history and ethnography of Peru, where he remained for five years. On his return to Europe (1843), he wished to join the Arctic expedition of sir John Franklin, but was again prevented by circumstances from doing so, and finally settled in Austria. In 1868 he was made Swiss ambassador at Vienna. Tschudi's principal works are: *Peru: Reisekizzen aus den Jahren 1838-42* (2 vols., St. Gall, 1844); *Untersuchungen über die Fauna Peruana* (St. Gall, 1844-47, with 76 plates); the splendid work, *Antigüedades Peruanas* (Vien, 1851), executed in conjunction with don Mariano Eduardo de Rivera (Eng. trans. 1854); *Die Kechuasprache* (2 vols., Vien, 1853), containing a grammar and dictionary of the Peruvian language; and his *Reisen durch Südamerika* (5 vols., 1868). He d. 1889.

TSENG, MARQUIS, 1839-90, Chinese statesman, son of Tseng-Kwo-Fan, whom he accompanied in the war against the Taipings. In 1879 he was sent as ambassador to Russia, and was instrumental in bringing about an important treaty between the two countries. He was afterwards ambassador to Great Britain and to France, and between 1882 and 1884 conducted the negotiations in respect to the French rule over Tonquin. He was again ambassador at London and St. Petersburg, but returning to China in 1886, became grand secretary and president of the admiralty board.

TSETSE, *Glossinia morsitans*, a dipterous insect, which is a terrible pest of some parts of s. Africa. It is not much larger than the common house-fly, of a brown color, with four yellow bars across the abdomen. The wings project considerably beyond the abdomen. It is remarkably alert, at least during the heat of the day, and dexterously avoids any attempt to catch it with the hand. "Its peculiar buzz," Livingstone says, "can never be forgotten by the traveler whose means of locomotion are domestic animals." Its bite is almost certain death to the ox, horse, and dog. Livingstone, in one of his journeys, lost 43 fine oxen by it. Yet the bite is harmless to man, to the mule, the ass, and apparently to antelopes and the other wild animals of the country. The proboscis is adapted for piercing the skin, and the fly lives by sucking blood. At first no effect is perceived; but in a few days after an ox has been bitten by the tsetse, the eyes and nose begin to run, "the coat stares as if the animal were cold," a swelling appears under the jaw, and sometimes at the navel, emaciation and flaccidity of the muscles ensue, purging, sometimes staggering and madness, and finally death. On dissection, the cellular tissue under the skin is found to be injected with air, as if a quantity of soap-bubbles were scattered over it.—Livingstone's *Travels*.

TSONG-KHA-PA (orthographically, *tTsong kha pa**) is the great reformer of Lamaism

* The small letters prefixed to the initials of the Thibetan words in this article are not pronounced.

(q.v.), who, by his co-religionists, was considered to be an incarnation of the Bodhisat-twa Amitâbha, or, according to others, of Manjus'ri or Vajrapân'i, and after his death, was canonized by the Lamaist church. He was born in the middle of the 14th c. after Christ, in the country Amdo, in the place where now the celebrated convent ssKu'bum is situated. According to the legends of Thibet, he was conceived by his mother in a supernatural, immaculate manner: he was born with a white beard, and from the day of his birth expressed himself clearly and fluently, and discoursed profoundly on religious matters. In his third year he resolved to renounce the world. His mother accordingly cut off his long beautiful hair; but when it fell to the ground, a tree grew up—which is still in a court-yard of the convent of ssKu'bum, and was seen and described by the missionaries Huc and Gabet, in the year 1845. The leaves of this tree are covered with one or more letters of the sacred Thibetan alphabet. He now lived retired from the world, entirely devoting himself to prayer and contemplation. A learned Lama from the west, "with a long nose and bright eyes," came to settle about this time in Amdo, and seems to have become his teacher. After his death, Tsong-kha-pa set out to Thibet, and traveled until he came near Lhasa, where a god bade him halt. Here he studied assiduously the Buddhistic law, and soon became convinced of the necessity of reforming the actual worship and discipline of the Lamaist church. When his teaching attracted a great number of pupils, and when these, in order to distinguish themselves from the followers of the old system, who wore a red cap, assumed as their mark a yellow cap, the head of the Lamaist church resolved to stop the innovator in his dangerous course, and accordingly summoned him to his presence. But Tsong-kha-pa did not deign to obey his command. Thereupon, the great Lama repaired in person to the bold monk; but when he entered the cell of Tsong-kha-pa, his red cap fell off—and when he began to descant on the superiority of the old system, Tsong-kha-pa—seated and turning the beads of his rosary—without raising his eyes, cried out, "Miserable! I hear the groans of a creature whom thou murderest!" And, in fact, unmindful of the first commandment of the Buddhist law, the great Lama was busy crushing a louse which he had caught. Confused, he fell at the feet of Tsong-kha-pa; and from this moment no further resistance could be made to his reforms. Such is the legend; but independently of it, history tells us that the influence which Tsong-kha-pa exercised on the reform of Lamaism, though not miraculous, was very powerful, such as to reduce the wearers of the red cap to a small minority. His reputation having widely spread, thousands of pupils thronged round him to hear and to adopt his doctrine. In consequence, in 1407 or 1409, he founded the convent dGa' lDan; and when this could no longer contain the number of his adherents, two other convents, which together, it is said, are now peopled with 30,000 monks of the yellow cap. His works are numerous and voluminous; the most celebrated of them is the *Lam nim chhen po*, or "The great Step-road toward Perfection," consisting of three parts, viz., "the road of the little, middle, and great man." The sect which he founded, and which adopted the yellow cap, is called dGe lugss pa, or the sect of virtue; and the principal reforms which he introduced into the Lama religion as it then existed, were compulsory celibacy for the monks—the Lamas of the old doctrine being conditionally permitted to marry—prohibition of sorcery and necromancy—which were extensively practiced by the wearers of the red cap—and the institution, at fixed periods, of religious exercises and of common prayers, and, consequently, of regular meetings of the whole community. His greatest achievement, however, was the organization of the Lamaist hierarchy as it still exists. See LAMAISM. He died in 1419.

T-SQUARE, an instrument consisting of two arms, the stock and the blade, used for drawing parallel lines in carpentry, architecture, etc.

TSURUGA, a Japanese sea-port on the w. side of the main island, on Tsuruga bay; pop. '92, 12,000. It is connected with Osaka and Kioto by railroad, and with lake Biwa by canal. Its harbor is the best on the w. coast, and it has a large trade. The surrounding country is rich in tea, silk, rice, etc.

TSUSHIMA. A pair of islands which command the southern entrance to the sea of Japan, between parallels 34 and 35 of n. latitude. Area, 361 sq. m.; pop. '95, 32,135. The channel which divides the two islands varies in width from 16 yds. to many miles. The southern island, which is about 125 m. in circumference, contains many mountains and deep ravines, and the city of Fukuye. The northern island, which has a coast line of about 400 m., is noted for its beautiful bays, of which the chief is Waniura, 32 m. from Fusan, the chief port of Korea. The people are mostly fishermen.

TUAM, an inland market-t. and episcopal seat of Galway, Ireland, is situated on the Harrow, a branch of the Clare, 19 m. n.e. of Galway, with which it is connected by a branch from the Midland Great Western railway. The pop. in 1891 was 3012. It has been an archiepiscopal see since the 12th c., and continues to have this rank in the Roman Catholic church; but in 1839 the province was united in the Established church with the archbishopric of Armagh, of which Tuam is now a suffragan see.

TUARIKS. See BERBERS.

TUBA, a name given to the bass instruments of the Saxhorn family, also called Bombardons. They are supplied with valves, large masterpieces, and require loose

embouchure. Tubas are made in many keys, and as they are played from the notes as written they require no special transposition. Their introduction into the orchestra is due to Wagner, who obtained fine effects through them. Tuba, Tuba mirabilis, and Tuba major are names given to a high-pressure reed-stop of eight-foot-pitch on the organ.

TUBER, in botany, a subterranean stem, thickened by the approximation of the nodes and swelling of the internodes, with latent buds along its sides ready to produce new plants in the succeeding year. The cellular tissue is unusually developed, and in general a large quantity of amylaceous matter is accumulated, whence the economical value of tubers, as in the potato, the Jerusalem artichoke, and the arrow-root. Tubers are capable of being employed for the propagation of the plant, by division into portions, each containing an *eye* or bud, according to the usual mode of planting potatoes. Like bulbs and corms, they may be regarded as a store laid up for the plant itself, that it may spring with new vigor in a new year. Like them, also, and even in a greater degree, they are in many cases a provision for the use of man. The most valuable tubers are those already named, but many others are used in different parts of the world. See *OXALIDÆE*, *TROPÆOLUM*, etc.

TUBERCLE is a word that has been employed by pathologists of different epochs in very different senses. The older writers employed the term merely to express an external form; and everything was called a tubercle which manifested itself in the form of a small knot. Without entering into any discussion of the views of Laennec (who asserted that tubercle presented itself in the lungs under two different aspects—namely, as *tubercular infiltration* and *tubercular granulation*, and thus opposed the old knot-theory), of Lebert (who was the first accurately to describe the so-called “tubercle-corpuscles”), of Reinhardt (who, with many others, holds that tubercle is nothing more than one of the forms presented by inflammatory products when undergoing transformation, and that all tubercular matter is really inspissated pus), or of Rokitsansky, Van der Kolk, Williams, Walsh, Paget, and other eminent pathologists, we shall briefly give the theory of tubercle which Virchow adopts in his *Cellular Pathology*, and which is perhaps more generally adopted than any other. Virchow holds that tubercle is a granule or a knot, and that this knot constitutes a new formation, which from the time of its earliest development, is necessarily of a cellular nature, and like all other new formations, has its origin in connective tissue. When this new formation has reached a certain degree of development, it constitutes a minute knot; and if it is near the surface, it forms a little protuberance, its mass consisting of small nucleated cells. The great characteristic of this formation is its extreme richness in nuclei, of which, at a first glance, it seems entirely to consist. But upon isolating the constituents of the mass, either very small cells with a single nucleus are seen, or larger cells with twelve, twenty-four, or even more divided nuclei are observed, these nuclei being always small, and having a homogeneous and somewhat shining appearance. In its minute nuclei and very small cells, tubercle contrasts strongly with the large and comparatively gigantic corpuscles of some of the more highly organized forms of cancer. To use the expressive language of Virchow, “tubercle is always a pitiful production, from its very outset, miserable.”

Tubercle is usually described as occurring in two principal forms, the first being distinguished as the yellow, and the latter as the gray; the latter is also known from its ordinary size as the milary tubercle. The latter is the tubercle to which the above description of Virchow applies, the yellow being the same in a state of fatty degeneration or cheesy metamorphosis. In consumption, we often find large masses of softening tubercular matter in the lungs and elsewhere. These large masses are formed by the aggregation of smaller masses, which have coalesced as the deposit continued to increase. The intervening tissues at length suppurate, and thus soften and break down the tubercular matter, and lead to its expulsion; for a process of ulceration having been established into the surrounding tissues, the softened tubercle is brought up by coughing, and a cavity or *vomica* is formed at the spot previously occupied by the morbid deposit. It is a remarkable fact, and one of the greatest importance in the diagnosis of consumption, that tubercles, when they affect the lungs, are almost invariably deposited in the upper lobes. When it is stated that consumption is only one manifestation of scrofula (q.v.), and that tubercle is the essential element of scrofula, one sees that the importance of this subject cannot be overrated.

TUBERCULIN or **TUBERCULINE**, the name commonly given to the preparation used by Dr. Robert Koch (q.v.) in his treatment of tuberculosis, and also known as “lymph,” “paratoloid,” and “Kochine.” Such knowledge of this preparation as is possessed by physicians in general, is based upon the published statement made by Dr. Koch himself on Jan. 15, 1891. The essential portions of the statement are as follows:

“Before going into the remedy itself, I deem it necessary, for the better understanding of its mode of operation, to tell briefly the way by which I arrived at the discovery. If a healthy guinea-pig be inoculated with the pure cultivation of German kultur of tubercle bacilli, the wound caused by the inoculation mostly closes over with a sticky matter and appears in its early days to heal. Only after ten to fourteen days a hard nodule presents itself, which, soon breaking, forms an ulcerating sore which continues until the animal dies.

"Quite a different condition of things occurs when a guinea-pig already suffering from tuberculosis is inoculated. An animal successfully inoculated from four to six weeks before is best adapted for this purpose. In such an animal the small indentation assumes the same sticky covering at the beginning, but no nodule forms. On the contrary, on the day following or the second day after the inoculation, the place where the lymph is injected shows a strange change. It becomes hard and assumes a darker coloring, which is not confined to the inoculation spot, but spreads to the neighboring parts until it attains a diameter of from .05 to 1 centimetre. In a few days it becomes more and more manifest that the skin thus changed is necrotic, finally falling off, leaving a flat ulceration which usually heals rapidly and permanently without any cutting into the adjacent lymphatic glands.

"Thus the injected tubercular bacilli quite differently affect the skin of a healthy guinea-pig from one affected with tuberculosis. This effect is not exclusively produced with living tubercular bacilli, but is also observed with the dead bacilli, the result being the same whether, as I discovered by experiments at the outset, the bacilli are killed by a somewhat prolonged application of a low temperature or boiling heat or by means of certain chemicals. This peculiar fact I followed up in all directions, and this further result was obtained—that killed pure cultivations of tubercular bacilli, after being diluted with water, might be injected in great quantities under healthy guinea-pigs' skin without anything occurring beyond local suppuration.

"Tuberculous guinea-pigs, on the other hand, are killed by the injection of very small quantities of such diluted cultivations. In fact, within six to forty-eight hours, according to the strength of the dose, an injection which is not sufficient to produce the death of the animal may cause extended necrosis to the skin in the vicinity of the place of injection. If the dilution is still further diluted until it is scarcely visibly clouded, the animals inoculated remain alive, and a noticeable improvement in their condition soon supervenes. If the injections are continued at intervals of from one to two days, the ulcerating inoculation wound becomes smaller and finally scars over, which otherwise it never does; the size of the swollen lymphatic glands is reduced, the body becomes better nourished, and the morbid process ceases, unless it has gone too far, in which case the animal perishes from exhaustion. By this means the basis of a curative process against tuberculosis was established.

"Against the practical application of such dilutions of dead tubercle bacilli there presents itself the fact that the tubercle bacilli are not absorbed at the inoculation points, nor do they disappear in another way, but for a long time remain unchanged and engender greater or smaller suppurative foci. Anything, therefore, intended to exercise a healing effect on the tuberculous process must be a soluble substance which would be lixiviated to a certain extent by the fluids of the body floating around the tubercle bacilli, and be transferred in a fairly rapid manner to the juices of the body, while the substance producing suppuration apparently remains behind in the tubercular bacilli, or dissolves but very slowly. The only important point was, therefore, to induce outside the body the process going on inside, if possible, and to extract from the tubercular bacilli alone the curative substance.

"This demanded time and toil, until I finally succeeded with the aid of a 40 to 50 per cent. solution of glycerine in obtaining an effective substance from the tubercular bacilli. With the fluid so obtained I made further experiments on animals, and finally on human beings. These fluids were given to other physicians to enable them to repeat the experiments. The remedy which is used in the new treatment consists of a glycerine extract, derived from the pure cultivation of tubercle bacilli. Into the simple extract there naturally passes from the tubercular bacilli, besides the effective substance, all the other matter soluble in 50 per cent. glycerine. Consequently it contains a certain quantity of mineral salts, coloring substances, and other unknown extractive matter. Some of these substances can be removed from it tolerably easily. The effective substance is insoluble in absolute alcohol. It can be precipitated by it, though not, indeed, in a pure condition, but still combined with the other extractive matter. It is likewise insoluble in alcohol. The coloring matter may also be removed, rendering it possible to obtain from the extract a colorless, dry substance containing the effective principle in a much more concentrated form than the original glycerine solutions. For application in practice this purification of the glycerine extract offers no advantage, because the substances so eliminated are unessential for the human organism. The process of purification would make the cost of the remedy unnecessarily high.

"Regarding the constitution of the more effective substances, only surmises may, for the present, be expressed. It appears to me to be derivative from albuminous bodies, having a close affinity to them. It does not belong to the group of so-called 'ox-albumens, because it bears high temperatures, and in the deslyser goes easily and quickly through the membrane. The proportion of the substance in the extract to all appearance is very small. It is estimated at a fraction of one per cent. which, if correct, we should have to do with a matter whose effect upon organisms attacked with tuberculosis goes far beyond what is known to us of the strongest drugs.

"Regarding the manner in which the specific action of the remedy on tuberculous issue is to be represented, various hypotheses may naturally be put forward. Without wishing to affirm that my view affords the best explanation, I represent the process

myself in the following manner : The tubercle bacilli produced when growing in living tissues, the same as in artificial cultivations, contain certain substances which variously and notably unfavorably influence living elements in their vicinity. Among these is a substance which, in a certain degree of concentration, kills or so alters living protoplasm that it passes into a condition that Weigert describes as coagulation necrosis. In tissue thus become necrotic the bacillus finds such unfavorable conditions of nourishment that it can grow no more, and sometimes dies. This explains the remarkable phenomenon that in organs newly attacked with tuberculosis, for instance in guinea-pigs' spleen and liver, which then are covered with gray nodules, numbers of bacilli are found, whereas they are rare or wholly absent when the enormously enlarged spleen consists almost entirely of whitish substance in a condition of coagulation necrosis such as is often found in cases of natural death in tuberculous guinea-pigs.

"The single bacillus cannot, therefore, induce necrosis at a great distance, for as soon as necrosis attains a certain extension the growth of the bacillus subsides, and therewith the production of the necrotizing substance. A kind of reciprocal compensation thus occurs, causing the vegetation of isolated bacilli to remain so extraordinarily restricted, as, for instance, in lupus and scrofulous glands. In such cases the necrosis generally extends only to a part of the cells, which then, with further growth, assumes the peculiar form of giant cells. Thus, in this interpretation, follow first the explanation Weigert gives of the production of giant cells. If now one increased artificially in the vicinity of the bacillus the amount of necrotizing substance in the tissue, the necrosis would spread a greater distance. The conditions of nourishment for the bacillus would thereby become more unfavorable than usual. In the first place, the tissue which had become necrotic over a larger extent would decay and detach itself, and where such were possible would carry off the inclosed bacilli and eject them outwardly, so far disturbing their vegetation that they would much more speedily be killed than under ordinary circumstances. The remedy contains a certain quantity of necrotizing substance, a correspondingly large dose of which injures certain tissue elements even in a healthy person, and perhaps the white blood corpuscles or adjacent cells, thereby producing fever and a complication of symptoms, whereas, with tuberculous patients, a much smaller quantity suffices to induce at certain places—namely, where tubercle bacilli are vegetating, and have already impregnated the adjacent region with the same necrotizing matter, more or less extensive necrosis of the cells, with the phenomena in the whole organism which result from and are connected with it. Thus, for the present, at least, it is impossible to explain the specific influence which the remedy, in accurately defined doses, exercises upon tuberculous tissue and the possibility of increasing the doses with such remarkable rapidity, and the remedial effects which have unquestionably been produced under not too favorable circumstances."

As to the practical results of Prof. Koch's discovery, the reader is referred to the article CONSUMPTION.

TUBEROSE, *Polianthes*, a genus of plants of the natural order *Liliaceæ*, having a funnel-shaped perianth, with 6-parted limb, stamens inserted in the tube of the corolla, a superior capsule, and flat seeds. The COMMON TUBEROSE, (*P. tuberosa*) has rounded bulbous root; a cylindrical, upright, unbranched stem, 3 or 4 ft. high; both root-leaves and stem-leaves sword-shaped, and very acute; flowers spiked and somewhat aggregated, large, pure white, the tube a little curved. The plant grows well in the s. of Europe, but only bears the open air in more northern climates during summer. The roots are a considerable article of export from the s. to the n. of Europe; the plant being in high esteem for the beauty and fragrance of its flowers, the odor of which is most powerful after sunset, and has been known to cause headache and asphyxia in a room. The fading flowers emit, in certain states of the atmosphere, an electric light and sparks. The flowers yield an essential oil, which is used by perfumers. The native country of the tuberose is not quite certain. Another species, *P. gracilis*, is found in Brazil, and has been supposed to be the original of the cultivated plant. The tuberose has been known in Europe for about three centuries.

TUBE-WELL is an American contrivance, introduced into England in 1867, having for its object the obtaining of a small supply of water in a very short space of time by the application of a limited amount of manual power.

During a trial of this apparatus in the cricket-ground at Old Trafford, Manchester, the tube was sunk to a depth of 10 ft. in 22 minutes, and water had been reached in even less than that time. Such a form of well, it is considered, will be free from the liability of received dirty surface-water; and no accident is possible from foul air or from the falling in of the sides. A well 15 ft. deep was sunk in one hour in the botanical gardens at Manchester, and excellent water reached. Another was sunk in the grounds of St. Cloud in half an hour, and pumped up water at the rate of 20 liters (18 quarts) per minute. The inventor accompanied the American federal army, and enabled the troops frequently to obtain water by the aid of these pumps. On one occasion, to try the capabilities of the tube, he sank one to a depth of 150 ft. at Ithaca, in New York state. Tube-wells were sent out with the British military force to Abyssinia.

TUBICOLÆ, an order of *annelida* (q.v.).

TUBICOLIDÆ, or **GASTROCHÆNIDÆ**, a family of lamellibranchiate mollusks, remarkable for the calcareous tube into which the proper shell is cemented. Examples are noticed in the articles **ASPERGILLUM**, **CLAVAGELLA**, and **GASTROCHÆNA**.

TÜBINGEN, an important t. of Württemberg, in the circle of the Black forest, 20 m. s.w. of Stuttgart, is situated on the Neckar, at the influx of the Steinlach, in one of the most beautiful and fertile districts of the Oberland. Tübingen is an old place, irregularly built, with steep and narrow streets in the main; but the suburbs, especially round about the new university, are very pleasant. Westward from Tübingen is the Schloss, built by duke Ulrich in 1535. Book-printing, book-selling, working in copper, weaving, bleaching, and the manufacture of surgical and physical instruments, are important. Tübingen has three Protestant churches and one Catholic church, a Bible society, a chamber of manufactures, and various educational and benevolent institutions. But it owes its celebrity wholly to its university. Founded in 1477 by Eberhard im Bart, afterward first duke of Württemberg, the university of Tübingen soon became a distinguished seat of learning, enjoyed for a time the presence of Reuchlin (q.v.), and Melancthon (q.v.), and continued to flourish long after the reformation had firmly established itself. The thirty years' war, however, fatally checked its prosperity; and it was not till the early part of the present century that it began to reacquire a reputation. Under Baur (q.v.) it became celebrated as a school of historico-philosophical theology, known as the "Tübingen school," the influence of which on the development of religious thought has been very great, and is likely to prove permanent. The university has six faculties, and in 1895 had 81 professors and teachers, a library of 300,000 vols. (located in duke Ulrich's Schloss), and was attended by 1262 students. Connected with it are an anatomical and physical institute, a botanical garden, a chemical laboratory, a collection of zoology and comparative anatomy, one of minerals, one of coins and antiquities, fencing, gymnastic, and swimming-schools, etc. Pop. of Tübingen '95, 13,989.

TUBULAR BRIDGE. The advantages of the tube for carrying a level roadway across a large span were brought into general notice by Robert Stephenson, engineer of the Chester and Holyhead railway, in the construction of the bridges to carry that railway across the Menai strait. It was required by the admiralty that these bridges, called the Britannia and Conway, should be constructed, so as not to interfere with the navigation, with clear spans of upward of 400 feet. The largest arched spans that had been previously constructed did not exceed 240 ft.; and suspension-bridges not being suitable for heavy and rapid railway traffic, the engineer was obliged to devise some new form, which should conform to the stipulated conditions. Mr. Stephenson having decided upon the tubular form, proceeded, in conjunction with Mr. Fairbairn, to make an elaborate series of experiments on tubes, to determine the most suitable arrangement of the wrought iron of which they were to be composed. They found that a rectangular tube, of which the top and bottom were cellular, gave the greatest strength with the least material. The span of the Conway tube was 400 ft.; while the tubular part of the Britannia bridge consisted of two spans of 460 ft., and two of 230 ft. each in the clear. The foundation-stones of these bridges were laid in 1846 and 1847 respectively. Since that time, many important bridges have been constructed on this principle. One of the largest and most important is the Victoria bridge, over the St. Lawrence, near Montreal, in Canada. The total length of this bridge is 9,144 ft., or nearly 1½ miles. It is built in 24 spans, of from 242 to 247 ft. each, and one of 330 feet. The greatest depth of the river is 22 ft., and the average rate of the current 7 m. per hour. The bottom of the center tube is 60 ft., and at the abutments the bottom is 36 ft. above the water, so that there is a rise of 1 in 130 in the roadway toward the center of the bridge. An idea of the stupendous nature of this structure may be formed from the facts that 9,000 tons of iron were used in the tubes, and 1½ millions of rivets; also that the total surface of iron was 32 acres; and as it received 4 coats of paint, the total painting was 128 acres. There were 2,713,095 cubic ft. of masonry, and 2,280,000 cubic ft. of timber in the temporary works, dams, etc.; and upward of 3,000 men were employed. The first stone was laid July 20, 1854, and the first train passed over on Dec. 17, 1859. The total cost was £7,000,000, or about \$285 per lineal foot. Notwithstanding the success of these structures, the tubular form has been to a great extent superseded in recent structures by the lattice or trellis. This has arisen from the great saving in the material of which the sides are composed, effected by the open lattice-work, as compared with the solid plated side of the tube. By the lattice arrangement, the material is more capable of arrangement in the direct line of the strains; and the section of the lattice-bars can be accommodated to the strain, so that there shall be no material which is not carrying its due share of the load. The first large structure of this nature was the Boyne viaduct, on the Dublin and Belfast Junction railway. Mr. Barton, the designer of this structure, in a notice of this bridge, gives the relative weight in the sides of the different forms of girders, neglecting the weights of the top and bottom, which are the same in every case, as follows: ordinary tubular girder, 100; girder as adopted in great exhibition, 117; Warren's girder (angle of bars 60°), 73; lattice girder (angle of bars 4.5°), 67. Besides this considerable saving in material, the facilities this form gives for repairs and painting, and the exposure of a smaller surface to the wind, are additional reasons for its preference. See BRIDGE.

TUCKAHOE' is the Indian name of a curious vegetable product of underground growth, somewhat resembling the truffle, but not to be classed with the *fungi*. Its composition is almost entirely of *pectine*, and in southern states it is used as an article of

diet in sickness to take the place of arrowroot. It is found in balls varying from an inch to 8 in. in diameter, and is entirely devoid of cellular structure. Its origin and method of growth are unknown.

TUCKAHOE, a magisterial dist., Henrico co., Va. Pop. '90, 4875.

TUCKER, a co. in n.e. West Virginia; 500 sq.m.; pop. '90, 6459, chiefly of American birth, with colored. Co. seat, Parsons.

TUCKER, ABRAHAM, an English author whose reputation falls far short of his merits, was b. in London, Sept. 2, 1705, studied at Merton college, Oxford, and in 1726 became a member of the inner temple. Tucker, who was of good family, inherited a large fortune from his father; and in 1727 purchased Betchworth castle and estate, near Dorking, in Surrey. During his life he enjoyed all the ease, comfort, and quiet happiness of an English gentleman of the 18th century. It is but fair to state that his frank, generous, virtuous nature, and his sincere love of intellectual pursuits, prevented him from misusing the advantages of his position. In 1736 he married Dorothy, daughter of Edward Barker, esq.—afterward cursive baron of the exchequer, and receiver of the tenths—by whom he had three daughters, the youngest of whom, Dorothy Maria, became in 1763 the wife of sir Henry Paulet St. John, bart. Tucker's affectionate regard for his family is a beautiful feature in his character. He was, too, all his life, an industrious student, a man of keen observation, of much innocent and cheerful humor, and withal, of methodical business habits. His death occurred Nov. 20, 1774. Tucker's great work is entitled *The Light of Nature Pursued*. It was begun in 1756, and formed the chief literary occupation of the rest of his life. It extended to seven volumes, only three of which were published in the author's lifetime, under the pseudonym of Edward Search, esq. It is not a regular systematic treatise, but consists of a series of disquisitions on metaphysics, theology, morals, etc., all of which exhibit a remarkable originality, simplicity of humor, ingenuity of illustration, and solidity of understanding.

TUCKER, JOSIAH, D.D., 1711-99; b. Wales; graduate of St. John's college, Oxford, rector of St. Stephen's, Bristol; prebend, 1755; dean of Gloucester, 1758 till his death. He was a thorough student, and careful writer on political economy and subjects pertaining to religion, and published several pamphlets in the beginning of the contest between the English government and its American colonies in favor of the colonists.

TUCKER, NATHANIEL BEVERLEY, 1784-1851; b. Va.; educated at William and Mary college; studied law, and in 1815 began practice in Missouri. In 1834 he was appointed a professor in William and Mary college, and held the position until his death. He published treatises on *Pleading* and on *Constitutional Law*, and novels, of which *The Partisan Leader*, reprinted in 1861, has some historical interest, and has been thought to foreshadow dimly the war of secession.

TUCKER, SAINT GEORGE, LL.D., 1752-1828; b. Bermuda; educated at William and Mary college, and called to the bar. He took part in an expedition against Bermuda in 1777, and was dangerously wounded at Yorktown, where he commanded a regiment. He was afterward a member of the Virginia legislature, a professor at William and Mary college, and for many years a judge in Virginia. Among his publications were an edition of Blackstone's *Commentaries*; and *A Dissertation on Slavery* (1796).

TUCKER, SAMUEL, 1747-1833; b. Mass.; made capt. in the American navy in 1777. The next year he commanded the frigate *Boston*, which took over John Adams, recently appointed minister to France. After the capture of several prizes he took part in the defense of Charleston, S. C., at whose capture he was made prisoner in 1780. Exchanged the next year he commanded the *Thorn*, making many prizes. He afterward removed to Maine, and served in the legislature.

TUCKER, WILLIAM JEWETT, D.D., b. Griswold, Conn., 1839; graduated at Dartmouth coll. 1861, and at Andover theol. sem., 1866; was ordained, 1867, and assumed the charge of the Franklin St. (Cong.) church, Manchester, N. H., where he remained till 1875. He was pastor of Madison Square (Pres.) church, 1875-80; was elected Bartlet prof. of sacred rhetoric and pastoral theology, at Andover sem., 1880. He was one of the founders of the *Andover Review*.

TUCKERMAN, HENRY THEODORE; 1813-71, b. Boston; educated in the public school. Among his works are *The Italian Sketch Book* (1835); *Isabel; or Sicily, a Pilgrimage* (1839); *Rambles and Reveries* (1841); *Artist Life* (1847); *Characteristics of Literature* (1849); *The Optimist* (1850); *A Memorial of Horatio Greenough* (1853); *The Rebellion* (1861); *America and her Commentators* (1864); *The Criterion* (1866); *Maga: Papers about Paris* (1867); *Book of the Artists* (1868). He was also a frequent contributor to periodical literature. He lived in New York city after 1845.

TUCKERMAN, JOSEPH, D.D., 1778-1840; b. Boston; graduated at Harvard college, 1798; studied theology, and became a Unitarian pastor in Chelsea. He is best known as one of the founders of the first sailors' aid societies in the country, and from his connection with other benevolent societies here and in England. He wrote *Principles and Results of the Ministry at Large*, and other religious pamphlets.

TUCSON, city and co. seat of Pima co., Ariz.; on the Santa Cruz river, and the Southern Pacific railroad; 250 miles e. of Yuma. It is the seat of the university of Arizona, and has a high school, the institute of St. Joseph, public and university libraries, convent, hospital, national banks, daily and weekly newspapers, large co.

court-house, and numerous plants for the reduction of gold, silver, and copper ores. It is the center of a large mining, stock-raising, and general farming region, and is an important market for the precious metals, wool, hides, general commodities, and special supplies for the Indians and the U. S. army. Tucson occupies the site of an ancient Indian pueblo or town; was settled by Jesuit missionaries in 1560; and was the capital of Arizona territory in 1867-77. It is a quaint and interesting city, having narrow streets and many old adobe buildings, and at the U. S. signal station is 2404 feet above sea-level. Pop. '90, 5150.

TUCUM' AND TUCUMA' PALMS. See **ASTROCARYUM**.

TUCUMAN', a prov. in n. Argentine republic, having on the e. the Gran Chaco, on the n. Salta, on the w. Catamarca, on the s. Santiago; 13,500 sq. m.; pop. '95, 215,693. It contains gold, copper, silver, and lead. Sugar planting is the most important industry. Salt, from mines and lakes, cattle and mules are exported. Large crops of cereals are raised. It has some manufactures. Capital, Tucuman.

TUCUMAN', SAN MIGUEL DE, a t. of the Argentine republic, capital of the province of the same name, in lat. 26° 50' s.; is embosomed in splendid plantations of orange-trees. Tucuman has a cathedral, college, library, hospital, convents, a Jesuits' college, and many handsome houses. It carries on manufactures of sugar, leather and brandy, has an active trade in oxen and mules; and the females are noted throughout the confederation for their skill in making saddle-cloths. Pop. '96, 34,300. Here, in 1816, a congress of deputies from the various Argentine provinces met, and proclaimed their independence of Spain.

TUDELA (the *Tutela* of the Romans), a town of Spain, province of Navarra, on the left bank of the Ebro, which is here crossed by a bridge of 17 arches; 47 m. by railway n.w. of Saragossa. It is a dull, gloomy-looking place, with narrow streets and lofty houses; but the promenades along the river are very fine, as also are the *plazas*, or public squares. Tudela is the seat of a bishop, has a Gothic cathedral, a medical college, and manufactures of coarse woollen cloths, soap, earthenware, etc., and carries on an active trade in the products of the district. Pop. 8,900.

TUDOR, the surname of a family of Welsh extraction, which occupied the throne of England from 1485 to 1603. In the Welsh language Tudor is the equivalent of Theodore. Owen Tudor, the first of the race known in history, has had a pedigree assigned him from the ancient Welsh princes, which rests on no very solid evidence. In fact little is known of his origin, except that his father had to quit Wales on a charge of murder, and was outlawed. He seems himself to have been at one time a brewer at Beaumaris, in Anglesey; and he was afterward a retainer in the suite of the bishop of Bangor, and fought at Agincourt. His dancing at some court pageant is said to have first ingratiated him with Catharine of Valois, widow of Henry V., who appointed him to the office of clerk of the household, and before long entered either into an illicit connection or a private marriage with him. The indignation of the public at this step obliged the queen to take refuge in a convent at Bermondsey, where she died; and Tudor was sent to Newgate, but succeeded in escaping, and obtaining two audiences of the young king, Henry VI., who afforded him protection, and conferred on him the lieutenancy of Denbigh. Two sons had been born to him by the queen. On the elder, Edmond, the king bestowed the earldom of Richmond; and on the younger, Jasper, the earldom of Pembroke. The earl of Richmond married Margaret, daughter and heiress of John Beaufort, earl of Somerset, whose father was an illegitimate son of John of Gaunt by Katherine Swynford. The sole issue of Richmond and the heiress of Somerset, Henry, duke of Richmond, invited from abroad to deliver England from Richard III., ascended the throne after Richard's death at Bosworth as Henry VII. The partisans of the house of Lancaster supported him on the extinction of the lawful descendants of John of Gaunt; and by his marriage with Elizabeth, eldest daughter of Edward IV., and representative of the house of York, he was considered to have united the factions of the white and red rose. Five sovereigns of the house of Tudor successively occupied the throne—viz., Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth—for an account of whom see separate articles. From Elizabeth, the last of the line, the crown passed to James VI. of Scotland, of the house of Stuart, in virtue of his descent from Margaret Tudor, daughter of Henry VII., and queen of the Scottish James IV. Strength of will was the prominent characteristic of the sovereigns of the house of Tudor; their rule, generally prosperous, was far more arbitrary and despotic than that of the Plantagenets. Parliament was in many cases but the exponent of the royal will, and taxes were frequently exacted, and penal statutes dispensed with, by the prerogative alone. The condition of England under the Tudors differed from despotic monarchies chiefly in the important respect that the sovereign had no standing army. The Tudor monarchs exercised a remarkable influence on ecclesiastical affairs; it was under their rule that the reformation took place, and the Anglican church was developed.

TUDOR, WILLIAM, 1750-1819; b. Boston, Mass.; graduated at Harvard, 1769; studied law with John Adams, and began practice in 1772. He became a col. and judge advocate general in the revolutionary army. After the war he was member of the legislature

and secretary of state in Massachusetts, was vice-president of the state division of the Cincinnati, and one of the founders of the Massachusetts Historical Society.

TUDOR, WILLIAM, 1779-1830 ; b. Boston ; graduated at Harvard in 1796. After a tour in Europe he founded the Anthology club, and contributed to its journal, the *Monthly Anthology*. In 1815 he founded the *North American Review*, writing most of the first four volumes. He was appointed consul at Lima in 1823, and *chargé d'affaires* in Brazil in 1827. He published *Letters on the Eastern States* (1820); *Life of James Otis* (1823), and other works. He was the originator of Bunker Hill monument.

TUDOR STYLE, in architecture, a rather indefinite term applied to the late perpendicular, and the transition from that to Elizabethan.

TUESDAY, the third day of the week, is so called from *Tuesday*, the day of Tiw or Tiu, the old Saxon name for the god of war. See **TYR**. The day bears a corresponding name in the other Germanic dialects.

TUFF, or **TUFA**, a rock formed from the ash or powder ejected from a volcano, mixed with the lapilli, or small fragments of lava. It may be arranged under the air, and remain quite loose, or be cemented by the percolation of water charged with mineral matter, by pressure or other cause. Sometimes the materials are arranged under water, and then the tuff contains organic remains, like other aqueous rocks.

TUFT-HUNTER. An undergraduate nobleman at Oxford has, until recently, been distinguished by a gold tuft or tassel worn on a black velvet cap. Hence the name *tuft-hunter* has been given in England to one who seeks the society of the nobility.

TUFTS, COTTON, 1734-1815 ; b. Medford, Mass. ; graduate of Harvard university, 1749 ; studied medicine and settled in Weymouth, Mass. He was one of the founders of the Massachusetts medical society ; its president, 1787-95 ; also one of the original members of the academy of arts and sciences. He made a vigorous appeal to the patriotism of his fellow-citizens in his instructions relative to the stamp act, 1765. He was representative to the general court, member of the governor's council, state senator, and delegate to the convention which ratified the U. S. constitution. He married a daughter of Col. John Quincy, aunt of the wife of President John Adams.

TUFTS COLLEGE, Medford, Mass., founded by the Universalists and first opened to students in 1855. Its endowment, a part of which is in real estate that for the present is unproductive, is estimated at \$1,800,000. It has an annual income of \$115,000. It has 14 excellent buildings, standing upon a tract of college land one hundred acres in extent. It has well appointed chemical, physical, and natural history laboratories, and an admirable cabinet of minerals, but as yet no considerable art collection. The library contains 35,000 vols. and 7000 pamphlets. The college has five departments—1. the college proper ; 2. department of engineering ; 3. the divinity school ; 4. medical school ; 5. Bromfield-Pearson school. The divinity school has five professors, one instructor, and four lecturers. The course of instruction does not differ essentially from that of other New England colleges of the first rank. Number of professors and instructors (1897), 85 ; of students, 500. Elmer H. Capen, D.D., president.

TUILERIES, PALACE AND GARDENS OF THE, were situated in the middle of Paris, on the right bank of the Seine, with Rue de Rivoli running along their n. side, and Quai des Tuileries to the south. Here, in 1342, a certain Pierre des Essarts possessed a pleasure house, called the *Hôtel des Tuileries*, on account of its being built in a locality outside the city where there were several tile-works (*tuileries*). Francis I. bought this property from the Sieur de Villeroy, as a present to his mother, the duchess of Angoulême. It was afterward chosen by Catharine de' Medici as the site of a new palace instead of that of Tournelles, and the building was begun in 1566. Originally, the palace consisted of only the square structure in the middle ; but was greatly enlarged by Henry IV., Louis XIII. and XIV., Napoleon I. ; and received still further improvements at the hands of the emperor, Napoleon III. Louis XIII. was the first sovereign who resided at the Tuileries. Louis XIV. only stayed there for a short time, and then established himself at St. Germain ; Louis XV. and XVI. lived at Versailles. In 1793 the national convention held its sittings in the Tuileries ; and Bonaparte chose it for his official residence. It was occupied by Louis Philippe, was the imperial residence of Napoleon III., and was burned by the commune in 1871. The side wings have been restored.

TUKE, DANIEL HACK, b. York, England, in 1827 ; visiting physician to the York retreat for the insane, subsequently medical practitioner at Falmouth. He has written many essays on the treatment of insanity for scientific periodicals. He wrote a *Prize Essay on the Progressive Changes which have taken place, since the time of Pinel, in the Moral Management of the Insane* (1854) ; *The Asylums of Holland, their Past and Present Condition* (1854) ; *On the Canon of the New Testament* (1860) ; *Insanity in Ancient and Modern Life* (1878) ; *A Dictionary of Psychological Medicine* (1892). He d. 1895.

TUKE, WILLIAM, 1732-1822, b. England ; a Quaker in religion, and noted for his benevolence. In 1792 he founded the York retreat for the insane, the first English asylum where patients were treated like unfortunates rather than as brutes. His *Biography* was published in 1856 by Dr. Daniel H. Tuke, his great-grandson.

TULA. See **TOULA**.

TULANE, PAUL, b. Princeton, N. J., in 1801; received a common school education; removed early in life to New Orleans, where he engaged in business and acquired great wealth. He retired from business, 1857, and returned to Princeton. In 1882 he gave to the city of New Orleans \$2,000,000 worth of real estate for the erection and endowment of a college for the education of the young white men of the city. He died at Princeton, 1887.

TULANE UNIVERSITY, an institution for higher education in New Orleans, La., formerly called the university of Louisiana. It has departments of law, arts and sciences, technology, and a university department of philosophy and sciences. With it is connected the H. Sophie Newcomb Memorial college for women. It is non-sectarian. In 1896 it had 952 students, 72 members in its faculties, and its president, in 1897, was William P. Johnston.

TULARE, a co. in central California, 5592 sq. m.; pop. '90, 24,574, chiefly of American birth, 524 colored. Co. seat, Visalia.

TULIP, *Tulipa*, a genus of plants of the natural order *liliaceæ*, having an inferior bell-shaped perianth, of six distinct segments, without nectaries; a sessile three-lobed stigma, a three-cornered capsule, and flat seeds. The bulb is fleshy, and covered with a brown skin. About thirty species are known, mostly natives of the warmer parts of Asia. The name tulip is supposed to be derived from the Persian name *thouleben*, which also signifies a turban. The most famous of all florists' flowers is the GARDEN tulip (*T. gesneriana*), which is from 18 in. to 3 ft. high, with a smooth stem, bearing one erect, large flower; the leaves ovate-lanceolate, glaucous, and smooth. The tulip is a native of the Levant; it was brought from Constantinople to Augsburg by Conrad Gesner, in 1559, and was rapidly diffused throughout all parts of Europe. The varieties in cultivation are innumerable. The tulip mania of the 17th c. in Holland is noticed in the article FLORISTS' FLOWERS. The tulip is still most sedulously cultivated in Holland, especially at Haarlem, from which bulbs are largely exported. It is prized merely for the size and beauty of its flowers; its smell being rather unpleasant. Great attention is paid to the cultivation of tulips, not only in the gardens of the wealthy, but often in those of the humbler inhabitants of small towns and villages, in which beautiful beds of tulips may often be seen. Tulips succeed best in a light, dry, and somewhat sandy soil. Bulbs are planted in the end of October, or beginning of November, and the flowers are produced early in summer. Beds of choice tulips are protected in spring by hoops and mats; and in the flowering season an awning of thin canvas is spread over them, which greatly prolongs the duration of their beauty, as they are soon spoiled by exposure to strong sunshine. Tulips are propagated by offset bulbs, and new varieties are raised from seed.—Another species of tulip, cultivated in gardens is the SWEET-SCENTED tulip, or VAN THOL tulip (*T. suaveolens*), which has a short, hairy stem, and yellow or red flowers, inferior to those of the common garden tulip in beauty, but prized for their fragrance, and for appearing more early in the season. It is often cultivated in pots in windows. It is a native of the s. of Europe. The WILD tulip (*T. sylvestris*), a native of many parts of Europe and Asia, is admitted into the British flora, but is a very doubtful native of Britain. It is common in the woods and vineyards of Germany and the s. of Europe. It has a slender stem, narrow lanceolate leaves, and a somewhat drooping, fragrant, yellow flower. It develops offset bulbs at the end of fibres thrown out from the root, at some distance from the parent plant. Its bulbs are eaten in Siberia, although bitterness and acidity characterize the bulbs of this genus.

TULIP MANIA. See FLORISTS' FLOWERS.

TULIP TREE, *Liriodendron tulipifera*, a beautiful tree of the natural order *magnoliaceæ*, a native of the United States of North America, having a stem sometimes 100 to 140 ft. high, and 3 ft. thick, with a grayish-brown cracked bark, and many gnarled and easily broken branches. The leaves are roundish, ovate, and three-lobed; the middle lobe obliquely truncated. The flowers are solitary at the extremities of the branchlets; they resemble tulips in size and appearance. The bark has a bitter, aromatic taste, and like that of all the *magnoliaceæ*, contains a bitter principle, called *liriodendrin*. It has been used as a substitute for Peruvian bark in intermittent fevers, and is a good tonic. The tulip tree is one of the most beautiful ornaments of pleasure-grounds, wherever it grows and flowers well, which, however, in Britain, it does only in the southern parts. It is now plentiful in many parts of the s. of Europe. In some parts of the basin of the Mississippi, it forms considerable tracts of the forests. The heart-wood is yellow, the sap-wood white. The timber is easily wrought, takes a good polish, and is much used for many purposes.

TULLAMORE, civic and market t., chief town of King's co., Ireland. It stands upon what may be called a fertile island of the great bog of Allen, and has within the last half c. risen into some importance. The pop. amounted in 1891 to 4522.

TULLE, a t. of France, dep. of Corrèze, at the embouchure of the Solane into the Corrèze. It is for the most part badly built, but has some fine promenades, excellent quays and bridges, a Gothic cathedral, an episcopal palace, a theological seminary, a communal college, an industrial college, a public library, and a theater. One of the

suburbs of Tulle, called Souillac, is a national military manufactory, and the town is otherwise notable for its manufactures of leather, paper, cards, lace (known as *point de Tulle*), liqueurs, and ironmongery. Some say that Tulle owed its origin to a Roman fort called *Tutela*; and in the vicinity are certain undoubted Roman remains; others, however, think it dates from the 4th century A.D. The pop. in '91, was 15,384.

TULLE, a kind of thin silk lace of a very open pattern and loose structure, usually in narrow widths, for dressing ladies' caps, etc.

TULLOCH, JOHN, D.D.; b. Scotland, 1823; educated at St. Andrews, and ordained at Dunbar in 1845 as a minister in the church of Scotland. He afterward studied theology in Germany; and in 1854 became principal of St. Mary's college in the university of St. Andrews. Among his works are: *Leaders of the Reformation* (1859); *English Puritanism and its Leaders*; *Rational Theology and Christian Philosophy in the Seventeenth Century* (1872); *Religion and Theology* (1875); *Movements in Religious Thought*. He d. 1886.

TULLY, WILLIAM, 1785-1859; b. Conn.; educated at Yale college; studied medicine; and in 1815 settled in Upper Middletown, now Cromwell, Conn. Meeting at that place Dr. Thomas Miner, he adopted his views on the treatment of spotted fever, and in 1823 published in association with him *Miner and Tully on Fever*. In 1824 he was chosen president of and professor of materia medica in the medical college at Castleton, Vt. He held the same chair in the Yale medical school, 1829-42.

TULTCHA, or **TULTSHA**, a t. in the Dobsudja, Roumania. It is built on the site of the ancient *Ægissus* on the right bank of the Danube; pop. about 12,000. It is 45 m. e.s.e. of Galatz, and has a good harbor, a citadel, and the ruins of a fortress damaged by the Russians, 1789-91. It was entirely destroyed in 1828; occupied by Russians, 1854. It has an important trade in salt fish, wool, and grain.

TUMBLER. See **LOCK**.

TUMBRIL, in an army, a covered cart on two wheels, for the carriage of ammunition, tools, etc., belonging to the artillery. The name obtained a melancholy celebrity from being applied to the carts which served to carry the unfortunate victims of the French revolution to the guillotine.

TUMORS do not admit of a simple definition, but, in the words of sir James Paget, who has specially investigated this department of surgical pathology, they all belong to the class of overgrowths or hypertrophies, and their most constant distinctive characters are: (1) that they are deviations both in respect to size and shape from the normal type of the body in which they are found; (2) that they have an apparently inherent power and method of growth; and (3) that their development and growth are independent of those of the rest of the body, continuing with no evident purpose when the rest of the body is only being maintained in its normal type.

Tumors are usually divided into two chief groups, known as innocent or benign, and malignant tumors. The characters of the latter are sufficiently discussed in the article **CANCER**, and we shall therefore restrict our remarks to innocent tumors. These may be divided into *cystic tumors*, or cysts, and *solid tumors*; while the latter are subdivided into the *discontinuous* and the *continuous*; the discontinuous being those which are completely invested with a layer of tissue, which at once isolates them and connects them with the surrounding parts, while the continuous ones appear as growths, not in, but of the surrounding parts, and appear as *outgrowths*, as, for example, many polypi, and pendulous or sessile tumors. In accordance with these ideas, sir J. Paget classifies innocent tumors as follows: I. **CYSTIC TUMORS: CYSTS**; which may be (A) *simple* or *barren* or (B) *compound* or *proliferous*. (A) *simple cystic tumors* include the varieties known as (a) *serous*, constituting what are termed *hydromata*, (b) *synovial*, (c) *mucous*, (d) *sanguineous*, (e) *oily*, (f) *colloid*, (g) *seminal*. (B) *Compound* or *proliferous tumors*, including (a) *complex cysts*, (b) *cysts with glandular* or other vascular growths, (c) *cutaneous cysts*, (d) *dentigerous cysts*. II. **SOLID TUMORS AND OUTGROWTHS**, including (a) *fatty* or *adipose*, (b) *fibro-cellular*, *areolar*, etc., (c) *fibrous*, *fibro-muscular*, (d) *cartilaginous*, (e) *myeloid* or *marrow-like*, (f) *osseous*, (g) *glandular*, and (h) *vascular*.

Of these various species we shall only notice a few of the most important. *Cutaneous cysts* may be congenital or acquired. They may be found under the skin of any part, but sir J. Paget regards them as probably a hundred times more common in the scalp than in any other part. Their rate of growth is uncertain. When they grow rapidly they are apt to ulcerate, and hence are derived most of the so-called "horns" of the scalp and face.

Cutaneous cysts are usually formed either by the morbid growth of natural ducts or follicles, or by the enormous growth of elementary structures, which increase from the form of cells and nuclei, and become closed sacs with organized walls capable of producing other growths. A hair follicle or a sebaceous gland of its duct become obstructed, is thus often the origin of a cyst. Cutaneous cysts may be treated in various ways. Those in which the skin over their chief prominence is marked with a small dark point, through which a fine probe may be passed into the cavity, may be gradu-

ally emptied by dilating their openings, and pressing out their contents; or they may be extirpated by caustic or the knife.

Fatty tumors are the most frequent of all innocent tumors, and are often described under the name of *lipoma* and *steatoma*. They do not differ materially in structure from the ordinary fat of the adjacent parts, and seldom cause much annoyance, except from their unseemly appearance. No good cause can be assigned for their formation, but they may sometimes be traced to a blow or friction, as of a strap. The age at which they most commonly show themselves is at about forty. They may occasionally be absorbed by the prolonged internal use of liquor potassæ; but this treatment is almost certain to disturb the general health, and, as a general rule, excision is the proper treatment. *Fibro-cellular tumors* are remarkable for the rapidity of their growth (three or four pounds in the year, and, in one case recorded by sir J. Paget, a pound a month), and the weight which they may attain (sometimes forty pounds or more). The most common seat of these tumors are the uterus, the scrotum, the bones, the subcutaneous tissue, the lobules of the ear, etc. Polypi of the uterus, nose, etc., belong to this class. Except in the case of polypi, excision is the only available remedy; and in some parts of the body this is of course impossible.

We will continue with a reference to a remarkable class of cases which often sadly puzzle the inexperienced surgeon. They are known as *phantom tumors*, and are apparently due to contraction of the muscles. "The abdominal muscles of hysterical women are most often thus affected; sometimes with intentional fraud. The imitation of a tumor may be so close as to require great tact for its detection, but chloroform, by relaxing the muscles, dissipates the swelling. Occasionally these apparent tumors move."—Paget on "Tumors," in Holmes's *System of Surgery*, vol. i., an article containing an excellent abstract of the most recent knowledge on the general subject of tumors.

The frequency of the occurrence of tumorous growths, the great variety of them, and their various relations to the constitutional condition of the subject in which they are developed, make them of great importance, not only to the surgeon, but to all who are liable to be afflicted with them, and a more or less general knowledge of them should constitute a part of the education of every intelligent person. According to Dr. John Hunter (1728-1793, q.v.), a tumor is a "circumscribed substance produced by disease, and different in its nature and consistence from the surrounding part," and this general definition by a master-mind, although not strictly correct in the light of modern pathology, is sufficient for our purpose. It may be well to add what has been proposed by one of the first of modern surgeons as an amendment, if for no other purpose than to show how little more can be added. "By a tumor may also be meant a more or less circumscribed mass, growing in some tissue or organ of the body, and dependent on a morbid excess of, or deviation from, the nutrition of the part." Tumors may be considered under two heads, viz., local hypertrophies, or outgrowths of the normal structure of the part, and of new formations presenting structural characters differing more or less from those of the parts around. The tumor thus formed grows by an inherent force of its own, without regard to the growth of the rest of the system, obeying, however, the general laws of growth which govern the organism in which they are developed.

A classification of tumors may be made from their anatomical structure, or from their vital and clinical characters. As stated in preceding paragraphs, surgeons have for a long time divided tumors into *malignant* and *non-malignant*, but this division is not scientifically exact. Some tumors, as cancers, are always essentially malignant, and others are always benign, as certain cysts; but there are many that are usually benign or non-malignant, which, however, from causes yet unknown may take on malignant characters. Such are termed semi-malignant. Non-malignant tumors are local in their development, and are often described as having no hereditary connection. This, however, is frequently not so, as it is well known that cystic tumors, particularly of the scalp, are known by common observation to be often hereditary. But notwithstanding they may be hereditary they are properly considered as local, because the constitution of the individual does not appear to be affected any more than where other peculiarities, such as double fingers and moles, are inherited.

From these growths malignant tumors have a wide difference. They are usually characterized by great luxuriance of development of a rather low character, a luxuriance termed vegetative, and are very liable to undergo, especially in their central parts, degeneration, ulceration, and gangrene. They represent a very great departure from the normal nutrition of the part, and as a rule indicate a fault, although it may be but little manifested outwardly, in the general nutrition of the body. Malignant tumors are often called heteromorphous, and this is true to a certain extent, but not so far as to signify that the new product is formed entirely on a new type, for the doctrine of Virchow, that "the same types of anatomical structures exist in new formations as are found in the body generally" is not disputed by the majority of pathologists. Briefly stated, the following are the principal signs in malignant tumors: It is at first small and usually with a distinct outline. There is a constant tendency to extension by local infiltration into the adjoining parts, by absorption, by incorporation into their substance,

and by deposit of the new elements in their place, and this process is continuous; often very slowly, as in hard cancer of the breast, but in many cases, in certain situations, rapidly, as in soft cancer, the rapidity being usually the measure of the malignancy. The extent of the growth is unlimited, that is to say, it may attain any size consistent with the life of the subject; but when a certain extent is reached, depending on the constitution of the patient, the central parts undergo fatty degeneration, and when this degeneration reaches the surface there is rapid sloughing or ulceration toward the center, causing profuse discharges which are usually very offensive, and often accompanied by hemorrhage. After a time, which varies considerably, the lymphatic glands which lie in the course of the lymphatic circulation, become enlarged and hardened in consequence either of a deposit of morbid elements, or from congestion of the glandular structure produced by a morbid condition of the fluids which pass through them. This affection of the glandular system constitutes what is called the secondary form of the disease, in contradistinction to the primary tumor. This lymphatic complication may occur before the skin is affected, but almost invariably soon after that occurrence, and the pathological condition of the glands as revealed by the microscope are the same as that of the primary tumor. After the lymphatics are affected the internal organs, particularly the lungs and the liver, become the seat of secondary deposits, which, however, may differ somewhat in character from the primary tumor, and these deposits then become the foci of further development of the elements of the disease, which have an increased rapidity of growth; in other words, an increased malignancy. After the lymphatic glands are affected constitutional symptoms appear, such as sallowness, disturbance of digestion, wasting of the body, and general anæmia. Most malignant tumors are cancerous, but not always, although cancers are always malignant. Other malignant tumors are sarcomas.

Tumors may be divided into five classes. 1. *Cystic tumors*, which may be again divided according to their contents into what are called (a) dermoid cysts, having their commencement in the derma, or skin, including three varieties; those containing epidermis; those containing true skin, hair, and glands; those containing cartilage, bone, and teeth. See *Cutaneous cysts* in TUMORS. (b) Serous cysts, occasioned by dilatation of sacs, cavities, or canals, including blood-vessels, most frequently situated about the neck, but met with in almost every situation. They are lined with flat endothelium (epithelium), like that lining serous cavities generally. See SEROUS MEMBRANES. A variety of serous cysts called multilocular (many-celled) are frequently met with in the ovaries, and constitute one form of ovarian dropsy or tumor. The ovarian cyst may also be unilocular (one-celled). Sanguineous cysts (hematoma) are a peculiar variety which have been well described by sir James Paget as chiefly occurring about the neck, parotid gland, and anterior part of the thigh, leg, and shoulder. They contain fluid blood more or less altered. They may be formed in three ways: by hemorrhage into a previous serous cyst; by transformation of nævus (q.v.); or by occlusion of a vein. (A peculiar form of hematoma of the ear is often met with in the insane). The term hematoma is also applied to those cysts which result from changes taking place in extravasated blood, as in the brain. Other serous cysts are formed by accumulation of fluid in the meshes of the areolar tissue, and by changes in the products of inflammation. (c) Colloid cysts, arising from colloid (gluey) degeneration of pre-existing cells, and from colloid degeneration of new cells. Other cysts are formed by the development of parasites, the most common of which is the hydatid cyst arising from the presence of the young of *tænia echinococcus*. 2. *Tumors composed of one of the modifications of fully developed connective tissue*, such as fatty tumors (lipoma,) fibrous or fibroid tumors, and fibro-cellular tumors (fibroma), cartilaginous tumors (chondroma, see ENCHONDROMA), bony tumors (osteoma, exostosis). The causes of *exostosis* are obscure. In some instances they are hereditary. The disease is usually met with at about the age of puberty. There are two modes of development; primarily as true bone, and secondarily from previously formed cartilage. Exostosis may be simple or multiple, and are of two kinds, hard, or *ivory exostosis* and *spongy, or cancellous exostosis*. Another variety of these tumors of the second class is *myxoma* or mucous tumor. This has been classed by some writers as a variety of sarcoma. Many tumors formerly described as colloid cancer belong to this class. These tumors usually appear in the form of round, oval, or lobular masses surrounded by a loose capsule of connective tissue. They are elastic and gelatinous, and of slow growth. When cut they present generally a delicate pink color, but are sometimes yellow, and pour out an abundance of a glairy, tenacious fluid resembling gum water. A microscopic examination shows a beautiful arrangement of branched cells and net-work. Virchow regards these tumors as closely related to embryonic fat. 3. *Tumors which resemble in structure more or less perfectly one of the more complex tissues of the body*. One variety of these is myoma, or muscular tumor. There are two classes, one containing striated, and the other non-striated, muscular fiber. Belonging to this class are *neuromas*, or nervous tumors, rare growths when strictly growing out of nervous tissue. They are always non-malignant, and should never be interfered with except when giving pain. *Angiomas* are tumors composed of vascular tissue of new growth; one variety is *nævus* (q.v.) Other tumors of this class are *lymphangioma*, a tumor composed of lymphatic vessels; *lymphadenoma*, one composed of tissue like that in the lymphatic glands, and *papilloma*,

a tumor resembling the papillæ of the skin or mucous membrane, and including such growths as corns and warts (q. v.). 4. *Tumors composed of tissue which is either purely embryonic, or as showing some signs of a tendency to develop into adult tissue of the connective type.* These tumors comprise the *sarcomas*, or sarcomata, growths which have been the subject of much controversy, but whose classification is now pretty well settled. Many until recently were known under a variety of names, and grouped in other divisions. Formerly the term sarcoma was applied to almost any soft fleshy growth. The soft sarcomata of bones and of secreting glands and lymphatics were formerly called soft cancer, and melanotic sarcomata were called melanotic cancer. Hard, firm sarcomata were often described as hard cancer or scirrhus. The tumors described by sir James Paget as fibro-plastic, fibro-nuclear, recurrent-fibroid, etc., have all been brought into the great class *sarcoma*. These tumors may grow in any part of the body, and present every variety of consistence, color, and form; they may be circumscribed or diffuse, and as benign, as a fatty tumor, or as malignant, as the worst form of cancer. The anatomical type of sarcoma is found in the embryonic tissue. See DEVELOPMENT OF THE EMBRYO. Its pathological type is seen in the cellular products of inflammation, with the particular difference that inflammatory new growths tend to limit themselves, whereas sarcomata have a tendency to indefinite growth, and the individual elements (cells) are often much larger, and have less tendency to form tissue. It is chiefly according to the size and form of the cells that sarcomas are divided into varieties. We have space here to scarcely more than mention the names of these varieties. *Small round-celled sarcoma*, or granulation sarcoma (formerly called encephaloid cancers), and resembling superficial layers of granulations in healing wounds, being composed of small round cells about the size of white blood-corpuscles. *Spindle-celled sarcoma*, formerly called recurrent-fibroid tumor, and fibro-plastic tumor, a growth composed of spindle-shaped, fusiform cells, either lying in contact or separated by a homogeneous or fibrous intercellular substance, the cells varying greatly in length, from $\frac{1}{1000}$ to more than $\frac{1}{100}$ of an inch. *Oval-celled sarcoma* is a variety of spindle-celled, of very rapid growth and great malignancy. *Myeloid, or giant-celled sarcoma*, formerly classed as fibro-plastic, and sometimes as soft cancer, and by Abernethy called *albuminous sarcoma*, whose peculiar characteristic is the presence of large, many-nucleated masses of protoplasm, resembling the cells found in the marrow of fetal bones. The cells are sometimes $\frac{1}{100}$ to $\frac{1}{50}$ of an inch in diameter, and of irregular shape, the nuclei varying from ten to forty in number, of oval shape, and having highly refracting nucleoli. These myeloid cells are imbedded in masses of spindle-shaped or roundish cells. These tumors are extremely vascular. *Ossifying and osteoid sarcomata*, formerly called bone, or osteoid cancer. Almost any form of sarcoma may undergo ossification, the varieties already mentioned often showing abundant formation of bone. *Alveolar, or large round-celled sarcoma*, occurring chiefly in the skin, bones, and muscles, and difficult of distinction from hard cancer. *Melanotic sarcomata*, or *melanosis*, formerly regarded as *melanotic cancer*, was carefully studied by Carswell, and arranged under the heads *punctiform melanosis*, *tuberiform melanosis*, and *stratiform melanosis*. These growths are usually of the spindle-celled variety, but contain large numbers of round or oval, and fusiform cells. The spindle-cells are large, and there is no fibrous material. The pigment consists of a brown granular matter in the interior of many of the cells, while the remainder are colorless. They are usually developed in those situations where pigment naturally exists, as in the skin, and the choroid coat of the eye-ball, but sometimes are found in the lymphatic glands. They are of rapid growth, and usually occur in middle life. They are among the most malignant of tumors, and the secondary deposits occur in every part of the body, being distributed either by the vascular system alone, or by both blood-vessels and lymphatics. If a melanotic sarcoma has reached the size of a filbert it may be concluded that secondary deposits have already taken place, and that the disease has reached a rapidly fatal stage. Of other forms of sarcoma there is no space for mention. This brings us to the consideration of the last class of tumors. 5. *Tumors composed of cells of an epithelial type arranged in spaces in a stroma consisting of more or less perfectly developed fibrous tissue.* This group constitutes the *cancers* or *carcinomas*. See CANCER.

TUMULUS. See SEPULCHRAL MOUND.

TUN, a word which, under various modifications, exists in the Celtic and Teutonic languages, seems connected with the Latin *teneo*, I hold, or the Greek *teino*, I stretch, and signifies primarily a large vessel or cask. In various countries, Britain included, it denotes also a liquid measure of capacity; in old ale and beer measure, the tun was equal to 216 gallons (each gallon = 282 cubic in.), in old wine measure it was equal to 252 gallons (each gallon = 231 cubic inches). The tun and all other liquid measures of higher denomination than the gallon are no longer legal; but the names are, for convenience, still retained. These denominations had their origin in the natural practice of giving names to casks in common use which preserved a uniform size. As a tun of water weighs a little more than 2,000 lbs., it is probable that the ton weight (see Ton) was taken from the tun measure.

TUNBRIDGE, a market town in Kent, England, stands on the Medway, on ground rising from the banks of that river, 27 m. s.e. of London. The castle, which stands on the Medway, near the entrance of the town, dates from the close of the 13th c., has a noble gate-tower of great size, richly ornamented, and is at present occupied as a military training school. The parish church is a large and old, but sadly disfigured building; but the chief establishment of the town is the grammar school, founded in 1553, with an endowment of £5500 a year. The manufacture of toys and turned and inlaid articles of wood (see next article) is a specialty. Pop. '91, 10,123.

TUNBRIDGE-WARE, a kind of wood manufacture carried on at Tunbridge and Tunbridge Wells. It consists of such articles as ladies' work-boxes, ring-boxes, desks, etc., which are covered with a veneer characteristic of this industry, and formed from small pieces of wood of square and triangular shape in transverse sections, built up in geometric patterns; these are carefully glued together so as to form a solid mass, from which thin transverse veneers are cut, and are used to cover the articles made. This trade was formerly of much greater importance than at present.

TUNBRIDGE WELLS, a famous English inland watering-place, and after Bath, the oldest in the country, stands on the s. border of Kent, 5 m. s. of Tunbridge. The town which is rapidly extending, occupies the head and slopes of one of the valleys of the Weald, and has in general a s.w. aspect, commanding very fine views. The three centers of population are mounts Ephraim, Sion, and Pleasant, separated by a large common and cricket ground. The waters are chalybeate. The wells, discovered in 1606 by lord North, are situated at the end of a promenade called the *pantiles*. In the vicinity are charming rides and walks. Tunbridge ware is also largely manufactured here. Pop. '91, 27,895.

TUN OF HEIDELBERG, THE, is a huge reservoir for the storage of wine, built in the castle of Heidelberg, Germany. The first tun was built about 1589 and held over 500 hogsheads. The present tun was finished in 1751. It is built of thick copper plates, strongly bound with iron hoops, measures thirty six feet by twenty four feet, and is as high as an ordinary two-story cottage. Its capacity is 49,000 gallons or about 800 hogsheads. For many years it was filled annually, and the close of the vintage was celebrated with rustic dances that were held on a platform on the top of the tun. It is now about half a century since it was filled the last time. Notwithstanding its immense size, it has been exceeded by some of the beer-vats in use by the London brewers, one of which is described as holding 108,000 gallons. Allusion to the tun of Heidelberg is found in the travels of Bayard Taylor and of Irving.

TUNDRA (in Finnish, *tuntur*—that is, mossy flat) is the Russian name for the vast plains which border on the Arctic ocean in Siberia, and also westward from the Ural along the n. of Europe. They are swampy tracts of land, partly covered over with a thick felt of bog-moss, and partly with a dry snow-white covering of reindeer-moss and different kinds of lichens. It is only the reindeer that renders this frightful waste habitable for the wandering hordes of Samoyedes, who hunt the furred animals as well as the swans and wild geese which in summer flock hither in vast numbers. These polar steppes, however, can be trodden only in winter, when the whole region is one sheet of frozen soil and ice. In summer, when the surface thaws, the greater part of the region becomes an inaccessible morass, except a portion along the n. coast of Siberia, which retains its snow covering throughout the year.—See Schrenk, *Reise nach dem Nordosten des Europ. Russland durch die Tundren der Samoyeden* 1837 (Dorpat, 1848).

TUNE, a short popular melody; also, that property of musical sounds by which they stand to each other in the relation of pitch (q. v.).

TUNGSTEN (symb. W, equiv. 92—in new system, 184—sp. gr. 17.6) is a rare metal, which derives its name from the Swedish words *tung*, heavy, and *sten*, a stone. It is chiefly derived from wolfram (whence the symbol W), which is a tungstate of iron and manganese, and likewise occurs in schleelite, which is tungstate of lime. It is unnecessary to describe the means of separating the metal, which may be finally obtained either as a dark-gray powder or in heavy iron-gray bars, which are very hard, and difficult of fusion. Aqua regia and nitric acid convert it into tungstic acid. When 10 parts of this metal are alloyed with 90 of steel, a mass of extraordinary hardness is obtained.

Tungsten forms two compounds with oxygen, viz., a binoxide (WO_2), which is obtained in the form of a brown powder, by heating tungstic acid to low redness in a current of hydrogen, and which does not form salts with acids; and an acid teroxide, known as *tungstic acid* (WO_3). Independently of *tungstic anhydride*, there are two modifications of this acid, represented by the formulæ $HO.WO_3$, and $HO.W_2O_6$, which are known as *tungstic* and *metatungstic acids* respectively. Various tungstates have been formed and examined. Of these, the most singular is tungstate of tungsten ($WO_2.WO_3$), which is of a splendid blue color; and tungstate of soda, which answers admirably as a means of preventing muslin, etc., from bursting out in a flame when brought in contact with fire. It is unnecessary to notice the metatungstates, or the sulphides, chlorides, etc., of tungsten.

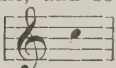

TUNGURAGUA, a province of the republic of Ecuador, with an area of about 1686 sq. m., and a population estimated, in 1890, at 103,033. The province contains the famous volcano of Tunguragua, nearly 16,700 ft. high, and on its western limits lie the volcanoes Chimborazo and Caribuhairazo. The capital is Ambato, with an estimated population of 12,000.

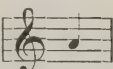

TUNGÛS, an ethnographic group of the Turanian family, are at the present time situated to the n. and e. of the Mongol group, inhabiting the vast plains stretching s. from the icy sea of Siberia, between the Yenesei and the Lena, the northern slopes and valleys of the Great Altaï, and the hilly uneven tract between the upper Ameer and the Lena. The chief peoples included under this group are the Niuju, the Däurians, Tshapodshirs, Manchûs (in the s.e.), and Lamûts (on the e. coast). In the n. they have intermingled with the Samoyedes; in the w. with the Ostiaks, whose territory is on the other side of the Yenesei; and in the s., the Manchûs, though being gradually pushed northward by the Chinese, have for a long time exercised undisputed sway over their supplanters. Divided politically between Russia and China, the southern portion of them are Buddhists, while the tribes further n. mostly practice Shamanism (q.v.), a few having, by the strenuous exertions of the Russian government, been induced to profess Christianity. The Tungûs are partly nomad and wandering, and partly agriculturists and settled rearsers of cattle. The first of these are commonly classed according to the districts they prefer to dwell in, as Tungûs of the forests, or Tungûs of the steppes; the former being shepherds, hunters, or fishers; and the latter exclusively shepherds. The steppe Tungûs, again, are divided according to the animals of draught they employ, into the reindeer-Tungûs, the horse-Tungûs, and the dog-Tungûs. The Tungûs are in general robust and lively, with flat visage and small eyes, the latter characteristics, however, being much less prominent in them than in the Kalmucks. A portion of the Chinese Tungûs constitute the Solon nation so celebrated as warriors in Chinese modern history. The Tshapodshirs tattoo their faces. See illus., ASIA, vol. I.

TUNICA, a co. in n.w. Mississippi, having the Mississippi river for its w. boundary; 450 sq.m.; pop. '90, 12,158. Co. seat, Tunica.

TUNICATA, a class of acephalous mollusks, having the body inclosed not in a shell, but a soft elastic tunic, which is perforated by two apertures, and is composed of a substance resembling cellulose (q.v.). The tunicata are extremely numerous, and are found in all seas. The *ascidiæ* (q.v.) belong to this class, and the *salpidae* (see SALPA).

TUNING-FORK, a contrivance for regulating the pitch of the voice or of a musical instrument. It consists of two prongs of steel springing from a handle, and so

adjusted as to produce a fixed note when struck. It is usually tuned in C 

in Britain, and in A  in Germany. In consequence of the absence of any

universally recognized standard, there is even in this country a considerable variety in the pitch of the tuning-fork. Messrs. Broadwood employ three forks of different pitch to tune their piano-fortes: one corresponding to the philharmonic standard of 30 years back for instruments used for the accompaniments at ordinary concerts; another somewhat higher for piano-fortes meant to take part in orchestral compositions; and a fork of still higher pitch, adopted for the present opera and philharmonic standard, which is about a semitone higher than the standard of 30 years ago. A fork has lately been invented in Germany capable of adjustment to different standards of pitch, by means of a moveable brass slider, fitted with a screw, there being indications on the prongs of the positions of the slider which give the pitch adopted by the principal orchestras in Europe. See illus., SOUND, vol. XIII.

TUNIS, a French protectorate in northern Africa, is bounded on the n. by the Mediterranean, on the w. by Algeria, on the s. by the Sahara, and on the e. by Tripoli and the Mediterranean. Its greatest length from n. to s. is about 440 m.; its average breadth, 160 m.; area, about 45,000 sq. m.; pop. estimated in 1881 to be 1,500,000. Tunis is traversed by branches of the great and little Atlas range, with an average height to 4000—5000 ft. The northern coast is rocky and steep, with numerous bays, of which the largest is the gulf of Tunis; and two of its promontories, capes Blanco (*Râs-el-Abid*) and Bon, are the most northern in Africa. The eastern coast, on the other hand, is flat, sandy, and infertile, like that of Tripoli, but has two large gulfs, Hammamet and Cables (the *Syrtis minor* of antiquity). The southern part of Tunis belongs to the desert steppe known as Belud-el-Jerid. There is only one fresh-water lake of any consequence, that of Biserta or Bensart, near the n. coast. The brooks and torrents of Tunis either lose themselves in the sand, or find their way to the sea after a short course. None are navigable. The longest is the Mejdah (the *Bagradas* of the ancients), which flows in a generally north-eastern direction into the gulf of Tunis. Other streams are the Ved-el-Milianah and the Ved-el-Kebîr. There are several mineral springs in the country. The climate of Tunis is fine, and the soil exceedingly fertile, so that, in spite of a very poor knowledge of agriculture, wheat, barley, maize, dhurra, pulse, olives, oranges, figs, grapes, pomegranates, almonds, and dates are abundantly produced. The culture of oil is more attended to, and is very lucrative. Great herds

of cattle are fed on the plains; the sheep are famous for their wool; and the horses and dromedaries are no less celebrated. The chief mineral products are sea-salt, saltpeter, lead-ore, and quicksilver. In the vicinity of the sea-coasts, considerable manufacturing and trading industry is manifested, more particularly in the cities of Tunis and Susa. Wool, cottons, cereals, cattle, wines, fruits, sugar, machinery, olive oil, hides, wheat, and barley are the principal exports. Cloth, leather, silks, muslin, spices, cochineal, and arms are transported by caravans to the interior of Africa, whence are brought for export to Europe, etc., senna, gums, ostrich feathers, gold, and ivory. In 1895 the imports amounted to 44,085,945 francs, and the exports to 47,525,784 francs. The total revenue, 1896, was estimated at 22,849,000 francs, and the expenditure at 22,848,000 francs. In 1895 there were 880 m. of railroads, and 1525 m. of telegraph line.

The predominant race is of Arabic descent, but there are many Berbers, especially in the interior. The French population in 1891 was 9973. The territory of Tunis corresponds pretty nearly with that of ancient Carthage; and for a sketch of its pre-Christian history the reader is referred to the articles CARTHAGE, ROME, HANNIBAL, HAMILCAR, SCIPIO, JUGURTHA, etc. Its subsequent fortunes, down to 1575 are interwoven with the general fortunes of Barbary (q.v.); but in that year Sinan Pasha conquered and incorporated it with the Ottoman empire, and gave it a new constitution. The government was placed in the hands of a Turkish pasha, a divan or council, composed of the officers of the Turkish garrison, and the commander of the janizaries. After a few years, however, an insurrection of the soldiery broke out, and a new government was established, the head of which was a "dey," possessing very limited authority; the chief power being at first exercised by the military divan. Gradually, however, an officer with the title of "bey," whose original functions were confined to the collection of tribute and taxes, acquired a supremacy over the other authorities, and finally obtained a kind of sovereignty, which Murad bey succeeded in making hereditary. The family of Murad Bey ruled in Tunis for 100 years, and gained considerable renown both by their conquests on the mainland, and their piratical enterprises against Christian powers at sea. During the 18th c., it became tributary to Algiers. About the beginning of the 19th c. Hamuda Pasha threw off the Algerian yoke, subdued the Turkish militia, and created a native Tunisian army; in consequence of which Tunis virtually attained independence. The recent rulers, Achmet Bey (1837), Mohammed Bey (1855), and Mohammed Sadyk Bey (1859), were very liberal, enlightened, and reforming sovereigns. By a firman of Oct. 25, 1871, the sultan renounced the tribute formerly exacted, and fixed the future relations of the sublime porte to Tunis. The "bey" was to receive his investiture from Constantinople; without the sultan's authority he could neither declare war, conclude peace, nor cede territory; the sultan's name must appear on all the coinage, the army must be at the disposal of the porte. In internal matters, however, the power of the bey was to be absolute.

In the spring of the year 1881 the government of France resolved to put an end to the repeated invasion of Algerian territory by plundering bands from Tunis. It was asserted by the French press that the invasion of French rights was not discouraged by the Italian consul, Signor Matteo. The invading troops approached and surrounded the capital, and May 12, 1881, the bey was induced to sign a treaty, in ten articles, of which the main provisions are said to be, that there shall be a French minister resident in the capital to guard French interests; that several positions on the coast shall be occupied by the French, including, it is reported, Susa, Goletta, and Benmenter; and that France shall in certain matters regulate Tunisian finances. This treaty has caused some indignation among the other powers, especially Italy and the Porte, the latter claiming a suzerainty over Tunis which is not practically evidenced.

TUNIS, capital of the African state of the same name, lies on the west side of a small lake or lagoon, near the s. w. extremity of the lake of Tunis, about 3 m. from the ruins of ancient Carthage. It occupies rising ground, and both the city proper and the suburbs are surrounded by walls. The streets are narrow, unpaved, and dirty, but the bazars are well furnished, and many of the mosques are really splendid, particularly the mosque of Jussuf, which has beautiful marble pillars. The palace of the bey is probably the finest building in Tunis; the ceilings glitter with gold and carmine and azure. All the principal rooms open into a large court-yard paved with marble, and surrounded by arcades supported on marble columns, while fountains everywhere diffuse a perpetual and delicious coolness. The citadel, begun by Charles V., and finished by Don John of Austria, is interesting from its collection of old arms, and was formerly the great slave-prison of Tunis. There are also Roman Catholic and Greek churches, Jews' synagogues, an Italian theater, and large barracks in Tunis. Tunis is the commercial center of the state. A canal was opened in 1893 by means of which ocean-going vessels can reach Tunis directly. Tunis has silk and woolen manufactures, as shawls, tapestries, mantles, bur-nooses, caps, turbans, colored cloths, also leather, soap, wax, and olive oil, all of which it exports, together with grain, fruits, cattle, fish, ivory, gold dust, coral, etc. Pop. stated at 153,000.

The lagoon or lake of Tunis is shallow, and communicates with the *Gulf of Tunis*, an inlet of the Mediterranean, by a narrow strait called the Goletta. The Gulf itself is 45 m. broad at the entrance—between cape Bon and cape Farina—and extends inland for 30 miles. The anchorage is good.

TUNKERS, a religious sect, occupying settlements in New England, New York, Pennsylvania, Ohio, Indiana, etc., and thus pretty widely scattered throughout the

northern and middle parts of the United States. They are nowhere numerous, and are chiefly occupied in the cultivation of the soil. The name which they take for themselves is simply that of brethren, and they profess that their association is founded on the principle of brotherly love. The name Tunkers is of German origin, signifying Dippers, and is due to their dipping in baptism. It is very commonly, by corruption, pronounced and written *Dunkers* and *Dunkards*. In the vicinity of their settlements they are generally known as the *Harmless people*. They derive their origin from a small village on the Eder in Germany, but have been an exclusively American sect since the beginning of last century, when they all emigrated to America. Religious statistics for 1894-5 gave the number of ministers of all "Dunkard" bodies in the United States as 1016 and the membership as 76,644. They reject infant baptism, and have no ministers specially devoted to the ministry as a profession. Every brother is allowed to stand up in the congregation and exhort; and when one is found particularly apt to teach, he is ordained by laying on of hands with fasting and prayer, and is expected to devote himself in some measure to the ministry, although without any stipend or pecuniary reward, even if his own crops should suffer by his neglect of them. There are deaconesses as well as deacons among the Tunkers. Like the Quakers, they use great plainness of dress and language; they refuse to take oaths or to fight; and they will not go to law. They celebrate the Lord's supper, and accompany it with love-feasts, washing of feet, the giving of the right hand of fellowship, and the kiss of charity. They anoint the sick with oil in order to their recovery, depending upon this unction and prayer, and rejecting the use of medicine. They generally believe in the doctrine of universal salvation; but it is not a tenet of the sect. They do not insist upon celibacy as an absolute rule; but they commend it as a virtue, and discourage marriage. They are industrious and honest, and universally held in good repute among their neighbors.

Sole dependence upon prayer for the cure of the sick is the characteristic also of a small religious sect, of which a few members are to be found in England, calling themselves the *Peculiar people*. In Switzerland the name of Dorothea Trudel (d. 1862) was long famous for the cure of ailments by prayer. She did not, however, in all cases, refuse to call in medical advice. In Germany a Protestant pastor, Blumhardt, pursues a similar system on a large scale, and it is said with great success. See BAPTISTS, GERMAN.

TUNNEL. Tunnels are passages constructed under ground to carry roads, railways, canals, or streams of water. Tunneling, which has long been in use for roads, and aqueducts, has of late received a great development in the construction of railways. At the present time there are believed to be upward of 80 m. of railway tunnels in Great Britain in constant use for the passage of trains; and, as their cost averages from £45 to £50 per yard, a total of about seven millions sterling has been expended in their construction. In tunnels of considerable length, as the progress made by working from the two ends would be very slow, it is considered advisable to commence the work from many points of its length; for this purpose, shafts or pits are made at these points down to the level of the tunnel. Of these shafts, some are temporary, and only kept open during the progress of the work; others are permanent, and for the purpose of ventilating the tunnel when in use. These shafts have to be large enough to allow the ascending and descending skips or buckets containing the excavated materials to pass one another. For the temporary shafts, an elliptical shape is found to give the greatest room for this purpose at the least expense. Square shafts are to be avoided, on account of the difficulty of excavating the corners in rocky strata. As the shaft descends, its sides are lined with timber-planks, supported by strong timber-frames, about 5 ft. apart. The permanent shafts, when the material is not of rock sufficiently solid, are lined with brick-work or masonry, built in lengths, as the shaft proceeds downward. These permanent shafts are generally made circular in section, and it is found better to place them 3 or 4 yards from the side of the tunnel, communicating with it by a small passage. This is convenient in the construction, and also is a useful refuge for workmen subsequently during the passage of trains. These shafts are generally made about 10 ft. diameter. They are sunk a few feet below the floor of the tunnel, to form a pit for the collection of the water from the workings, which is hauled to the top in barrels or buckets. The raising of the excavations and the water, and the lowering of building materials, and of the workmen, is done by a windlass, a horse-gin, or steam-power, according to the extent of the work. On the completion of the shaft, the tunnel is commenced in both directions from its bottom; and in the case of ordinary rock, it is found convenient to commence by making a small adit, or passage, along from shaft to shaft, through the whole length of the tunnel; this is made six or seven ft. high, and the top of it placed at the level of the top of the tunnel. When this is completed, the correct center line is marked out in it throughout the tunnel; the adit is then enlarged to the shape and size of the arch of the tunnel, which is built in, and then the excavation is completed, and side-walls built up to underpin the arch. In cases where the material is soft and full of water, the full section of the tunnel is generally carried forward at once, and in such cases an invert has to be built between the side-walls, to withstand the upward pressure, as the pressure of soft material has the character of a fluid pressure, and presses the tunnel on all sides. The excavation is then done in lengths of about 24 ft., which is firmly secured with poling-boards and larch bars, and securely shored; the centers are

then set, and the brick-work built up. The timber bars are generally drawn out when the brick-work is carried up, and the holes they leave rammed tight with clay; but they have sometimes to be built in. When the quantity of water is very great, an adit is driven through the tunnel, at the level of its floor, before the work is begun, to allow the water to run off.

Tunnels are generally made straight, but sometimes they are curved; this is done that they may pass under the lowest part of the hill, in order that the shafts may be as short as possible. They are frequently constructed on steep gradients, but as the trains experience some resistance from the air in passing through them, it is advisable not to make them so steep as the gradients in the open air.

Before the St. Gothard tunnel was built, the most remarkable was the Mont Cenis,* which connects the railways of France and Italy, and is on the direct railway route from Paris to Turin. The length of this tunnel is 7 m. 4½ furlongs. It is 434 ft. higher at Bardonnèche, on the Italian side, than at Modane, on the French side. On this account, it is on a gradient of 1 in 45½ from Modane to the middle, and thence it falls 1 in 2,000 to Bardonnèche, this latter fall being sufficient to run off the water. The dimensions at Modane are 25 ft. 3½ in. wide at base, 26 ft. 2½ in. at widest part, and 24 ft. 7 in. high, the arch being nearly semi-circular. At Bardonnèche it is 11½ in. higher. The work was begun in 1857, and was at first done in the usual way by hand; but in 1861 the perforating machines described below were introduced on the Italian side, and two years later (1863) on the French side. On June 30, 1863, the tunnel had been driven 2,800 yds., and the rate of advancement was 9½ ft. per day. All the efforts of the engineers to accelerate the work were for several years unavailing; and in Oct., 1866, just one-half the distance, or 6,680 yds., had been pierced, showing the same constant rate of 9½ ft. per day. At this rate, the tunnel would not have been completed till 1872. Owing, however, to improved modes of working, and to a favorable change in the nature of the rock, the rate of advancement became greater toward the end, and the two parties met on Dec. 25, 1870. The tunnel was formally opened in Sep., 1871. A premium was to be paid by the French government to the Italian government, which did the work, for each year by which a term of 25 years, counting from 1862, was reduced. France was also to pay \$6,435,000 for one-half the tunnel when completed.

This great work, which appeared almost impracticable to ordinary methods of tunneling by manual labor, was rendered practicable by machinery introduced by the engineers, Messrs. Sommeiller, Grandis, and Grattoni. The great difficulty lay in the fact that, from the great height of the mountain, shafts were impracticable, and progress could only be made from each end. The ventilation also presented serious difficulties. M. Sommeiller perfected a small machine, weighing 6 cwt., which bored a hole 1½ in. diameter and 3 ft. deep in twenty minutes; the time taken by two miners working by the ordinary method being two hours. Eleven of these machines were placed on a movable support, and were capable of working at almost any angle. Three or four large holes were bored in the center of the heading, and round these other holes of the ordinary size, in all 80 holes. The large holes were not fired, but were for the purpose of weakening the rock. The others were then fired in succession and in detachments, beginning with those nearest the center, and working outward. The machines were worked by compressed air acting, like high-pressure steam, on a piston in a cylinder; this air being compressed outside the tunnel by water-power acting on the hydraulic-ram principle, and also by an air-pump; it was used at a pressure of five atmospheres above the atmospheric pressure, and was conveyed to the workings by a pipe 7½ in. diameter. After it had expended itself in working the borers, it escaped into the tunnel, and so ventilated the workings. The advanced heading was the only place where these machines were used. During the construction, a temporary locomotive railway was laid along the road over the pass.

The St. Gothard tunnel is a still more stupendous enterprise. It was begun in January, 1871; and, 1880, Feb. 29, the borings from the Swiss and Italian sides met, though much time and labor were still required to prepare the tunnel for railway traffic. The total length is 9½ miles, the width 21½ feet. The average rate of progress was 18 ft. per day; the improved M'Kean drill, latterly used, cut its way at the rate of twelve inches per minute. The contract of the tunnel was near two millions sterling, but the actual cost, including approaches, is given at several millions more. France proposes a tunnel through the Simplon. A tunnel connecting England and France beneath the English channel, for which a company was formed in 1872, would eclipse all former undertakings; its length would be 31 miles. But the British government has declined to sanction the undertaking. The Arlberg tunnel, begun in the middle of 1880, was ready for use in Nov. 1884. It is slightly over six miles in length, and its connections on both ends being complete, it gives direct railway communication between the Austrian province of Vorarlberg, touching Lake Constance, and Innsbruck in the Tyrol.

One of the most important railway tunnels in the United States is the Hoosac tunnel in Berkshire co., western Mass., owned by the state, is an important part of the Fitchburg railway from Boston to the west. The e. end of the tunnel is 137 m.

* This is really a misnomer; the tunnel is at a considerable distance from Mont Cenis, and the chief summit under which it passes is the "Grand Vallon" (11,000 ft. high).

from Boston. Some preliminary work was undertaken in 1851, but the actual cutting of the mountain did not begin till 1856. In 1862 the work came into the hands of the state, which brought it to completion. The tunnel is $4\frac{1}{2}$ m. long, running through micaceous schist, and of sufficient width to permit the laying of two railway tracks. The work of cutting was chiefly done by pneumatic drills. The entire cost of the tunnel is not easily stated, but with some 40 m. of railroad, it probably approached \$15,000,000. It is now in constant and successful use, and few lives have been lost in the work of its construction.—A subaqueous tunnel to supply the city of Chicago with pure water from lake Michigan extends 2 m. into the lake easterly, having two shafts, 6 and 7 ft. in diameter. Work was begun on the first shaft in 1864 and completed in 1867; the second was finished in 1874. On the crib, 2 m. in the lake, is a light-house and keeper's house. The entire cost of the city water-works up to 1874 was somewhat more than \$5,000,000. The chief difficulty encountered in the construction of this tunnel was from explosive gas, and several accidents occurred from this cause, none of which, however, were fatal. The quality of the water thus furnished to the city has been as a rule very good, though in the summer of 1881 unusual causes drove the city sewage for a short time to the mouth of the crib. Somewhat similar tunnels have been built at Buffalo, N. Y., and Cleveland, Ohio. The latter is 6,660 ft. long and 5 ft. in diameter. In its construction difficulties were encountered, as at Chicago, from volumes of inflammable gas, which from time to time entered it and exploded. Some lives were thereby lost. The work was begun in 1869 and finished in 1874, at a cost of somewhat less than \$350,600.—A railway tunnel under the Hudson river at New York is designed to give that city railway connection with the west. Work is still (1891) being carried on, and a similar tunnel to connect the cities of Brooklyn and New York has been projected.—Of the various mining tunnels in the United States, the most notable is that at Sutro, Lyon co., Nev., about 10 m. s. of Virginia City. The tunnel, which opens the Comstock lode of silver, is about 4 m. long, and has cost about \$5,000,000. See CENIS, MONT, GOTHARD, ST., CHANNEL TUNNEL. A tunnel two and a half miles in length, and twenty-three feet high, was finished in 1891, through the Khwaja Ameran mountains in India, and known as the Khwaja Tunnel.

TUNNY. *Thynnus vulgaris*, a fish of the family *scomberidae* (q.v.), found in the Mediterranean, and in the Atlantic ocean, but particularly abundant in the Mediterranean, where the tunny fishery is of great importance. It occasionally, but rarely, occurs on the British coasts. The genus *thynnus* is closely allied to *scomber* (see MACKEREL), but has the dorsal fins close together, the detached finlets more numerous. The tunny is a very large fish, sometimes 9 ft. in length, and weighing 1000 lbs., or even more. Its form is much thicker than that of the mackerel; its tail so widely forked as to be crescent-shaped. It is very plentiful near Constantinople, where it appears in shoals, sometimes so crowded that it may even be taken with the hand. The chief tunny fisheries of the present day, however, are on the coasts of Spain, Italy, and Sardinia. The Phenicians established a tunny fishery at a very early period on the coast of Spain, and the tunny appears on Phenician medals of Cadiz and Carteia. Salted tunny was much esteemed by the Romans, and was called *saltamentum sardicum*. The tunny is generally captured by means of nets arranged in a funnel-like form, the fish entering the wide mouth of the funnel, and being gradually driven to the narrow end, where they are killed by lances and harpoons. The line of nets is often more than a quarter of a m. long, and costs about \$6,000.—The AMERICAN TUNNY (*thynnus secundo-dorsalis*) is found on the coasts of New York, and thence northward to Nova Scotia. It sometimes attains a length of 12 feet. It is nearly black above, silvery on the sides, and white below. Its flesh is much esteemed. It also yields much oil, which is obtained by boiling the head and the belly. Twenty gallons of oil are often obtained from a single fish.

To the same genus with the tunny belong the bonito (q.v.) and the albacore or albacore (*T. albacorus*) which inhabits the West Indian seas, and is esteemed for the table. The name albacore, however, seems to be often given to different species of this family, inhabiting tropical seas, and sometimes to the tunny itself.

TUNSTALL, a prosperous market-t. of England, in the co. of Stafford. There are manufactures of iron, and pottery and tiles. Pop. '81, 14,244; '91, 15,730.

TUNSTALL or **TONSTALL**, CUTHBERT, 1474–1559; b. England; educated at Oxford and Cambridge, and studied at Padua; was rector of Harrow-on-the-Hill, 1511; archdeacon of Chester, 1515; master of the rolls, 1516; sent as commissioner to Brussels; dean of Salisbury, 1521; bishop of London, 1522; lord privy seal, 1523; ambassador to Spain, 1525, and France, 1527; bishop of Dunham, 1530; deprived of his bishopric, 1552, and committed to the Tower on a charge of treason; reinstated by Mary, but declining the oath of supremacy to Elizabeth was again deprived, 1559. He published *In Laudem Matrimonii*; *Compendium and Synopsis*, an abridgment of Aristotle's *Ethics*.

TUOLUMNE, a co. in central California; 2048 sq.m.; pop. '90, 6082, chiefly of American birth, with colored. In this county is Table mountain, 30 m. long and 6288 ft. high, with steep, perpendicular sides. Co. seat, Sonora.

TUPELO, *Nyssa*, a genus of trees of the natural order *alanziaceæ*, natives of North America, chiefly of the southern parts of the United States; having simple alternate leaves

mostly entire, greenish, inconspicuous flowers at the extremity of long stalks, the fruit a drupe. *N. villosa* attains a height of 60 to 70 feet. It is often called BLACK GUM TREE. *N. tomentosa*, the LARGE TUPELO, is a lofty and beautiful tree, remarkable for the extraordinary enlargement of the base of the trunk, which is sometimes 8 or 9 ft. in diameter, while at no great height the diameter diminishes to 15 or 20 inches. The fruit resembles a small olive, and is preserved in the same way by the French settlers in America. *N. candicans* or *capitata*, the OGEECHEE LIME or SOUR GUM TREE, is a small tree.

TUPPER, SIR CHARLES, Canadian statesman, b. in Amherst, Nova Scotia, in 1821. He studied medicine in Edinburgh, receiving the degree of M.D. In 1855 he was elected to the provincial parliament in Nova Scotia, and subsequently held the following offices: Provincial Secretary (1856); Premier (1867); President of the Council (1870); Minister of Inland Revenue (1872); Minister of Customs (1873); Minister of Public Works (1878), subsequently taking the portfolio of Railways and Canals. In 1867 he was made a C.B.; and in 1879, a Knight of the Order of Michael and George. He took a prominent part in Canadian federation, and enthusiastically aided the building of the Canadian Pacific Railway. In 1883 he was made Canadian High Commissioner at the English court; reappointed in 1888; was prime minister of the Dominion of Canada for a short time in 1896.

TUPPER, MARTIN FARQUHAR, D.C.L., F.R.S., a poet rather popular than great, was b. on July 17, 1810. His father, Martin Tupper, was a well-known London surgeon, of a family originally German, which had long been settled in Guernsey. Martin Tupper was educated at the Charter-house, and afterward at Christ Church, Oxford. On leaving college, he entered himself as a student at Lincoln's Inn, and was called to the bar in 1835; but literature had more charms for him than the law, which he never seriously prosecuted. In 1832 he published anonymously a small volume of poems, which attracted little attention. For this lack of success, he was, however, amply repaid on the appearance, in 1839, of his *Proverbial Philosophy*. The popularity of this work in England, and still more in America, has ever since been immense, and almost unprecedented. The critics have indeed been less kind to it than the reading public; and the fame of Mr. Tupper was long a topic of mirth to the wits of the literary guild; but from the serene height of his fortieth edition an author could perhaps afford to smile at the attacks of the envious generation below. A fair criticism would probably adjudge that, while there is nothing in Mr. Tupper's *Proverbial Philosophy* to justify its enormous success—so far as mere circulation is success—the book is yet something better than the mere conglomeration of stupid platitudes which its detractors so confidently proclaim it to be. Besides this work, on which his reputation—such as it may be—rests, Mr. Tupper published *The Crock of Gold*, a tale; *Geraldine*, a sufficiently ludicrous attempt to complete Coleridge's inimitable fragment *Christabel*; with various other works in prose and verse, which it is quite unnecessary to enumerate, inasmuch as no one of them succeeded in making the least impression on the public. He d. 1889.

TU QUOQUE ARGUMENT. See ARGUMENTUM AD HOMINEM.

TURANIAN LANGUAGES. In opposition to *Iran*, the name of their own country, the Persians from the earliest times called the countries lying to the n. of it Turan, and this name is still frequently used as synonymous with Turkistan. The term Turanian derived from it has been adopted by philologists, in contrast with Aryan (q.v.), to designate a family of languages comprising "all languages spoken in Asia and Europe (including Oceania), and not included under the Aryan and Semitic families, with the exception of Chinese and its cognate dialects." The languages of this family are of the agglutinate order (see PHILOLOGY). Max Müller classes them in two great divisions, the northern and the southern. The northern division falls into five sections—the *Tungusic*, *Mongolic*, *Turkic*, *Finnic*, and *Samoyedic*. Of these, the Tungusic dialects, which extend n. and w. from China, are the lowest in organization, being, some of them, nearly as destitute of grammatical forms as the Chinese. The Mongolic dialects are superior to the Tungusic, although the different parts of speech are hardly distinguished; both branches, however, are believed to be manifesting symptoms of grammatical development. The Turkic dialects, of which the Osmanli or Turkish of Constantinople is the most prominent, occupy an immense area, extending from the Lena and the Polar sea to the Adriatic. They are extremely rich in grammatical forms, especially in the conjugation of the verb. The most important members of the Finnic class are the Finnic of the Baltic coasts (see FINNS), and the Hungarian language, or Magyar (see HUNGARY).

The southern division comprises, among others, the *Tamulic* or Dravidian dialects of southern India (see TAMIL); the *Gangetic* group, in two branches, the trans-Himalayan or Thibetan (see THIBET), and sub-Himalayan (Bhotanese, etc.); the *Taic*, or the dialects of Siam; and the *Malaic*, or Malay and Polynesian dialects. The Turanian languages do not present the same unmistakable family likeness, the same clear evidences of genealogical relationship, as are presented by the Aryan and Semitic groups. The nature of their structure, and the nomadic character of the peoples speaking them, are sufficient to account for their exceeding diversity, even supposing them to have all sprung from the same original stock. "The only characteristic Turanian feature which always remains is this: the root is never obscured. Besides this, the determining or modifying syllables are generally placed at the end, and the vowels do not become so absolutely fixed for each syllable as in Sanskrit and Hebrew. On the contrary, there is what is

called the law of harmony, according to which the vowels of each word may be changed and modulated so as to harmonize with the key-note struck by its chief vowel. The vowels in Turkish, for instance, are divided into two classes, *sharp* and *flat*. If a verb contains a sharp vowel in its radical portion, the vowels of the terminations are all sharp; while the same terminations, if following a root with a flat vowel, modulate their own vowels into the flat key. Thus we have *sev-mek*, to love, but *bak-mak*, to regard, *mek* or *mak* being the termination of the infinitive. Thus, we say, *so-ler*, the houses, but *at-lar* the horses, *ler* or *lar* being the termination of the plural."—Max Müller's *Science of Language*, 1st series.

TURBARY, in the law of England, is a right to go upon the soil of another and dig turf, and carry away the same. It is classed under the head of a *profit à prendre*, and is generally traced to some ancient custom of a manor, or is proved by prescription, or long use for 30 years and upward.

TURBINE. See WATER-POWER.

TURBIDINÆ, a family of gasteropodous mollusks, having a spiral shell with a narrow entire aperture. The species are numerous; some of them are found on the British coasts. They are numerous and widely distributed. Some are large, others small; some are very beautiful. The beautiful pheasant-shells (*phasiunella*) of the South seas are referred to this family.

TURBOT, *Rhombus maximus*, a fish of the family *pleuronectidæ*, or flat-fishes, the most valuable of them all. The genus *rhombus* has the body rhomboidal; the dorsal fin commencing immediately above the upper lip, and extending almost to the tail-fin; the eyes generally on the left side. The brill (q.v.) belongs to it as well as the turbot, and some other less important fishes. The turbot attains a large size, sometimes 70 to 90 lbs. weight. Its form is shorter, broader, and deeper than that of almost any other flat-fish. It is of a brown color on the upper surface, which is studded with hard roundish tubercles. Like the other flat-fishes, it generally keeps close to the bottom of the sea; and it is found chiefly on banks where there is a considerable depth of water. Some of the banks in the German ocean abound in turbot—as the Dogger bank—and yield great quantities to the London market. The turbot, however, is also found, although more sparingly, in estuaries. In former times it was chiefly caught by long lines; but of late the greater part of the supply for the London market is obtained by beam-trawling (see TRAWLING). Few kinds of fish are more prized for the table than the turbot.—The AMERICAN or SPOTTED TURBOT (*rhombus maculatus*) is also highly esteemed for the table. It is common on the coasts of New England and New York. It attains a weight of 20 lbs. The breadth is about one-half of the length. The upper surface is smooth, reddish-gray, with large circular or oblong darker blotches, and numerous white spots.

TURDIDÆ. See MERULIDÆ.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, Vicomte de, one of the most eminent of France's military heroes, was the second son of Henri, duke of Bouillon, and Elizabeth of Nassau, the daughter of William I. of Nassau-Orange, the great assertor of the liberties of the Netherlands, and was born at Sedan, in the dep. of Ardennes, Sept. 11, 1611. Brought up in the Reformed faith, he was sent, on the death of his father in 1623, to Holland, where, under his uncle, the celebrated Maurice (q.v.), he was initiated into the art of war. Returning to France in 1630, he was favorably received by Richelieu, who at once gave him a commission. In 1637 he was attached to the army of Bernard of Weimar, which at that time was engaged in Lorraine; and by bringing about the capture of Landrecies, Maubeuge, and other places, including the key of western Germany, Brisach, gained such repute, that on his return to Paris (1638), he experienced quite a triumphal reception. The victories of Route and Casale in the Italian campaign of the following year, added to his laurels; and in 1641 he was for the first time intrusted with the supreme command. The rapid and thorough conquest of Roussillon from the Spaniards in 1642, was good proof of his masterly military genius, and was rewarded in 1644 with the baton of a marshal of France, and the chief command on the Rhine, where repeated reverses, a defective commissariat, and want of pay, had completely demoralized the army. But through a liberal expenditure of his own funds, and of loans obtained by him on his own security, the troops were speedily re-equipped; and by a victory over the Bavarians at Rottweil (1644), their *morale* was restored. Condé's arrival transferred him to a subordinate position; and his restoration to supreme command was followed by the commission of a glaring strategic error, for which he was severely punished by his able and watchful opponent, Mercy, who completely routed him at Marienthal, May 5, 1645; but on Aug. 3 of the same year, this disgrace was amply avenged by Condé at Nordlingen, where Mercy was slain; and Turenne gloriously concluded the war on the part of France by the reconquest of the Treves electorate, by the conquest of Bavaria in conjunction with the Swedes, and by a successful campaign in Flanders. In the civil wars of the Fronde (q.v.), which immediately followed, Turenne joined the party of the *frondeurs*, of whom his elder brother was one of the principal leaders; but after being defeated at Rethel (Dec. 15, 1650), he withdrew to Flanders, returning on Mazarin's retirement. On the minister's return, Turenne joined his party, while Condé deserted to the *frondeurs*, and the two greatest generals of the period were for the first time pitted against each other. Turenne was

uniformly victorious over his former chief, though his forces were inferior in number; and ultimately forced him to retire from France; after which he subdued the revolted cities, crossed the northern frontier, and conquered much of the Spanish Netherlands. In 1667, on the outbreak of war between France and Holland, Louis XIV. made him marshal general of France, and would have made him constable, had he not been a Protestant. Indeed, the unorthodoxy of Turenne had for some time been a matter of grave concern to the bigoted young monarch, at whose suggestion Bossuet attempted the veteran's conversion by composing his celebrated *Exposition de la Doctrine Chrétienne*, which, backed by the king's repeated solicitations and remonstrances, and doubtless, as Voltaire suggests, by the more efficacious promptings of ambition, had ultimately the desired effect. Turenne's campaign in Holland, in which he was nominally under Louis's command, was a most triumphant one; and the elector of Brandenburg, who had ventured to side with the Dutch, was pursued to Berlin (1672), and forced to beg for peace. The emperor next took up arms on behalf of Holland, whereupon Turenne was transferred to the Upper Rhine. This, his last campaign, is foully disfigured by the horrible devastation of the Palatinate, executed under express orders, doubtless, but with a willing thoroughness which is utterly unjustifiable. After routing the Germans at Mulhausen and Turckheim, and forcing them across the Rhine, he was at last opposed to a worthy antagonist in Montecuculi (q.v.); but, unfortunately, their famous passage of strategy of nearly half a year's duration was left unfinished. Turenne being killed while reconnoitering the ground at Salzbach, with a view to a grand engagement. His grateful sovereign, to show that he made no distinction *entre porter le sceptre, et le bien soutenir*, ordered him to be entombed at Saint Denis, and funeral orations were pronounced for him by Flechier and Mascaron. On the desecration of Saint Denis during the revolution, Turenne's monument suffered with the rest, and was ultimately placed by Napoleon under the dome of the Invalides. Turenne has left memoirs of his campaigns from 1643 to 1658, which are of considerable interest to the student of history. Many biographies of this eminent warrior have been written, by Raguenet, Ramsay, Buisson, D'Avrigny, etc.

TURF. See HORSE RACING.

TURF LAWS. The laws concerning the ancient pastime of horse-racing are subdivided into those affecting races, wagers, and betting-houses, for which last, see BETTING. 1. As to racing. The stewards or persons intrusted with the management and possession of the land for the time have a right, which is seldom enforced, to turn off any person they please from the grounds. Many of the great races are not run within a year from the time the horses are entered. The owner of a horse entered can withdraw or "scratch" him before the race is run. When the race is run, the successful party may sue for the amount of the stakes; and if the race is not run, or cannot be run, each subscriber may sue for recovery of his contribution. If the stakes are contributed for an illegal game, it is otherwise; and before the stakes have been paid away, any contributor may sue for and recover his deposit; but he ought also formally to demand it back. The stewards decide all disputes about the fairness of a race, and their award is binding: if they cannot agree, then it will fall to be decided by a jury.—2. As to wagers. But by the ordinary statutes of wagers, all wagers were declared void, except as regards subscriptions of money or plate to be awarded to the winner of a lawful game, sport, pastime, or exercise. If one makes a wager on a race, he may retract it at any time before the event comes off, and require the money, if deposited, to be repaid; and no wager can be tried in any court of law or equity, so that the winner cannot compel payment. It is merely a debt of honor.

TURGENEFF, ALEXANDER IVANOVITCH, 1784–1845; b. Russia; traveled extensively in Germany, Italy, France, and Denmark, making investigations in regard to the mediæval history of Russia. He published *Historiæ Russiæ Monumenta*, 2 vols. (1841–42); and *Supplementum* (1848).

TURGÉNEFF, IVAN SERGÉYEVITCH; Russian author; b. Orel, Oct. 28, 1818; d. Bougival, France, Sept. 3, 1883. He was educated at Moscow, St. Petersburg, and the university of Berlin. After his return to Russia he obtained a situation in the office of the minister of the interior. His first published work was a poem, *Parasha* (1843); his first story, *Andreï Kolosov*, appeared in 1843. In 1852 he was imprisoned, owing to an article he published on *Nicholas Gogol*, and was then interned at his estate for two years. After 1855 he lived in Baden-Baden and in Paris, visiting Russia at intervals. Until within a few years before his death he was unpopular in Russia, and was especially disliked by the Liberals, by whom he was denounced as a reactionist. The last works that appeared from his pen, his exquisite poems in prose (1882), and a mystical novel, *Clara Militch*, revealed his patriotism—often called into question—and his sorrow at being misunderstood by his friends. Extremely sensitive to the sensuous impressions of life, he yet possessed the religious impulses, with a deep insight into the complexity of the soul. His writings give a large account of life, dealing with all classes, types, degrees of fortune, and phases of manner; but they are tinged with a sadness bordering upon pessimism, and with that fatalism which is noticeable in the writings of George Eliot. His other writings include the novels: *Fathers and Sons* (1862), perhaps his masterpiece; *Smoke* (1867); *Virgin Soil* (1876), and numerous short sketches, tales, etc.; *Two Friends* (1853); *Still Life* (1854); *Dimitri Rudin* and *Faust* (1856); *A Nest of Noblemen* (1859); *On*

the Eve and First Love (1860); *Visions* (1861); *The History of Lieut. Jergunov* (1866); *The Brigadier* (1866); *King Lear of the Steppe* (1870); *An Unfortunate Woman* (1868); *Tschertopchanov's End* (1872); *The Dream* (1876), etc. A new English edition, by Mrs. Constant Garnett, was in course of publication in 1897.

TURGÉNEFF, NIKOLAI, 1790-1871, b. Russia; educated at Göttingen. He entered the Russian civil service, and in 1813 was associated with baron Stein in governing the German provinces taken from France. He was afterward deputy secretary of the interior and agriculture. He advocated the emancipation of the serfs, and in 1825 was sentenced to death for his connection with the attempt at revolution in 1825. He escaped to Paris, where he published *La Russie et les Russes* (1847).

TURGOT, ANNE ROBERT JACQUES, French statesman, b. in Paris, May 10, 1727, was descended from one of the oldest families in Normandy. Turgot was destined for an ecclesiastical career, but adopted by preference the profession of law. In 1761 he was appointed intendant of Limoges, and administered the affairs of the province for thirteen years. He introduced a more equitable administration of imposts, and succeeded in abolishing the old method of repairing roads and bridges by the compulsory labor of the poor inhabitants of the district, called *corvées*. He also exerted himself in providing for the subsistence of the people and the protection of commerce. He introduced into the Limoges the cultivation of potatoes. A wider field opened before him on the death of Louis XV. The finances were in a terrible state of disorder, the whole social and political system of France needed regeneration and reform; and Turgot appeared to be the man to meet the crisis. He was first made minister of marine, and afterward comptroller-general of France, when to fill that post was to be virtually the prime minister. In his letter to Louis XVI., he adopted, as the principle of his administration, that there should be "no bankruptcy, no augmentation of imposts, no loans;" yet he foresaw that the strength of the privileged classes; and the corrupt influence of those who profited by abuses, would be too much for him, and that against such enemies he could hardly hope to retain the confidence of the king. His first task was so far to reduce the expenditure as to leave a surplus of 20 millions of francs a year, to be applied to the liquidation of old debts. He augmented the public revenue without imposing new taxes, and he introduced exactness of payments and fidelity of engagements into all his financial operations. One of his first measures was the carrying out of free-trade in corn throughout the interior of the kingdom. He constantly occupied himself with the amelioration of the condition of the people. He proposed to enfranchise the rural districts from statute labor, provinces from their barriers, commerce from internal duties, trade from its shackles, and lastly, to make the nobility and clergy contribute to the taxes in the same proportion as the third estate. This great minister and virtuous citizen, of whom his colleague, Malesherbes, said: "He has the head of Bacon, and the heart of L'Hopital," wished, by means of provincial assemblies, to accustom the nation to public life, and prepare it for the restoration of the states-general. If the nobility and privileged classes had possessed enough of foresight and patriotism to submit to his plans for reforming France, she might have been spared the horrors and excesses of the revolution. But his projects for the public good were defeated by the confederacy formed against him by nobles, courtiers, farmers of the revenue, and financiers. The king forsook him, although, at the same time, observing that Turgot and himself were the only persons who desired the welfare of the people. He retired, having held office for only twenty months. It is alleged against his practical talent for statesmanship, that he labored under a want of address, and that he did not sufficiently dissemble his hatred and contempt for the cowardice and baseness of those who fattened upon the abuses that were eating like an ulcer into the heart of France. After his retirement, he resumed his early worship of the muses. His Latin inscription for the portrait of Franklin is a line of which any author might be proud: "*Eripuit celo fulmen, sceptrumque tyrannis.*" He also devoted himself to physics and mathematics. His works are a mine of sound and original thought. His *Mémoire* on the American war expresses views on the nature of colonies which have since been adopted by the best writers. His work on *Usury* contains almost all that is of value in Bentham's *Letters on the Usury Laws*. He held general objections to charitable institutions. He died of gout, Mar. 20, 1781, leaving behind him a memory which France will ever cherish with veneration.

TURIN (*Augusta Taurinorum, Bodincomagus, Colonia Julia, Taurasia*—in Italian, *Torino*), a city of northern Italy, formerly capital of Piedmont, then of the kingdom of Italy, is situated near the confluence of the Po and the Dora Ripaira, 45° 4' n. lat., 7° 42' e. long. Its pop. at the beginning of this century was 42,000—in 1863 it was 235,000; in 1895 it was 345,000. It began to acquire importance when Amadeus V. declared it the capital of Savoy in 1418; built a castle there, and made it his residence. In 1620 Charles Emanuel I. enlarged the city by royal decree: it was still more enlarged in 1673 and in 1702. At the beginning of this century the French destroyed and leveled the ramparts of the town, converting them into public promenades. Of late years the moats and fortifications have been demolished to make way for new streets toward Pota-Susa. In consequence of these improvements Turin has become one of the handsomest cities in Europe. It is famed for its handsome squares. Some of the finest are—Piazza Carlo, surrounded by wide porticoes, and adorned by a fine equestrian statue of Emanuel Philibert of Savoy, by Marochetti; Piazza Castello, also surrounded by

porticoes, which are prolonged down via Po to the end of Piazza Vittorio Emanuele, the finest square in Europe for size, regularity of architecture, and beauty of situation; Piazza Carlo Felice, with porticoes and a fine garden; Piazza Carlo Alberto, with an equestrian statue of the king of that name by Marochetti; Piazza d'Armi, a vast open space for military exercises, flanked by the old and new arsenals of the kingdom. Leading out of Piazza Vittorio Emanuele, there is a handsome five-arched bridge across the Po, begun by Napoleon I., with money got by the sale of the jewels and votive offerings of the cathedral, and finished by the kings of Sardinia. Another fine bridge is that across the Dora, of one single arch, nearly straight, the work of the engineer Mosca. Among the numerous churches, the principal are the cathedral of San Giovanni, a Gothic structure built in the 7th c. and reconstructed 1492-98; San Filippo, the handsomest church in Turin; La Consolata; La Gran Madre di Dio; and a Waldensian temple. On the summit of a hill near the town is La Superga, a splendid basilica, raised by Victor Amadeus II. to fulfil a vow, and now the mausoleum of the house of Savoy. Among the "palaces" must be noticed the royal palace designed by Castellamonte, which is poor in outward appearance, the Carignano palace, an odd building, by Guarini; the town-hall, designed by Lanfranchi; the university, with 85 professors and about 2300 students, a library of 200,000 vols., and 3000 MSS.; the Accademia delle Scienze, with an Egyptian museum, the finest in Europe; the seminary; the hospital of San Giovanni. The private palaces are numerous and vast, but in a bad style of architecture. There is the theater royal; the Carignano theater, designed by Alfieri; the Vittorio Emanuele, and many other theaters.

The manufactures of Turin consist of woolen and silk fabrics, matches, paper, pottery, leather, arms and liquors. The population is sober, industrious, and generally well off.

Turin was originally inhabited by the Taurinians, a tribe of Ligurians. It is first mentioned in history in the time of Hannibal, by whom it was taken and sacked, on his descent into Italy after crossing the Alps. Turin became a royal colony 166 B.C., and was called by Augustus, *Augusta Taurinorum*. On the fall of the empire it went to the Lombards, and became the capital of one of the 30 Lombard duchies. Charlemagne made it the residence of the duke of Susa, whose line ruled till 1032, when the house of Savoy succeeded it. It was taken by the French in 1506, and held by them for nearly 60 years. They again took it in 1640; and in 1796 it was dismantled, and united to the French empire in 1800 with the name of the department of the Po. In 1815 it was restored to the house of Savoy. From 1861-65 it was the capital of United Italy. The city is also eminent for having been the birthplace of many men of mark, among whom may be mentioned Cesare Balbo, D'Azeglio, and Cavour, all prominent statesmen; Gioberti, the philosopher and writer; Marochetti, the sculptor, and Lagrange, the mathematician.

TURKESTAN, or TOORKISTAN. See TURKISTAN.

TURKEY *Meleagris*, a genus of gallinaceous birds of the family *pavonidae*, or, according to some ornithologists, of a distinct family, *meleagridae*, both, however, being included by others in *phasianidae*. The head is bare, the neck wattled, and the bill of the male surmounted with a conical fleshy caruncle, sometimes erected, sometimes elongated and pendulous. A curious tuft of long hair springs from the base of the neck of the male, and hangs down on the breast. The bill is rather short, strong, and curved, the tail is broad and rounded, capable of being erected and spread out, as the male delights to do when he struts about in pride, with wings rubbing on the ground, uttering his loud peculiar *gobble*. The COMMON TURKEY (*M. gallo-pavo*), the largest of gallinaceous birds, well-known as an inmate of our poultry-yards, is a native of North America. It appears to have been introduced into Europe in the beginning of the 16th c., and is naturalized in some places, as it may be said to have been in the royal park of Richmond, near London, in the first half of the 18th century. In a domesticated state the turkey varies much in plumage; in its wild state this is not the case. The plumage of the wild turkey is also richer, and its power of wing greater; but the wings even of the wild bird are short, scarcely extending beyond the base of the tail. The darkest-colored of domesticated turkeys most nearly resemble the wild turkey in plumage. In its native woods it seems to attain even a larger size than in the poultry-yard. Turkeys were once plentiful in the forests of the Atlantic states of North America, and as far n. as lower Canada, but have disappeared as cultivation has advanced, and have become rare even in the eastern parts of the valley of the Mississippi, where their numbers were once very great. The turkey is found as far s. as the isthmus of Darien, but does not occur to the w. of the Rocky mountains. It inhabits the woods of the larger islands of the West Indies. In warm climates it is said to produce two or three broods a year; but in colder countries it produces only one. The males associate in flocks of from 10 to 100, and seek their food during great part of the year apart from the females, which go about singly with their young, or associate in flocks, avoiding the old males, which are apt to attack and destroy the young. At the pairing-time desperate combats take place among the males. Wild turkeys roost on trees. They feed on all kinds of grain, seeds, fruits, grass, insects, and even on young frogs and lizards. They make their nests on the ground, merely gathering together a few dry leaves, and often

in a thicket. The eggs are usually from 9 to 15 in number, sometimes 20. They spread themselves in summer over the higher grounds; but in winter congregate in the rich low valleys. The sexes mingle in winter and form larger flocks than in summer.

On account of its size, and the excellence of its flesh and eggs, the turkey is one of the most valued kinds of poultry. The management of it differs little from that of the common fowl. The young are tender for the first few weeks, and require care, particularly to keep them from getting wet by running among the wet grass, or the like; but afterward they are sufficiently hardy. Nettles are excellent food for turkeys, and are often chopped up for them, to be given in addition to grain, bran, boiled potatoes, and other such food.

Another known species of turkey is *Meleagris ocellata* (Cuv.), a native of Honduras. It is not quite so large as the common turkey, and has a smaller tail. The neck is less wattled, but the head has a number of fleshy tubercles. The plumage is beautiful, rivaling that of the peacock in metallic brilliancy: blue, green, bronze, red, and golden hues being intimately and finely mingled, and forming eyes on the tail; whence the specific name. A variety of our common turkey, *gallopavo*, the *M. Mexicana* of Gould, inhabits the table lands of the southern United States and Mexico. Extinct species are represented by *M. altus* and *M. celer* (Cope) from the post-pliocene beds of New Jersey, and *M. antiquus* (Marsh) from the miocene beds of Colorado. Audubon chose the wild turkey as a device for his private seal, and it is said that when it was proposed to select some bird for an emblem of the new American republic, Benjamin Franklin suggested the wild turkey, this being peculiar to the western continent.

TURKEY, or the **OTTOMAN EMPIRE** (q.v.), includes large portions of the continents of Europe, Asia, and Africa, and consists of Turkey proper, which is under the direct rule of the sultan, and of several dependent and tributary states. The arrangements sanctioned by the Berlin congress in 1878 have largely changed the size and organization of the empire. Turkish affairs could not soon be expected to settle into equilibrium; and on most subjects trustworthy statistical results are at best approximate.

The *Statesman's Year-Book* of 1897 gave the following estimate of the area and population of the Turkish empire based on the census of 1885, still incomplete:

| | Square Miles. | Population. |
|-----------------------------------------------------------------|---------------|-------------|
| Immediate Possessions: | | |
| Europe..... | 61,200 | 4,780,000 |
| Asia..... | 687,640 | 21,608,000 |
| Africa (Tripoli)..... | 398,738 | 1,300,000 |
| | 1,447,578 | 27,688,000 |
| Bulgaria (including Eastern Roumelia), autonomous province..... | 37,860 | 3,154,375 |
| Bosnia, Herzegovina, and Novibazar, under Austria-Hungary..... | 23,570 | 1,504,091 |
| Samos, tributary principality..... | 232 | 48,500 |
| Egypt..... | 400,000 | 6,817,265 |
| | 461,662 | 11,524,231 |
| | 1,609,240 | 39,212,231 |

The estimates of 1885 are, of course, radically different from those made before the Berlin congress of 1878 (see History of the **OTTOMAN EMPIRE**). This congress, which met primarily to revise the "preliminary" treaty of San Stefano, concluded between Russia and Turkey at the close of the war of 1877-78, has revolutionized the relation of the Porte to the subject Christian principalities and provinces, alienated large portions of hitherto Turkish territory, and inaugurated what must necessarily be a new era in the history of the Ottoman empire. The principal results of the congress's work are treated under the several heads of the states they chiefly concern (see **ROMANIA**, **SERVIA**, **MONTENEGRO**, **BULGARIA**, etc.), but must here be briefly summarized.

The vassal states Romania and Servia, as well as Montenegro, were declared independent, and each obtained a change or extension of territory; Romania, which had to yield up its portion of Bessarabia to Russia, received in compensation the Dobrudscha, cut off by a line from Silistria to Mangalia. Servia was considerably extended to the south. Montenegro received an addition chiefly on the Albanian side, including Antivari; and in 1880, Dulcigno, including part of the Adriatic sea-board of Antivari. What was formerly the Turkish vilayet of the Danube, was, with the exception of the Dobrudscha, now Romanian, constituted a tributary but automatic principality, its southern boundary being the Balkan range. A large territory to the s. of the Balkans was constituted into the separate province of Eastern Roumelia, and though remaining directly under the military and political authority of the sultan, secured the right of having a Christian governor-general and administrative autonomy. It was agreed that Herzegovina and Bosnia, excepting a small portion of the latter, should be occupied and administered by Austro-Hungary, and thus in large measure alienated from the porte; Spizza and its sea-board, immediately n. of Antivari, was incorporated with Dalmatia; Greece was to receive additional territory; the congress recommending that the rectified frontier should

run up the Salambria river from its mouth, cross the ridge dividing ancient Thessaly from Epirus, cut off the town of Janina so as to leave it to Greece, and descend the Kalamas river to the Ionian sea. In Crete the reformed government promised in 1866 was to be immediately and scrupulously carried out. In Asia the changes were much less considerable; the port of Batum, henceforth to be essentially commercial, Kars and Ardahan, with a portion of Armenia, were ceded to Russia, and Khotour, e. of lake Van, to Persia; the porte engaging to carry out at once much-needed administrative reforms in Armenia and elsewhere. By the "conditional convention," made in 1878, between Turkey and the United Kingdom, the English government undertook to defend the porte's dominions in Asia, and received in return the right to occupy and administer Cyprus. The rectification of the Greek frontier was not arranged till 1881. After endless negotiations and procrastination, which for a while seemed almost certain to lead to war, the porte agreed to cede, and Greece to accept, a considerable portion of territory, though less than the congress of Berlin had recommended. The new frontier gave to Greece all Thessaly, s. of the water-shed, forming the n. boundary of the valley of the Salambria (anc. *Peneus*), including the towns of Larissa and Trikhala; and in Epirus follows the line of the Arta river, leaving the town of Arta to Greece. The fortifications of Prevesa were to be destroyed by the Turks, and the Gulf of Arta was to be neutral.

During the years 1895, 1896, and 1897 the attention of the whole civilized world was drawn to Turkey in connection with the relations of the Porte to Armenia, Crete, and Greece.

First.—The Armenian massacres. Reports as to the origin of the trouble in Armenia are conflicting, some placing the blame wholly upon the Porte, others accusing the Armenians of rebellious designs and of seeking to provoke the Turks to atrocities in order to draw upon the victims the sympathy of European powers and to make a general rising successful. In 1894 a war arose between the Armenians and the Kurds, and later in the year there was a series of massacres of the Armenian peasantry in the Sasun district. An attempt of Turkish officials to levy taxes upon the Armenians was repulsed and the authorities at Constantinople were given to understand that a serious insurrection had broken out. A force of regulars was thereupon dispatched to Sasun and, under the appearance of suppressing the revolt, committed numerous acts of cruelty. At the request of the European representatives, a commission of inquiry was appointed by the sultan to investigate the nature of the alleged atrocities. The European members of this commission, in their report, outlined a scheme of reforms which, however, the Porte hesitated to accept. In the meanwhile, the sultan appointed a separate commission to draw up an independent plan of reforms. The powers persisted in demanding the execution of the reforms proposed by their ambassadors and the Armenians also petitioned the Porte for a redress of grievances. Before the sultan had replied to the demands of the powers, conflicts took place between the Armenians and the Turks, and several hundreds of the former were massacred at Trebizond in October, and atrocities were committed by the Kurds at Diarbekr. The French, British and Russian ambassadors now renewed their demands of the sultan, who finally (Oct. 17th, 1895) announced his agreement to them. From inability, or through a deliberate purpose, the Porte failed to carry out these measures, and the foreign powers, at the instance of Great Britain, began to consider the advisability of adopting coercive measures. The Russians opposed this plan as contrary to the treaty of Paris and forbidden by implication in the treaty of Berlin. They favored a policy of delay, in the hope that the sultan would be able to set the administrative machinery in motion and improve the condition of the Armenians. The British government, finding that this view was held by some of the other European powers, reluctantly acquiesced. On an investigation by the embassies of the foreign powers at Constantinople, it was declared, early in 1896, that 25,000 Armenians had been massacred up to that time, not including those whose lives had been taken in massacres of which no official reports were procurable. In August, 1896, the Ottoman bank at Constantinople was seized by a party of Armenians, who threatened to blow it up, sacrificing their own lives along with the lives of the officials in the building, unless they were allowed to leave the country in safety. This outbreak on their part led to two days of rioting in the streets of Constantinople, which resulted in the slaughter of thousands of the Armenians. The sultan having consented reluctantly to the withdrawal of the insurgents in the Ottoman bank, they were secretly taken on board a vessel and shipped to Marseilles. The effects of this riot were the exportation, or massacre of fully one-half of the Armenian residents of Constantinople. The powers now protested to the Porte against the butcheries committed by the Turks in Constantinople and the protest was renewed in the following month. In October, 1896, the Porte finally yielded to the pressure of the powers and opened negotiations with the Armenian revolutionary committee. It was announced, in November, that the government was ready to introduce the promised reforms. In January, 1897, several remedial measures were put into effect, such as the appropriation of a sum for Armenian relief, the remission of some of the taxes, and the introduction of some administrative reforms. For several months there was a cessation of the outrages, but the suffering of the Armenian peasantry was intense. Some relief was afforded through the activity of the American Red Cross society, which, though at first refused permission by the sultan to enter his dominions, finally gained access to certain of the desolated districts. In 1896 and 1897 the importance of the Porte's relations with Crete and Greece drew attention away from the Armenian difficulty.

Second:—Crete. As a result of the recommendations made by the Berlin congress, the Halepa pact was formed, granting Crete a fair measure of autonomy. This required the appointment of a Christian governor for five years, but the military governor still remained a Mohammedan. There were factional strifes among the islanders and affairs were for several years in confusion. Finally, after the elections of 1888, the defeated party took up arms, and bloodshed resulted. This led to the sending of a Turkish governor to the island with military authority, and to the withdrawal of the chief provisions of the Halepa pact in 1889. For several years the Christians submitted, but refused to go to the polls, and other things manifested marked discontent. In 1894 the Porte appointed a new governor, Karatheodory Pasha, a Christian, and the assembly met for the first time since 1889. The islanders now demanded reforms from the Turkish government and the feeling between the Moslems and the Christians ran high. In the spring of 1896 the Christian governor was recalled and a Mussulman sent in his place. The discontent now took the form of an open revolt. The powers intervened, and, desiring to secure peace until their representations had induced the Porte to grant reforms, proposed a pacific blockade of the island. This was resolutely opposed by Great Britain. The reforms which the powers pressed upon the Porte were finally accepted. They included the renewal of the pact of Halepa and the extension of some of its provisions. The governor was to be a Christian and the subordinate officials should consist, two-thirds of Christians and one-third of Mussulmans. Instead of the Porte's having a general claim on all the revenue, only a definite part was to go to it. Unfortunately, the carrying out of these reforms was delayed, and the Cretans, suspecting bad faith, again broke out in revolt. The difficulty was complicated by the fact that the Greek people, who had all along sympathized heartily with the Cretans, supplied them continually with money and arms. In February, 1897, the Greek government declared that ties of race and religion compelled it to intervene on behalf of the Cretans. An army of occupation was sent to Crete with orders to protect the Christian families and to restore peace. This action of Greece led to a protest from the Porte to the powers, and the latter resolved on a peaceful blockade of the island. The blockade went into force in March, 1897. When warned by the powers of the intended blockade, Greece replied with the suggestion of a compromise, but requested that the Cretans should be allowed to decide for themselves whether they preferred autonomy or union with Greece. With a strong feeling both in Crete and Greece in favor of union, it seemed probable that the latter power would persist, even at the risk of war. This proved to be so. Preparations for war were made by Turkey and Greece, and the troops were massed near the borders of Thessaly. In March the Crown Prince left Athens to take command of the Greek forces on the frontier.

Third:—War with Greece. For some of the details of the conflict between Turkey and Greece, see the article GREECE. The success of Turkey gave her a firm position in international affairs. The peace negotiations dragged on for some time, but, on Sept. 18, 1897, the preliminary treaty of peace was signed. Turkey demanded at first a considerable portion of Greek territory, as well as a large indemnity. The attitude of the powers was opposed to any violation of the integrity of Greece, but in regard to the indemnity, it was proposed that one or more of the foreign governments should assume control of the Greek financial administration, with a view to insuring the payment of the sum demanded by Turkey. Although the powers refused to admit Turkey's demand for a large accession of territory, they acquiesced in a so-called strategic rectification of the frontier between Turkey and Greece. This gave the victorious power control over many of the important strategic points, such as the mountain tops and passes which are capable of fortification along the line of the Thessalian frontier.

TURKEY IN EUROPE, generally hilly and undulating, is traversed by a mountain system which has its origin in the Alps, enters Turkey at the n.w. corner, and runs nearly parallel to the coast, under the names of the Dinaric Alps and Mt. Pindus, as far as the Greek frontier. This range sends numerous offshoots e. and w.; the great eastern offshoot being the Balkans (q.v.) range, with its numerous branches to n. and south. The rivers of Turkey are chiefly the tributaries of the Danube; the Maritza, Strumo, Vardar; the Narenta, Drin, and Voyutza. On the high lands, the cold is excessive in winter, and the heat of summer is almost insupportable in the western valleys. Violent climatic change is, on the whole, the rule in European Turkey; but those districts which are sheltered from the cold winds, as the Albanian valleys, enjoy a comparatively equable temperature. The wild animals are the wild boar, bear, wolf, wild dog, civet, chamois, wild ox.

TURKEY IN ASIA.—This portion of the Turkish empire is more hilly than the other, the two almost parallel ranges, Taurus and anti-Taurus, which are the basis of its mountain-system, cover almost the whole of the peninsula of Asia Minor or Anatolia (q.v.), with their ramifications and offshoots, forming the surface into elevated plateaux, deep valleys, and inclosed plains. From the Taurus chain, the Lebanon range proceeds southward parallel to the coast of Syria, and diminishing in elevation in Palestine, terminates on the Red sea coast at Sinai. Besides the Euphrates (q.v.), Tigris (q.v.), and Orontes (q.v.), the only important rivers of Turkey in Asia are the Kizil-Ermak, which rises on the borders of Cilicia, and after a devious course across the peninsula, falls into the Black sea, near Samsoun; the Meander and Sarabat, which flow to the Ægean; and the Sakaria, which empties itself into the Euxine. On the whole, Turkey in Asia is ill-supplied with water; and though the mountain slopes afford abundance of excellent

pasture, the plains, and many of the valleys, especially those of the Euphrates, Tigris, and Jordan, are reduced by the parching droughts of summer to the condition of sandy deserts. In ancient times, these now desert districts were preserved in a state of fertility by artificial irrigation; but during the six centuries of almost constant war which convulsed this once fair region, the canals were neglected, and have, ever since the rise of the Osmanli power, remained in an unserviceable condition. The fauna includes the lion (e. of the Euphrates), the hyena, lynx, panther, leopard, buffalo, wild boar, wild ass, bear, jackal, jerboa, and many others; and the camel and dromedary increase the ordinary list of domestic animals. In Africa, Tripoli and Egypt are still tributary. See TUNIS.

Industries, Manufactures, and Trade.—Owing to the natural fertility of the soil, the land yields sufficient materials for the comparatively unimportant manufactures of the country, despite the primitive methods employed in agriculture. The unsettled conditions have checked the development of industry. There is a lack of enterprise among the natives, and foreign capital is kept away by the insecurity of investments. The delays and uncertainties in the administration of justice and the prejudice against foreigners make Turkey an unattractive field for the western investor. The factories are few in number. In Constantinople there are factories for boots and shoes, cotton cloth and felt hats and caps, all owned by the government, as well as a few establishments belonging to private persons, including manufactures of ice, glass, beer, paper, cotton yarn, and tobacco. In 1896 a considerable decrease was reported both in the industries and in the foreign trade, owing to the political disturbances outlined in a preceding paragraph; but exact statistics could not be obtained. Many of the principal products of Turkey find a market in the United States, especially carpets, rugs, opium, mohair, attar of roses and wool. Other exports are gum tragacanth, nuts, paper, canary seed, millet, skins, tobacco, raw silk, and iron ore. The chief trade of Turkey is with Great Britain, France, Austria, Russia, Bulgaria, Persia, Italy, Roumania and Egypt. In 1892-93 the exports amounted to 1,557,204,200 piasters, and the imports to 2,446,698,542 piasters, the piaster being equivalent to 4.4 cents in United States currency. Internal and coastwise trade suffers from the inadequate transportation facilities, but some improvements have been made in this respect, such as the construction of new quays at Constantinople and the building of new railway lines both in European and Asiatic Turkey. In 1896 there were 2423 miles of railway open for traffic. Communication with the United States is by steamers from Constantinople to Liverpool, Marseilles, Hamburg, Havre and Genoa, at which ports the goods are transferred to vessels bound for the United States.

Administration, Religion, Education.—The government of Turkey has always been a pure despotism, the constitutional reforms proclaimed in 1856 and 1876 not having been carried out. The power of the sultan is absolute, provided it is in conformity with the recognized principles of the Mohammedan religion as laid down in the Koran. Under his supreme direction there is the Sheik-ul-Islam, who is the head of the church and the chief of the Ulema (q. v.), a body of theologians, jurists and teachers. At the head of the civil administration, under the sultan, is the Grand Vizier who is aided by a privy council, termed the Medjliss-i-Hass. The empire is divided into 31 governments, called vilayets, which, in turn, are subdivided into sanjaks, or provinces. At the head of each vilayet is a vali, or governor-general, who is assisted by the provincial council, and at the head of the sanjaks are subordinate officers. The prevailing religion is Mohammedanism. According to the latest figures available in 1896, the Ottoman empire, as defined by the treaty of Berlin, contained 16,000,000 Mohammedans and 5,000,000 Christians. These estimates do not include the Arabian and African provinces, which were thought to contain about 7,000,000 Mohammedans. The Mohammedan population is unequally distributed throughout the empire, comprising the great majority of inhabitants in Asiatic Turkey, but only about one-half of those in European Turkey. Nominally the non-Mohammedans enjoy toleration, being recognized by the government, and having the right of possessing their own ecclesiastical organizations. There are seven non-Mohammedan sects thus recognized, namely the Roman Catholics, the Greeks, Armenians, Maronites, Syrians and United Chaldeans, Protestants, and Jews. Education is in a backward condition, although, since 1847, some efforts have been made to promote it. There are public schools in most of the Turkish towns, and colleges for secondary education in connection with the chief mosques.

Revenue and Debt.—Turkey has been under a sort of financial tutelage since 1881, when a council of administration, representing the interests of the foreign bondholders, was formed at Constantinople. Down to that time there was great uncertainty in regard to the actual revenue and expenditure of the Turkish government. Estimates were given, but the budgets were so framed as either to show a surplus or to make the income and disbursements balance each other, while it was notorious that there were heavy deficits year by year. Years before the war of 1877, the Turkish exchequer was evidently on the brink of insolvency, and the effect of that war was greatly to add to the indebtedness. It virtually declared itself bankrupt and, in 1881, permitted the appointment of the above mentioned council of administration for the benefit of its creditors. In 1895-96 the net revenue collected by the council was £1,942,852. The loans outstanding in 1896 amounted to £131,514,124. For some account of the military and naval forces of Turkey, see the articles ARMIES, MODERN and NAVIES, MODERN. The history of Turkey down to the Congress of Berlin is given under OTTOMAN EMPIRE.

TURKEY BUZZARD. See **VULTURE.**

TURKEY-RED. This celebrated color—the most durable, and perhaps one of the most beautiful which has yet been produced on cotton—is dyed by a process supposed to have been practiced in India from immemorial time. It passed from thence through other parts of Asia to the countries of the Levant, and was introduced into France about the middle of last century. The first successful attempt to introduce it into Great Britain was made in Glasgow in 1783, by a Rouen dyer named Papillon, in conjunction with Mr. George Macintosh, the father of the inventor of waterproof cloth. They established the celebrated Turkey-red business now carried on by Messrs. Henry Monteth & Co. By an agreement with the trustees for manufactures in Scotland, Papillon allowed them to make his process public in 1803; and since then, Turkey-red dyeing has been extensively carried on in Glasgow and its neighborhood, and also in Lancashire.

There is a mode of dyeing cotton red with madder practiced by calico-printers—the cloth being previously bleached with chloride of lime—where the whole process only occupies a day or two. But in the case of Turkey-red, which is also a madder-dye, the operations are long and tedious, and the bleaching with chloride of lime especially objectionable. The following is an outline of the steps in the Turkey-red process, as usually conducted: 1. Unbleached calico is thoroughly washed at a dash-wheel or other washing-machine, and then boiled for some time in a solution of carbonate of soda. 2. The cloth is soaked in a bath containing a soapy emulsion of olive oil, sheep's dung, carbonate of soda, and water; and allowed to remain for a week or more impregnated with the solution, after which it is aired in the field, and dried in stoves. This operation is repeated at least three times. 3. The next stage, sometimes called "liquoring," consists in passing the cloth through an emulsion of olive oil and carbonate of soda, but without sheep's dung; after which it is aired in the field, and dried in stoves, as in the last operation. The "liquoring" is repeated at least four times. 4. The cloth now requires to be soaked in a weak alkaline lye of pearl-ash and soda, in order to remove any excess of oil. 5. The cloth is warmed in a bath containing a mixture of powdered oak-galls and sumac, or either of these substances alone, the operation being sometimes called "galling," and sometimes "sumaching." 6. The cloth is next steeped for twelve hours in a solution of alum, partially neutralized by carbonate of soda, but sometimes acetate of alumina is used instead of alum. Without this treatment, the dye could not be fixed upon the cotton. See **DYEING**. 7. When thoroughly washed, the cloth is ready to receive the red dye, which is produced by immersing it in a decoction of madder, to which some chalk and bullock's blood are sometimes added. It is put into the dye-beck when cold, and kept in it for two hours after it has been raised to the boiling-point. 8. It is next boiled in a weak solution of soap and soda, which removes a brown coloring matter present in the madder-dye, but more fugitive than the red portion. 9. Finally, the dyed cloth is cleared or brightened by boiling it in a solution of chloride of tin, and then washing and drying it. A more recent plan is to employ chloride of lime for the clearing.

The theory of Turkey-red dyeing is not well understood, which so far accounts for the fact that it has been found impossible materially to shorten the process. The three most essential operations are the oiling, or rather the impregnation with an oleaginous soap, the mordanting with alumina, and the dyeing with madder; but it is found that if any of the numerous dippings in the oily emulsions are left out, the color is inferior in proportion to the number of omissions. This is the least understood part of the process, and is no doubt the cause of the rich appearance of the dye, which approaches some of the fine reds produced on wool.

Besides being largely used in its plain state, Turkey-red cloth is extensively employed for handkerchiefs with white patterns produced upon them by discharging the color (see **BANDANA**); and of late years articles of various kinds, with patterns in several colors, have been produced by ordinary calico-printing machines, where, by proper arrangements, the different colors are obtained on parts where the red color is discharged by chloride of lime.

TURKEY-STONE. See **HONES.**

TURKISH LANGUAGE AND LITERATURE. The Turkish is one of the Turanian (q.v.) idioms, and is chiefly divided into eastern and western Turkish. The former is mainly represented by the Uigur (Jagatai), an idiom but recently recognized not only to belong to the Turkic stock, but to be its most ancient representative. Its forms are fuller and more pure, albeit, to a certain extent, harder and rougher. Its alphabet is formed from the Zabian, out of which have sprung also the Mongol and Mantshu. Besides this, the Kiptchak, spoken in Kasan and Astrakhan, forms a principal branch of the eastern Turkish, for which, however, but little has hitherto been done from a philological point of view.

Of infinitely higher importance, however, is the western Turkish, or language of the Osmanlis, which, through the conquests of that race, has spread far and wide over the whole of western Asia, the Levant, and parts of Europe. The Osman or western Turkish (emphatically Turkish) is more melodious and soft than the former, and so much

mixed with foreign elements, chiefly Arabic and Persian, that, were it not for its grammar, which is purely Tartarian, it could hardly be called an original language, but rather a conglomeration of the three respective idioms. Besides, it has also received a large increase of words from other Asiatic and European languages, e.g., the Chinese, Greek, and Italian. It is one of the most widely spoken idioms; not only western Asia, but even the e. of Europe, use this tongue to a great extent for commercial and political transactions. The characters in which it is now written are no longer the original Uigur letters, but the Arabic, the 28 characters of which have been increased by the four additional Persian characters—produced by further diacritical points, and a new one of their own, amounting in all to 33, which are written from right to left, as is the case in all (save one) Semitic languages. But this alphabet is not well suited to a language composed, like this, of elements belonging to the three great families of speech, viz. Semitic, Indo-European, and Turanic. Neither the vowels nor the consonants are adequately represented in all cases. Occasionally, however, it is also written in Armenian characters, which renders its sounds much more faithfully. There is no definite article or gender. The plural is indicated by a final *lar* or *ler*, and the cases are formed by the addition of *ung*, *eh*, *i*, *den*, and *le* for gen., dat., accus., abl., and instrumental respectively; which are, in plural, affixed to the *ler* or *lar*. The adjective has no flexion, but is placed unchanged after the noun. Diminutives are formed, somewhat like in Italian, by suffixes. The comparative and superlative are formed by circumlocution. The personal pronouns are without gender, and their declension is like that of the nouns. The possessive pronouns are made by suffixes. The Turkish verb is of a very complex nature. There are seven *genera* (active, passive, negative, impossible, causal, reciprocal, reflexive), all of which are formed by certain monosyllables affixed or prefixed. The root of the verb is the second person singular imperative, to which the infinitive affix *mak* or *mek* is joined. The moods and tenses are formed chiefly by the addition of the respective forms of the auxiliary verb *olmak*, to be. Apart from this, there are special particles to express the optative, conjunctive, etc. Conjunctions are either formed by gerundives or possessive forms, or they are borrowed from Persian and Arabic. Adverbs are formed by certain suffixes. The Turkish construction is most peculiar; the genitive always precedes the nominative, and the verb always stands at the end. All this gives the Turkish style a peculiarly artificial and inverted appearance, and often a sentence cannot be in the least comprehended until it is quite finished. Oriental flourishes, and allegorical figures of speech, with which Turkish is very lavish, do not tend to facilitate the study of the language.

The original literature of Turkey is to be found in the scanty remains of the Uigur period. That remote eastern branch of the Turkish family had, after their emigration from their homes, s. of the lake Baikal, to the Tangnu Tagh, played a foremost part in the contests and migrations of Central Asia, until they disappeared in the Mongol empire about 1200 A.D. They were acquainted with Chinese literature, and had adopted the Buddhist doctrines to a certain extent, and their scanty literary relics bear traces of these influences. When, however, the Turks, in the 11th c., began their conquest of the countries of Mohammedan Asia, they learned to appreciate the literature of Persia, then beginning to grow up in its full glory; and ever since, Turkish literature and Turkish language have retained a strong Persian impression. Two branches of Turkish literature are usually distinguished—first, the Eastern or Jagataian, which chiefly flourished between Timur's and Baber's time (1400–1530). Mir Ali Shir, the vizier of sultan Hussein, is the most renowned poet of this period. He also collected the most ancient Jagatai poems. Sultan Baber, also belonging to this epoch, wrote memoirs of his life and time (translated into English), which are of considerable importance. The other or Turkish literature, principally so called, is exceedingly rich, but hardly deserving the name of an original literature, it being for the greatest part, a mere imitation of Persian and Arabic models. Of early writers, deserve special mention Sheikhi, a romantic poet and physician, and Soleyman Tchelebi. In the 16th c., the most flourishing period of Turkey, we find Meshihi, the poet; Kemal Pasha Zadeh, the historian and jurist. In history, we have, besides annalists like Saad-ed-Din, historians like Mohammed Effendi. Of the same epoch is Lamii, who excelled in many branches of literature, besides being an accomplished translator of Persian poets. Fasli (d. 1563) and Baki, the chief of Turkish poets (d. 1600) conclude this period, which is followed by another of great activity, but of inferior rank. It boasts of Nebi, the poet; Nefi, the satirist; but above all, Hadji Khalifah (q.v.), the eminent historian, geographer, and encyclopædist. Raghib Pasha stands out in the 18th c., together with Said Rufet Effendi, and a number of smaller writers. Little is to be told of the present stage of Turkish literature; but there is a great activity now visible in the province of educational works, and the reproduction of ancient writings; a feature which augurs well for the future. David's (Lond. 1836), Redhouse's (Par. 1846), and Kasem-Beg's (Kasan, 1845; Ger. by Zenker, 1847) are the best known Turkish grammars; and Kieffer and Bianchi's (*Dictionnaire Turc-Française*, 2 vols., Par. 1835), as well as Redhouse's and Zenker's, among the best dictionaries. See Redhouse's *History of T. Poetry* (1879); Gibb's *Ottoman Poems* (1882).

TURKISTAN', "the country of the Turks," called also *Jagatai*, and by the Persians *Turan*, is an extensive region of Central Asia, stretching from the Caspian sea eastward

CENTRAL ASIA

60 Longitude East from 04 Greenwich

72

68

56

to beyond Lob-nor (long. 110° e.), and from Siberia and Dzungaria southward to Persia Afghanistan, and Thibet. Until quite recently, it was supposed that the Bolor Tagh (q. v.), a mountain chain of the first magnitude, running n. and s., divided it into two parts. English explorers entering Turkistan from the s., and Russians from the n., have shown that no such range exists. Its place is taken so far, however, by a lofty table-land, the Pamir Steppe, which, sloping gently toward the e. and w., separates the rivers running eastward to the desert of Gobi from those which run to the sea of Aral. It separates Turkistan into a western and eastern portion.

WESTERN TURKISTAN, *Great Bukharia*, or simply *Turkistan*, or *Turan*, consists of the great hollow plain of the Caspian and Aral seas, which occupies its w. and center, and of the hilly and well-watered districts formed by the ramifications of the Thian-shan mountains and Hindu Kush. The plain is composed of deserts of loose shifting sand, interspersed with oases where a subsoil of clay renders the formation of lakelets of rain possible; strips of fertile land along the banks of rivers, and occasional tracts clad with coarse thin grass; the eastern districts abound in valleys of remarkable fertility. The climate varies on the plains from extreme cold to burning heat, and though, in the eastern highlands, the cold is almost as intense in winter, the heat of summer is much less. The rivers of Turkistan are the Sir-Daria (see JAXARTES) and Amu-Daria (see OXUS); the Zer-Afshan, which rises on the s. of the Asfera-tag, and flows westward for 400 m., terminating in a small salt lake or marsh near Bokhara; and the Murghab, which rises in the mountains of Ghur, and after a w.n.w. course of 450 m., loses itself in a marsh beyond Merv. The vegetable products of the country include fruits, grain, cotton, flax, hemp, and tobacco. Forests can hardly be said to be at all represented in this extensive region. Salt is abundant, large tracts of desert being strongly impregnated with it; and sal ammoniac is common. Agriculture and the breeding of the domestic animals are the occupations of the great mass of the population; but manufacturing industry is also considerable, including cotton, silk, linen, and woolen goods, shagreen (superior to that manufactured in Europe) and other kinds of leather, paper made of raw silk, carpets, and a few sabers, knives and rifles.

Western T. is divided into Khokan (q. v.), now the Russian province of Ferghana, in the n.e.; Khiva (q. v.), part of which is now Russian territory, in the w.; Bokhara (q. v.) in the e. and center; Kunduz or Badakshan (q. v.) and Balkh (q. v.) in the s.e.; and the tracts lying n. of the Persian frontier. The population of Western Turkistan, estimated at 4,000,000, consists of various races, the Usbegs (q. v.) or Uzbeks, the dominant race, Turkomans, Karakalpaks, Kirghis (q. v.), Sarts or Tajiks, Persians, Kiptchaks, and a few Arabs, Hindus, and Jews. Of these the Sarts or Tajiks, the original inhabitants of the cities, are of ancient Persian stock, and along with the Uzbeks, Hindus, and Jews form the settled population; the Persians are either slaves, or, being introduced into Turkistan as such, have obtained their freedom, and settled in the country; the other races are mostly nomad and predatory. The prevalent religion is Mohammedanism, and most of the tribes are Sunnites. A few Sheeahs, Sufis and Buddhists are also found.

Turkistan has played an important part in Asiatic history from the very earliest times. The earliest light of history shows us Bactriana (Balkh) and Sogdiana (Bokhara) as well-cultivated and populous countries, inhabited by Persians, to whom most of the prominent cities of Turkistan owe their origin. With Persia, Turkistan passed into the hands of the Macedonians, who made Bactria an independent Greek kingdom, while the rest was in possession of the Parthians. Under the Sassanides, the Persian boundary was again advanced to the Jaxartes; but the gradual gathering of Turkish tribes from the n.e. on the right bank of that river, led to a constant state of warfare on the frontier, which ultimately resulted in the occupation of *Maver-ul-neher* ("the country between the rivers"—i.e., the Oxus and Jaxartes) and of Khaurezm (Khiva) by the invaders. In the 8th c. of the Christian era, the Arabs possessed themselves of Turkistan, and during the decline of the caliphate, it became the seat of various minor dynasties, as the Samani (q. v.) in Mawer-ul-neher, and the shahs of Khaurezm; and after a brief union with the Seljuk empire in Persia, was mostly united to Khaurezm, and along with it overrun by the Mongol hordes under Genghis Khan (q. v.), on whose death it became one of the four divisions of his vast empire, and was allotted to his son Jagatai. On the decline of Jagatai's dynasty, Timûr (q. v.) rose to supreme authority in Turkistan, and in the course of a 35 years' reign, made it the center of an immense empire, which stretched from the Hellespont to the frontiers of China, and from Moscow to the Ganges. This period was the golden age of Turkistan; its powerful monarch was never weary of adorning its cities with the spoils of victory; colonies of learned men, skilled artisans, and all whose knowledge or abilities could be of service to his subjects, were either transferred to Turkistan from the countries he had conquered, or induced by the most munificent offers to settle there; till under him and his more immediate successors, Samarkand became a focus of enlightenment and learning. But after the death of shah Rokh, Timûr's youngest son, the empire was split up into numerous fragments; and after a time a new dynasty snatched Persia from Timûr's family, while the Uzbeks, under Sheibani Khan, drove them (1500) from the country n. of the Amu-Daria; one of the expelled princes, Mirza Baber, who had ruled in Ferghana (the s. half of Khokan), subsequently founding the "Great Mogul" empire in Hindustan. The Uzbek empire generally included Badakshan, Herat, and Meshed; but these were

lost on its division in 1658 into various independent khanates. Khiva was conquered by Nadir Shah in 1740, and Bokhara limited to the n. bank of the Amu-Daria; but the Kirghis of the Little Horde restored the independence of Khiva, which they ruled till 1792, when the present Uzbek dynasty obtained the throne; and shah Murad (1806-22), celebrated under the appellation of *Beggee Jan*, effectually re-established its former extensive sway to the Bokhariot scepter. Khokan, after emancipating itself from the authority of Sheibani's successors, was incorporated with Bokhara; but afterward united with the states of eastern Turkistan; and on their conquest by China, resumed its independence. The recent history of Turkistan records a series of wars between Bokhara and Khokan, and Bokhara and Khiva, in which the Bokhariots had generally the advantage, owing to the aid of the Turkomans of the southern desert, whom they subsidize; the raids of the Turkomans along the northern frontier of Persia; the advance of the Afghans from the s.e.; and the progress of Russian conquest from the n. and west. To explain the Turkoman raids, a few additional words on the geography of Turkistan are necessary. Between the deserts of Turkistan and those of Persia lies a long and fertile tract running from the s.e. of the Caspian to Herat, the "key to India;" over it pass the great routes from western to eastern Asia. North of it, chiefly in the deserts, dwell the Turkomans, a population of savage brigands and man-stealers, constantly engaged in marauding expeditions against the northern Persians. They have desolated the frontier, and the atrocities they commit far exceed anything recorded of the African slave-trade. In 1860, Hanza Mirza, an uncle of the present shah, marched against them, but was defeated in attempting to capture their intrenchments in a marsh. On that occasion, 15,000 Persians and 30 guns were taken by the Turkomans. In 1865 a more successful expedition proceeded against Saraks, and the guns were recovered. Still the northern routes are in the hands of the Turkomans, more especially that leading by the Daman-i-koh hills; and, so late as 1872, reports appeared of Turkoman raids in northern Persia. The south-eastern part of Turkistan has also been the scene of recent strife. The Afghans have invaded it for the recovery of possessions they claimed n. of the Hindu-Kush. In 1850 they took Balkh and Khulm, and in 1859, Kunduz, Badakshan, at the same time submitting to pay a large tribute. The English and Russian governments seem now to recognize the claim of the Afghans to fix their frontier at the Oxus (see debate in house of commons, April 22, 1873). In 1884 they invaded Khokan, and took Tashkend and Khokan. A struggle followed with Bokhara. On May 20, 1866, was fought the battle of Irjar, the most important event in the recent history of Turkistan. The emir had to flee for his life, leaving his camp in the hands of the enemy. In 1868, the Russians, 8000 men, again advanced and crossed the river of Samarkand. The troops of the emir, 40,000 men, took to flight when they saw the Russians approach with their dreaded artillery, and on June 14 a treaty was concluded, by which Bokhara transferred to Russia, Samarkand and all the territory n. and e. of it. Khiva still remained independent in the midst of its deserts. But early in 1873 an expedition in four divisions set out from the Russian frontier posts against Khiva, which fell in June of that year, after no great resistance. A great part of Khivan territory n. of the Amu-Daria was ceded to the conquerors; and after a fierce struggle in 1875 and 1876 with the warlike inhabitants of Khokan, which is now the Russian province of Ferghana, Russia formally annexed the whole. The news of the fall of Khiva was welcomed in Great Britain as a triumph of civilization over barbarism; but the further annexation of Khokan provoked the fear that Russia would go on to annex other territories then in the hands of the Turkomans, including the northern routes to Herat; that she would convert the Turkomans into a great army of horsemen, under European officers, the most formidable in the world, and prepare for further conquests. The oasis of Merv was annexed in 1883, and with the subsequent submission of the Sarik tribe to the south, the conquest was complete.

EASTERN TURKISTAN, known also as *Upper Tartary*, *Chinese Turkistan*, *Little Bokhara*, and *Tarfan*, is bounded on the n. by the Thian-shan mountains, on the w. by the Pamir table-land, and on the s. by the highlands of Thibet or Cashmere. Toward the e. it sinks to the desert plain of the Gobi, round the western bay of which it forms a vast crescent-shaped oasis from 4000 to 5000 ft. in elevation, drained by the tributaries of the Tarim. This river flows eastward into the desert, and empties itself, after a course of 1500 miles, into the Lob-nor, a lake, or rather series of lakes and marshes. The region around it is very desolate and unattractive. The country produces gold and abundance of silk; and the inhabitants are skillful in making gold and silver stuffs, carpets, and linen, cotton, and silk goods. Silver, copper, lead, and iron ore are abundant, but are not mined to any extent. The political capital is Kashgar; the commercial capital, Yarkand. In the latter are numerous colleges and schools; in both there used to be an active trade, with resident representatives of most of the nations of Asia. But since the reconquest of the country by China, anarchy prevails, and trade is, for the time being, destroyed; all the more as Kuldja, taken by the Russians from the rebels against Chinese authority in 1871, has been retained by Russia, in spite of Chinese protestations. In 1879, however, it was understood that Kuldja was to be restored to China. The inhabitants speak Turkish, but are said to be of Persian descent. Little is known of eastern Turkistan previous to its conquest by Genghis Khan; but after the decay of his empire into petty states, among which are Kashgar, Yarkand, Aksu, and Khoten, the chiefs of these were constantly quarreling with each other — a temporary peace being occasionally produced by their subjection to some powerful neighbor — till several of the leaders, with the Yarkand prince at their head, invited the Chinese to take possession of the country, and in

1758 it became a province of China. In 1864, however, a mutiny among the Chinese troops induced the dispossessed native chiefs to stir up a Mohammedan insurrection. They invited a Khokan prince, Buzurg Khan, to assume the government. Through his lieutenant, Yakooob Beg, he dispersed the Chinese garrison left to defend the fort of Kashgar. But the lieutenant soon superseded him, and became sole emir, under the title of Athalik Ghazi. He possessed civil as well as military capacity, and raised the country to a state of considerable prosperity. He sent an envoy to Calcutta in 1872, and in 1873 Sir T. D. Forsyth visited Kashgar from the Indian government. But the emir's position did not secure more intimate relations. He had since 1869 successfully resisted the encroachments of Russia, but in 1876 the Chinese again advanced, defeated him, and retook their old province in 1877. The emir died shortly after. See *illus.*, *ETHNOLOGY*, Vol. V.

TURKS, the name of a numerous, important, and widely-spread family of the human race, members of which are to be found as well on the banks of the Lena in Siberia, as on those of the Danube and the shores of the Adriatic in Europe. The Turks belong to the second of Blumenbach's five great divisions of mankind—viz., *Mongolians*; and to the first, or *Mongolidae*, in Dr. Latham's threefold classification. In this latter classification, the Turks form a branch of the Turanian stock of Altaic Mongolidae. Their geographical distribution, according to Dr. Latham, is as follows: "1. As a continuous population. East and w.; from the neighborhood of the lake Baikal, 110° e. long., to the eastern boundaries of the Greek and Slavonic countries of Europe, about 21° e. long. N. and s.; from the northern frontiers of Thibet and Persia, about 34° n. lat., to the country n. of Tobolsk, about 59° n. lat. 2. As an isolated population. Along the lower course of the Lena, and the shores of the White sea, chiefly within the Arctic circle. 3. As portions of a mixed population in China, Thibet, Mongolia, Persia, Armenia, the Caucasian countries, Syria, Egypt, Barbary, Greece, Albania, and the Slavonic portion of Turkey in Europe." The names *Tourkoi*, *Turkai*, and *Turcæ* occur in some ancient authors as applied to a Scythian people dwelling in Asiatic Sarmatia, and it is very likely that the Scythians of antiquity were allied in blood with the numerous existing Turkish tribes, if not absolutely their ancestors. The original seat of the Turks was probably upon the northern slopes of the Altai range, from which, while a portion emigrated into independent Turkistan, others going s.s.e., established themselves upon the confines of the Chinese empire. MM. Abel-Rémusat, Klaproth, Ritter, and other high authorities concur in tracing all the now existing Turkish tribes to the Hiong-nu, a powerful nation who, prior to the Christian era, threatened to overrun and subjugate China, and who then occupied the whole of the vast region now called Mongolia, from the n. of China to mount Altai. Dr. Prichard coincides in this opinion. The Hiong-nu (or *vile slaves*, so called by the Chinese), indeed, for some time succeeded in establishing a kind of rule in China, and even intermarried with the imperial family; but about the commencement of the Christian era, their power in China began to wane, and before the end of the 2d c. they were driven back as far as independent Turkistan. "After the fall of the empire of Hiong-nu," says Prichard, the Turks "are known in Chinese history by the name of *Thu-k'iu*, or *Turks*, and *Whey-ou-eul*, by Europeans written *Huy-hurs*, and more correctly, *Uigours*. The *Uigours*, or eastern *Turks*, whose history has been elucidated by Abel-Rémusat, are the link of connection between these more remote nations and the Seljuki and Osmanli *Turks*, who are known to European historians."

After the fall of the Hiong-nu empire in China, the tribes who composed its strength separated, some maintaining themselves in their acquired settlements, and even conquering portions of China; but by far the greater number spread westward over western Mongolia, e. and w. Turkistan, and southern Siberia, and gradually lost their power and unity as a nation. Out of this *débris* of a fallen people arose, in the 5th c., the great empire (the empire of Kiptchak) of the *Thu-k'iu*, which contested the supremacy of central Asia with the Chinese on the e., and the Sassanidae (q.v.) on the w., ultimately falling in 744 before the *Hoei-he*, a confederation of Turkish tribes which had hitherto been subject to it. The *Hoei-he*, attacked in the w. by the *Hakas* (the ancestors of the present Kirghis), yielded to their assailants in 848, but retained their power e. of the *Bolor-tagh*, and for 150 years longer ruled supreme from that range to the *Hoang-ho*. During the eight centuries succeeding their expulsion from China, a regular though slow progress westward had been maintained by some of the Turkish tribes, a portion of whom appear (5th c. A.D.) in southern Russia, and on the northern frontier of the Byzantine empire, driving before them the kindred race of the *Avars*. They were found in Syria and Mesopotamia in the 7th c., and about the same time wandered into northern and eastern Khorassan. But the seat of power of the Turkish race still was in central Asia, whence in the 10th c. the *Seljuks* (q.v.) emerged, conquering Persia, Syria, and Asia Minor, and establishing an empire which reached from Constantinople to the borders of Mongolia. The subdivision of the Seljuk empire in south-western Asia led to its gradual absorption by the *Khaurezmians* in the n., and the *Kurds* in the w., till the irresistible tide of Mongol invasion under Genghis Khan (q.v.), rolling over central and western Asia, and the e. of Europe, completely overwhelmed Turkish dominancy. The great empire of Timur (q.v.) was Turk, with a strong infusion of the Mongol element, the residue of Genghis's irruption; and its destroyers, the *Usbegs* (q.v.), and the various other tribes—*Kirghis*, *Kiptchaks*, *Turkomans*, etc.—which now possess its

extensive domains, are also of Turkish race. The Osmanli-Turks are descended from a portion of the Turkish tribe of the Kayi, which fled from its settlements in Khorassan before the Mongols, and took refuge with the Seljuks of Iconium. See OTTOMAN EMPIRE, SELJUKS, etc.

The following is the enumeration of the principal Turkish tribes given by Dr. La-tham: "1. *Uigurs*.—On the Mongol frontier. Belonging to China. The Uigurs were the first Turks that used an alphabet. Little known. 2. *Turks of the Sandy Desert*.—Conterminous with Mongolia and Thibet. 3. *Turks of Khoten, Kashgar, and Yarkend*. 4. *Kirghis*.—Independent Tartary. The Kirghis (q.v.) form a portion of the population of the highest table-land in Asia—perhaps in the world—Pamir and the source of the Oxus. 5. *Usbegs* (q.v.).—The Turks of Bokhara. 6. *Turkomans*.—The Persian frontier of Independent Tartary from Balkh to the Caspian. Pastoral robbers. 7. *Ottoman or Osmanli*.—The Turks of the Turkish empire. 8. *Nogays*.—The Turks of the parts between the Black sea and the Caspian, n. of Caucasus. 9. *Turks of the Russian Empire*.—Bashkirs, Teptyars, Baraba, etc. With all these, although the language is Turk, there is good reason to believe that the original substratum is Finn. With the Bashkirs, this is generally considered to be the case. 10. *The isolated Yakuts of the Lena*."

In physical appearance, all these tribes, with the exception of the Ottoman Turks, partake more or less of the Mongolian type. They have in general a broad, flat face, with prominent cheek-bones, the head from side to side nearly equal to its length from the forehead to the occiput, the nose flat, the eyes small, the color of the skin yellowish, straight hair, little or no beard, and stature undersized. It is among the nomad and agricultural Turks that these characteristics are most prevalent, while among the more civilized they almost entirely disappear. Dr. Prichard quotes lieut. Wood's account of the Kirghis as a good average description of the primitive Turkish tribes. "In stature," he says, "the Kirghis are under the middle height; of a *kyl* numbering seven men, the tallest was 5 ft. 5½ in. in height. Their countenance is disagreeable; the upper part of the nose sinks into the face, leaving the space between their deeply-seated and elongated eyes without the usual dividing ridge; the brow immediately above the eye is protuberant, but starts back more abruptly than in Europeans; their cheeks, large and bloated, look as if pieces of flesh had been daubed upon them; a slender beard covers their chin; and in those individuals who have more luxuriant hair, the beard has a natural curl. Their persons are not muscular. Their complexions are darkened by exposure to all weathers rather than by the sun. The women are rather good-looking, and of delicate form, like the Hazaras, and make good wives." The Turks of the Turkish empire, especially those of the upper classes, differ considerably from the type here described. The Ottoman Turks, in fact, both in feature, height, and general physical structure, bear a strong resemblance to other European nations. This is accounted for chiefly by the custom now prevalent among them for ages of intermarrying with Circassian females.

The various Turkish tribes speak very nearly the same language; "so much so, that the Yakut of the Icy sea is said to be intelligible to the Turks of central Asia, and even of Constantinople." In religion, the Turks are for the most part Mohammedans; but the Yakuts are Shamanists; the Turks bordering on the Chinese empire are Buddhists; and those of Siberia Christians of the Russo-Greek church.

TURK'S ISLANDS, a group of small islands in the Bahama archipelago, n. of Hayti; pop. '91, 4745. The chief island is Grand Key or Turk's. The sea-ports are East Harbor, Caicos, Salt Cay, and Grand Turk. Much salt is exported, and there is a considerable floating population which comes every year from the Bermudas to rake salt. The soil of the islands is entirely barren. The group is governed by Jamaica.

TURMERIC, *Curcuma longa*; see CURCUMA, a plant of the natural order *scitamineæ* a native of the East Indies, much cultivated both in India and in Cochin-China. The leaves are lanceolate, sheathing each other at the base, about a foot long; they spring from the crown of the root, and from their center rises a short leafy spike, with small cream-colored flowers. The root is divided into several fleshy fingers, oblong, and as thick as a man's thumb, sometimes crooked when young, and the root then abounds in a kind of arrow-root; but in a more advanced stage, it contains in large quantity a peculiar, resinous, yellow substance, which is used as a dye-stuff, and for other purposes, and is called *turmeric*. It appears in commerce in the form of dried roots, or as a powder. It depends for its value chiefly on a resinous principle called *curcumin*, which is scarcely soluble in water, but easily soluble in alcohol and ether. The yellow color obtained from turmeric is not very durable, although it is employed as a dye both for silk and wool. Chemists make much use of turmeric as a test for alkalies, which change its yellow color to reddish brown, as do also their carbonates and phosphates, some of the alkaloids, and boracic acid. Turmeric test-paper is made by immersing unsized paper in tincture of turmeric. It is much employed in the east in medicine, as a gentle laxative, diuretic, and stimulant. It is also much used as a condiment with many kinds of food, and is the principal ingredient in *curry-powder*. For its cultivation, turmeric requires a rich friable soil, and a situation not liable to be flooded. It is propagated by cuttings of the root, which are planted at distances of eighteen in. or two feet. It is planted in April or May, and the crop is gathered in December. This kind of turmeric is sometimes distinguished by the name of LONG TURMERIC; and

the name of **ROUND TURMERIC** is given to *kempferia pandureta*, a plant of the same order, also a native of the East Indies, the roots of which are shorter and rounder, but otherwise of very similar quality. They are not nearly so much an article of commerce as the other kind, but are particularly valued for the preparation of an artificial gold varnish, as they yield a better color than the long or true turmeric. The Arabic name of turmeric is *kurkum*, whence *curcuma*.

TURN, in music, an embellishment formed by the adjoining notes above and below combined with the principal note, and indicated by the sign ∞. Thus

Should another than the principal note follow the turn, the principal note is added

before the next note is played, so as to give the turn four notes; thus:

is played In either of these cases, the turn must be played

during the time of the principal note. But when the sign ∞ is placed above or below the principal note, the first note of the turn takes the place of the principal, which is

played in combination with the others; thus is played

TURNAU (Boh. *Turnáv*), a walled t. of Bohemia, circle of Jung-Bunzlau, on the e. bank of the Iser, 50 m. n.e. of Prague. It has a church, built in 1825, which is reckoned one of the most beautiful in Bohemia. Turnau has manufactures of cotton, woollens, and more particularly artificial gems, which are exported in great quantities to the United States. Pop. '90, 5904. Here was fought (July, 1866) a battle between the Prussians and Austrians, in which the former were victorious.

TURNBULL, ROBERT, D.D., b. Scotland, 1809; graduated at the university of Glasgow; became a Baptist; settled at Danbury, Conn., 1833; pastor of a Baptist church in Detroit, Mich., 1835; of South Baptist church, Hartford, Conn., 1837; of Harvard street church, Boston, 1839; First Baptist church, Hartford, 1845. He was a graceful writer, and published *The Theater; Olympia Morata; Vinet's Vital Christianity; The Genius of Scotland; The Genius of Italy; Theophany, or The Manifestation of God in Christ; Christ in History; Pulpit Orators of France and Switzerland*; edited sir Wm. Hamilton's *Discussions on Philosophy*. He d. 1877.

TURNBULL, ROBERT JAMES, 1775-1833; b. Florida; his father was the founder of a Greek colony at New Smyrna, Fla., but before the revolution forfeited his grants on account of his adherence to the popular side. The son was educated in England, became a Charleston lawyer, and practiced there till 1810. He was conspicuous in politics, prominent in the nullification movement of 1832-33, and wrote pamphlets on the subject. A monument was erected to his memory in Charleston.

TURNBULL, WILLIAM, 1800-74; b. Md.; graduated at West Point, 1819; commissioned in the artillery, served in the topographical corps, and was promoted to a captaincy in the topographical engineers in 1831. He had charge of the construction of the Potomac aqueduct, 1832-43. This was the first work of the kind in this country in which the piers were laid upon the rock-bed by means of coffer-dams, and by surmounting the difficulties of its construction, Col. Turnbull gained high repute as an engineer. In the Mexican war he was with Scott as chief topographical engineer, and took part at Contreras and Churubusco. Among his more important professional works were the building of the New Orleans custom-house, and the Cape Fear river improvements.

TURNER, a co. in s.e. S. Dakota, consisting of fertile prairies; 615 sq.m.; pop. 1890, 10,256. Co. seat, Parker.

TURNER, JOSEPH MALLORD WILLIAM, the greatest of British landscape painters, was born at 26 Maiden lane, Covent Garden, London, in 1775. The precise day of his birth is unknown; but an approximation to it is furnished by his baptism, which is registered in the parish church as of date May 14 of that year. He was the son of a barber, and received an exceedingly defective education. His turn for art showed itself very early, and drew attention to the boy. To a Dr. Monro, in particular, who gave him access to his excellent collection of water color drawings, and otherwise kindly furtherance, he used afterward to express his obligations. In 1789, he became a student at the

Royal academy, where, doubtless, he learned something; but throughout he seems to have been indebted less to any formal teaching than to the tentative efforts of his own singularly original genius. In 1787, when only twelve years old, he exhibited two drawings at the Royal academy. Again, in 1790, he exhibited; and thence onward till his death, with intermission of only one or two years, his pictures were regularly to be found on the walls. His success is sufficiently shown in the fact that so early as 1799 he was elected an associate of the Royal academy, and only three years afterward attained the full dignity of academician. The honor was worthily bestowed on one whose claim was already admitted as the first landscape painter of his time; but his election in 1807 to the post of professor of perspective could scarcely be considered so judicious. A man so abnormally illiterate that his simplest note included a crop of solecisms, was not likely to succeed as a lecturer; and as a lecturer he failed utterly. The knowledge which he abundantly possessed, he could not in the least communicate; and after a very few years, he ceased to make the attempt. In the exercise of his art, Turner traveled much; he was frequently in Scotland, France, Switzerland, and the Rhine countries; and in 1819, 1829, and 1840, he paid visits to Italy. His industry was almost as unexampled as his genius. To the exhibitions of the Royal academy, he contributed in all 259 pictures; but among these, many of his finest works were not included; and in another branch of art, the amount of his achievement was extraordinary. In 1807, he commenced the publication of his famous *Liber Studiorum*, a series of engravings from original designs, which ranks as one of his most important undertakings; to this is to be added his *Scenery of the Southern Coast, England and Wales, Rivers of England, Rivers of France*, etc.; and besides, his services were continually in request as an illustrator. The illustrated edition of Rogers's *Poems* is his most celebrated work in this kind, and is quite unique in magnificence. At his death, which took place Dec. 19, 1851, at Chelsea, where his few last years were passed in a small house by the river side, it was found that he had bequeathed to the nation the noble collection of his works, which now occupies a room in the National gallery, and remains a permanent monument of the power and splendor of his genius, if also of its occasional eccentricity and extravagance. The large fortune, amounting to something like £200,000, which he had amassed by his industry and thrift combined, he left to found an asylum for decayed artists; but owing to some technical defect in his will, this purpose could not be carried out.

Of the genius of Turner, and the various phases through which it was developed till it sunk in the decay and delirium obvious in the work of his few last years, we cannot here attempt to treat. In the eloquent pages of Mr. Ruskin's *Modern Painters*, the subject will be found thoroughly discussed. There are lives of Turner by Walter Thornbury (1862) and by P. G. Hamerton (1878). The picture presented, especially by the former, is a somewhat dark and painful one. This creator of the beautiful on canvas was in his character and way of life by no means so surprising a revelation of it. He was coarse, sensual, sordid, avaricious: of his inordinate passion for money, many odd anecdotes are extant; but it is only fair to say, that by the few friends who knew him intimately, he was held to be essentially a man of kindly and generous nature. He lies buried in the crypt of St. Paul's, beside sir Joshua Reynolds.

TURNER, PHILIP, 1740-1815; b. Norwich, Conn.; pursued his early studies under the direction of Dr. Elisha Tracey, with whom he studied medicine; served as assistant-surgeon under Gen. Amherst at Ticonderoga, 1759; settled in Norwich, 1763; surgeon of the Connecticut troops before Boston, 1775. He attended the army through some of the bloodiest battles of the war; surg. gen. of the e. dept., 1777; afterwards surgeon to the staff of the U. S. army, stationed on York island. He married a daughter of Dr. Tracey.

TURNER, SAMUEL HULBEART, D.D., 1790-1861; b. Philadelphia; educated at the university of Pennsylvania. He took orders in the Protestant Episcopal church, and after officiating as rector of churches in Chestertown, Md., New York, and Brooklyn, became in 1818 professor of historic theology in the New York general theological seminary, and in 1821 professor of biblical learning and scripture interpretation. He was also professor of Hebrew in Columbia college after 1830. Among his works are: *Notes on the Epistle to the Romans* (1824); *Companion to the Book of Genesis* (1841); *Parallel References of the New Testament* (1848); *Thoughts on Scriptural Prophecy* (1852).

TURNER, SHARON, the Anglo-Saxon historian, was b. in London, Sept. 24, 1768, articulated to an attorney at the age of fifteen, and succeeded his master in the business before the period of his clerkship had expired. He continued, however, to gratify his literary tastes; and after years of hard reading and patient collection of materials, published, 1799-1805, a *History of the Anglo-Saxons*, in 4 vols, a work, with all its imperfections, that has given its author a permanent place in English literature. Other writings of Turner's are: *The History of England from the Norman Conquest to 1509* (1814); *History of Henry VIII.* (1826); and *Reigns of Edward VI., Mary, and Elizabeth* (1829); all of which were subsequently republished together under the title of *History of England from the Earliest Period to the Death of Elizabeth*; *Sacred History of the World as displayed in the Creation and Subsequent Events to the Deluge* (1832 et seq.); a volume of essays and poems, etc. Turner died Feb. 13, 1847.

TURNER, THOMAS, b. Va., 1808; entered the navy as midshipman, 1825; rose through successive grades to be rear-admiral, 1868. He served in the Mexican war, was actively engaged at Tuspan in 1847, commanded the sloop-of-war *Saratoga*, and in 1860 took two prizes, Spanish steamers in the harbor of Auton Leyardo, Mexico. During the late civil conflict he commanded the frigate *New Ironsides* in Charleston Harbor, 1863; com. South Pacific squadron, 1869-70; retired, 1870. He d. 1883.

TURNER, SIR WILLIAM, English anatomist, b. 1832, educated at St. Bartholomew's hospital, became a demonstrator of anatomy in the University of Edinburgh in 1854, and professor of anatomy in the same institution in 1867. Besides these offices, he has held various other teaching positions, and for many years represented the University of Edinburgh in the General Council of Medical Education. His articles in scientific journals are very numerous and deal with various topics, both in human and in comparative anatomy. From 1866 to 1894 he was one of the editors of the *Journal of Anatomy and Physiology*. In 1886 he was made a knight. Among his longer works are *An Introduction to Human Anatomy*; *Lectures on the Comparative Anatomy of the Placenta*, and an *Atlas of Human Anatomy and Physiology*.

TURNER, WILLIAM WADDEN, 1810-59; b. London; emigrated to New York, and became a printer's apprentice. He studied many languages, was librarian of the university of New York, instructor in Hebrew in the Union Theological Seminary, and librarian of the U. S. patent office. Besides contributions to learned societies and periodicals, he published a translation of Von Raumer's *America and the Americans*, and he translated the most of Freund's *Latin-German Lexicon* for Prof. E. A. Andrews.

TURNHOUT, a well-built t. of Belgium, province of Antwerp, 34 m. e.n.e. of the city of Antwerp, in the district known as the Campine (see BELGIUM), and the terminus of a branch-line of the Brussels and Antwerp railway. The inhabitants manufacture ticking, and linen and lace goods, cutlery, playing cards, paper, oil, etc. Pop. '90, 18,747. Turnhout is historically noteworthy as the scene of two battles, the first won Jan. 22, 1597, by the Netherlands, under Maurice, prince of Orange, over the Spaniards; and the second, Oct. 27, 1789, by the patriots under Van der Mersch, over the Austrians.

TURNING, the art of shaping wood, metal, ivory, or other hard substances into forms having a curved (generally circular or oval) transverse section, and also of engraving figures composed of curved lines upon a smooth surface, by means of a machine called a *turning-lathe*. This art is of great importance and extensive application in mechanics, the most delicate articles of luxury and ornament, equally with the most ponderous machinery, being produced by it. The art of turning dates from a very early period, and Theodorus of Samos (about 560 B.C.) is named by Pliny as its inventor; but long before this period, the *potter's wheel* (see POTTERY) the earliest and simplest form of turning-machine, was in general use, as is evidenced by numerous references in Holy Writ. The immense variety of work performed by turning-machines necessitates great variations in their construction; but their mode of operation is always the same, and consists in fixing the work in position by two pivots or otherwise, causing it to revolve freely round an axis of revolution, of which the two pivots are the poles, and holding a chisel or other cutting-tool so as to meet it during its revolution, taking care that the cutting-tool be held firmly and steadily, and moved about to different parts of the work till the required shape be obtained. Lathes are divided, with respect to the mode of setting them in motion, into *pole-lathes*, *foot-lathes*, *hand-wheel lathes*, and *power-lathes*; with respect to the species of work they have to perform, into *center-lathes*, which form the outside surface, and *spindle, mandrel, or chuck lathes*, which perform hollow or inside work, though this distinction is for the most part useless, as all lathes of good construction are now fitted for both kinds of work. *Bed-lathes* are those used by turners in wood, and *bar-lathes* for the best sort of metal-work; and the small metal center-lathe employed by watchmakers is known as a *turn-bench*.

The primitive and most simple form of lathe for wood-cutting is the pole lathe. It consists of two planks or beams placed horizontally side by side with a narrow space between them, which, being firmly supported at a convenient height, constitute the *bed*; of two uprights or *puppets* rising from the bed, one of them stationary at the left end, and the other sliding along over the slit between the beams, and capable of being fastened at any required point by a projecting tenon and wedge beneath; of a *treadle* below and parallel to the bed; and of an elastic *pole* or *lath* (whence some derive the name lathe) fixed to the ceiling above. This form of lathe is well adapted for turning long thin cylinders of wood, the piece to be turned being held fast at each end by the conical iron or steel point projecting from the inner face of each puppet. Motion is communicated to the work by a cord which is fastened to the lath overhead, wound twice or thrice round the work, and then attached to the treadle below. When the workman presses his foot on the treadle, the work commences to revolve rapidly, unwinding the cord toward the treadle, and winding it up on the side next the pole, causing the latter to bend considerably. During this period the workman has been holding his cutting instrument to the work; but after the treadle has been quite pressed down, he removes his foot, and the reaction of the bent pole causes the work to revolve in an opposite direc-

tion, till the pole has straightened itself; and during this latter revolution no cutting is done. When the whole piece is to be turned, the cord must be moved from an unfinished to a finished part of the work. For the pole, an elastic steel bow and string are substituted when the work is light or fine, the cord being attached to the middle of the string, and the bow fastened to the ceiling by its center. The advantage of the pole-lathe is that it never acquires an impetus in the direction of the cutting motion, for whenever the pressure on the treadle is removed the reaction of the pole takes effect; but the great waste of time during the straightening of the pole and rising of the treadle has caused the abandonment of this machine for the foot-lathe. The foot-lathe, the most common and generally useful form of lathe, differs from the former in having a *head-stock* or *fast-head* in place of the left-hand stationary puppet. This head-stock,

puppet *front-head*, or *tail-stock*, movable along the slit in the bed, and capable of being fastened like the rest; its point, I, can be advanced or retired as required by means of the screw, J. C is the spindle, which, being connected with the treadle, W, by means of the rods or chains, E, E, turns the fly or foot wheel, F, and by means of an endless band connecting the latter with the speed-pulleys, communicates motion to the mandrel. The pulleys on the spindle and mandrel are of different sizes, and so arranged that when the endless band is placed on the left-hand pulleys, an extremely rapid motion is communicated to the mandrel, the motion being reduced more and more as the band is transferred more to the right, till, at the extreme right, the rotatory motion is much slower than that of the spindle. When the foot-lathe is required for center-work, the inner end of the mandrel is furnished with a point similar to I; but when hollow or inside work is to be done, it must be armed with a screw, as in the figure. In this latter case, certain contrivances, known as *chucks*, for holding the work, are screwed on to the end of the mandrel. Some of these most commonly used are the *screw-chuck*, which shows on its right side a flat circular surface, from the center of which projects a large, coarse, conical screw for holding firmly any large piece of wooden work; the *hollow chuck*, a strong circular cup with perpendicular sides, into which one end of the work is firmly fastened by a mallet, or, if too small, by four screws working inward through its sides; the *drill-chuck*, of a cylindrical form similar to the last, but with a square cavity for holding drills, the instrument, and not the work, being made to rotate in this instance; and the *concentric chuck*, a most ingenious piece of mechanism—a flat plate with two slits almost to the center, and in line of a diameter, within which slits works a spindle, with screw-ends carrying two steel studs, whose heads project through the slits above the surface on the right side; these heads carry two curved pieces, which serve as clamps to hold the work; and as the spindle-screws are of the same fineness, and with right and left threads, the revolution of the spindle either removes both further from the center, or brings both nearer to it; hence, when the studs are once set at equal distances from the center, they always remain so, and the work may be removed and replaced without danger of destroying the adjustment. All these chucks are of metal, and are mostly employed for heavy work; turners of wood or ivory preferring wood-chucks, which can be altered as required, and secured by an iron ring round the outside, to prevent splitting. The cutting-tools employed are very various: gouges are used to rough out the work—if soft wood—after which chisels with a straight oblique edge are employed: the instruments for harder materials, such as ivory or bone, are smaller than the former, and have their sharp edges “better backed;” for inside-work, drills are first employed to make an opening, and then cutting-tools of various shapes are employed, according to the form which is wished to be given to the interior surface. To avoid the imperfections in the workmanship arising from unsteadiness of hand in the workman, the *slide-rest* is employed. This valuable addition is furnished with two motions, one toward the work, and the other along, parallel, or at any inclination to it, according as cylindrical or conical figures are required; there is a socket for the chisel, which is firmly held in its place by a screw; and after the slide-rest has been adjusted, the operator has only to move the rest forward or sideways, as may be required, the motions being effected by two screws and winches.

The *hand-wheel* lathe is similar to the former, but so much larger as to require two workmen, one of whom is employed in setting the instrument in motion by turning a wheel, which corresponds to the wheel F in fig. The *power-lathe* is similarly set in motion by horse, water, or steam power, and is employed for heavy metal-work, as piston-rods, iron columns of various kinds, wheels, artillery, etc. This machine differs from the foot-lathe chiefly in the substitution of rack-work, and wheels and pinions, for the endless band, and for manual labor, in the various adjustments of the machine, such as in moving forward the tail-stock, etc.; and in the mandrel being supported by both puppets of the head-stock. In wood-turning, the wood is first prepared by a hatchet and rasp, must be lightly though firmly pressed against by the cutting-tool; while metal-work must be cleared from the sand of the mold or scales of the forge, and in turning, requires less care. Soft woods must be made to revolve with great rapidity; very hard woods and brass require much less velocity; wrought iron and copper, still less; steel, a further diminution of speed; and cast iron, the least velocity of all. After the work has been duly shaped, it requires to be polished; and this is effected while it is still in the lathe and rotating, by applying shark's skin to wood, pumice-stone and chalk to ivory and horn, and emery, tripoli, or putty powder to metals.

Hitherto, we have supposed that the axis of revolution of the work is fixed, and consequently that all work has been turned so as to present a transverse circular section; but many other forms of section may be easily obtained. The general mode of obtaining these non-circular figures is by screwing on to the mandrel an apparatus, by means of which the work can be thrown out of the center of rotation at regular intervals; but as each different class of form requires a separate kind of apparatus, it is impossible here to describe the operations in detail. One species, however, known as *rose-engine turning*, and employed for producing involved curvilinear figures, such as appear on bank-notes and on ornamented gold, silver, or gilt work, is so peculiar and ingenious as to call for more special notice. In this species, the standards which support the mandrel are no longer fixed at right angles to the bed, but are capable of oscillating backward or forward in a plane parallel to the plane of rotation of the mandrel, and are so acted on by a spring that when pushed to one side they are at once restored to their former position on the pressure being withdrawn. Suppose, then, a metal wheel with its rim waved or indented, fastened concentrically on the mandrel, and the mandrel, pushed aside by a fixed steel point or roller, applied to the rim of the wheel; the reaction of the spring against the pressure of the roller will keep the latter in close contact with the waved rim throughout, and will produce a definite oscillatory movement of the mandrel, of the chuck, and the work fastened on it, and consequently—the cutting or graving tool being firmly held by the slide-rest—definite deviations from a circle in the lines marked on the face of the work. The wave-rimmed wheel, called a *rosette*, may be replaced by another, and that by a third, and so on till a sufficient number of different waved lines are obtained. A number of rosettes are generally strung at once on the mandrel, and the fixed guide is brought into gearing by means of a steel band called a rubber, with one rosette after another. Similar concentric curves of greater or less perimeter are obtained by removing the slide-rest from, or bringing it nearer to, the axis of revolution.—For more complete information respecting this most interesting machine, and its many varieties of form and application, see article "Turning" in the *English Cyclopædia*, Holtzapffel's *Turning and Mechanical Manipulations* (Lond. 1847-52), and *Tourneur (Manuels-Roret)*, by Valicourt (Paris, 1858). See illus., GEARING, etc., vol. VI.

TURNIP, *Brassica rapa*, is a biennial plant, with lyrate hispid leaves; the upper part of the root becoming, especially in cultivation, swollen and fleshy. It is a native of Europe and the temperate parts of Asia, growing in borders of fields and waste places. It is commonly regarded as a native of Britain, although in most cases of its being found apparently wild, it may be doubted if it has not derived its origin from cultivated varieties. It has been long cultivated, and is to be found in every garden of the temperate and cold parts of the world as a culinary esculent; it is also extensively grown in fields for feeding cattle and sheep. It was cultivated in India long before it could have been introduced by Europeans, and is common there in gardens and about villages. The cultivated varieties are very numerous. In them, the upper part of the root assumes a globose, oblong, or roundish depressed form. Some are common to the garden and the farm, and some of the largest kinds attain such a size as to weigh 20 or 25 lbs. Although the turnip is of great value for feeding cattle, and the introduction of it into general field-culture was one of the greatest improvements ever effected in the husbandry of Britain, it is not very nutritious, no less than 90 to 96 parts of its weight actually consisting of water. Garden turnips are sown from the end of March to the end of August; field turnips generally in June, it being requisite that they should not be sown so soon as to incur a risk of their throwing up flower-stems in the first year, which, when it takes place, prevents in a great measure the swelling of the root, and renders it coarse and fibrous. In the garden cultivation of turnips, the root is generally intended for use in the first year. In dry weather the plants are apt to throw up flower-stems, and so disappoint the hope of the gardener; which is also the case if the seed is sown too early in spring. Moist cloudy weather is most favorable. Garden turnips are sown, and allowed to grow, much closer than field-turnips; being gradually thinned out, and

the thinnings used even when a small size. The varieties both of garden and field turnips are very numerous. The garden turnips are generally of comparatively small size, more rapid in growth, and more delicate.—The SWEDISH TURNIP, or *RUTA BAGA*, which was introduced into cultivation in Britain, from the north of Europe, more recently than the common turnip, and has proved of very great value to the farmer, is regarded by some botanists as a variety of the same species, and by some as a variety of *brassica napus*, but more generally as a variety of *B. campestris*, a species common in corn-fields and sides of ditches in Britain and the north of Europe.

The cultivated turnip grows best in a rich free soil. The mode of culture varies with the soil. Where the soil is light and dry, a smaller amount of plowing, harrowing, and drilling is necessary than on stiff soils. The turnip is not well suited to clay soils, although it is often grown on them. A complete pulverization of the soil is requisite before the sowing of the seed. On light soils, a crop of turnips generally succeeds wheat or oats. Turnip-land is generally made up in raised drills, by the plow, and the seed is sown by the drilling machine, on the top of the narrow ridges, which are about 27 in. apart. Small doses of guano, super-phosphate of lime, crushed bones, or other such manures, produce great crops of turnips. They seem to act chiefly while the plant is young; and when it is further advanced, it derives nutriment from the soil, and even from the subsoil, by deeply penetrating roots, and from the atmosphere by its large leaves. See BONES, DISSOLVED. The young plants are thinned out by the hand-hoe, to a foot or upward apart, and the ground is stirred and carefully kept clean by the plow or horse-hoe. The turnip-crop is thus of great use in clearing the land of weeds. In many places part of the crop is eaten on the ground by sheep, which are confined to a small part of the field by means of movable fences. It is common to leave one of each three rows of turnips for this purpose, the other two rows being carried to the farm-yard for feeding cattle, or stored. Turnips are stored either in a house or in conical heaps, covered with their own leaves, or with straw and earth. They are sometimes protected from frost by being earthed up in rows by the plow. Some kinds are much more easily injured by frost than others; the Swedish turnips least of all.

The introduction of the turnip as a field crop is one of the most important events in the history of British agriculture. It has rendered possible a rotation of crops, which has been extremely advantageous; and has made the supply of butcher-meat more constant, by providing a supply of winter-food for cattle and sheep, whereas, formerly, all depended on the pasture. Turnip-husbandry was introduced into Scotland from Norfolk in the latter part of the 18th c., but soon attained a development, and was carried to a perfection in Scotland far beyond what it had previously reached anywhere. The climate of Scotland is particularly adapted to it, as is also that of Ireland; moist weather, both in summer and autumn, being suitable to the turnip; whilst the climate of North America is so unfavorable to it that it has not become an important crop there. Of late years, turnip-crops in Britain have suffered very much from the disease called anbury (q.v.), or *fingers and toes*. This is not the case in Norfolk, and the exemption is supposed to be due to the use of clay-marl as a manure; but the whole subject is involved in obscurity. The turnip not unfrequently suffers from a fungus of the genus *botrytis* (*B. parasitica*), allied to that which is supposed to cause the potato disease. It infests plants of rank growth, attacking their roots, which are weakened by the too great luxuriance of the leaves. Plants weakened by drought are liable to suffer from a white mold, a species of *oidium*, which attacks the leaves, and renders the plant worthless. The leaves are devoured by the turnip-fly, turnip-flea, or turnip-beetle (*altica nemorum*), and by other species of the same genus. The nigger caterpillar, the larva of *athalia spinarum*, also devours the leaves, as well as the caterpillars of white butterflies (*ponti brassica repa*, and *napi*), and of some moths. The leaves are also mined by the larvæ of several dipterous flies. Several species of aphids suck the juices of the leaves, and one (*A. floris rapæ*) devotes its attention to the young crops in seed leaf, which are also attacked by a rose-chaffer (*cetonia aurita*), and a minute beetle (*meligethes cæneus*). Slugs, snails, and wire-worms are among the enemies of the turnip.

The young leaves of the turnip are good as greens, and particularly those of the Swedish turnip, when it has begun to sprout in spring.

TURNIP-CUTTER, an implement used for cutting turnips for cattle. It is useful, not only as saving the teeth of sheep, which are apt to be much injured by eating turnips, but as preventing waste, for sheep feeding upon turnips scoop out a part, and leave the rest to rot. The oldest and simplest turnip-cutter acts by mere pressure, and is like a large nut-cracker on a stand. Many kinds are now in use, of which perhaps the best are those having knife-edges on the surface of a cylinder or cone, which are brought to act on the turnips by turning a handle.

TURNIP-FLY, a name given to several insects destructive to turnips. It is often given to *altica* (or *haltica*) *nemorum*, also called TURNIP-FLEA, from its skipping or leaping powers, but which is truly a very small beetle, with long and strong hind-legs, and ample wings, of a shining black color, with two yellowish stripes down the wing-cases, and ochreous legs. It swarms in meadows and hedge-rows in most parts of Britain from March to October, the larva feeding on many cruciferous plants. It often commits great ravages in turnip-fields, while the turnips are very young. The female lays her

eggs on the under side of the leaf, and the minute larva mines in the leaf, under the skin, making a tortuous gallery. Farmers sometimes steep the seed of turnips, in order to prevent the ravages of this insect, but no good can be thus done, as the eggs are not in the seed.

The **TURNIP-FLY**, more properly so called, is *anthomyia radicum*, a dipterous insect of the family *muscidae*, and of the same genus with the cabbage-fly and beet-fly. It attacks the root of the turnip, as the cabbage-fly does that of the cabbage, the larva living in the root.

TURNIP SAW-FLY. See **SAW-FLY**.

TURNPIKE ROADS. See **HIGHWAY, TOLL**.

TURNPIKE STAIR, a turret stair revolving round a central newel.

TURNSOLE, a peculiar coloring material consisting of very coarse linen rags, usually pieces of sacking, prepared by cleaning and bleaching, and then dipped into the juice of the leguminous plant called *crozophora tinctoria*, previously mixed with ammoniacal matter, and exposed to the air for some time. It is made in France, but is exclusively used in Holland, but for what is not certainly known: it is said, for coloring cheese, pastry, etc.

TURNSTONE, *Streptilas interpres*, a bird of the plover family (*charadriadae*), very widely distributed, and, indeed, found in almost every part of the globe. It appears in Britain, chiefly as a winter bird of passage, but breeds in the Shetland islands. It frequents the sea-shore, and derives its English name from its habit of turning over small stones with its bill in search of food. It is the only known species of its genus. The eggs, which are four in number, are laid on lonely rocky coasts where there is sparse vegetation. They vary very much in color and markings, and are cunningly concealed. The whole length of the turnstone is rather more than 8 inches. The plumage varies with the age of the bird and the season. In August the plumage begins to get dull.

TUR OČZ, a co. in n.w. Hungary, crossed by the Carpathian mountains; 444 sq. m.; pop. '90, 49,979. Capital, Szent-Márton.

TURPENTINE is a semi-solid resin which is yielded by various species of pine, and by some other trees when incisions are made into them. The chief varieties of turpentine are *common turpentine*, yielded by *pinus abies*; *Venice turpentine*, yielded by the larch; *Bordeaux turpentine*, yielded by *pinus maritima*; and *Chian turpentine*, yielded by *pistacia lentiscus*. The Venice turpentine, which is regarded as the best variety, occurs as a clear, transparent, pale yellow, viscous mass, of a balsamic odor, and an acrid bitter taste, perfectly soluble in spirits of wine, and increasing in density on prolonged exposure to the air. On distilling it with water it yields a considerable quantity of essential oil, vulgarly known as *spirits of turpentine*. This oil of turpentine (which, from its greater cheapness, is usually obtained from common turpentine) is, after rectification, represented by the formula $C_{20}H_{16}$ and has a spec. grav. of 0.864, and a boiling-point of 320°. It is colorless, transparent, has a strong refractive power, a strong peculiar odor, and a disagreeable acrid taste. It is readily soluble in alcohol, in ether, and in the fixed and essential oils, but is insoluble in water, on which it floats. It is a good solvent for many substances, among which may be especially mentioned sulphur, phosphorus, caoutchouc, and the various resins; and is largely used in many departments of the arts, forming a large proportion of all oil paints. Great quantities are exported to Europe from the United States, where it is mostly yielded by the swamp-pine.

Turpentine is an energetic producer of ozone (q.v.); and on keeping it for a long time in a stoppered flask, which should be occasionally shaken, the odor of ozone is very distinct on opening the vessel. Oil of turpentine forms three hydrates, of which two are solid. Commercial oil of turpentine often consists of a mixture of several isomeric hydrocarbons which act oppositely on polarized light (like the several varieties of sugar). Deville and Berthelot have ascertained that there are various modifications of which this oil is susceptible without its undergoing any change in its chemical composition. Of these, *isoterebenthene* and *metaterebenthene* differ *inter alia* in their boiling-points, and may thus be separated; *terebene* (which has an odor resembling that of oil of cloves) and *colophene* are obtained by acting on the oil with sulphuric acid; and *camphylene* and *terebylene* by decomposing artificial camphor (which is a combination of the oil with hydrochloric acid) by means of quicklime.

Under the influence of nitric, hydrochloric, and sulphuric acids, chlorine, etc., oil of turpentine yields many products of interest to the chemist, but as yet of little practical value.

Oil of turpentine is used to a considerable extent in medicine, although, from its disagreeable taste, and from certain bad effects which occasionally follow its use (as strangury, bloody urine, vertigo, a species of intoxication, and an eruption on the skin), it is often supplanted by less certain remedies. It is probably the most effective remedy for the expulsion of tapeworm, is nearly equally efficacious over the lumbrici or round-worms, and in the form of an injection is serviceable in the case of ascarides or thread-worms. For an adult, in the case of tapeworm or round worm, the dose should be one ounce, combined with an equal quantity of castor-oil, or made into an emulsion with yolk of egg or mucilage. In the case of children and delicate women, it is better to try a milder vermicide (see **VERMIFUGES**). In doses of from two drams to two ounces, and

in similar combination with castor-oil, it may be given as a cathartic in cases of obstinate constipation, especially when dependent on affections of the brain; in hysteria, epilepsy, tympanitis, passive hemorrhage, and in purpura hemorrhagica, in which last-named disease Dr. Neligan highly recommends it. In small doses (as from 10 to 20 minims), oil of turpentine is regarded as a diuretic; but it must be given with caution, in consequence of its stimulating properties. It is of more service in chronic mucous discharges of the genito-urinary organs, as gleet, leucorrhæa, etc., than in dropsy. In small doses, it is often useful in chronic rheumatism and in sciatica. In the Dublin school, it is much employed in small and repeated doses as a general stimulant in the low stages of continued fever. *Turpentine punch* has long been a favorite remedy in the Meath hospital (where Graves and Stokes made their reputation) in these cases. It is composed of an ounce of oil of turpentine, two ounces of brandy, eight ounces of boiling water, and a sufficient quantity of sugar. A third of this should be taken for a dose, and should be repeated if necessary every third hour. When applied externally, oil of turpentine is a speedy and powerful rubefacient and counter-irritant, and is beneficially used in this capacity in inflammatory attacks of the throat, chest, and abdomen. The best method to pursue is to rub the oil by means of a bit of flannel over the part to be acted on; over this to lay three or four folds of flannel, wrung out of hot water, and over the flannel to place a dry towel; two or three such applications produce a sufficient result. There is a *liniment of turpentine* which is powerfully stimulating, and is applied as a dressing for extensive burns; and is likewise used, with friction, in rheumatic and neuralgic cases. There is also the *liniment of turpentine and acetic acid*, which is the official representative of the well-known *St. John Long's* liniment, and is an excellent counter-irritant (applied with a sponge) in pulmonary consumption and other chronic pulmonary affections. Lastly, *ointment of turpentine*, a warm stimulating application, requires mention.

It was mentioned at the beginning of this article that on distilling turpentine with water, the oil comes over. The residue left in the retort constitutes common *resin* (or *rosin*), known also as *colophony*. See RESINS.

TURPENTINE TREE. See PISTACIA.

TURPIN, Archbishop of Rheims, friend and companion of Charlemagne, and eye-witness of the exploits he relates—such are the names and qualifications assumed by the author of a chronicle in Latin prose narrating the expedition of the Frankish emperor against the Saracens of Spain, and particularly the events that preceded and followed the battle of Roncevalles (q.v.). That a Bishop Turpin existed about this period is admitted, but the very documents in which he is mentioned, state that he was slain at Roncevalles. There was also an Archbishop Turpin of Rheims (753–800 A.D.), but he has no claim to the description given above; and, in fact, all internal evidence leads to the conclusion that it is a work of the 11th century. It seems to have sprung out of the epic ballads and traditions of the Carlovingian heroes, while these were still in a comparatively pure condition; but through the legendary manner in which they are told, there is visible a monkish aim—viz., to encourage the foundation of churches and monasteries, the undertaking of religious wars against the Saracens, and above all, the pilgrimage to San Jago de Compostella. Now, as in the year 1190, a brother of the archbishop of Vienne (subsequently pope Calixtus II.) obtained by marriage the countship of Galicia; as it was from Vienne that the pseudo-Turpin's chronicle was recommended to the rest of Christendom; as the same archbishop was detected on several other occasions fabricating false documents; as subsequently, in his quality of pope, he himself pronounced the chronicle authentic in a bull of 1122 (the authenticity of which has, however, been questioned); as he pursued the same family policy in his acts as pope, and in his sermons in honor of San Jago; finally, as the chronicle of the pseudo-Turpin is very often followed in the MSS. by a dissertation of Calixtus upon the miracles of San Jago, it has seemed to critics highly probable either that pope Calixtus wrote the work himself, while yet archbishop of Rheims (*circa* 1090), or, at least, that he took an important part in its composition. The book soon acquired a great popularity, was translated into French after 1206, and was made use of by divers chroniclers, as the author or authors of the *Chroniques de Saint-Denis*, Vincentius Bellovacensis, etc. The chronicle is of great historic value, in spite of all the embellishments it has from time to time received; for, as one of the most ancient traditions of the time of Charlemagne, it has preserved numerous traits and details with more purity and fidelity than the poems of the Carlovingian cycle, which are generally of later date. The chronicle has been printed in Reuber's edition of the *Scriptores* (Hanau, 1619; Frank., 1726).

TURPIN, "Dick," a famous highwayman, was born in Essex, England. He was a butcher, and supplied his shop with meat, whenever he could, by depredations on his neighbors' cattle. Being discovered, he fled, joined a gang of thieves, with whom he soon quarreled, and went off into York, where he passed for a gentleman. He was soon suspected, and finally captured with some stolen horses, tried, and executed April 10, 1739. Turpin's reputation as a hero, and a man of courage and generosity, are mere fabrications of some ingenious writer. In *Rookwood*, a novel by Ainsworth, Turpin is a prominent character.

TURQUOIS, a mineral hitherto found only in the province of Khorassan, in Persia, and much prized as an ornamental stone. It is essentially a phosphate of alumina, containing also a little oxide of iron and oxide of copper. It is harder than felspar, but softer than quartz, and has a greenish-blue color. It is opaque, or sometimes translucent at the edges. It is sometimes called oriental turquois; while the name occidental turquois is given to a substance of similar color, found near Simon, in Languedoc, which is said to be merely bone colored with phosphate of iron.

TURRETIN, or **TURRETINI**, FRANÇOIS, 1623-87; b. Geneva; studied theology first in his native city and afterward in Holland; pastor at Geneva, 1647; removed to Leyden, 1650; recalled to Geneva as professor of theology, 1653. His principal work, *Institutiones Theologiæ Elencticae*, ranks high among the expositions of Calvinistic theology. His complete works were published at Geneva (1688, in 4 vols). His son, JEAN ALPHONSE, 1671-1737, b. Geneva, was professor there of ecclesiastical history, and author of several valuable works relating to his department.

TURRET-SHIP, a recent invention in naval warfare, consists of an iron-plated vessel rising but slightly above the water. In the middle of the deck are one or more turrets incased in the most massive plates, and holding each one or two guns of heavy caliber. The turret, in American vessels, is pivoted on the keel or other firm base; in English specimens it revolves on rollers under the periphery. By means of simple mechanism, it can be made either by a steam-engine or by hand, to revolve with considerable speed, thus giving the gun a range in every direction. Turret ships were first proposed in America, by Mr. Theodore R. Timby, of New York, and were patented in Gt. Britain by Capt. Cowper Phipps Coles of the royal navy, who, after much discussion with the admiralty, was allowed to adapt the *Royal Sovereign*, a wooden vessel which had been built for a three-decker, to his designs. The plan was tried under disadvantages, as the ship had not originally been destined for such heavy work. Notwithstanding, the *Royal Sovereign*, as a turret-ship, was declared by competent officers to be at that time the most powerful vessel in the British navy. Almost simultaneously in the United States, similar vessels, called "monitors," sprang into existence, the principal point of difference between them and the British build being that their hulls are almost entirely submerged, the turrets being wholly above the upper deck; while, in the latter, the hulls rise higher from the water, and the turrets are sunk below the deck, except in so far as is absolutely necessary for discharging the ordnance. The British model gives the advantage of higher free-board, and consequent greater safety in heavy seas. Capt. Coles lost his life in the greatest naval catastrophe of modern times, the capsizing of his great turret-ship, the *Captain*, with about 600 souls on board, in the bay of Biscay, in Sept., 1870. This vessel was built after his complete design; but naval architects attribute her loss to a low free-board, coupled with heavy masting. It has for several years been in dispute whether to trust to turret-vessels or to ships with their battery in broadside. Under the administrations of lords Palmerston and Russell, the admiralty built broadside vessels. Lord Derby's government signalized their accession to power in 1866 by immediately ordering four iron turret-ships of immense power and 4,000 tons each.

Among the advantages claimed for turret-ships are—that much heavier ordnance can be carried centrally than at broadside, with equal dislocating pressure on the keel; that in a sea the platform from which aim is to be taken is steadier at the center; that the mark offered to the enemy is smaller; and that the gunners are safer, as the turret can be turned with its port-hole away from the enemy during loading. The *Devastation*, with her 35-ton guns, has been exceeded in power by the *Inflexible*, whose armor-plating, amidships, is two ft. thick, and which is furnished with two turrets, each containing two 81-ton guns. See NAVIES, MODERN; ARMOR PLATES. Hydraulic power enables the loading and firing to be conducted by two men only.

TURRITELLIDÆ, a family of gasteropodous mollusks, having a much elongated spiral shell, the lower spires remarkably separated. The name turret-shell is often given to them.

TURTLE, the popular name of those chelonian reptiles, the family *cheloniadæ* of some, which have a rather flat carapace, and fin-like paddles instead of legs, suited for swimming, and not for walking. The fore-limbs are much longer than the hind-limbs. The toes are not all furnished with nails; in some species, there is only one on each foot, in others there are two. Turtles are all marine, and although they lay their eggs on the beach, seldom visit the shore for any other purpose. They deposit their eggs in holes, which they scoop in the sand with their hind-feet. The eggs are numerous, one hundred and fifty or two hundred being often deposited at a time, and the turtle lays several times a year. The young, soon after being hatched, make their way through the sand which covers them, and immediately betake themselves to the water. The eggs are hatched by the heat of the sand alone, and the young receive no attention from their parents. Turtles crawl slowly and awkwardly on the shore; but their movements in water are comparatively quick, and even graceful. Some of the species feed entirely on grass-wrack and sea-weeds; which their powerful, hard, and sharp-edged jaws cut with great ease; others prey on crustaceans, mollusks, and fishes. Their jaws are powerful enough to crush very large shells, and the carnivorous turtles are in general more rapid in their movements than the others. The flesh of those which

subsist on animal food is musky and unpleasant; but that of the species whose food is vegetable is much esteemed. In many tropical countries, turtles, after being captured, are kept in enclosures to which the tide has access, to be killed when they are wanted. They are capable of subsisting long without food, and are imported alive from the West Indies into Britain, to supply the tables of the wealthy. In tropical countries, turtles are often very cheap. Their eggs are a much-esteemed article of food in the countries where they are found, and are sought for by probing the sand with a light stiff cane in the places known to be frequented by turtles. Turtles are easily taken when they come ashore for the purpose of laying their eggs, and one after another may be turned on its back—in which position it is helpless, and cannot make its escape—till a sufficient number is secured. They are also, however, taken in the sea, being cautiously approached by boats when resting, or apparently sleeping, at the surface, or by divers when descried at the bottom in their feeding-grounds. A small harpoon is used, or a rope is thrown over the head of the turtle. Turtles are sometimes pursued by boats in shallow parts of the sea until they are exhausted, the clearness of the water permitting them to be seen even when they dive; and when the boat gets near enough, a man leaps overboard, and seizes the turtle, clinging with both hands to the shell. It is said that at Mozambique a species of sucking-fish (*echineis*) is used for catching turtles, a cord being attached to the fish, which is allowed to swim away in the sea, and is sure to fasten itself firmly to the first turtle it meets. See *illus.*, CROCODILES, ETC., vol. IV.

The most esteemed turtle of the West Indies is the GREEN TURTLE (*chelonina mydas*) which is the only kind imported into Britain for aldermanic and other feasts. The green turtle attains a large size, being sometimes six or seven feet in length, and weighing 700 or 800 lbs. The plates of its carapace do not overlap one another; the central ones are almost regular hexagons. The popular name is derived not so much from the external color, which is mostly a dark olive, passing into dingy white, as from that of the fat, so much prized by epicures.—Another excellent species of turtle is the EDIBLE TURTLE (*chelonina virgata*) of the East Indies, which is frequently four or five feet long.—The HAWKBILL TURTLE (*caretta imbricata*), found in the warmer parts of the Atlantic ocean, in the Indian ocean, and in the Red sea, is particularly valuable, as yielding the best tortoise-shell (q.v.). It is one of those turtles which have the plates of the carapace imbricated, or overlapping one another like tiles. Its flesh, although not so much esteemed as that of the green turtle, is a good article of food; its eggs are also very good.—There are other turtles, having the head of a larger size, and the jaws curved toward one another at the extremity, of which one is the LOGGERHEAD TURTLE (*caouana olivacea*), a native of the warmer parts of the Atlantic, and a very rare visitant of the British seas. Others, again, have the carapace and plastron not hard, but leathery, and sometimes soft enough to yield to the pressure of the finger. One of these is the CORR-ACEOUS TURTLE (*sphargis coriacea*) of the Mediterranean and Atlantic, occasionally, but rarely, found even on the British shores. It attains a very large size, even greater than any of the species already described, but its flesh is coarse and unpleasant.

The French, encouraged by their success in pisciculture, have attempted to introduce the green turtle on the southern coasts of France.

TURTLE-BACK. See WHALEBACK.

TURTLE-DOVE, or TURTLE, *Turtur*, a genus of *columbidae*, having the bill more slender than pigeons, the tip of the upper mandible slightly bent down. They are also more slender and elegant in form than pigeons, and generally smaller; the wings are longer and more pointed; and the tail is longer, rounded, or slightly graduated. There are numerous species, natives of warm climates. Their soft and gentle, yet loud *cooing* has attracted attention even more than their beauty, and made them a favorite subject of allusion in poetry. *T. risorius*, the most common species in Palestine, and probably the one intended in the Song of Solomon, is about ten inches in entire length, with a short tail; the general color gray tinged with red; the upper parts greenish brown, with a black collar on the back of the neck. It is often kept in confinement, and becomes very tame.—Very similar to this in size and form is the COMMON TURTLE-DOVE (*T. communis*), a native of almost all the warmer parts of the Old World, a summer visitant of the s. of Europe and of England, where it is chiefly found in the south-eastern counties. In Kent, flocks of twenty or more are often seen, particularly in the pea-fields. The tail is long and much rounded; the plumage soft, and without gloss, exhibiting finely-mingled tints of gray and brown; the crown of the head bluish; all the tail-feathers tipped with white; a black patch on each side of the neck. Other species of turtle-dove, from different parts of the world, as well as these, are not unfrequently kept in confinement, and are very gentle, if not very intelligent pets. Their cooing resounds through a whole house.

TUSCALOO'SA, city and co. seat of Tuscaloosa co., Ala.; on the Black Warrior river, at the head of steamboat navigation, and on the Queen and Crescent Route railroad; 56 miles s.w. of Birmingham. It is the seat of the university of Alabama, the Central female college (Bapt.), the Tuscaloosa female college (Meth. Epis., S.), the Stillman institute for colored students (Pres.), and the state hospital for the insane, and has a public high school, Pierson library in the hospital for the insane, Stillman institute

library, university library, national banks, large coal and cotton interests, and daily, weekly, and monthly periodicals. Pop. '90, 4215.

TUSCALOOSA, a co. in n.w. Alabama, containing a part of the coal field of Alabama; 1346 sq. m.; pop. '90, 30,352. Co. seat, Tuscaloosa.

TUSCANY, formerly a sovereign grand duchy in the w. of Italy, lying for the most part, but not wholly, s. and w. of the Apennines, in lat. $42^{\circ} 20' - 44^{\circ} 10' \text{ n.}$, and long. $10^{\circ} 15' - 12^{\circ} 20' \text{ east.}$ Area, 9304 sq. m.; pop. in 1860, at the date of its annexation to Sardinia, 1,800,000; estimated pop. '95, 2,310,534. The n. and n.e. of the country is filled with mountains, whence numerous rivers and streams flow down to the sea, the most important of which are the Arno (q. v.), the Serchio, and the Ombrone. This district is also the source of the Tiber (q. v.). The rest of Tuscany is an undulating region of hills and dales, except the coasts, which are flat and marshy. Of these marshlands, the largest is (or was) the *Maremma* (q. v.). Tuscany, as a *compartimento* of the kingdom of Italy, comprises the administrative provinces of Arezzo, Firenze, Grosseto, Livorno, Lucca, Massa e Carrara, Pisa, and Siena.—The ancient history of Tuscany is described at length in the article *ETRURIA*, and its mediæval history in the article *FLORENCE*. It is only necessary to add that modern Tuscany was first constituted in its present dimensions in 1569, when Cosmo de' Medici became grand duke of Tuscany. On Aug. 16, 1860, the national assembly of Tuscany pronounced the deposition of the reigning dynasty; and, four days later, declared for annexation to Sardinia.

TUSCARA WAS, a co. in e. Ohio; 539 sq. m.; pop. '90, 46,618, chiefly of American birth, with colored. Co. seat, New Philadelphia.

TUSCARORAS, a tribe of North American Indians, who, at the settlement of North Carolina, had 15 towns on the Tar and Neuse rivers, and 1200 warriors. In 1711 they began a war with the settlers, and, after a series of savage encounters, were defeated, and joined the Iroquois in New York, where they became allies of the English.

TUSCOLA, a co. in e. Michigan, having Saginaw bay on the n.w.; 830 sq. m.; pop. '90, 32,508. Co. seat, Caro.

TUSCULUM, anciently a city of Latium, about 15 m. s. of Rome, was situated on a ridge of hills known as the *Colles Tusculani*, and forming part of the Alban range. We ought not to infer from its name (as Festus does, *s. v. Tuscos*) that it had any connection with the Etruscans. Mythically, it derived its origin from Telegonus and Circe; but we catch the first certain glimpse of its historical existence toward the close of the regal period at Rome. Then, however, it appears in the enjoyment of a high degree of prosperity and power, and therefore its beginnings are in all probability remote. Octavius Mamilius, ruler of Tusculum, and the foremost prince in Latium, married a daughter of Tarquin the Proud (see *TARQUINIUS*), and played a conspicuous part in the last of the great struggles made by the banished tyrant to regain his kingdom. On that occasion, the Latins were so thoroughly beaten (see *REGILLUS LAKE*) that they were fain to enter into an alliance with the victor, and ever after—except in the single instance of the great Latin war (340–338 B. C.)—remained steady in their attachment and fidelity to Rome. As early as 378 B. C., the inhabitants of Tusculum received the Roman franchise, and among its many distinguished *gentes* may be specially mentioned the Porcian, which produced two famous men of a thoroughly "Roman" stamp, Cato major and Cato minor. Toward the close of the republic, Tusculum became a famous country residence of the wealthy Romans. Lucullus had a villa here (with parks and gardens extending northward for miles); so had Cato, Brutus, Hortensius, Crassus, Cæsar, and Cicero. The villa (*Tusculanum*, Tusculum house) of the great orator is peculiarly memorable as the place where he composed many of his philosophical works, and particularly those charming dialogues (*Tusculanæ disputationes*) which derive their name from it. Long after the western empire had fallen, Tusculum continued to flourish. As late as the 12th c., the ancient city continued entire; but in 1191 it was stormed by the Romans (between whom and the Tusculans there had long been a deadly feud), and razed to the ground. It never recovered from this blow; but lower down there arose from its ruins, if we may so speak, the town of Frascati (q. v.). Many fine remains of ancient Tusculum have been dug up in recent times, the most remarkable, perhaps, being the amphitheater, theater, and city walls.

TUSSILA'GO, a genus of plants of the natural order *compositæ*, suborder *corymbifera*, having bractæ with a membranous edge, a naked receptacle, a hairy pappus; the florets of the ray pistilliferous, in many rows, tongue-shaped; those of the disk perfect, few. *T. farfara*, sometimes called *COLT'S-FOOT*, is the only British species. It has single-flowered scaly scapes, appearing before the leaves in early spring, the flowers yellow, both disk and ray; the leaves heart-shaped, angular, downy beneath. The leaves have a somewhat glutinous and subacid taste, and are used either by smoking, or in the form of a decoction, for relief of asthma and troublesome coughs. They have been used with advantage in scrofula.—Nearly allied to this genus is *petasites*, of which one species, the *BUTTER BUR* (*P. vulgaris*, formerly *tussilago petasites*), is a native of Britain. The leaves resemble those of *tussilago farfara*, but are much larger; the flowers also appear before the leaves, but in a dense thyrsus, and are of a pale flesh-color. The flowers of

both are much sought after by bees, as are those of *P.* (formerly *tussilago*) *alba*, *P.* (formerly *T.*) *fragrans*, natives of the s. of Europe, not uncommon in gardens. See *illus.*, *FLOWERS*, vol. VI.

TUTTI, or **TUTTO** (Italian, from the Latin, *totus*, all), a musical term signifying that all the parts are to be played together in full concert.

TUTTLE, DANIEL SYLVESTER, D.D., b. N. Y., 1837; graduated at Columbia college, 1857; studied theology in the General Theological Seminary (Protestant Episcopal); consecrated bishop of Montana, including in his jurisdiction, Idaho and Utah, and subsequently bishop of Missouri.

TUTTLINGEN, a t. of Württemberg, on the right bank of the Danube, 20 m. w.s.w. of Sigmaringen. It has shoe factories, tanneries, and manufactures of surgical instruments. Pop. '90, 10,092. Tuttlingen is historically notable as the scene of a battle in 1643, during the Thirty Years' war, in which an Austro-Bavarian force, under Hatzfeld and Mercy, defeated the French.

TUTUILA, an island in the Pacific, belonging to the group of the Navigators' or Samoan islands (q.v.), is about 17 m. long and 5 m. broad, and is said to contain about 3750 inhabitants. The coast is bold, and the island is traversed by sharp-peaked mountains, highly picturesque in outline, and rising to from 2500 to 3500 feet. The harbor of Pago Pago, an ancient crater, is very deep, and completely landlocked by lofty mountains. The mountains are clothed with dense green forests, comprising the bamboo, banana, cocoa-nut tree and other palms. Between the months of November and May, fearful hurricanes break over the island, and so powerful is their effect, that they are said by the natives to *skin the land*.

TUXEDO PARK. The region of country now known as Tuxedo Park comprises about 4558 acres of land, at the extreme south corner of Orange County, in the state of New York, with a small portion crossing the Rockland County line. It is situated in the heart of a mountainous district at the junction of the Blue Ridge and Alleghany Ranges, which cross each other at this point, the Blue Ridge running very far north to form the Green Mts. of Vermont, the Alleghany stopping with the Shawangunk and Catskills. The local name of the hills in which lie Tuxedo park and lake is the Ramapo. The region is, of course, rugged and mountainous, presenting superb points of view, of which the great lake and outlying ponds are most picturesque features. The rock formation is common granite and drift, interspersed with limestone. In the immediate neighborhood are large deposits of iron ore, as, for instance, at Ringwood, where the Hon. Abram S. Hewitt has his extensive furnaces and iron works. Mr. Hewitt has also a sumptuous summer residence at Ringwood with hundreds of acres laid out in park, garden, and pleasure grounds.

The origin of the name Tuxedo has been variously explained. Mr. William Waldorf Astor, in his Report to the Executive Committee of the Tuxedo Club, after an exhaustive investigation of the subject, and an examination of the language of the Algonquins, who occupied this region, comes to the conclusion that it is a corruption of two or more Indian words. Mr. Astor says: "It was suggested that a frequent habit of the Indians was to name a place after the chief whose tribe occupied it, and this clew being taken up, mention was discovered of a sachem named 'P'tauk-Seet, the bear,' who in the seventeenth century ruled over a tract of country including Tuxedo. Uniting his name with 'tough,' the Algonquin for 'place,' we should infer the original spelling to have been P'tauk-Seet-tough, and its meaning 'The Home of the Bear.'" The first description of this section of country was written, according to Mr. Astor's report, by the Marquis de Chastellux, a French officer, who came to this country with La Fayette, and who, on Dec. 19th, 1780, following the Continental Road through the gorge south of the lake then called "The Clove" presently came in view of Tuxedo. The marquis writes: "I got on horseback and penetrated afresh into the woods, mounting and descending precipitous hills until I found myself at the edge of a lake so secluded that it is hardly visible from the surrounding thicket. Its banks are so steep that if a deer made a false step on the top, he would infallibly roll into the lake. This lake, which is not marked upon the charts, is called Duck Sider, and is in the wildest and most deserted country I have yet passed through." Nothing appears to have been done to develop or cultivate this desolate region, or to utilize its vast material advantages for more than a hundred years from this date. In 1884 Mr. Pierre Lorillard, a wealthy and influential citizen of New York, conceived the idea of purchasing the tract and converting it into a vast park and pleasure ground, including a club house and building sites for men who were able to pay for the comforts and advantages that he would provide. Mr. Lorillard began work immediately, overcoming all the obstacles and difficulties that nature had put in his way, grading and leveling, building and constructing, until an ornamental domain so perfect and beautiful that it has been compared to an English nobleman's country seat, grew out of the wilderness in the Ramapo mountains. A number of Mr. Lorillard's friends, when they saw what his liberality had accomplished, joined with him in the enterprise, and in 1885 it was incorporated as the Tuxedo Park Association. Only a year later, in June, 1886, a magnificent club house, standing in its own grounds and approached by roads unequaled in any part of

the world, was formally opened to subscribers. Since then one hundred and seventy acres of building sites have been sold at an average price of \$3200 per acre. Cottages have been erected, grounds laid out, the park stocked with deer, the lakes with trout, and the woods with game. Trout raising has been a great success, and in 1890, 22,000 trout averaging about four to the pound were turned out, and 3000 pounds of fish sold. The wild flora that abound in the woods make the neighborhood a paradise for botanists. Wild orchids of many different families, an immense variety of asters, the red and blue cardinal flower, the fringed gentian, pyrola, trailing arbutus, as well as many healing and medicinal plants are to be found there. Handsome specimens of wild animals, such as gray and red foxes—others—the mink, coon, and lynx, have been captured by the gamekeepers, as well as almost every variety of North American birds. The material growth of the place has been rapid. There are now fifty-five resident members, and the total number of souls in the park proper and village is estimated at about 1800. Everything inside of Tuxedo is private property, and the cost of running it, including the pumping of water, repairing roads, cleaning and flushing sewers, lighting the roads, policing the park night and day, and the incidental planting and keeping the public parts in order is paid by the property owners, and the association in proportion to the amounts invested.

The Club House combines everything in the way of elegance and comfort; handsome dining, drawing, and ball-rooms, the latter with a stage, scenery, and every requisite for amateur performances. Tennis courts, billiard-rooms, and bowling alleys are in different parts of the grounds, and in winter the Tuxedo toboggan slide is the resort of all who love Russian sports. There are also boat-houses, with every facility for matches and regattas, all for the benefit of members and subscribers, who have united with Mr. Lorillard in bringing this herculean enterprise to a thoroughly successful issue.

TUYERE, the nozzle or small pipe through which the air is forced into a blast-furnace.

TVER, a government of Great Russia, bounded on the n.w. by the government of Novgorod, and on the s.e. by those of Moscow and Smolensk. Area, 25,180 sq. m.; pop. '94, 1,930,015, mostly Russians. In configuration, the government is an elevated table-land, forming part of the Valdai plateau, which throws off rivers that run n.w. into the Baltic, and s.e. into the Caspian sea respectively. The chief rivers are the Volga (with its affluents, the Tvertza, and the Mologa), the Western Dwina, the Msta, and the Tsna. Most of these rivers rise in the n.w. of the government.

TVER, a city of Great Russia, capital of the government of the same name, stands at the confluence of the Volga with the Tvertza, 348 m. s.e. of St. Petersburg, by the St. Petersburg and Moscow railway. The Volga, which is here wider than the Thames at London bridge, becomes first navigable for steamers at this town, although there is much difficulty in accomplishing the voyage hence to Nijni-Novgorod when the water is low. Tver is a well built city, with handsome squares and fine broad streets, is the seat of the governor and of an archbishop, has numerous churches, a theater, and a statue of Catharine II. Pop. '97, 53,477.

TWAIN, MARK. See **CLEMENS, SAMUEL LANGHORNE**.

TWEED, the most famous of Scottish rivers, rises in the extreme s. of Peeblesshire, at an elevation of 1500 ft. above sea level. It flows n.e. to near Peebles, thence e. by s. to its junction with Ettrick water, and thence in an easterly and finally north-easterly direction to its embouchure in the North sea at Berwick-on-Tweed. The river drains great part of Peeblesshire, traverses the northern districts of Selkirk and Roxburgh shires; and in its lower course it forms the boundary between Berwickshire on the n.w. and the English border-land on the s.e. It receives the Ettrick, the Teviot, and the Till from the s.; and the Gala, Leader, and Adder from the north. The Tweed passes Peebles, Innerleithen, Melrose, Dryburgh abbey, Kelso, Coldstream, and Berwick, where it falls into the sea after a course of 96 m., and having drained an area estimated at 1870 sq.m.—greater than that of any other Scottish river, except the Tay. The highest regions through which the river flows are for the most part of the nature of moors; the middle course of the river is through narrow valleys, flanked by hills, clothed with woods or in pasture; and its lower course, through wide-spread valleys, picturesque and beautiful, and through the rich plain of the Merse (see **BERWICKSHIRE**), has many attractions. The tide is felt at Norham castle, 10 m. from the mouth of the river; but there is little or no navigation above Berwick. Possibly the Tweed owes its fame more to the associations which connect themselves with it, than to the charms of the scenery through which it flows. Traversing the heart of the "borders," it has been witness to many a foray between the warrior-farmer n. and s. of its banks, as well as many a deadly struggle between the rival houses of the s. of Scotland; and its name is frequent in ballad and story. The Tweed is famous as a salmon and trout stream.

TWEED, WILLIAM MARCY, 1823-78; b. N. Y.; son of a chair-maker, and followed the same business, receiving slight education; entered politics while a very young man, and was an alderman in 1850, and member of congress in 1853. In 1857-59 was school commissioner of the 7th ward; became a member of the board of supervisors of the county (New York), and president of the board during four successive terms. In 1867 and 1869 served as state senator; a member of the Tammany Society for many years, he became grand sachein in 1869-71. Having been appointed deputy street commissioner in 1863, when that department was changed to the department of public works, he was

at its head, a position which enabled him to initiate, as is generally believed, the formation of the combination known as the "Tammany ring," though by many it is claimed that the actual leader in this movement was Peter B. Sweeney, city chamberlain. A system of "raising" the amounts of vouchers for city and county work was arranged by those who were in the "ring," and thus enormous sums were stolen, which were divided among them. The power gained by the possession and use of so much money was employed to facilitate the operations of the "ring," and to prevent its members from being brought to justice. Legislatures and judges were bribed; and bills passed and decisions rendered in their favor. Gigantic schemes of city improvement were organized and carried out successfully. Fraudulent bills were audited, and their sum divided among the thieves. No such complete plan of public spoliation was ever devised and executed before in any country. The exposure of this vast system of speculation was made through the columns of the N. Y. Times, through the intervention of a disappointed enemy of the "ring;" and Tweed was indicted in 1872 for forgery and grand larceny. Two trials were held, and he was convicted on 51 counts, and sentenced to 12 years' confinement in the penitentiary, and to pay a fine of \$12,300.18; one year for each of 12 counts in the indictment; and a fine of \$250 each for 39 other counts. He was confined on Blackwell's Island from Nov., 1873, until June, 1875, when he was released by a decision of the court of appeals, on a legal technicality. He was immediately arrested on a warrant issued in a civil suit for \$6,198,957.85, and sent to Ludlow Street jail. Being permitted to go out to drive with an officer, he made his escape while paying a visit to his wife in Fifth Avenue, and successfully fled the country and went to Spain. He was caught and returned in Nov., 1876, and again incarcerated in Ludlow Street Jail until April 12, 1878, when he died.

TWEED MOUTH. See BERWICK-ON-TWEED.

TWEEDS, a name originally given to a certain kind of woolen cloth, produced in the s. of Scotland, largely made at Galashiels, Hawick, Selkirk, Jedburgh, and other places on the Tweed and its tributaries. It is prepared chiefly for men's apparel, but its use and consumption for women's wear has of late been steadily on the increase. It is of an open, soft, flexible nature; differing from English superfine cloth in not being so finely spun or closely woven, and most of all in not being so thoroughly felted. The fabric of broadcloth is not intended to show any appearance of weaving, whereas in tweeds, starting from the "shepherd's plaid," the whole art of weaving is capable of being developed in novel and fanciful designs, admitting of great variety of texture. Tweeds are further characterized by their purity of color and genuineness of make—shoddy, mungo, and cotton-warp not being yet used in the production of even the cheaper kinds. It is a manufacture of comparatively recent date. Seventy-five years ago, Galashiels, a principal seat of the manufacture, was only a small village; its few weavers individually manufacturing a species of coarse woolen cloth called "Galashiels gray," made from wool grown on the surrounding hills. About forty years later the fabric was so far improved, that its use was no longer confined to the border shepherds, but it had begun to be more or less worn by all classes in towns. The warmth, comfort, and durability of tweeds, as well as their suitability for all seasons, gradually led to their being preferred to the hard tartans, Manchester linens, and nankeens of former days; and eventually even to English doeskins. The demand for them rapidly increased. Galashiels has become a considerable town, and many large mills are now in active operation on the Tweed and its "waters," although they have for many years ceased to furnish power enough for the machinery. Nor has the manufacture confined itself to Tweedside, but has spread northward to Aberdeen, Elgin, and Inverness; and southward to Dumfries, and into Cumberland. The wools used in the production of tweeds are principally Cheviot, South American, and Danish for the coarser kinds; and Australian, New Zealand, and Saxony for the better qualities. The processes of spinning and weaving are similar to those adopted for English woolen cloth, the machinery, in fact, being, in the main, exactly the same.

TWELFTH-DAY. See BEAN-KING'S FESTIVAL, and EPIPHANY.

TWELVE APOSTLES, TEACHING OF THE. See TEACHING OF THE, etc.

TWELVE TABLES (Lat. *Lex* or *Leges Duodecim Tabularum*) the name given to the earliest code of Roman law. According to the ancient account, the code originated in this wise: In the year 462 B.C., a tribune, C. Terentilius Arsa, brought forward a proposal to appoint five men to draw up a set of laws, with the view of limiting the *imperium* of the consuls. The aristocracy, always furious, selfish, and unwise in their struggles with the commons of Rome, violently resisted this reform, and for eight years a fierce parliamentary warfare—if we may so call it—was carried on between the two orders, which ended in a sort of partial victory for the plebeians; that is to say, in 454 B.C., the senate assented to a *plebiscitum* (see PLEBISCITE), in virtue of which three commissioners were dispatched to Greece to report on the laws in force among the different states there. After a lapse of two years they returned; and it was then agreed that ten men (*decemviri*) should be selected to draw up a code (*legibus scribundis*); but the patrician or aristocratic party took care that these decemvirs should all be chosen from their body. The story of the political fortunes of the decemviri (q.v.), and of the

fate of the leading decemvir, Appius Claudius (q.v.), are well known, though we believe that it has not come down to us in a very historical dress; indeed, it is politically quite unintelligible in the main. But what concerns us here is not the political career of these men, but the character of the legislation ascribed to them. We say ascribed to them, for the whole story of the foreign travels of the commissioners, and of their eclectic procedure in the matter of the Solonian and other laws, is so completely at variance with the simple, narrow, *home-centered* feelings of the Roman people at that early time, and with the thoroughly *Italian* stamp of the legislation embodied in the "twelve tables," that it has very reasonably been doubted whether such a commission ever existed, or, if it did, whether it did not acquire its information from the Hellenic cities of lower Italy. Niebuhr, however, thinks the embassy to Greece just possible, though he is obviously reluctant to go further, and affirm that it really did occur (*Lect. Rom. Hist.*, vol. i. p. 296), and points out very clearly the difference between the Roman and Greek laws. "All," says he, "that is distinctive in the Roman law, is not to be found in the Athenian; and distinctive it is with regard to the rights of persons and things. Never had the Greeks the right of paternal authority, like the Romans; never the law, that the wife, by her marriage, entered into the relation of a daughter and co-heiress; never the *jus mancipii*, the formality in the purchase. The difference between property by formal purchase and simple property, between property and hereditary possession, does not exist in the Attic law; the Roman law of inheritance, the Roman law of debt, the Roman system in contacts of borrowing and lending, are quite foreign to the Athenians" (*Lect. Rom. Hist.*, vol. i. pp. 295, 296). These differences, and the number could easily be enlarged, have induced modern historians to adopt the theory—if, indeed, that should be called a "theory" which, in the eyes of all sound investigators, is a demonstrated fact—viz., that the twelve tables, instead of being an eclectic assortment of foreign laws, hitherto unknown to the people of Rome, and imposed on them for the first time, really expressed the first effort toward the codification of the consuetudinary law of the Latin race.

According to Livy (iii. 57) and Diodorus (xii. 56), the laws of the twelve tables were cut on bronze tablets (whence their name), and put up in a public place. Whether these tablets were destroyed by the Gauls when they sacked and burned Rome (390 B.C.) is uncertain. At all events, the later Romans entertained no doubt that the collection which existed in their time was genuine. The only portions extant are those which have been quoted by jurists and others. The twelve tables is described by Livy (iii. 34) as the *fons publici privatique juris*—the fountain of public and private law. Cicero (*de Or.* i. 43, 44) speaks of them with high praise. In the course of years, the *jus publicum*, as could not fail to be the case, was greatly changed, but the *jus privatum* of the twelve tables continued the fundamental law of the Roman state. See George Long's article "Lex," in Smith's *Dic. of Gr. and Rom. Ant.*; Niebuhr's *Lect. Rom. Hist.* (English translation, vol. i. pp. 295-319), Mommsen's *Hist. of Rome* (English translation, vol. i. book i. chap. 11, and book ii. chap. 2). The most complete essay on the history of the extant fragments of the twelve tables is to be found in Dirksen's *Uebersicht der bisherigen Versuche zur Kritik, und Herstellung des Textes der Zwölf-Tafel-Fragmente* (Leip. 1824).

TWESTEN, AUGUST DETLEV CHRISTIAN, D.D., 1789-1876; studied at Kiel; professor of theology at Kiel, 1814; succeeded Schleiermacher at Berlin, whose views he had adopted, 1835; was a member of the new supreme ecclesiastical council of the united evangelical church, 1850. He published *Vorlesungen über die Dogmatik der evangelisch-lutherischen Kirche* (1826); *Grundriss der analytischen Logik* (1834); *Matthias Flacius Illyricus* (1844); and edited Schleiermacher's *Ethik*.

TWESTEN, KARL, 1820-70; b. Kiel, Germany; son of August; educated at the universities of Berlin and Heidelberg. He was connected with the Prussian judicial services, became a leader in the progressive or liberal party, and in 1861 was elected to the chamber of deputies, and later a member of the North-German *reichstag*. He was the author of *Schiller in seinem Verhältnisse zur Wissenschaft* (1863); *Macchiavelli* (1868); and *Die religiösen, politischen, und socialen Ideen der Asiatischen Kulturvölker und der Aegypter in ihrer historischen Entwicklung* (1872).

TWICKENHAM, a village in England, county of Middlesex, on the left bank of the Thames; pop. '91, 16,026. It is connected with Richmond on the opposite bank by a substantial bridge, and is 10 m. s.w. of St. Paul's, London. It contains the great church of St. Stephen's, completed in 1874; the estate of Alexander Pope, where the grotto is all that remains; his monument is in the church. At a little distance is the home of Walpole, called Strawberry hill; and the Orleans house, temporarily occupied by Louis Philippe and still owned by his descendants.

TWIGGS, a co. in central Georgia, 376 sq.m.; pop. '90, 8195, chiefly of American birth, with colored. Co. seat, Jeffersonville.

TWIGGS, DAVID EMANUEL, 1790-1862; b. Ga.; son of Gen. John Twiggs, a revolutionary officer. He served in the war of 1812, rose through successive grades to brig. gen., 1846, and commanded the right wing in the battle of Palo Alto and Resaca de la Palma in the Mexican war; brevetted maj. gen. for gallantry, at Monterey, 1848; presented with a

sword by congress. In 1848 he was appointed military and civil governor of Vera Cruz; dismissed the service in 1861, for surrendering troops and munitions of war to the state of Texas, which had seceded. His brother Levi was killed at the battle of Chapultepec in 1847.

TWILIGHT. If the earth had no atmosphere, we should be involved in total darkness from the instant of sunset till the instant of sunrise. The transition from day to night and from night to day, occupies an interval which varies with the latitude and the declination of the sun, and this intermediate stage is called twilight. As long as the sun is not more than 18° below the horizon, its light is reflected by the air and the clouds and vapors suspended in it, in sufficient quantity to render even distant objects visible. The question of the duration of twilight is, therefore, simply reduced to this: How long, after sunset, or before sunrise, does the sun reach a position 18° below the horizon of a given place? And this can be answered easily by calculation in spherical

trigonometry. Thus, if Z be the zenith, P the pole of the heavens, ASB the horizon, and $MSTN$ the (small) circle which the sun describes about the pole; there is twilight while the sun moves from T to S , ZT being an arc of 108° . In the spherical triangle ZPT , we know the three sides, for ZP is the colatitude of the place, PT the sun's polar distance, and ZT is 108° . Hence we can calculate the angle ZPT , which is the sun's *hour-angle*; and from this we find at once how long before or after noon the sun passes the point T . If ZT' be also 108° , we see that it is night while the sun moves from T' to T , day while it moves from S (through M , its meridian position) to S' , morning twilight from T to S , and evening twilight from S' to T' . Make $ZC = 108^\circ$, then, if PN be less than PC , but greater than PA , there will be no point of the sun's path ($MS'NS$) so far as 108° from Z ; and therefore the points T and T' will not exist. In this case the sun will set and rise, but there will be *no night*, or, rather, twilight will occupy the whole interval from sunset to sunrise. This cannot occur in low latitudes, but does occur during certain periods of the year in northern and southern countries. For

PN is 90° —sun's declination,
 PC is latitude $+ 18^\circ$,

and our condition is, therefore, that 90° —sun's declination, while greater than the latitude, does not exceed it by more than 18° . Or, in a simpler form, the latitude, together with the sun's declination, must lie between 90° and 72° . Now the sun's greatest declination is about $23^\circ 30'$, and therefore, in lat. $48^\circ 30'$ (72° to $23^\circ 30'$), there will be one night in the year (at the summer solstice) consisting wholly of twilight; for higher latitudes, more; and for lower none. Some curious problems on this subject, such as the finding the time of year at which the twilight is longest in a given latitude, were among the early triumphs of the differential calculus. A curious phenomenon, known as the *afterglow*, or second twilight, often seen in the Nubian desert, is referred by sir John Herschel to a second reflection of solar light in the atmosphere. Lambert and others had previously speculated on the possibility of second and even third twilights, but in their time there was no recorded observation of such appearances.

TWILL, a woven fabric, in which the warp is raised one thread and depressed two or more threads for the passage of the weft: this gives the structure a curious appearance of diagonal lines.

TWIN-SCREW (*nautical*). A pair of screw propellers on separate shafting, and built to work *right* and *left* respectively. The object of the right and left motion is to counteract the tendency to produce lateral vibration. The credit of the invention is due to Col. John Stevens, of Hoboken, N. J., who constructed, in 1804, a boat, fifty feet in length, which worked successfully, and the machinery of which is still preserved in the Stevens Institute of Technology, at Hoboken, N. J. As a test of the workings of the machinery, it was in the year 1844 placed in a vessel built on a model of the one in which it was first used, and successfully propelled at a speed of 8 miles an hour. The screws were placed one on either side of the rudder, and were driven by the same engine.

The principal ocean steamers at present thus fitted are the *City of Paris* and the *City of New York*, of the Inman line; the *Majestic* and *Teutonic*, of the White Star line; and the *Augusta Victoria*, *Columbia*, and *Normannia*, of the Hamburg-American line, with others building. The great benefit gained is that if one set of machinery is disabled, the other acting independently, will still propel the ship while repairs are being made, and thus avoid disaster, while, when both are in working order, there will be a very material addition to the speed of the steamer. See STEAM-NAVIGATION.

TWO MOUNTAINS, a co. of s.w. Quebec, having the Ottawa river for its s. boundary; 258 sq. m.; pop. '91, 15,027. Co. seat, Ste. Scholastique.

TYBEE, an island and sound at the mouth of the Savannah river, Ga. The sound is a bay of the Atlantic, extending from Tybee island on the s. to Hilton Head on the n., opening to Port Royal entrance by Cooper's river, Wall's, cut, Lazaretto creek, and other channels. The island is 6 m. long by 3 wide; and was occupied in 1861 by Gen. Gillmore, who erected batteries for the reduction of Fort Pulaski, which capitulated April 11, 1862.

TYBURN, previously to 1783, the chief place of execution in London, was situated near the n.e. corner of Hyde park, at the western extremity of Oxford street, and at the point where the Edgware and Uxbridge roads unite. It took its name from a small stream which ran from Hampstead to the Thames through St. James's park, but which has long since disappeared. The gallows seems to have been a permanent erection, resting on three posts, whence the phrase "Tyburn's triple tree." Wooden galleries were erected near it for the accommodation of spectators. Hogarth's *Idle Apprentice* was executed at Tyburn; and the print which represents the scene, gives a good idea of an execution there. The criminal was conveyed all the way from Newgate to Tyburn, a distance of about 2 m., by Holborn and the Tyburn road, now Oxford street, but in the 17th c. a "sloughy country road." As Oxford street and London generally spread westward, the long procession became inconvenient, and the place of execution was, on Dec. 9, 1783, removed to the Old Bailey, or Newgate, where it has since remained.

In early times, the frequency of executions rendered the office of hangman more important than it has since become. Throughout the reign of Henry VIII. (38 years), the average number of persons executed in England was 2,000 annually. In our own time, the corresponding number has sunk to twelve. Formerly, the hangman must have had almost daily work. This fact, taken in connection with the increase of population, and the employment of the Tyburn hangman in state executions, explains the important place he occupied in popular imagination, and the frequent mention of him in contemporary literature. The first on record was "one Bull," who flourished in 1593. He was succeeded by Derrick, referred to in the *Fortunes of Nigel*, and mentioned in a political broadside as living in 1647. In the ballad of *The Penitent Tailor*, published in the same year, reference is made to his successor, Gregory Brandon—

I had been better to have lived in beggary,
Than to have fallen into the hands of Gregory.

In Gregory's time, it became the custom to prefix "squire" to the names of the Tyburn hangmen. This is said to have originated in a practical joke played upon the Garter King-of-arms. He was induced to certify the authenticity of a coat-of-arms of a gentleman named Gregory Brandon, who was supposed to reside in Spain, but who turned out to be the hangman. The Garter King was committed to prison for his negligence, and hence the popular error, that "an executioner who has beheaded a state prisoner becomes an esquire." Gregory was succeeded by his son Richard. "Squire Dun" followed; and after him came Jack Ketch, or squire Ketch, first mentioned in 1678. He was the executioner who beheaded lord Russell and the duke of Monmouth. Lord Macaulay, in speaking of the execution of the latter, says: "He then accosted Jack Ketch, the executioner, a wretch whose name has, during a century and a half, been vulgarly given to all who have succeeded him in his odious office. 'Here,' said the duke, 'are six guineas for you. Do not hack me, as you did my lord Russell. I have heard that you struck him three or four times. My servant will give you some gold, if you do the work well.'" —See *History of England*, vol. ii. p. 205. What followed, it is needless to repeat. After this time, the "kings of Tyburn" all received the name of Ketch, and their patronymics seem to have been less noted. Jack Ketch's immediate successor was "one Rose, a butcher," and the last of the Tyburn hangmen was Edward Dennis, condemned for taking part in the no-Popery riots, but respited, it is believed, on the ground that his services could be ill dispensed with.

Among the most memorable executions at Tyburn were those of Elizabeth Barton, the holy maid of Kent, and her confederates (1534); John Felton, the murderer of the duke of Buckingham (1628); Jack Sheppard, the highwayman (1724); Jonathan Wild, the thief catcher (1725); Mrs. Brownrigg, the murderer of an apprentice (1766); Dr. Dodd (q.v.), found guilty of forging a bond for £4200 (1777); and the Rev. Henry Hackman, murderer of Miss Reay (1779). The associations connected with Tyburn have naturally led to the suppression of the name in the street nomenclature of London, but it survives in that given to the quarter of the metropolis described by Mr. Thackeray as "the elegant, the prosperous, the polite Tyburnia, the most respectable district in the habitable globe."

Under a statute of William III. (10 and 11, c. 23, s. 2), prosecutors who secured a capital conviction against a criminal were exempted from all manner of parish and ward "offices within the parish in which the felony had been committed." Such persons obtained what was called a "Tyburn ticket," which was enrolled with the clerk of the peace, and sold like any other property. The privilege the tickets conferred must have been highly valued, as they sold at a high price. "Last week," says the *Stamford Mercury* of March 27, 1818, "a Tyburn ticket sold in Manchester for £280." The act under which they were granted was, however, repealed a few months later, by 53 Geo. III. c. 70, passed June 3, 1818; and since then they have ceased to be recognized.

TYCOON, SHOGON, or SHOGUN, the title of the hereditary military ruler of Japan, formerly regarded as emperor. The office has been abolished since the revolution in favor of the "mikado," or spiritual ruler. The tycoon had his court at Yedo, now Tokio, and was the highest authority known to *foreigners*, though not in fact the chief ruler. The treaties which admitted foreign commerce and residents to Japan were negotiated with him. See JAPAN.

TYE, CHRISTOPHER, an English musician of note of the 16th century. He was b. at Westminster in 1500, educated in the king's chapel, and held the office of musical instructor to Edward VI. when prince of Wales. He received the degree of musical doctor from the university of Cambridge in 1545, and from Oxford in 1548. Under Elizabeth, he was organist to the chapel royal, and produced various services and anthems, some of which are yet in repute among musicians. Dr. Tye's general scholarship was considerable.

TYLDESLEY, a well-built and increasing town of Lancashire, England. Pop. '91, 12,891.

TYLER, a co. in e. Texas, having the Neches river for its e. boundary; 930 sq.m.; pop. '90, 10,877. Co. seat, Woodville.

TYLER, a co. in n. W. Virginia, having the Ohio river on the n.w.; 330 sq.m.; pop. '90, 11,962. Co. seat, Middlebourne.

TYLER, BENNET, D.D., 1783-1858; b. Conn.; graduated Yale college, 1804; ordained pastor of Congregational church, South Britain, Conn., 1808; president of Dartmouth college, 1822-28; pastor of Second church, Portland, Me., 1828-33. Advocating the "older" theology, he was the prominent opponent of Dr. Taylor's views on the nature of sin and the government of God; and the controversy led to the formation of a theological seminary at East Windsor, of which Dr. Tyler was president and professor of theology. The fierce theological debate lingers now only in faint echoes. He published *History of the New Haven Theology*; *Memoir of Rev. Asahel Nettleton*; *Review of Day on the Will*; *Treatise on the Sufferings of Christ*; *Letters to Dr. H. Bushnell on Christian Nurture*.

TYLER, MOSES COIT, b. Conn., 1835; educated at Yale college and Andover theological seminary. He was settled over a Congregational church in Poughkeepsie, N. Y., 1860-62, when he left the ministry on account of ill-health. He lived in England 1863-67, and then became professor of English literature in Michigan university. He afterwards entered the Episcopal church. He has published the *Brownville Papers*, an edition of Morley's *English Literature*, a *Life of Patrick Henry*, *Three Men of Letters*, *Literary History of the American Revolution*, and *History of American Literature during the Colonial Time* (1897). In 1881 he was appointed professor of history at Cornell university.

TYLER, ROBERT OGDEN, 1831-74; b. N. Y.; graduated West Point, 1853; commissioned in the artillery. He served on the border and as col. of volunteers through the peninsular campaign, and held important commands at Chancellorsville and Fredericksburg. In the Richmond campaign and at Spottsylvania he commanded a division of heavy artillery, and at Cold Harbor was wounded. He retired in 1865 with the brevet rank of brigadier-general.

TYLER, ROYALL, 1757-1826; b. Vt.; educated at Harvard college; read law with John Adams, and was for a time aid to Gen. Lincoln, serving in Shays' rebellion. He began to practice law in Vermont in 1790, and was chief justice of the supreme court of that state, 1800-6. He published in 1809 *Reports of Cases in the Supreme Court of Vermont*. He wrote several plays, and one of them, his comedy *The Contrast*, represented in New York in 1786, was the first American play produced by a regular dramatic company.

TYLER, SAMUEL, LL.D., b. Md., 1809; son of Grafton, a tobacco planter; fitted for college with Dr. Carnahan in his seminary at Georgetown; graduated at Middlebury college, Vt.; studied law at Frederick city, Md.; admitted to the bar, 1831. In 1844 he published a *Discourse of the Baconian Philosophy*; *Burns as a Poet and as a Man* (1848); articles and essays in the *Princeton Review*, 1836-59. He was appointed professor of law in Columbia university, Washington, D. C., 1867, and was appointed to simplify the pleadings and practice in the courts of Maryland. He d. 1878.

TYLER, WILLIAM SEYMOUR, D.D., b. Penn., 1810; educated at Amherst college. After being a teacher of the classics at Amherst academy, he graduated at Andover theological seminary and received a license to preach in 1836; but being called to the chair of Latin and Greek in Amherst college, was not ordained till 1858. In 1837 the professorship was divided and he took the chair of Greek, which he held until 1893. Among his numerous works are *The Germania and Agricola of Tacitus* (1847); *The Histories of Tacitus* (1848); *Plato's Apology and Crito* (1859); *Demosthenes de Corona* (1874); *The Olynthiacs and Philippics of Demosthenes* (1875); and a *History of Amherst College* (1895). His long and faithful service has given the college a high rank in his department. He died in 1897.

TYLER INSURRECTION. In 1381, during Richard II.'s minority, a poll tax of three groats was laid to defray the expenses of the war with France. This excited the common people to resistance. The people gathered from all parts of the realm, assembling at Blackheath under the conduct of two peasants, Wat Tyler and Jack Straw, "professing themselves," says Hollinshed, "to be zealous of truth and justice, and not thieves or robbers." The king, finding it vain to resist, promised a general pardon, freedom of commerce, and the abolition of villeinage. Meantime, a party of insurgents broke into the Tower, and killed the primate and chancellor and the treasurer. The king, meeting Wat at the head of the rioters in Smithfield, invited him to a conference, where he was perfidiously slain in the king's presence by William Walworth, mayor of London, who was incensed at Wat's fearlessness. The revolt was not extinguished without considerable bloodshed, but its effects were beneficial in giving an impetus to popular rights and ensuring the destruction of villeinage.

TYLER, JOHN, tenth president of the United States; was b. in Charles City co., Va., Mar. 29, 1790. His father, of the same name, was speaker of the house of delegates, gov. of Virginia, and a leading patriot of the revolution. John entered William and Mary coll. at 12, was admitted to the bar at 19, and almost immediately entered upon a large practice. At 21 he was elected to the state legislature, supporting the policy of Jefferson, Madison, and the democratic party. He was almost unanimously elected five times, and in 1816 he entered congress, where he took a leading part in the debates. During his long congressional career, he sustained all the measures of the state-rights party. In 1825 he was elected gov. of Virginia, and in 1827 senator in congress. He supported Gen. Jackson as a choice of evils, but condemned his proclamation against South Carolina, though equally disapproving of the principle of nullification. At a later day, in 1833-34, he made a report in which he censured Gen. Jackson for removing the deposits from the U. S. bank. When the whig party was formed, in 1834, he became one of its leading members, in opposition to executive despotism as exercised by Gen. Jackson. He was nominated for the vice-presidency in 1835 and again in 1840, when he was elected with Gen. Harrison. President Harrison died Apr. 4, 1841, a month after his inauguration, by which event Mr. Tyler became president. Unfortunately, he experienced the opposition of Clay, who proposed the scheme of a U. S. bank—a measure carefully eschewed by the whigs in the canvass, and to which both Gen. Harrison and Mr. Tyler had ever stood opposed. Mr. Tyler vetoed Clay's bills, and at his dictation all the cabinet save Webster resigned. The most important acts of his administration were the Ashburton treaty, by which several dangerous questions were settled with Great Britain, and the annexation of Texas, which opened up the great west to American enterprise. There was but one defaulter—and he for a very small sum—during his administration, while the expenses of the government were reduced one-sixth. At the close of his term of office he retired to private life until 1861, when he was pres. of a peace convention at Washington. Failing in his efforts at compromise, he gave his adhesion to the confederate cause, and was a member of the confederate congress until his death, at Richmond, Jan. 18, 1862. His life has been written by his son, Lyon G. Tyler, and is entitled *The Letters and Times of the Tylers*.

TYLOPHORA, a genus of plants of the natural order *asclepiadacea*, natives of the East Indies, New Holland, etc., with a wheel-shaped corolla, and a 5-leaved fleshy coronet. *T. asthmatica*, a native of the coast of Coromandel, has a high reputation, medicinally.

TYLOR, EDWARD BURNETT, LL.D., b. London, 1832; of a Quaker family; educated at Tottenham. He became a noted ethnologist and antiquarian, and in 1860 went to Mexico and there carried on extensive investigations of the religion, superstitions, social customs and manners of the natives, the results of which are given in *Anahuac, or Mexico and the Mexicans, Ancient and Modern* (1859). He has also written *Researches into the Early History of Mankind and Development of Civilization* (1865); and *Primitive Culture* (1871), *Anthropology* (1881). In 1891 he became president of the Anthropological society.

TYMPANUM (Lat. a drum), in anatomy, the middle ear (see EAR). In architecture, the flat space left within the sloping and horizontal cornices of the pediment of classical architecture, usually filled with sculpture (see GRECIAN ARCHITECTURE); also, the space between the arch and lintel of doorways in Gothic architecture, which is frequently enriched with sculpture.

TYNDALE, or TINDALE, WILLIAM, an eminent English reformer and martyr, well known as a translator of the Bible, was b. about 1484. He was educated first at Oxford, and afterward at Cambridge, and was, from his youth, as Foxe says, "singularly addicted to the study of the Scriptures." After leaving Cambridge, he became tutor and chaplain in the house of sir John Walsh, a knight of Gloucestershire, where he frequently engaged in religious disputes with the clerical dignitaries of the neighborhood, and soon incurred their wrath by what they deemed the heresy of his opinions. He went to London about the middle of 1523, bent upon the fulfillment of his long-cherished desire of translating the New Testament into English. Failing, however, to obtain the patronage he expected in carrying out this intention, he retired to Germany in 1524. Here his translation of the New Testament was published in 1525 or 1526, and conveyed into England. This work, although denounced by government, was yet so eagerly

received by the English, that several reprints of it were produced by the Dutch printers within the next few years. Tyndale continued on the continent, writing tracts in advocacy of the reformed doctrines; in 1520 he published a translation of the Pentateuch, and in 1531 one of the prophet Jonah. In 1533 he took up his abode in Antwerp, where, in 1534 and 1535, he published two revised editions of his New Testament. In 1535 he was treacherously arrested, and after a confinement of 16 months, was publicly strangled and burned as a heretic at Vilvorde near Brussels, in 1536.

Tyndale was a man of great learning as well as talent, and his own writings, in addition to his translations, show how well adapted he was for the great work of his life, so fearlessly carried out. Our modern version of the New Testament is substantially Tyndale's translation with modernized spelling. See *William Tyndale*, by Rev. R. De-maus, M.A. (1871).

TYNDALL, JOHN, physicist, was b. Aug. 21, 1820, at Leighlin Bridge, county Carlow. He had few educational advantages. On returning from the continent, where he received part of his education, he found employment in one of the subordinate grades of the ordnance survey. He was afterward appointed teacher of natural philosophy at Queenwood college, Stockbridge, and there commenced those original investigations which have distinguished him among the explorers of science.

In Jan., 1853, Tyndall communicated his first paper to the royal society, *On Molecular Influences—Transmission of Heat through Organic Structures*. It exhibits much of that skill in experimenting and fertility of resource which characterize his subsequent researches, and illustrates certain important questions in natural philosophy.

Year by year from the date above mentioned, Dr. Tyndall extended our knowledge of science. His field of research is wide and varied, as exemplified by the subjects of his papers published in the *Philosophical Transactions*—*On the Vibrations and Tones produced by the Contact of Bodies having Different Temperatures* (1854); *On the Physical Phenomena of Glaciers* (1857); *On some Physical Properties of Ice* (1858–59); *On Transmission of Heat through Gaseous Bodies* (1859); a series on *Radiation*, six papers (1861–65); *On Calorescence* (1865); *On the Invisible Radiation of the Electric Light* (1865). During the year 1867, he lectured on *Sounding and Sensitive Flames*.

In 1855, and again in 1861, Tyndall was appointed to deliver the Bakerian lecture to the Royal Society; the subjects were: *On the Nature of the Force by which Bodies are repelled from the Poles of a Magnet*; and *On the Absorption and Radiation of Heat by Gases and Vapors, and on the Physical Connection of Radiation, Absorption, and Conduction*, the latter being one of the series on *Radiation* above mentioned. The publication of this series of papers marks a period in the history of scientific research, for the facts therein set forth, and the conclusions drawn from them, demonstrate the relation of aqueous vapor to radiant heat, and elucidate certain meteorological phenomena which connect themselves with some of the profoundest and most interesting questions of cosmical science.

In 1864 the council of the Royal Society awarded to Tyndall their Rumford medal, in recognition of his scientific researches, particularly as bearing on light and heat. As a lecturer on scientific subjects, Tyndall enjoyed a high reputation. His lectures at the Royal Institution and the School of Mines were marked by great fullness of knowledge and clearness of illustration. Tyndall had experimented and written on the subject of germs, and on the acoustic transparency or cloudiness of the atmosphere.

In 1852, Tyndall was elected a fellow of the Royal Society. In 1858 he was appointed professor of natural philosophy in the Royal Institution, where, as successor to Davy and Faraday, he sustains the reputation of the place for original scientific research. His lectures at the School of Mines were attended by crowds of workmen. He was LL.D. of Cambridge, and a member of a number of the scientific societies of the continent. He was chosen president of the British Association in 1874. Besides his papers for the Royal Society, Tyndall also wrote articles in the *Philosophical Magazine* and *The Fortnightly Review*. His separate works comprise: *The Glaciers of the Alps, being a Narrative of Excursions and Events* (1860); *Mountaineering in 1861* (1862); *Heat considered as a Mode of Motion* (2d ed., 1865); *Radiation*, being the Rede lecture, delivered at Cambridge in 1865; *Lectures on Sound* (1867); a memoir of Prof. Faraday (1868); *Fragments of Science, and Hours of Exercise in the Alps* (1871); *Nine Lectures on Light* (1870); *Address delivered before the British Association in 1874, with Additions* (1874); and *Essays on the Floating Matter of the Air* (1881). He died Dec. 4, 1893.

TYNE, a river in the north of England, important from the enormously valuable mineral district through which it flows, and for the flourishing towns that line its banks, is formed by the confluence of two head-waters—the north Tyne and the south Tyne. The north Tyne rises on the Scottish border, 11 m. s.e. of Hawick. It flows s. across Keelder Moor, and s.e. to Hexham, after traversing a district abounding in picturesque villages and gentlemen's seats. Its chief affluent is the Reed, which rises on Carter Fell, and flows s.e. past Otterburn to Bellingham, where it joins the larger stream. Near Hexham, the north Tyne is joined by the south Tyne, which rises on the slopes of Cross Fell, 11 m. n. of Appleby, in Westmoreland, flows n. to Haltwhistle, and thence e. to Hexham, through a district crowded with old castles and peel-houses. From the junction of the two head-waters, the Tyne flows e. through the south of Northumberland,

which presents charming scenery, and is studded with castles and country seats. At Blaydon—about 8 m. above Newcastle—the navigation begins, and from this point, passing Newcastle (q. v.), Gateshead (q. v.), North and South Shields (see SHIELDS, NORTH, SOUTH), its banks are lined with foundries, furnaces, docks, wharves, and quays. It serves chiefly for the transport of coal. Total length, 80 miles. For the navigation of the river, see the chief towns near its mouth.

TYNEMOUTH, a small village and parish of Northumberland, takes its name from the river Tyne, on the north bank of which, and near its mouth, it stands. It is 8 m. e. of Newcastle by railway, and its light-house is in lat. $55^{\circ} 1' \text{ n.}$, long. $1^{\circ} 25' \text{ west.}$ Though itself only a village, it gives name to a township containing (1891) 46,267 inhabitants. Much of this township, however, is comprised in the town of North Shields (see SHIELDS, NORTH), and counts in the population of that town. It also gives name to a parliamentary and municipal borough, including besides the village of Tynemouth, the large town of North Shields, and the three villages of Chirton, Preston, and Cullercoats. The village of Tynemouth is much frequented as a watering-place by the inhabitants of Newcastle. Its sands, about a mile in length, form an excellent bathing-ground. There are many attractive buildings and institutions, as the castle and fortifications, the fine ruins of a priory and lady chapel, the master mariners' asylum, etc. The borough of Tynemouth sends one member to the house of commons.

TYNG, STEPHEN HIGGINSON, D.D., b. Mass., 1800; graduated, Harvard college, 1817; engaged in mercantile pursuits for 2 years; studied theology, and was ordained a minister of the Protestant Episcopal church, 1821; preached at Georgetown, D. C., 1821–23; at Queen Anne's parish, Prince George's co., Md., 1823–29; rector of St. Paul's church, Philadelphia, 1829; of the church of the Epiphany, 1833; of St. George's church, New York, 1845, which charge he resigned in 1879, having had for the 2 or 3 years previous the Rev. Dr. Williams as colleague. Dr. T. was a leading opponent of ritualism. He was widely noted for his fervid eloquence as a preacher, and he zealously advocated the temperance and other reforms. He has published *Lectures on the Law and the Gospel*; *The Israel of God*; *Christ is All*; *Christian Titles*; *Recollections of England*; *Sermons preached in the Church of the Epiphany*; *Family Commentary on the Four Gospels*; *Bible Companion*; *Forty Years' Experience in Sunday-Schools*; *The Spencers*; *The Prayer-Book Illustrated by Scripture*; *The Feast Enjoyed*. He edited the *Episcopal Recorder*; *Protestant Churchman*; *Theological Repository*. He d. 1885.

TYNG, STEPHEN HIGGINSON, JR., D.D., b. Philadelphia, 1839; graduated, Williams college, 1858; studied theology at the Virginia Episcopal seminary; ordained 1861; was assistant to his father in St. George's church for 2 years; rector of the church of the Mediator, New York, 1863; chaplain to the 12th New York volunteers, 1864; rector of the church of the Holy Trinity, New York, which he organized, 1865; resigning on account of impaired health in 1881, when he accepted the agency for a New York life insurance company in Paris. He edited, 1864–70, *The Working Church*, a weekly journal. He has shown rare gifts in the organization of various benevolent instrumentalities in connection with his church, which have accomplished an immense work of good.

TYPE, in theology, an image or representation of some object which is called the antitype. In theological use it is applied chiefly, although not exclusively, to those prophetic prefigurings of the persons and things of the new dispensation which are found in the ritual, and even in the history of the Old Testament. Under the heads HERMENEUTICS, EXEGESIS, have been explained the different senses of which the literal text of Scripture is considered susceptible. Of one of these, the "mystical," the "typical" sense forms a further subdivision. The word "type" itself is used as well by the writers of the New Testament (Acts, vii. 43; Romans, v. 14; Philippians, iii. 17) as by the Jewish historians, for instance, Philo, *Opp.* t. i. p. 108; and while St. Paul and other sacred writers speak of the ancient types of things to come, St. Peter completes the parallelism by describing baptism as the antitype of the ark of Noah, 1 Peter, iii. 21. Of the types of the Old Testament, many are directly pointed out as such in their very institution; many also are distinctly applied in the New Testament. There is a large class, however, which more properly fall under the mystical sense of Scripture, and which are called indirect, that is to say, "adaptive" or "applied" types. In the application and interpretation of these, many of the fathers, and especially Augustine and Gregory the great, are most elaborate and ingenious.

TYPE (Gr. *typos*, an impression or stamp), the name given to the stamps or dies which impress the letters on the paper in printing (q. v.). Printers, in early times, made the letters which they used, but in process of time the necessity for a division of labor created the distinct business of *type-founding*. There is evidence that, at the beginning of the 16th c., the apparatus for type-founding was much the same as up till near the middle of this century. The first step in the process is the cutting of a punch or die resembling the required letter. The punch is of hardened steel, with the figure of the letter cut, the reverse way, upon its point. On this die being finished, it is struck into a piece of copper about an inch and a quarter long, one-eighth of an inch deep, and of a width proportionate to the size of the type to be cast. This copper, being so impressed with the representation of the letter, requires to be adjusted to the mold, so that the "face" or impression of the punch (in the copper) may be brought into such relation with the metal which forms the

"body" or stalk of the type, that when the types are "set up" they may stand at the proper distance from each other, and be in "line" or range, and also square to the page; this work is termed "justifying," and the copper is now a "matrix." The matrix is now fixed into a small instrument or frame, called the mold, which is composed of two parts. The external surface is of wood, the internal of steel. At the top is a shelving orifice, into which the metal is poured. The space within is of the size of the required body of the letter, and is made exceedingly true. The melted metal, being poured into this space, sinks down to the bottom in the matrix, and, instantly cooling, the mold is opened, and the type is cast out by the workman. This process of casting types is executed with great celerity. Of course, every separate letter in the alphabet, every figure, point, or mark, must have its own punch and matrix. In casting types, the founder stands at a table, and has beside him a small furnace and pot with heated metal, which he lifts with a small ladle. *Type-metal* was a compound of lead and regulus and antimony, with a small proportion of tin; but in 1856 a new compound was formed by adding a *large* proportion of tin to the lead and antimony, which considerably increased the cost of the metal, but it doubled its durability. The antimony gives hardness and sharpness of edge to the composition, while the tin gives toughness and tenacity, and removes the brittleness which antimony causes when used largely without tin.

Various attempts were made during the early part of this century to cast type by machinery; but the first successful apparatus for this purpose was the invention of Elihu White of New York, which was modified and repeatedly improved upon by David Bruce, a Scotchman resident in America. The type-casting machine was introduced into Great Britain, and patented by Miller & Richard, of Edinburgh, in 1848. This machine, which requires a man to drive it, produces more than double the quantity that the hand-mold did, while the finish and regularity of the type so cast are much more perfect. Another machine was constructed and patented some years after by the same firm, with the view to apply steam for driving, which was successfully completed in 1860, and is now the most advanced and approved system of casting.

The type-casting machine consists, first, of a small melting-pot, which contains the molten metal, and is placed over a small furnace having an outer case of cast-iron. In the interior of the pot is arranged a forcing-pump and valve for admitting the metal under the piston, and also for preventing the return of the metal into the mass in the pot when the piston is depressed, and thus securing the full force exerted upon the piston being transmitted by the piston to the molten metal under it, and forcing it through a narrow channel leading from the bottom of the chamber in which the piston works to the outside of the pot, where a nipple is inserted, with a small hole through it, communicating with this narrow channel. Against this nipple, the mold in which the type is formed is pressed at the moment at which the piston descends, and so receives the molten metal that forms the type.

The second part of the machine is that which carries the mold, and to which the mold is firmly bolted. The mold is similar to the old hand-mold, but modified to suit the machine; it is much stronger; the "jets" are shorter, and the orifice by which the metal enters is smaller, so that it may be brought exactly coincident with the small hole in the nipple in front of the pot. The mold—as the old hand-mold—is made in halves; the one-half being firmly bolted to an arm which, by cams and levers, is made to oscillate, and carry the mold to and from the nipple in front of, and above the pot; the other half of the mold is bolted to another arm, which, by a peculiarly formed hinge, is attached to the first arm, so that the two halves of the mold may be made to open and shut upon each other like the lid of a snuff-box; and so both sides of the mold oscillate together to and from the nipple in the pot from which they receive the molten metal. The furnace, with the pot and machine carrying the mold, are raised upon cast-iron framing to a height convenient for a man standing to watch the working of the machine. The operation of the machine is as follows: The piston being raised in the chamber of the pump, and the chamber being supplied with metal through the valve, the mold is brought against the nipple; the valve closes to prevent the metal being forced back into the pot; the piston descends, and forces the metal through the narrow channel into the mold; the mold then recedes from the nipple, and in receding the two halves separate from each other and eject the type; the mold again approaches the nipple, and in approaching the two halves close together, and are ready for another operation.

A blast of cold air is directed upon each mold to keep it cool.

When the type is cast from the mold it is in a rough state, and as soon as a heap has accumulated on the caster's table they are removed by a boy, who breaks off a superfluous tag of metal, or "jet," hanging at the end of each type. From the breaking-off boy the types are removed to another place, where a boy rubs or smoothes their sides upon a stone. Being now well smoothed, they are next removed to a table and set up in long lines upon a "stick;" they are then dressed or finished, and, after being examined by a magnifying-glass, are ready for use. These different operations are now performed in a single machine which turns out perfect type which require no finishing. Whatever be the size of the types, they are all made of a uniform height, and must be perfectly true in their angles, otherwise it would be quite impossible to lock them together. A single irregular type would derange a whole page. All the types of one class of any founder are always uniform in size and height, and, to preserve their individuality, all

the letters, points, etc., belonging to one class, are distinguished by one or more notches or nicks on the body of the type, which range evenly when the types are set. These nicks, as we shall immediately see, are also exceedingly useful in guiding the hand of the compositor. Types are likewise all equally grooved in the bottom, to make them stand steadily.

The earliest types used were in the style known as Gothic or black-letter; which was afterward superseded, except in Germany, by the Roman letter. See BLACK-LETTER. The varieties of size of types in the present day amount to 40 or 50, enlarging by a progressive scale, from the minutest used in printing pocket-Bibles, to the largest which is seen in posting-bills on the streets. Printers have a distinct name for each size of letter, and use about 16 sizes in different descriptions of book-work; the smallest is called *brilliant*, the next *diamond*, and then follow in gradation upward, *pearl*, *ruby*, *nonpareil*, *emerald*, *minion*, *brevier* (the type with which this sheet is printed), *bourgeois*, *long primer*, *small pica*, *pica*, *English*, *great primer*, and *double pica*. The larger sizes generally take their names thus—*two-line pica*, *two-line English*, *four*, *six*, *eight*, or *ten line pica*, etc. Other nations designate many of these sizes by different names. Some of these names were given from the first maker; others from the books first printed with the particular letter. Thus, *Cicero* is the name of a type in France and Germany, with which Cicero's letters were first printed (Rome, 1467); *pica* is from the service of the mass, termed *pica* or *pic*; *primer*, from *Primarius*, the book of prayers to the Virgin; *brevier*, from *breviary*; *canon*, from the *canons* of the church, etc.

The following are the names of the sizes usually employed in the English language :

| | |
|------------------|----------------|
| 1—Brilliant, | International. |
| 2—Diamond, | International. |
| 3—Pearl, | International. |
| 4—agate or Ruby, | International. |
| 5—Nonpareil, | International. |
| 6—Minion, | International. |
| 7—Brevier, | International. |
| 8—Bourgeois, | International. |
| 9—Long Primer, | International. |
| 10—Small Pica, | International. |
| 11—Pica, | International. |
| 12—English, | International. |
| 13—Great Primer, | International. |

A complete assortment of types is called a *font*, which may be regulated to any extent. Every type-founder has a scale showing the proportional quantity of each letter required for a font; and a peculiar scale is required for every language. For the English language, the following is the type-founder's scale for the small letters of a font of types of a particular size and weight:

| | | | | | | | | | | | |
|---|--------|---|------|---|------|---|------|---|------|---|------|
| a | 8500 | f | 2500 | k | 800 | o | 8000 | s | 8000 | w | 2000 |
| b | 1600 | g | 1700 | l | 4000 | p | 1700 | t | 9000 | x | 400 |
| c | 3000 | h | 6400 | m | 2000 | q | 500 | u | 3400 | y | 2000 |
| d | 4400 | i | 8000 | n | 8000 | r | 6200 | v | 1200 | z | 200 |
| e | 12,000 | j | 400 | | | | | | | | |

Type-founding originated in Germany along with printing; as early as 1452, P. Schöffer (see GUTENBERG) had substituted types of cast-metal for the original wooden types. The earliest and best punch-cutters were in Nuremberg, which continued for a considerable time to supply the type-founders throughout Germany with punches. Bodoni (b. 1740, d. 1813) in Italy, the Didots (q.v.) in France, and Breilkopf (b. 1719, d. 1794) in Leipsic, are the most distinguished names in the subsequent history of type-making on the continent. The art made little progress in Great Britain from the time of Caxton, and the types used were mostly imported from Holland, until about the year 1720, when William Caslon, originally an engraver of ornamental devices, turned his attention to letter-cutting, and soon established such a reputation as to not only put a stop to the importation of foreign types, but caused his own to be frequently sent to continental countries. The foundry established by Caslon in London is still in existence.

Type-setting or "*Composing*."—All the types used in printing-offices are sorted in cases, or shallow boxes, with divisions. There are two kinds of cases—the *upper* and *lower case*; the latter lying nearest the compositor upon the frame for their support. The lower case is placed immediately under his hand, the upper case directly above in a slanting position, and the under part of the frame is stocked with cases of different fonts. (See illus., PRINTING, vol. XII., plate I., fig. 6.) In the upper case are placed all the capitals, small capitals, accented letters, a few of the points, and characters used as references to notes. In the lower case lie all the small letters, figures, the remainder of the points, and spaces to place between the words. In the lower, no alphabetical arrangement is preserved; each letter has a larger or a smaller box allotted to it, according as it is more or less frequently required; and all those letters most in request are placed at the nearest convenient distance to the compositor. By this ingenious and irregular division of the lower case much time is saved to the compositor, who requires

no label to direct him to the spot where lies the particular letter he wants. To a stranger nothing appears so remarkable as the rapidity with which a compositor does his work; but habit very soon leads the hand rapidly and mechanically to the letter required. When *italic* letters have to be introduced, they are taken from a separate pair of cases of the same font.

The process of composing and forming types into pages may now be adverted to. Placing the copy or manuscript before him on the upper case, and standing in front of the lower case, the compositor holds in his left hand what is termed a composing-stick. Sometimes this instrument is of wood, with a certain space cut in it of a particular width; sometimes of iron or brass, with a movable slide, which, by means of a screw, may be regulated to any width of line. (See *illus.*, PRINTING, vol. XII., plate I., fig. 7.) The composing-stick must be perfectly true and square. One by one, the compositor lifts and puts the letters of each word and sentence, and the appropriate points, into his stick, securing each with the thumb of his left hand, and placing them side by side from left to right along the line. When he places a letter in the stick he does not require to look whether he is placing it with the face in its proper position; his object is accomplished by looking at what is called the *nick*, which must be placed outward in his composing-stick. This is one of those beautiful, and at the same time simple, contrivances for saving labor which experience has introduced into every art, and which are as valuable for diminishing the cost of production as the more elaborate inventions of machinery. When he arrives at the end of his line, the compositor has a task to perform in which the carefulness of the workman is greatly exhibited. The first letter and the last must be at the extremities of the line: there must be no large spaces left in some instances, and crowding in others, as we see in the best manuscript. Each metal type is of a constant thickness, as far as regards that particular size of letter; though all the letters are not of the same thickness. The adjustments, therefore, to complete the line with a word, or at any rate with a syllable, must be made by varying the thickness of the spaces between the words. A good compositor's work is distinguished by uniformity of spacing; he will not allow the words to be very close together in some instances, and with a large gap between them in others, as is evident, for instance, in this sentence. In composing poetry, or similar matter, where there is always a blank space at one of the ends of the line, spacing is very easily accomplished by filling up the blank with larger spaces, or *quadrats*. But whether prose or poetry, the matter of each line must be equally adjusted and *justified*, so as to correspond in point of compactness with the previously set lines. The process of composing is greatly facilitated by the compositor using a thin slip of brass called a *setting-rule*, which he places in the composing-stick when he begins, and which, on a line being completed, he pulls out, and places upon the front of the line so completed, in order that the types he sets may not come in contact with the types behind them, but glide smoothly into their places to the bottom of the composing-stick.

When the workman has set up as many lines as his composing-stick will conveniently hold, he lifts them out by grasping them with the fingers of each hand, and thus taking them up as if they were a solid piece of metal. He then places the mass in an elongated board, termed a *galley*, which has a ledge on one or perhaps both sides. The facility with which some compositors can lift what is called a *handful* of movable type without deranging a single letter, is very remarkable. This sort of skill can only be attained by practice; and one of the severest mortifications which the printer's apprentice has to endure is to toil for an hour in picking up about a thousand letters, and then see the fabric destroyed by his own unskillfulness, leaving him to mourn over his heap of broken type, technically denominated *pt.* (See same *illus.*, fig. 8.)

Letter by letter, and word by word, is the composing-stick filled; and by the same progression the galley is filled by the contents of successive sticks. When the compositor has set up as many lines as fill a page he binds them tightly round with cord, and removes them from the galley.

Sometimes, as in the case of newspaper and similar work, the *handfuls* of type are accumulated till they fill the galley, and in that form are prepared for press. After the matter is thus far prepared, it is the duty of the pressman to take an impression or *first proof* from the types, in order that the first-proof *reader* may compare with "copy," or MS.; after which it is handed to the compositor, so that he may correct the errors which are sure to have been made. Proofs are usually taken by a press kept for the purpose. After the galley matter is corrected and re-corrected by the compositor, it is divided into pages of the size wanted; and head-lines and figures indicating the number of the page being added, the pages are arranged upon a large firm table, and there securely fixed up in an iron frame or *chase*, by means of slips of wood and wedges, or *quoins*.

This process, which is called *imposing*, being completed, and the face of the types being leveled by a *planer* and mallet, the *form*, as it is called, is proved, and prepared for press. Proof-sheets being taken, they are subjected to the scrutiny of a *reader* employed in this peculiar function in the office, the author himself having previously given effect to his corrections or emendations. When the *reader* has pointed out words and letters to be altered or corrected, the compositor once more goes over the form, correcting the errors by lifting out the letters with a bodkin, and, when revised, the sheet is pronounced ready for printing. The imposing-table at which all these corrections are made is usually composed of smooth stone, or marble, or cast-iron on the top, and requires to be a substantial fabric. See TYPE-SETTING MACHINES.

TYPES, CHEMICAL. The idea of referring organic bodies to some simple type or representative, has attracted the attention of many chemists, among whom Dumas, Sierry Hunt, Laurent, and Gerhardt, especially deserve notice. As our limited space prevents us from attempting to trace out the history of the theory, we shall confine ourselves to a statement of the outline of the doctrine as laid down by Gerhardt, and now adopted in most recent books on organic chemistry. The four principal types, to which most of the chemical compounds are referred, are the following: (1) The hydrogen or metallic type, $\begin{smallmatrix} \text{H} \\ \text{H} \end{smallmatrix} \}$; (2) The hydrochloric acid or chloride type, $\begin{smallmatrix} \text{H} \\ \text{Cl} \end{smallmatrix} \}$; (3) The water or

oxide type, $\begin{smallmatrix} \text{H} \\ \text{H} \end{smallmatrix} \}$ O; and (4) The ammonia or nitride type, $\begin{smallmatrix} \text{H} \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N.

1. The *hydrogen type*, $\begin{smallmatrix} \text{H} \\ \text{H} \end{smallmatrix} \}$, includes, according to Gerhardt, the radicals of the alcohols, marsh gas, and the hydrocarbons homologous with it, the aldehydes, etc. Thus,

methyl hydride (marsh gas), CH_4 , is written thus. $\begin{smallmatrix} \text{CH}_3 \\ \text{H} \end{smallmatrix} \}$;
and dimethyl (ethane), C_2H_6 , is written $\begin{smallmatrix} \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \end{smallmatrix} \}$;
also acetyl hydride (aldehyde), $\text{C}_2\text{H}_4\text{O}$, may be written $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{H} \end{smallmatrix} \}$;
and acetyl methyl (acetone), $\text{C}_3\text{H}_6\text{O}$ $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{CH}_3 \end{smallmatrix} \}$.

Among the compounds of inorganic chemistry belonging to this type, Gerhardt places the hydrides, arsenides, and antimonides of the metals.

2. The *hydrochloric acid type*, $\begin{smallmatrix} \text{H} \\ \text{Cl} \end{smallmatrix} \}$, is removed by many chemists from the primary or principal types, and is regarded as a derived type from the preceding one, one equivalent of H being here replaced by one of chlorine. It includes the chlorides, fluorides, iodides, bromides, cyanides, the ethers of the hydracids, etc. As examples, we have:

ethyl chloride (hydrochloric ether), $\text{C}_2\text{H}_5\text{Cl}$, written $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{Cl} \end{smallmatrix} \}$;
acetyl chloride, written $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{Cl} \end{smallmatrix} \}$;
and benzoyl chloride $\begin{smallmatrix} \text{C}_6\text{H}_5 \cdot \text{CO} \\ \text{Cl} \end{smallmatrix} \}$;
also cyanogen chloride may be written $\begin{smallmatrix} \text{CN} \\ \text{Cl} \end{smallmatrix} \}$.

3. The *water type*, $\begin{smallmatrix} \text{H} \\ \text{H} \end{smallmatrix} \}$ O, includes the oxides (in which term are embraced acids, bases, and salts), the sulphides, the alcohols, the simple and compound ethers, the mono-basic organic acids, etc. The following are a few examples:

ethyl alcohol (common alcohol), $\text{C}_2\text{H}_5\text{O}$, written $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{H} \end{smallmatrix} \}$ O,
ethyl ether (common sulphuric ether) $(\text{C}_2\text{H}_5)_2\text{O}$ $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \end{smallmatrix} \}$ O,
acetic acid, $\text{C}_2\text{H}_4\text{O}_2$ $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{H} \end{smallmatrix} \}$ O,
and acetic anhydride $(\text{C}_2\text{H}_5\text{O})_2\text{O}$, written $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{CH}_3 \cdot \text{CO} \end{smallmatrix} \}$ O.

4. The *ammonia type*, $\begin{smallmatrix} \text{H} \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N, includes the nitrides and phosphides, the compound ammonias, and the amides; as, for example,

ethylamine $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N; acetamide $\begin{smallmatrix} \text{CH}_3 \cdot \text{CO} \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N,
diethylamine $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{H} \end{smallmatrix} \}$ N; benzamide $\begin{smallmatrix} \text{C}_6\text{H}_5 \cdot \text{CO} \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N,
triethylamine $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \end{smallmatrix} \}$ N; and cyanamide $\begin{smallmatrix} \text{CN} \\ \text{H} \\ \text{H} \end{smallmatrix} \}$ N.

Besides these three or four principal types, there are *derived types*, *multiple types*, and *mixed types*; and under one or other of these types, primary and derived, multiple and mixed, all organic compounds can be arranged; and the theory of types leads to the general conclusion, that all organic compounds, or, more strictly speaking, their molecules, may be regarded as molecules of hydrogen, water, ammonia, hydrogen sulphide, etc., in which the hydrogen is entirely, or in part, replaced by organic radicals.—For further information on this subject, the reader is referred to Roscoe and Schorlemmer's *Treatise on Chemistry*, vol. iii., part 1, 1886, and to the second volume of Gorup Besanez,

Lehrbuch der Chemie, pp. 24-48. The chapter "On Types," from this volume, has been reprinted separately in the form of a pamphlet.

TYPE-SETTING MACHINES. There are few problems in mechanics that have been so persistently attacked by the inventor, and until recently with such indifferent results, as that of a successful T. S. M. The difficulties to be overcome are so numerous and so great that many have rightfully doubted whether any mechanism could be devised that would profitably supersede the old hand method of setting type. Stored away in many printing-offices and other places in this country are machines of which both inventors and printers had great hopes; hopes which have never been realized.

Inventions in this line are of the following classes:

1. Machines for simply composing ordinary type.
2. Matrix machines, or machines by which molds are set up, and from which metal printing plates are cast.
3. Machines for setting up lines of dies, which are immediately pressed into papier-mâché, wood, or other material, the material so impressed becoming a mold for the subsequent casting of a metal printing plate.

In England, as early as 1822, William Church, a Connecticut man, took out patents on a machine of the second class. Since that time Young, Delcambre, Hattersley, Fraser, and Mackie have brought out machines, some of which have been for a considerable time before the public; but all, for one reason or another, impracticable.

In our own country the inventor has been rather more successful, and the attention which the subject is just now receiving seems to indicate that at no distant day nearly all our newspaper and book composition will be effected by machinery. The *New York Tribune*, *Louisville Courier-Journal*, *Chicago News*, *Washington Post*, and *National Republican Critic*, were among the first newspapers to adopt the Linotype. It is now in general use in almost all large printing offices, and is the invention of one Ottmar Mergenthaler. This machine is of the second class above referred to, and takes its name from the fact that it sets up a line of molds, and casts a line of type, or rather a solid plate, being the same as if a line of type were fused into a solid. These molds or matrices are small pieces of sheet metal, each with a letter impressed on its edge. They are placed in magazine tubes, all the *a*'s in one tube, all the *b*'s in another, and so on, the tubes being arranged vertically in a continuous line. The machine has a key-board like a type-writer, and the depression of a key causes a matrix to drop into an inclined race, down which it is driven by a blast of air from right to left, where it takes its place in line. The spaces between words are simply duplex wedges, dropped into position the same as the matrices. When the compositor has set all that will go into a line, the duplex wedges are slid one upon another, thus "spacing out" the line, and from the line so formed, automatically, the line of type is cast, and its sides and base planed, after which it is deposited on a galley, the matrices meanwhile being released and passed overhead upon a distributing belt, whence they drop into their appropriate magazine tubes. Corrections, if any are needed, are usually made just after the line is assembled and before casting.

The advantages of this machine are, among others, that it gives constantly a new type-face to print from, and also that there is no distributing to be done, the plates being melted over. The "spacing out" device is another, and a very decided advantage.

Another machine which has stood very severe tests thus far is the invention of John L. McMillan, and belongs to the first class above referred to. For this machine the type is all arranged in brass cases, each case holding all *a*'s or *b*'s, etc. These cases are simply channels wide enough to admit of the free passage of the letter. The cases are held in the machine in a nearly horizontal position, in superposed tiers, and discharge their types into races that are parallel to the sides of the V-shaped case-frame, each race forming a confluence with a main vertical race. Each touch of a key discharges a type which gravitates to the point of formation of the line. The line so formed is met by a second operator, who divides it into lines of the required newspaper or book measure, and does the justifying. A careful estimate shows that on ordinary matter an operator will average about 41,000 ems per day. This will be understood as representing the labor of two men. A companion to this machine is the distributor, which consists of a nearly horizontal revolving disk, in the upper face of which are any number of radial channels, in which the lines of type are placed. Each type is differently "nicked," and as the disk revolves the letters are discharged into their appropriate cases.

In addition to the above are the Burr machine and the Thorne machine, both of the first class, and both used to a limited extent in New York. The former of these is said to have made a very good record for itself, and that it has not come into more general use may be attributed, in some measure at least, to what has been hitherto an ultra-conservatism on the part of the craft.

A very ingenious type-setting machine is the Typotheter, the invention of Alexander Lagerman, a Swede, but practically an American product. The object of this machine is simply to facilitate the existing hand method of type-setting. The compositor throws the type into a funnel, and as it emerges at the bottom it is seized by a pair of fingers, and borne to its place in line. The wonderfully ingenious part of the mechanism is that no matter in what position the letter may be when seized, it will be turned over and upside down, if necessary, to bring it right, and is not turned at all if it does not need it. The advantage of this machine is that it enables the compositor to use both hands in picking up the type. As in other machines, a second operator does the justifying.

TYPE-WRITERS. The T.W., like the telegraph, the telephone, the sewing-machine, and many other equally important inventions, is purely an American product. It is true that the English inventor was first in the field, but his efforts do not seem to have been rewarded with success. As early as 1714 a patent was taken out in England by one Henry Mill for a type-writing device; but the invention appears never to have been perfected, and no further attempts by English inventors are recorded until 1841. Since that time there have been more than a hundred T.W. devices patented in England, but they all seem to have shared the fate of the Mill invention. The American inventor appears first to have turned his attention to this important subject in 1843; for in that year a patent was taken out by Charles Thurber, of Worcester, Mass. This is the first machine shown in our illustrations, and is simply an order of type-bars in a vertical position around a horizontal brass wheel, sixteen in. across, which revolves about a central post; the characters being brought into position by hand from either direction. Common types are inserted in the lower ends of the type-bars. This machine is still in existence. In 1856 Mr. A. E. Beach, who, as early as 1847, had constructed a fairly successful but never perfected T.W., took out a patent for a machine intended to print embossed letters for the blind. This is worthy of record, because it covered a principle afterwards developed into the modern T.W.—namely, a basket of levers arranged on a circle, so as to deliver their impressions on a common center.

In order to make raised letters there were two sets of bars, one coming up and the other down, one having a raised letter and the other, its mate, a sunken or intaglio letter. The strip of paper was grasped between the two. Beach was followed by S. W. Francis, who was the first to really complete a T.W. To the Beach principle of a circle of type-bars, Mr. Francis added the piano-forte action. Thomas Hall, the inventor of the present Hall T.W., had been experimenting with a T.W. apparatus at the same time that Beach and Francis were working, but it seems without any suspicion of them or their intentions. In 1859 he heard of these prior patents, and was compelled to negotiate for their purchase in order to make way for his own. The outbreak of the war seems to have put an end to Mr. Hall's experiments; but in 1867 they were renewed, and several of his machines were actually ordered by the departments at Washington. Although the machine embodied the principle of a circle of type-bars, yet their movement, instead of being from below upwards, was from above downwards, converging at a common center, an inked ribbon intervening between the type and the paper. But Mr. Hall was compelled to abandon his efforts without realizing his great expectations.

About this same time, 1867, Mr. Charles Latham Sholes, Samuel W. Soule, and Carlos Glidden, of Milwaukee, Wis., began to experiment on the construction of a T.W., and it was in their first arduous experiments, continued over many months, that the Remington T.W. of the present day had its origin. The first crude working model was completed in that year. Early in 1868 Soule and Glidden ceased their connection with the enterprise, and Sholes, encouraged by the suggestions and the financial aid of James Densmore, of Meadville, Pa., continued his experiments. Several machines were built, and sent here and there to be tested by practical stenographers. One after another these machines were thus demolished, until the patience of Mr. Sholes became nearly exhausted; but Densmore persisted that, as the machines were designed for popular use, none of these tests were too severe. In 1873 the machine was deemed sufficiently complete to justify arrangements for its general sale, and a contract was made by the T.W. company with E. Remington & Sons, of Ilion, N. Y., for its manufacture. During the year 1874, about four hundred machines were built and disposed of, being all of the pattern shown in our second illustration, now known as the Remington No. 1, and briefly described as follows: Pivoted about a horizontal ring are the type-bars, some thirty-eight in number, with steel types inserted in their lower ends, and so pivoted as to rise vertically to a common center. The short arms of these levers are connected by wire rods with the levers proceeding from the key-board. The paper to be printed passes around the rubber cylinder shown, and the lower side of this cylinder of course receives the impact of the types. An inked ribbon intervenes between the type and the paper. This ribbon, in the operation of the machine, is gradually unwound from a spool at one side of the machine to another on the other side, and when the spool is exhausted, the motion is reversed. With each release of a key by the finger of the operator, a ratchet movement at the back of the cylinder allows the carriage to move along one space, thus making room for the next letter. The tension is kept on the carriage by a coiled spring and strap. At the end of a line the carriage is drawn back to the starting-point by means of the arm seen depending in front, and the same movement turns the cylinder, and carries the paper to make ready for the following line.

In 1877 a very important improvement was introduced, whereby each type-bar in the circle was made to carry two characters and adjusted to separate common centers. By depressing a key, the carriage is thrown forward to the second center, which is adjusted to receive all the capital letters and many other characters. This double alphabet machine is known as the Remington No. 2, and in dimensions is fifteen in. on the side, twelve in. on the front, and nine in. in height, and weighs twenty-three lbs. It prints a line of six and one half in., ten letters to an in. The whole key-board covers a space of only eight by two and one half in., and the speed of the machine seems to be limited only by the capacity of the operator. In a speed contest held at Toronto, August 13, 1888, Miss

M. E. Orr wrote 987 words in ten minutes with a Remington No. 2, an average of nearly ninety-nine words per minute, exclusive of all errors. Mr. F. E. McGurrian followed with an average of ninety-five words per minute, and it would appear that the limit of speed on this machine has not yet been reached. We have been thus minute in describing this machine, because of the commanding position it has held in the market from the first.

The Remington may be regarded as the pioneer machine. The first to follow was the Caligraph, largely the invention of George W. N. Yost, whose attention had been closely directed to the Remington machine in the years between its invention and general sale. This machine, like the Remington, has the type-bar and pianoforte action, and in many respects closely resembles its rival. In this machine the so-called shift from capitals to small letters is done away with, and there is a separate lever and type-bar for each character. The horizontal levers with which the keys are connected are also hinged at the front instead of the back. The carriage is supported, and is adjusted much the same as in the Remington, but is actuated by a torsion spring about a rod extending from the front to the back of the machine frame, where a vertical arm connects with the carriage frame above. The cylinder has a polygonal surface, the impressions being received on the faces. This machine, like the Remington, by means of carbon paper between the sheets, will make from five to fifteen copies at one writing, according to the thickness of the paper. In the speed contest above referred to, Mr. F. W. Osborne wrote 935 words in ten minutes on the Caligraph.

The Remington and the Caligraph were the earliest of the machines manufactured which embody the type-bar feature; but nearly every other known principle for bringing the letters to a common center has been utilized. In March, 1881, Thomas Hall, above referred to, took out a patent for a T.W. constructed upon an exceedingly interesting and novel principle. As shown in the illustration, there is a perforated dial plate two in. square, containing seventy-five characters. Underneath this dial plate in his latest machine, called the Century, is a rubber-faced cylinder with letters on its surface corresponding to those on the dial plate. When the stylus as shown is brought to any perforation in this dial plate, the cylinder beneath is turned to present the corresponding letter to the paper, and the stylus being pressed into the hole the letter is printed. The under cylinder revolves against an inked pad.

Prominently identified with the history of the T.W. is Mr. L. G. Crandall, the inventor of the machine which bears his name, and which was first brought out in 1875. This is a keyed instrument, but its action is wholly unlike that of the type-bar machine. In front of the rubber cylinder is erected a vertical post, and over this is slipped a sleeve, having on its surface eighty-four characters in parallel rows. Obedient to the pressure on the key, this sleeve rises or falls, twirls to the right or left, until the proper letter is brought in front of the paper, when it is tripped, delivering its blow with a hammer-like action against the paper, the inked ribbon intervening.

A machine with a good many claims to popular favor is the Hammond, the invention of James B. Hammond, and which has now been several years on the market. Its central principle is that of the type-wheel, a favorite device of John Pratt, an English inventor, who labored for a long time, but unsuccessfully, to make his invention a practical success. The operation of the machine can hardly be understood from the illustration. Within the cylindrical turret on the center is a horizontal type-wheel, the letters being on the ends of the spokes. As in the Crandall, a depression of the key raises or lowers this wheel, and twirls it about until the given letter is brought to face the paper. An impression hammer is then tripped from behind by the furthest depression of the key, driving the paper against the type, an inked ribbon intervening between type and paper. The work of this machine, in careful hands, shows great beauty and perfect alignment.

In addition to these larger and more expensive machines, and which are the T.W. used in business houses where the demands are the most exacting, there are several smaller T.W., such as the World, the Sun, the Columbia, the Crown, the Morris, and the Herrington, all of which have their more or less practical uses.

Improvements and alterations in type-writers and writing-machines are continually going on. Among the more recent are the following: The Yost Writing Machine, invented by Mr. G. W. N. Yost, the maker of the Caligraph already mentioned. This machine, of which a cut is subjoined, presents the following distinctive features: (1) a

THE YOST WRITING MACHINE.

double alphabet, capitals and small letters; (2) the absence of the inked ribbon, the printing being done directly from the type; and (3) the admirable centre-guide which gives a perfect alignment upon which wear produces no effect. Simplicity is sought and secured in every detail of this excellent instrument.

The Anderson Reporting Machine was patented in 1885 by Mr. George K. Anderson of Memphis, Tenn. This is a further development of a machine known as the Stenograph, the invention of Mr. M. Bartholomew, and patented in 1879. The Stenograph is a small machine, consisting of five writing keys, each carrying a "marker," and with a spacing key, an inked ribbon, a guide, etc. Four of the writing keys are V-shaped and one is straight. All the letters can be made with either hand. It does not print letters, but rather marks representing sound, and is intended for the use of stenographers. The Anderson machine, instead of marks, prints letters. It has 13 keys, five of which are struck by the thumb and fingers of the hand on either side, and two by the palms of the hands, while the dot is made by the thumb. The design is to write only the consonants of a word, and to indicate the class of the vowels on which the accent falls. To use the machine, it is essential to commit to memory 125 abbreviations and contractions which form a part of the system.

The Capital Type-Writer is the invention of Mr. C. T. Moore, of Washington, and was patented in 1890. Its distinctive features are: (1) an increase of possible speed over other instruments, secured by the device of a type-wheel, which revolves in one direction and allows the type-carrier to move from the letter printed to the character designated, while the operator's hand is passing to the succeeding key; (2) great clearness of impression; (3) the use of printers' type; and (4) the fact that the work is constantly before the eyes of the operator.

The Barlock Type-Writer, invented by Mr. Charles Spiro, is one in which the type-bar strikes downward. The blow is given on a cylinder over which an inked ribbon is imposed at the moment of impact, immediately disappearing so as to leave the whole line in plain sight. There is a double-bank key-board with a separate key for each character. A rubber band is fitted to the feeding bar so that the alignment, which is secured by an ingenious arrangement of bronze pins, is not disturbed.

The Crown Type-Writer of Mr. B. A. Brooks has a type-wheel set in a vibrating framework, with a letter-plate and finger-piece attached to a rack which rotates the shaft of the type-wheel in order to bring the character into position. The frame is then lowered by a lever worked with the left hand, so that the wheel strikes the paper on the top of a platen. The writing is always visible to the operator.

The Morris Type-Writer, invented by Mr. Robert Morris, uses 45 letters and characters, and allows the use of interchangeable styles on the same machine. The type is inked by a pad. The Smith-Premier is also a popular machine, and so of late is the Williams.

The Herrington, or "Pocket Type-writer" is a very small instrument, not weighing more than half a pound. It has 46 characters which are held in a wheel, and with it ordinary sized paper can be employed in writing. Apart from its smallness, its chief advantage is the facility with which it can be adjusted for use upon any part of the pages of a bound volume.

INKS FOR TYPE-WRITERS are usually colored with anilines and have a glycerine body. The ribbons for type-writers are prepared in all colors. Formerly some shade of purple was more popular, as being bright and clear; but black is now commoner. All colors fade more or less on continual exposure to light.

PAPER.—The usual size of the page carried by the type-writer is one of 8½ inches, in half sheets. Ruled paper is unnecessary, as the machine makes its own lines. Paper of almost any texture can be used with good effect.

DUPLICATING OR MANIFOLDING.—Several copies can be made at once by the use of carbon-paper, or in some cases by the use of thin oiled paper, with double carbon-paper. Care is necessary in adjusting the sheets. By the use of the oiled paper, as many as twenty or more copies have been made at once. In this process, the ribbon is removed to prevent it from interfering.

The appearance of the T.W. as a time and labor-saving invention, especially since about 1882, when its larger usefulness became disclosed, has been an event of the greatest magnitude. It has created a revolution. It has facilitated business in all the old-line industries, and created many new ones for itself. T.W. schools abound in all our cities and large towns, and avenues for high grade employment at remunerative wages have been opened to a countless number of young men and women. Type-writing, aided by its yoke-fellow, stenography, has in a decade changed the whole face of affairs. In short, so important is the place which the little T. W. has made for itself in an almost incredibly short time, it would be equivalent to a revolution backward to now dispense with its use. Many persons suffering from *chorea scriptorum* (see SCRIVENER'S PALSY) have been enabled to dispense with the services of an amanuensis and still to retain their independence in writing by the use of these machines; and the gain in clearness of "copy" is very great, obviating many typographical errors unavoidable when compositors were obliged to set their type directly from the author's manuscript. Naturally, great diversity of opinion exists as to what constitutes a "perfect" machine, some considering speed the first requisite, others handsome print, and others still portability, or great manifolding capacity.

TYPH-FEVER is a term which has sometimes been used to designate continued low fever. The best-marked varieties of this affection are known as typhus and typhoid fevers, which in typical cases are easily distinguished from one another, but not unfrequently so merge into one another that it is difficult to decide whether the disease should be classed as typhus or typhoid fever; and hence the general term typh-fever is a very convenient one in doubtful cases. All the typh-fevers belong nosologically to the miasmatic order of zymotic diseases.

TYPHA, a genus of plants, belonging to the natural order *typhaceæ* of some botanists, which, according to others, is a sub-order of *araceæ*. The *typhaceæ* all inhabit marshes or ditches. They have nodeless stems, unisexual flowers arranged on a spadix without a spathe, the spadix of the male flowers being situated at the summit of the stem, above that of the female flowers, the perianth consisting of scales or lax hairs, the anthers on long filaments, the fruit dry, consisting of the seed with adherent pericarp. They are found in very different climates, and scattered over the world. Two species of typha are found in America, *T. latifolia* and *T. angustifolia*, and are popularly known as CAT'S-TAIL or REED-MACE. *T. latifolia* is the most common. It is sometimes called bulrush. It grows to the height of five or six feet. The root-stocks are astringent and diuretic, and abound in starch. The young shoots both of this and *T. angustifolia*, a smaller plant, are much eaten by the Cossacks of the Don; and are sometimes used in England under the name of *Cossack asparagus*. The pollen of typha is inflammable, like that of *lycopodium*, and is used as a substitute for it. *T. angustifolia* and *T. elephantina* are employed in India for making mats and baskets.

TYPHON, in Egyptian mythology, was the Greek name of a son of Seb (Kronos) and Nut (Rhea). The latter gave birth to five children on the last five days of the year; first, Osiris and Haroeris, then Typhon, and lastly Isis and Nephthys. The Egyptian name of Typhon was Set, also Suti and Sutech, and in the earliest times he was a highly venerated god. He often appears on the monuments in the form of a beast, the cunning crocodile, the dreaded hippopotamus, or the obstinate ass, and with yellow hair and long blunted ears. From him the kings of the 19th dynasty, Seti (Sethos, Sethosis, changed by Herodotus into Sesostriis), derive their name. The city of Ombos was a special seat of his worship. In later times, however, either about the close of the 21st dynasty or afterward, his worship was abandoned, and his figure and name were obliterated from many of the monuments. The cause of this curious religious revolution is unknown, but at any rate, Typhon came to be regarded as a god hostile to the Egyptians, and was gradually developed into a personification of the principle of evil—in short, the Egyptian devil, the opponent of holy doctrine, and adversary of Osiris—the god of the waste howling wilderness, of the salt lakes, of drought, and of scorching heat.

The connection between the Egyptian Set and the Greek Typhon is not very easy to trace, but it undoubtedly existed. According to Homer Typhon (called also Typhāon) was a huge giant, chained under the earth in the country of the Arimoi, and lashed by the lightnings of Zeus. Hesiod makes him a son of Typhōeus and a hurricane, and, by the snake-goddess, Echidna, the father of the Chimæra, the many-headed dog Orthus, the hundred-headed dragon that guarded the apples of the Hesperides, the Colchian dragon, the Sphinx, Cerberus, Scylla, Gorgon, the Lernaean Hydra, the eagle that consumed the liver of Prometheus, and the Nemean lion. Typhōeus, again, was the youngest son of Tartarus (hell) and Gæa (earth), or, as others say, of Hera (Juno) alone. At a later period the father and son coalesced into one person. Pindar describes Typhon as a monster with a hundred dragon-heads, fiery eyes, a black tongue, and a terrible voice. He sought to wrest the sovereignty of the world from Zeus, but after a fearful struggle, he was subdued by a thunderbolt from Olympus, and hurled into Tartarus, or buried under Ætna. The later poets modify the older myth with fabulous additions of their own. They connect Typhon with Egypt—a proof, perhaps, that he had come to be identified with the Egyptian Set. According to Ovid and others, all the gods fled before him into Egypt, and through fear, changed themselves into animals, excepting Zeus and Athene. After an appalling struggle, in the course of which Zeus was once hamstrung, and carried off by the daring monster, Typhon was vanquished, but not before he had hurled all mount Hæmus against his adversary, in a paroxysm of supernatural rage. It is very possible that the fierce physical opposition of Typhon (especially when the monster came to be identified with Set, the Egyptian devil) may have had (along with other causes) a material influence in determining that popular conception of "satan" which reigned both in patristic and mediæval times, and of which Milton has so largely availed himself in his *Paradise Lost*.

TYPHOONS' (Chinese *tei-fun*, i.e. "hot wind;" the word, it need scarcely be said, has no connection with the Typhon of mythology) are violent storms which blow on the coast of Tonquin and China as far n. as Ningpo and the s.e. coasts of Japan. Varenus, in his *Geographia Naturalis*, describes them as "storms which rage with such intensity and fury that those who have never seen them can form no conception of them; you would say that heaven and earth wished to return to their original chaos." They occur from May to November; but it is during the months of July, August and September,

that they are most frequent. They resemble the storms of western Europe (see STORMS) in their general characteristics, with this difference, that the main features are more strongly marked. There is a depression of the barometer, over a space more or less circular in form, accompanying the typhoon, but it is generally more contracted in area, and deeper and more abrupt than in European storms. It is not uncommon for the barometer, at the center of the depression, to read 28.3 in., and on rarer occasions to fall even as low as 27 in.; and the changes of pressure are very rapid, frequently .2 or .3 in. in an hour. It is this enormous difference of atmospheric pressure between neighboring places, and the consequent rapidity of the fluctuation, which give to these storms their terribly destructive energy—the law regulating the strength of the wind being, that it is proportioned to the difference of pressure between the place from which it comes and the place toward which it blows. The low pressure in the center is confined to a very limited space, and since all around this space the pressure is greater, it follows that the level of the sea there will be higher. Hence, a high wave is frequently found to accompany these storms, advancing inland, carrying with it ruin and dismay, and not unfrequently bearing ships far over the level fields, where they are left stranded a considerable distance from the sea.

Typhoons have their origin in the ocean to the east of China, especially about Formosa, Luzon, and the islands immediately to the south. They thence proceed, in four cases out of five, from e.n.e. toward w.s.w., more rarely from e.s.e. to w.n.w., and scarcely ever from n. to s. or from s. to n.; in other words, their course is generally along the coast of China. The body of the storm advances at the rate of 12 m. an hour and upward, within which the winds blow often from 80 to 100 m. an hour, whirling round the center of atmospheric depression in a direction contrary to the motion of the hands of a watch, as all storms in the northern hemisphere do. They thus rotate in the direction s., e., n., w.; and travel along the coast, so that the coast feels the northern side of the storm, while at a distance from the coast the southern side is alone experienced. The s.w. monsoons (q.v.) prevail in summer over southern Asia, to the eastward of which are the n.e. trade-winds. See WIND. Here, then, are two great aerial currents flowing contiguously, *but in opposite directions*, each highly charged with moisture, especially the s.w. current, which they have taken up from the oceans they have traversed. It is highly probable that the typhoons take their origin from these opposing currents, as whirlpools do at the meeting of two sea-currents; and their intensity is aggravated by the large quantity of heat disengaged in the condensation of the vapor of the atmosphere into the deluges of rain which fall during the storm—10 and 12 inches of rain frequently falling in one day. Much yet remains to be done toward the examination and explanation of this remarkable class of storms, the first and essential step being the establishing of meteorological stations on the Chinese coast, in Japan, in Formosa, and in Luzon.

TYPHUS AND TYPHOID FEVERS. I. TYPHOID FEVER.—An infectious, parasitic, febrile disease, classed among the continued and not eruptive, or exanthematous fevers, and characterized by an invasion of bacilli, and consequent pathological changes in several internal organs of the human body. Formerly typhoid was more or less confounded with typhus fever, but since 1850 certain facts have been recognized in all civilized countries in regard to the mode of communication and development of the contagious element, and exact knowledge has increased from that time to the present. It has only been by the power of the microscope, comparatively recently perfected to a wonderful degree, that science has been able to detect the lurking foe and avoid its attacks.

The direct cause of the affection is the entrance into the system of numbers of microscopic organisms (see GERM THEORY OF DISEASE), first discovered and described by Eberth in 1880, and by Klebs, and after them by Koch and many others. The microbe is a small bacillus of one third the diameter of a red blood globule in length, and one third the diameter of its length. Each end is rounded and contains a shining, round body, which may perhaps be a spore, from which other bacilli become developed. The *bacilli typhoides* of Eberth will produce free cultures (see BACTERIUM) on potato, gelatine, blood serum, bouillon, etc. They also rapidly multiply in sterilized milk, and may live in it for thirty-five days, and in butter twenty-one days. Many articles of diet are good culture media for bacilli, but only a few of the cultures are characteristic, that on the potato being the most so.

It has been claimed that typhoid fever was known to Hippocrates, but nothing definite is heard of it before the seventeenth century, when Spigelius observed in some post-mortem examinations lesions especially characteristic. Bartholin, Willis, Sydenham and others observed the same special features and discovered more. In the next century Huxham, Lancisi, Morgagni and others described either the symptoms or lesions of typhoid fever; but it was not known to be a distinct entity or as other than a variety of continued fever. In Germany, Von Hildenbrand, in 1810, is said to be the first to clearly distinguish between typhoid and typhus fevers. Some years later Louis added further knowledge, but no one had as yet demonstrated the separate existence of typhoid fever. This is claimed to have been done by Gerhard and Pennock of Philadelphia, in 1837, and that as a result its individuality was recognized in America sooner

than in France or England. It was not until 1849 and 1853 that Sir William Jenner, in a series of able papers, published during that period called the attention of the medical world to the fact that typhus and the so-called typhoid fever were as distinct as any two of the exanthemata. His writings did much to set the vexed question at rest, although many years elapsed before the specific distinctness of the two fevers was finally and universally recognized.

From the time of the labors of Jenner and others, more than a quarter of a century was passed in laborious researches with microscopes and methods of preparation of objects—improving in instruments and methods, getting nearer and nearer from year to year—before the “eureka” of triumph could be announced. Before the actual discovery, however, of the *bacillus typhoides* the germ theory of disease had been placed upon a pretty firm foundation, many poison-producing microbes having been discovered. The microbe of typhoid fever, though only one ninth of the sectional area of a blood globule, had to strike its colors at last to the enormous power of the microscope.

Typhoid fever is more or less prevalent all over the world. Until recently the tropics were thought to enjoy an immunity, and it is more rare there than in northern latitudes. It is met with in India, and Hirsch thinks that climate does not exert a determining influence, but it certainly does exert a powerfully controlling influence, or the tropics would never have been supposed to be exempt. In fact, the germ is just as hardy and vital as its environments allow. It flourishes in cool, moist climates like that of the British Isles, where it is endemic. It is most common in England, but more in Ireland than in Scotland, and in all, more prevalent on the west than on the east side (Murchison). In Iceland, where it is known by the name of *landfarsot*, or “sickness of the country,” it is met with every year, often as a malignant epidemic. It prevailed extensively among the British troops in the Zulu, Egyptian and Soudan campaigns, and among the French soldiers in Tunis. In North America it is endemic from Greenland to Mexico, and it has been observed throughout South America and most parts of Australasia.

It is stated on high authority that typhoid fever sometimes arises apparently independent of a previous case, in the presence of fermenting fecal and other forms of fermenting matter, in which presumably the “resting spores” have lurked. It may be communicated by persons in health by being carried, but even then the poison is not like that of smallpox or scarlet fever, or typhus, given off from the body in a virulent form, but is developed from the decomposition of the excreta discharged by a patient.

In regard to the access, or paths of infection, it may be transmitted by currents of air, where the wind can take up from the surface where they may exist, microbes or germs ready to be propagated if they happen to be conveyed to any part of a person's body or clothing from whence they might reach the alimentary canal or mouth of such person, or by his handling clothing or articles upon which the bacilli of the disease had become active, or had preserved their vitality. Drinking water is the most common medium for the dissemination of typhoid fever; not that from which bacilli have been excluded, but that which comes from rivers and ponds and wells which are located near privies and cess-pools, where the stools of typhoid-fever patients are thrown. This, and the carelessness associated with it, is the principal cause of the spread of the disease, and it is proper here to remark that great care should always be taken in the disposition of the excreta. It should be thoroughly disinfected by turning it in some vessel and covering it with a strong solution of chloride of lime, and in the absence of this, some other efficient disinfectant (consult the art. HYGIENE).

The season of the year has much to do with the frequency of the attacks. It occurs most frequently in the autumn, but prevails to a greater or less extent at all seasons. According to Murchison, out of 5988 cases seen in the London fever hospital during twenty-three years, 2461 occurred in the autumn, 1490 in summer, 1278 in winter, and 759 in spring. According to Bartlett, of the 645 cases of typhoid fever admitted to the Lowell hospital during a period of eight years, 250 occurred in the autumn, 163 in the summer, 130 in the winter, and 102 in the spring. It has generally been remarked that typhoid fever is apt to prevail most after hot and dry summers. Pettenkofer and Buhl showed that it was more common on the ground level of the water—that is, when the water was low—which then was thought to allow the germs to develop rapidly in the soil and filter through the surface into the wells. The operation of these causes will depend much upon the character of the soil and subsoil and other geological, as well as surface conditions. Baumgarten suggests that the dust of dry seasons may disseminate the germs, and it is thought by some that the suggestion adds to the probability that in some cases the bacilli may enter with the inspired air; but this latter supposition is not as probable as that the dust may enter the mouth and pass to the stomach by swallowing.

There is no reason to believe that sex exerts any influence, except so far as it may determine the occupation, and therefore the place of residence, or the locality where most of the time is passed. Young men are more apt to congregate in cities, where the causes of typhoid fever are generally most active, and are therefore more liable to become subjects of the disease than the females who have remained in the country. It occurs at all periods of life, but more often between the ages of 15 and 25 years, becoming less after 35, and becoming more and more seldom till after 50 and 60; but is occasionally met with up to extreme old age. It is more general in very early life than is usually supposed. Murchison reports its occurrence in an infant six months old, and Charcclay has reported two cases in infants but a few days old, while several observers

have discovered evidences of the disease in the fœtus. Dr. Pepper has observed several cases during the first year of life, and has seen patients recover from well-marked attacks after seventy-five years of age, and Hamernyk has recorded a case of recovery in a patient over ninety years old.

The typhoid bacilli possess great vitality; they have been known to remain active in parts of the body fifteen months after convalescence, and outside of the body may retain their vitality in water for weeks, and in badly drained soil are said to be capable of multiplication, and may continue to live for an indefinite time. They are killed by exposure to moist heat, but not by heavy frost. According to Prudden they may live in ice for months, and Seitz has shown that they will multiply at a temperature of 37.4° F. They will develop in milk without changing its appearance, and will continue to live in fœces for long periods. Sunlight is destructive to them. Janowsky found that cultures ceased to develop after four to eight hours' exposure to sunlight. How do they enter the system? Certainly by way of the mucous membrane, but it has not been proved that they enter by way of the respiratory tract. It is quite certainly by way of the mucous membrane of the intestinal canal. That they may be transmitted through the mother to the fœtus has already been stated. As to their exact mode of action after entering the intestine, our knowledge is as yet insufficient. They may, perhaps, multiply in the intestinal contents, or at least acquire further development before penetrating the mucous membrane. At any rate, they soon find lodgment in the lymph glands of the bowel; also in the mesenteric and other lymphatic glands, and in the spleen and liver. Their development yields certain toxic agents. Brigger, Fraenkel, and Vaughn have described ptomaines which are capable of producing poisonous symptoms when administered to the lower animals, and it is probable that the constitutional symptoms of the disease are due to the action of these toxic products. Typhoid fever is not contagious in the same way that typhus is—that is to say, there are no exhalations from the skin of contagious matter, which shows that the *contagium* is of much finer organization in the latter disease and more volatile. The infectious material of typhoid fever is contained in discharges from the bowels, and in vomited, and perhaps expectorated matter. The alvine discharges, by drying and becoming diffused in the air, as in sweepings from hallways and sidewalks, may enter the mouth of unsuspecting passers by and be swallowed. The tenacity of the life of the typhoid-fever bacillus, therefore, allows of extensive dissemination. One of the most remarkable epidemics which ever occurred was at Plymouth, Pa., in 1885, and was studied by Dr. L. H. Taylor, of Wilkesbarre. A mountain stream supplied the germs from a single patient along its bank many miles away from the town. More than 1000 cases developed at the rate of 50 to 100 a day, and nearly 100 persons died.

As might be supposed from what has already been said, the anatomical characters of typhoid or enteric fever are inflammatory tumefaction, ulceration, and sloughing of the glands of the small intestines, and less frequently those of the large intestine also. The solitary and agminated glands of Peyer (see PEYER'S GLANDS) of the ileum are especially affected, and there is tumefaction of the mesenteric glands and spleen. The alterations taking place in the solitary and agminated glands of Peyer are usually divided into four stages, viz.: (1) the stage of infiltration and engorgement, in which the follicles project above the surface of the mucous membrane, their capillaries becoming filled with blood. This first stage begins early, Murchison detecting it in two cases dying at the close of the first day. It reaches its height about the middle of the second week. In a large number of glands, resolution now takes place, accompanied by decrease of tumefaction. (2) The second stage, or that of necrosis or death of the gland, rarely begins before the middle of the second week, and reaches its height toward the end of the same week. The follicles die and form sloughs, and the process may occur in all or only some of the follicles of the patches of Peyer, and may be superficial, or extend to the serous coat of the intestine, perhaps producing perforation of the bowel into the cavity of the peritoneum. The stage is most marked at the lower portion of the ileum, which may to a great extent have a sloughing condition. (3) Following the death of the gland is the stage of ulceration. The sloughs loosen, and at about the end of the third week are detached, leaving ulcers. Sometimes a whole Peyer's plaque is involved, leaving an oval ulcer. The solitary glands also undergo ulceration. (4) The stage of cicatrization begins about the commencement of the fourth week of the disease, and continues for two or more weeks. Delicate gray granulations cover the floors of the ulcers, and sometimes secrete pus, at last being replaced by connective tissue, the cicatrices appearing as smooth thin spots remaining for years. It must be remarked that these stages are not necessarily simultaneous. The same Peyer's patch may show cicatrization in one part and sloughing in another. There may be, therefore, perforation after convalescence has apparently commenced. At the same time with the earlier changes in the above-named glands there are pathological changes going on in the mesenteric glands and spleen. The latter organ nearly always becomes enlarged. The enlargement, generally greater in the severer cases, begins with hyperæmia, the capillaries and veins being enlarged and the sinuses filled with red and white blood cells. Rupture has been known to occur. The liver may become the subject of degeneration. It early becomes hyperæmic; it is softer than normal, and the outlines of the lobules are not well marked. The gall bladder is sometimes affected with catarrhal inflammation and ulceration. The kidneys and other organs are more or less pathologically affected, but space does not permit their consideration.

The temperature is one of the most important symptoms in typhoid fever, and the most comprehensive account of its behavior is given by Wunderlich. He maintains that the presence of the disease can certainly be decided when both morning and evening temperatures have been taken for a short space of time. In the beginning of the fever about three days' observation only are required for diagnosis, but in the height, and in the convalescence, from four to six days are necessary as a rule; but there are occasionally rare cases in which it never rises above the normal point, and a subnormal temperature has been observed in severe cases with well-marked intestinal lesions. The period of invasion may vary considerably. Where the poison is very virulent it may not exceed four or five days, and Griesenger mentions a case in which it was accomplished in one day. On the other hand it is claimed that it may extend to three or even four weeks, but such cases are difficult to determine, and about a week may be stated as the average. The fever increases from day to day, with a morning and evening exacerbation, and a remission in the early morning. By the end of the first week the temperature, taken under the tongue, reaches 103° or 104° F., as a rule. During this time the patient is dull and apathetic. There is often severe headache, and the hearing is indistinct. The pulse increases in frequency, but not in proportion to the increase of temperature, and is full, and rather soft. The temperature is likely to rise until the fourteenth day with some variation, and exacerbations and remissions, and sometimes higher; but this will depend much upon the treatment, and the constitution of the patient, as will presently be noticed. After the fourteenth day the exacerbations and remissions generally become more irregular, and by the twenty-first day the temperature begins to decline rapidly. The range of temperature in typhoid fever differs much from that in typhus, being much shorter in the latter disease, lasting as a rule only about fourteen days; but the range of typhoid is often less than that named above, under the most favorable circumstances. Pressure in the right iliac region reveals gurgling sounds and tenderness, and there will be more or less rumbling in other parts of the bowels. The ascending, transverse and descending colon will be found more or less distended with gas, giving a sort of tub-shape to the rather prominent abdomen, as was remarked by Sir William Jenner. The pain in the right iliac region is, of course, the consequence of the Peyer's glands and follicles in the lower end of the ileum becoming ulcerated. Constipation is generally present at the commencement, but diarrhoea may set in immediately with dull yellowish stools. At about the end of the first week, or two or three days later, a distinctly characteristic eruption of rose-colored spots, diagnostic in their number, aspect, time of appearance and duration, make their appearance upon the upper part of the abdomen and lower part of the chest. They vary in number from one, two or three, to twenty or more, but they are the rose-colored spots of typhoid fever, and that alone. They appear in succession, perhaps until the end of the third week. In rare cases they spread over the whole surface of the body. These spots are slightly elevated, and from 1 to 3 lines in diameter, easily disappearing on pressure, returning as soon as the pressure is removed. Each spot lasts two or three days and then gradually fades, sometimes leaving a slight stain. Fresh crops appear at intervals of three to five days, but there is no regularity of sequence. Murchison has counted as many as 400, but there may be but few, two or three in the course of the disease; and in children, more often than in adults, there may be no eruption at all.

Treatment.—This need occupy but a little space, for the reason that the practitioner must be entirely relied upon to manage the case. It will, however, be proper to state briefly the general rules of treatment. The patient should be kept cool, and bathed frequently, and occupy a large, well-ventilated room. In regard to alcoholic stimulants, they are generally recommended, but the reason for their use does not seem to be sufficiently explained. They are generally given to support the strength, but that really involves the question as to how much alcoholic stimulants support the strength. This is denied by many, but no one disputes their power to destroy, or to combat the effects, upon the system, of organic poisons. In typhoid fever the bacilli furnish, during their development, toxic principles to which the disease owes its virulence, and to these principles much of the power of the alcoholic stimulants is addressed, acting probably very much in the manner in which they combat the effects of the bites of poisonous reptiles. The amount of stimulant should be proportioned to the effect it produces; not the immediate effect, but that which is seen a few hours after the administration, which, therefore, requires considerable judgment, and must be left to the medical attendant. It is good practice to give cooling drinks freely. The diet ought not to be stimulating or abundant, but sufficient and nourishing enough to allow the system to keep up the process of assimilation and nutrition with as little loss of tissue as possible. The alkaline ingredients of the blood are apt to pass away rapidly in this disease, and therefore it will be found beneficial to administer two or three times a day or oftener moderate doses of bicarbonate of soda, and occasionally smaller doses of the corresponding potassa salt, in the proportion of about one or one and a half drachms of the former and one half a drachm of the latter, daily. Quinine forms an important part of the medicine, and may be given in doses of one or two grains three, four or five times a day, for a short period, or longer, depending so much upon the symptoms that no directions can here be given, or even suggested. As to other remedies the same may also be said. Wakefulness is sometimes one of the distressing elements in a case of typhoid fever, and will often tax the ingenuity of the medical, as well as all the other attendants; but here it must be remarked that quiet, and therefore, very few attendants or nurses, is an important mat-

ter. It will also be found that experience confirms the remark that when a patient suffering under typhoid fever gets enough nourishment, but not too much, and has the toxic elements which are furnished by the development of the microbes, contended against, and the surface of the body is kept as cool as is consistent with the necessary progress toward convalescence he need not pass so very uncomfortable a period as has been, until within quite recent times, regarded as unavoidable. Great progress has been made in the management of typhoid and typhus fevers. In the discriminating use of refrigerants, much is to be looked for. There is a disposition to carry the use of cold baths too far, and the administration of antipyretics, especially the coal-tar derivatives, ought to be discouraged, as it is admitted, even by those who employ them, that they weaken, and sometimes destroy the heart's action. It is believed that the parting words of Sir William Jenner on the treatment of typhoid fever will be of advantageous insertion here. He says: "While admitting without reserve that heroic measures, fearlessly, but judiciously employed, will save life when less potent means are useless, the physician whose experience reaches over many years, will, on looking back, discover that year by year he has seen fewer cases requiring heroic measures, and more and more cases in which the unaided powers of nature alone suffice for effecting a cure; that year by year he has learned to regard with greater diffidence his own powers, and to trust with greater confidence in those of nature."

Typho-malarial fever.—This name has, by common consent, been given to the simultaneous existence of typhoid fever, and the fever produced by swamp miasm, or malaria. All the abdominal changes take place as in a case of pure typhoid, and the microbic development is, therefore, not absent. The malarial element sometimes adds grave complications, and seems often to intensify the poison, the temperature often attaining a greater height. Where the malarial element enters largely into the disease it need scarcely be said that, as a rule, quinine should be relied on to a considerable extent, as it is, *par excellence*, the destroyer or opposer of malaria. In regard to the use of calomel, it may be said here with propriety that small doses, often not more than one tenth of a grain (and pellets of that amount are now found at most druggists), given several times a day are now generally admitted to have the power of restoring the action of the cellular elements, and other glands, including the intestinal. This remedy therefore places a considerable controlling power in the hands of the physician, and this remark applies as well to cases of pure typhoid or typhus fever as to those mixed with malarial elements. As to the bibliography of typhoid fever, an enumeration of the many authors who have written well upon the subject would be altogether too extended and unnecessary here, and a shorter list would perhaps seem partial. A consultation of any extensive medical treatise on the subject will satisfy any curious reader. The above brief sketch of typho-malarial fever is deemed called for, because of the independent place given to it in works of repute on fevers.

II.—**TYPHUS FEVER.**—An acute, specific and highly contagious fever, endemic, and also prevailing in epidemics, especially in times of destitution and in the presence of overcrowding and bad ventilation, presumably due to a micro-organism, as yet undiscovered, and attended with no characteristic lesion of the tissues, as in the case of typhoid fever, but with serious alteration of the blood. It is ushered in by an abrupt onset, with marked nervous symptoms, rheumatic pains, rigors and headache. A maculated eruption appears, most commonly on the fifth day of the disease, of slightly elevated spots, deble on pressure at first, afterwards persistent and darker, and there is early prostration of the nervous and muscular systems. Delirium usually comes on during the second week, sometimes of an acute and noisy character, but oftener of a low, wandering kind, with a tendency to stupor. The fever terminates by a crisis, which generally occurs on or about the fourteenth day.

Among authors who have written upon the subject Sir John Pringle occupies a foremost place, and gave an excellent description of the epidemics occurring in the British army in 1742 and 1745. Its literature is much older than that of typhoid fever, because the latter disease was, until within the last fifty years, supposed to be only a variety of the former. Murchison gives ninety-eight names by which it has at various times been called. Previous the time of de Suavages it was called "pestilential," "camp," "jail," "hospital," "ship fever," and other similar names. From its contagious nature it was called "parish infection" in the English bills of mortality of 1600-1700, and it has borne the names of "morbus pulicans" and "spotted fever." Hirsch says that Fracastori, who lived in Verona in 1483-1553, mentions it under the name "lenticulæ." On account of the cerebral symptoms, it was called "typhus comatosa" by de Suavages in 1760, and "brain fever" by various authors. "The history of typhus," writes Hirsch, "is written in the dark pages of the world's story which tell of the grievous visitations of mankind by war, famine and misery of every kind." It has from time to time prevailed in all parts of Europe, but to a greater degree in Great Britain, Ireland and Russia. Ireland has been more afflicted than any other country. In the United States and Canada it has at various times appeared as an epidemic. It is said to be scarcely known in Australia, New Zealand, India, Africa, or the tropical parts of America. It is a disease of the temperate and cold zones, and this fact is regarded as caused to a considerable extent by the mode of life adopted by a great majority of the peoples of cold countries congregating, as multitudes of them do, in badly ventilated habitations. Hirsch remarks "The idea that overcrowding in filthy and unventilated rooms affords the essential conditions for the development of typhus foci, and for the spread of the disease, has been

completely borne out by the experience of all times." But epidemics of typhus fever are becoming rarer year by year.

In all cases typhus arises from the reception into the system of a specific virus, of the intimate nature of which we as yet positively know nothing, although observers with the microscope have at times been encouraged to believe that they have made valuable discoveries. Dr. Cayley, the editor of the third edition of Murchison's *Treatise on the Continued Fevers of Great Britain*, says that "it seems probable that typhus is due to a specific *microbe* which requires conditions of overcrowding and imperfect ventilation to develop its virulent and contagious properties." In 1868 Hallier announced the discovery of a *typhus fungus*, but the discovery has not been confirmed. In 1873 Zuelzer claimed to have obtained "positive results" from infection experiments in animals, but there is no evidence that the disease produced in the animals experimented upon was typhus fever. In 1883 Mott (*British Med. Jour.*) described active dumb-bell cocci in the blood and plugs of cocci in the lymphatics of the heart in cases of typhus fever, and other researches have been made, but without definite results. There are, however, certain interesting facts which are known respecting the typhoid-fever poison. Actual contact is not necessary for its communication. The contagious principle is cast off by exhalations from the lungs and skin, and most probably from the alvine evacuations. The "striking distance" of typhus is not great, if a limited fresh air space separates the patient from the healthy person; as if the poison became disorganized by contact with fresh air, oxidation being a suggested cause. It is readily absorbed by clothing, bedding, furniture, wooden beams, etc. The experiments of Dr. O. Motschutkovsky show that neither typhus nor enteric fever can be communicated to man by inoculating the blood. One attack generally confers immunity from a second, but there are exceptions. Murchison himself suffered from several attacks, each attended by the characteristic eruption. Observation and experiment show that the *contagium* of typhus fever is lighter than atmospheric air. It is found that it will spread to the upper stories of a hospital when it is treated on the ground floor; but patients in the lower stories enjoy immunity when the typhus patients are treated on the upper floors. "This was so well known," says Dr. Moore, the author of a classical work on fevers, "at the Meath hospital when I was a student there a quarter of a century ago, that the typhus cases were treated in wards at the top of the General hospital. This plan has been long since abandoned for that of isolated epidemic wards."

Among other characteristics of typhus fever which differ from those of typhoid are the absence of the peculiar affection of the agminated and solitary glands of Peyer in lower portion of the ileum, and the consequent pain in the right iliac region. The mesenteric glands do not contain anything resembling the typhoid material, there being no bacilli to be found; and it can hardly be supposed that there is any similar poisonous organism there, or it would produce its effects.

The spleen is frequently enlarged and softened and the heart is often flabby. It may be that some organism will be found in them, but if so it will be so minute as to challenge the powers of the microscope. The blood in the heart and large vessels is unnaturally dark and fluid. Congestion of the lungs and pulmonary oedema are more frequent than in typhoid fever. Cerebral congestion and effusion of serum into the ventricles of the brain and the arachnoid cavity are not uncommon. The kidneys are apt to be congested, enlarged, and the convoluted tubes filled with desquated epithelium. There is more congestion of the capillaries of the face and general surface than in typhoid fever, which gives the face especially a dusky hue, compared with its appearance in typhoid, so that the nurses in hospitals learn to discriminate between them by the physiognomy. An expressionless countenance is the usual characteristic which corresponds to the general dullness and nervous apathy of the disease. Delirium is more frequent than in typhoid, and is sometimes accompanied by contraction of the pupil, and may be so marked that it has been called by Graves *pin-hole pupil*. The tongue, oftener than in typhoid fever, becomes covered with a thick brown or black coating. Sometimes it is reddened, glazed and fissured. Diarrhoea is often absent in typhus, and when present is generally slight, and the same may be said of tympanitis (drum-like sound on percussing the abdomen, caused by collections of gas). Perforations of the intestine do not occur, as ulceration of the bowels is absent, and hemorrhage from the bowels is a rare occurrence. The copiousness of the eruption generally corresponds to the gravity of the disease, which statement does not hold good with typhoid fever, but it is stated by Flint that among the characteristic maculae there are occasionally mingled a few rose-colored papulae of typhoid. Although diarrhoea is a rare occurrence in typhus, dysentery is not very infrequently present, and, as has been mentioned in the article on Typhoid Fever, the two are sometimes thought to exist together.

Treatment.—As in the case of typhoid fever, little can be said here of advantage and interest, except to allude to general principles. Frequent ablutions are to be recommended, both on account of cleanliness and refrigerating effects. In regard to baths the same remarks which were offered in the treatment of typhoid are applicable here. The administration of drugs should not be looked upon as having much curative effect, and the employment of antipyretics should be regarded with reluctance, as they always have a depressing effect upon the heart's action. The best antipyretics are the natural refrigerants and their innocuous salts, as bicarbonate of soda conjoined with small doses of calomel, which increase the tendency to general glandular action. The immense surface covered by the sudoriferous glands of the skin is not to be disregarded. When

the general glandular system is acting, as it is powerfully assisted in doing by the effects of these simple medicines—for the soda is really a supply of nourishment to replace the waste of this element by fever—and when this is assisted by proper quantities of alcoholic stimulants, given with discrimination, with the requisite amount of nourishment in the form of milk, soft-boiled eggs and beef tea, chicken or mutton broth, much reliance can be placed upon the powers of nature, and the quotation from Sir William Jenner at the close of the article on TYPHOID FEVER may be read with advantage. Of course quinine, the different ingredients of opium, and other medicines have their use and are not to be disregarded by the intelligent physician, but it is unnecessary to speak of them in an article intended not for his instruction, but as affording an intelligible guide to the general reader, and affording him a reasonable amount of information.

TYR is the old Norse name of a god, who, however, did not belong exclusively to the northern mythology, but was common also to the German, being called in old High-German *Ziu* or *Zio*, and in Ang.-Sax. *Tiw*. He was the son of Odin, and was the god of war and of fame, which idea is expressed in old Norse by the word *tyr*; and when the Romans and Greeks speak of a Mars or an Ares among the Germans, it is Tyr that is meant. According to the Edda, he was single-handed. When the Asa-gods persuaded the wolf Fenrir to allow himself to be bound with the bandage Gleipnir, Tyr put his right hand in the wolf's mouth, as a pledge that he would be loosened; and when the gods refused to release him, the wolf bit off Tyr's hand to the wrist, which was called, in consequence, *ulflithr*, or the wolf's joint. In the twilight-battle of the gods, he meets his death at the same time with his enemy, the monster dog, Garmr. The old Norse Runic character ᚢ bore the name of the god. The third day of the week, too, the *Dies Martis* of the Romans, is called after him, in old Norse, *Tyrsdagr*; Ang.-Sax., *Tuesday* (from which our English *Tuesday*); old Friesic, *Tysdei*; old High-German, *Ziruestac*; in the n. of Germany, *Tiestac* or *Diestac*, from which the German of the present time, *Dienstag*. Places, and in particular hills and plants, were named after him. The word Tyr appears in epithets of Odin, signifying god in a general sense; as, for example, *Sigtyn*, that is to say, the god of victory; also in epithets of Thor, as *Reidhartyr*, the god of the chariot or of thunder.

TYRANT (Gr. *tyrannos*, Doric for *koiranos*, from *kuros* or *kurios*, a lord or master), a name given in modern times to an arbitrary and oppressive ruler, but originally applied, not necessarily to one that exercised power badly, but merely to one that had obtained it illegally, and therefore equivalent to our word *usurper*. The ancient Greek "republics," it must be remembered, were generally aristocratic and even oligarchic in their constitution. When the "governing families" among the Athenian or Syracusan nobles, for example, quarreled with each other, it was natural, if they could not otherwise agree, that the boldest and most reckless of the set should seek for success by allying himself with the masses of the people, should figure as their champion, promise to redress their wrongs or increase their comforts, and when a fitting occasion presented itself, should, by a clever if somewhat violent stratagem—*coup d'état*, it is now called—deliver them from the domination of his order by himself grasping possession of absolute power, and ruling without any other restraint than the necessity of retaining his popularity imposed—even this limitation being frequently absent when a body-guard of foreign mercenaries rendered it superfluous. If the political adventurer who thus rose on the ruins of the constitution happened to be a man of sense, and wisdom, and generosity, his "tyranny" might prove a blessing to a state torn by the animosities of selfish oligarchs, and be the theme of praise in after-ages, as was the case with the "tyrannies" of Peisistratos (q.v.), Gelon (q.v.), Hiero II. (q.v.), and many others; but if he was insolent, rapacious, and cruel, then he sought to reduce the citizens to a worse than Egyptian bondage, and his name became infamous to all time. Such has been the fate of most of the "thirty tyrants of Athens" (q.v.), more particularly of the blood-thirsty Critias, of Alexander of Phæræ, of Dionysius the younger, etc. It was the method of exercising authority pursued by these and similar usurpers that latterly, even in ancient times, gave the word tyrant that evil significance it has ever since uninterruptedly retained.—See Plasz, *Die Tyrannis bei den Griechen* (Bremen, 1852); Wachsmuth, *Hellen. Alt.*, vol. i. pp. 279-88; and the histories of Thirlwall and Grote.

TYRANT SHRIKE, the popular name of a section of the shrike family (*laniadæ*), connecting that family with the fly-catchers (*musciicapidæ*), and entirely American. In the genus *tyrannus*, the bill is straight, rather long, strong, the upper mandible rounded above, the point suddenly hooked. The birds of this genus are remarkable for their fierce and bold disposition. They are always ready for battle, and often engaged in it. In defense of their young, they rush against any aggressor. The tyrant shrike, TYRANT FLY-CATCHER, or KING-BIRD (*T. intrepidus*) of North America, has no hesitation in attacking an eagle, rising above him and pouncing down upon him. This species migrates northward in summer as far as lat. 57°. It feeds much on the larvæ of insects, but has an unfortunate fondness for bees, and will take its post on a fence or bush near a hive, to dart upon them as they depart or return; on which account it is disliked by American farmers. The true tyrant shrikes (*tyrannus*) have the plumage of white and black, variously blended; but in the genus *tyrannula*, which approaches more to fly-catchers, the plumage is almost always olive-colored, serving for their concealment among foliage.

TYRCONNEL, RICHARD TALBOT, Duke and Earl of, b. early in the 17th century. In his youth, according to lord Macaulay, he was "one of the most noted sharpers and bullies of London." Soon after the restoration, he endeavored to obtain the favor of the royal family by blackening the reputation of Anne Hyde, so as to furnish the duke of York with a pretext for breaking his promise of marriage to her. Though unsuccessful in this, he succeeded in gaining the favor of the duke, and contrived to make himself welcome at the palace both as a votary of its pleasures and as a counselor in affairs of state. Immediately on the accession of James II., he was made earl of Tyrconnel and put in command of the troops in Ireland; and in 1687, by fawning, bullying, and bribing, he got possession of the office which had long been the object of his ambition—he was appointed lord-deputy of Ireland. His arrival in that country spread terror and dismay through the English Protestant population, who had already suffered somewhat under his military rule. Events quickly justified their terrors. Nearly every office of dignity in the country was soon transferred to the hands of the Roman Catholics. The Protestant party, so long dominant, complained bitterly that they had become a laughing-stock even to their own servants, and that to appeal to law was vain; judgment in every case being given for the native against the Englishman. But this state of matters did not last long. The revolution of 1688 had a sudden and sobering effect upon the rule of the lord-deputy; and there can be little doubt that he would have submitted to William III.; but the Irish people threatened that if he dared to sell them for wealth or honor, they would burn the castle and him in it, and put themselves under the protection of France. On the arrival of James in Ireland in 1689, he created the earl, duke of Tyrconnel. After the fatal battle of the Boyne, at which he held high command, he retired to France. In 1691 he returned to Ireland, with a view to furthering the efforts in favor of James, which were still being made by his adherents. Notwithstanding the defeat of Aghrim (July 12, 1691), and the capitulation of Galway, he made preparations for the defense of Limerick, binding himself and his countrymen by an oath not to surrender until they received permission from James, then at Saint Germain. He at the same time dispatched a letter in which he stated his conviction that all was lost. On Aug. 11, before an answer could arrive, he was struck with apoplexy. He died on the 14th of the same month. He has been characterized by Macaulay as "the fiercest and most uncompromising of all those who hated the religion and liberties of England." His wife, so famed for her beauty and fascinating manner, entered life as maid of honor to the duchess of York. As wife of the duke of Tyrconnel, during his rule in Dublin, her conduct seems to have been characterized both by dignity and purity. She died in a small private nunnery in Dublin in circumstances of great poverty. See Macaulay's *History of England*, vols. ii., iii., and iv.; Chambers's *Book of Days*, vol. i., ed. 1863, p. 310; Mrs. Jameson's *Memoirs of Beauties of the Court of Charles II.*, vol. ii., p. 223.

TYRE (Phen. *Sûr* or *Sôr*, rock), a city of ancient Phenicia, situated in lat. 33° 19' n., which probably derived its name from the double rock on which it was first founded. It was a matter of doubt among the ancients themselves whether Tyre or Sidon was the older of the two, and the question is not easily to be settled. So much, however, seems certain, that Tyre had existed already independently for a long time, when Sidon, defeated by Ascalon, transferred herself almost bodily to the former (see PHENICIA). There were two towns of Trye closely connected together in historical times; one on the continent, the other on the island opposite, together embracing about 19 Roman miles. The more important of the two was the continental town, called Palæ Tyrus; while the island-town served more or less for the purpose of store-houses, manufactories, arsenals, and the like. The situation of the entire city was one of the most fertile, and its magnificent combination of land and sea scenery formed the theme of many an ancient poet and seer.

Nothing but myths have come down to us respecting the earlier period of its existence. History begins to dawn upon us with Abibal, the predecessor of the biblical Hiram, under whose rule (980–47 B.C.) Tyre attained to its full glory and renown. An alliance with Solomon was also entered into; trading expeditions were undertaken jointly by the Israelites and the Phenicians, and Solomon is supposed even to have married Hiram's daughter. During Hiram's reign, Tyre was much enlarged and embellished; and its two roadsteads and harbors, the wonders of the ancient world, probably date from the same period. He was followed, according to ancient writers, by Balæastartus; after him reigned, for brief periods, his four sons, by the murder of the last of whom the throne became hereditary in the house of Ithobaal, the Ethbaal of Scripture, whose daughter was married to Ahab. Tyre then appears to have gained the supremacy over Sidon, and also spread her colonies far and wide. Shortly after the death of this king, Carthage was refounded by Elissa (Dido), about 813 B.C., in consequence of a popular demonstration, which deprived her of the throne in favor of Pygmalion. This "new city" gradually diminished the importance of the old one; at least Tyre seems to have been weakened to such an extent by the emigration of its best elements, that it disappears from history until the three great powers, Chaldaea, Assyria, and Egypt, by turns endeavored to make themselves masters of the Tyro-Phenician coast, with its eastern and western trade. Shalmaneser, king of Assyria, reduced Tyre, after a long siege; and the whole of Phenicia, the most important places of which had already

thrown off their allegiance to Tyre, was rendered tributary to Assyria. During the Chaldeo-Egyptian struggle, Tyre, again at the head of the country, sided with Egypt, and was conquered by the Chaldeans. Once more the Phenicians attempted to throw off the foreign yoke, and Nebuchadnezzar marched against them at the head of his armies. Having taken Jerusalem (587 B.C.), he reduced the whole sea-coast, except Tyre, which stood a thirteen years' siege by water and by land, ending, not in subjection, but only in a kind of apparent submission, leaving the native sovereigns on their thrones, and their wealth and power untouched. In 538 B.C., Cyrus became master of Phenicia, which at that time again stood under Babylonian supremacy, and the hegemony was bestowed upon Sidon. For a long time, Phenicia prospered under wise Persian rulers; but when Xerxes, in his Greek wars, had completely destroyed the Phenician fleet, and exhausted nearly all her resources, the exasperated inhabitants rose once more, but only to be utterly crushed. Sidon, at the head of the revolution, was fired by its own inhabitants, and once more Tyre resumed the lead (350 B.C.). Having refused to pay allegiance to Alexander the Great (after the battle at Issus), it was besieged by him in 332 B.C., and fell after a seven months' hard resistance. Alexander replaced the old inhabitants by new colonists, chiefly Carians, and though the city had sustained all but complete destruction, it yet rose again after a very brief period to wealth and power, and already in 315 B.C., was able to hold out for 18 months against Antigonus. Under the Romans, Cleopatra received Tyre as a present from Antony; but the last trace of its independent existence was taken from it by Augustus. A Christian community was founded there at an earlier period. The trade and manufactures of Tyre, aided by her exceptionally favorable naval position, insured for it, even under Roman dominion, a high place among its sister cities; and once more, in 193 A.D., it even took an active part in the contest between Septimius Severus and Pescennius Niger, which, resulting in the success of the former, brought back to it some of its ancient distinction. In St. Jerome's time, it was again the noblest and most beautiful city of Phenicia, nay, one of the most prosperous and noble cities in the whole east. In the 7th c., it came under the dominion of the Saracens, and so remained until taken by the crusaders; and in 1192 A.D. became the northern boundary of Christian territory in Palestine. It continued to flourish—still chiefly through its world-renowned purple—until 1516 A.D., when the conquest of Selim I., together with the newly discovered route to Asia by the cape of Good Hope, put an end to its wealth and commerce, and almost to its existence. Although there has been a slight improvement in its prospects of late, the desolation and wretchedness of that once magnificent city are still most striking. From 3,000 to 4,000 inhabitants now dwell among the ruins of its ancient glory, finding scanty livelihood in insignificant exports of tobacco, cotton, wool, and wood. Frederick Barbarossa and Origen are both buried here.

TYRNAU or **TIRNAU** (Magyar *Nagy-Szombat*), a t. of Hungary, co. of Ober-Neutra, on the river Trna, about 30 m. n.e. of Presburg. It has a cathedral dating from 1389, a large episcopal palace, and numerous churches and convents. Tyrnau carries on manufactures of cloth, linen, woad, etc., and has a tolerably lively general trade, especially in wine. From 1635 to 1777 it possessed a university, which in the latter year was transferred to Pesth. Tyrnau is likewise famous for a huge cask, which can hold twice as much as the great Heidelberg one. Pop. '90, 11,500.

TYRNAVO, a town in Greece, near the Turkish frontier, 11 m. n. of Larissa, and s.e. of the Reveni pass. Pop. about 5300. Tyrnavo came into prominence during the Græco-Turkish war of 1897, when, after the capture of the Milouna pass by the Turks, the fighting continued for several days around the town, until, on the night of April 23, Crown Prince Constantine found it necessary to abandon Tyrnavo, the retreat in utter darkness soon becoming a disastrous rout. Large military supplies fell into the hands of the Turks.

TYROL (in German more commonly spelled *Tirol*; not spoken of as *das Tirol*, though usually called in England *the Tyrol*) forms with Vorarlberg the most westerly province of the Austro-Hungarian monarchy, and borders n., w., and s. on Bavaria, Switzerland, and Italy. Area, including Vorarlberg, 11,324 sq.m.; pop. '90, 928,769.

Surface.—The Tyrol may be regarded as an eastern continuation of Switzerland. It is traversed from e. to w. by the great chain of the Alps, and is encircled on all sides by lofty ranges. It consists, however, almost entirely of three great valleys—(1) one running e. and w. n. of the great Alps, and drained by the Inn; (2) one s. of the Alps, also running e. and w., and drained by upper tributaries of the Adige or Etsch; (3) one running s. from the middle of the last, and drained by the main stream of the Adige. These valleys are surrounded by a circuit of mountains. The northern valley is separated from Bavaria by the Algau Alps. The southern valley is bounded on the e. by the Trent Alps; on the w. by the Ortler Alps, which, like protecting walls, run s. into the plain of Lombardy. The main chain is crossed toward the center of the Tyrol by a deep depression, in which lies the Brenner pass (elevation, 4470 ft.). It is the lowest of the great passes of the Alps, and that over which runs the great commercial route connecting Italy and Germany.

The dialect and manners of the Bavarians prevail in the northern and middle valley. The dialect and manners of Lombardy, on the other hand, have crept up the third valley to a boundary-line which rests upon the mountains which bound the middle valley

on the south. Hence the most important divisions of the Tyrol are into the German Tyrol and the Italian Tyrol. The German Tyrol is divided into (1) the Oberinntal, or the Upper Inn valley; (2) The Unterinntal, or the Lower Inn valley; (3) the Vintschgau; (4) the Etsch district; and (5) the Pusterthal, the three last belonging to the middle valley of the Tyrol. Beyond the geographical limits of the Tyrol the Austrian province of the Tyrol includes (6) the Vorarlberg, a district drained by streams which fall into the lake of Constance, and in which a dialect is spoken resembling those of German Switzerland; and (7) the Lienz district, on the Drave, in which the language of the people is Austrian. The Italian Tyrol is divided into (1) a northern valley, or that of Trent; (2) a southern valley, or that of Roveredo; (3) the valley of the Sarca, or district of Riva, on lake Garda.

Geology and Soils.—The rocks of the Tyrol are chiefly crystalline Silurian and secondary, with obtruding granites and traps. The chief mineral products are iron, rock-salt, worked near Innsbruck, and marble, quarried in the south, silver, copper, lead, zinc, and sulphur are also extracted. The tertiary strata of the Swiss and Swabian plains are totally wanting; and it is only along the water-courses that level tracts of recent formation are found. These tracts are the only parts of the country admitting of cultivation by the plow, and seldom attain a width of more than half a mile. Taken altogether they form barely one-tenth of the whole country.

Climate.—The loftiest mountains of the Tyrol are in the main chain of the Alps—the Gross Glockner (12,460 ft.), e. of the Brenner pass, and mount Gebatsch (12,276 ft.) w. of it and, in the Ortler chain, the Ortler Spitz (12,818 ft.). These mountains are covered with vast glaciers, which descend, like those of Switzerland, far into the valleys. Between 6000 and 5000 ft. snow disappears in summer, and Alpine plants and grass cover the hills, diversified here and there with stunted bushes. Into this region the herds are driven, as in Switzerland, during the summer months. Below 5000 ft. the firwoods abound; potatoes and a few vegetables are cultivated, and houses permanently occupied make their appearance. The beech replaces the fir at 4000 ft. and agriculture begins, the chief grains being rye and barley. Wheat is not cultivated with success at a higher elevation than 2000 feet. In the lower part of the southern valley, the temperature is highest, and tobacco, the fig, the olive, and the mulberry are cultivated. Out of every 100 acres of the Tyrol, 30 are inaccessible mountain-tracts, 40 forests, 20 commons and meadows, and 10 corn-fields and gardens.

Industry.—The industry of the Tyrol is not important. There are, however, glass and paper factories near Innsbruck; and carpets, linens, gloves, and straw hats are manufactured extensively for home consumption. Wooden ware is also largely produced. The rearing of canaries is a business which was long a monopoly of the northern Tyrolese, who supplied all Europe with these birds. The exports from the Tyrol consists of cattle, cheese, timber, wine, tobacco, silk, iron, and salt. The imports are grain and manufactured goods. The transit-trade between Italy and Germany gives employment to a large number of the inhabitants. Thousands migrate annually into neighboring countries, to sell their wood wares, gloves, and carpets. Railways have for a number of years connected Innsbruck with Munich, and Botzen with Verona; and in 1867 the section between Innsbruck and Botzen, over the Brenner pass, was opened, which completed the first railway communication between Italy and Germany. Numerous lines have been built in recent years, and the total length of roads in operation in 1896 amounted to over 442 miles.

Inhabitants.—The northern or German Tyrolese bear to the southern or Italian, the proportion of three to two; and the habits and language resemble those of the adjoining parts of Italy and Germany. In the Tyrol, according to the census, the inhabitants are all Catholics, with the exception of 358 Jews, 1235 Protestants, 29 Greek Christians, and a few members of other sects. The Tyrolese have an independent national diet, meeting at Innsbruck, in which are represented all classes of the population, the clergy, the nobility, the people of the country, and those of the towns. There are, to some extent, separate administrative arrangements for the Italian districts. Education is now very generally diffused, and one of the nine Austrian universities is at Innsbruck.

History.—The history of the Tyrol is partly German and partly Italian. In early times the Tyrol formed part of Rætia, and was conquered by the Romans, 15 B.C. Subsequently it was overrun by various German tribes; still later the southern valley fell to the share of the Lombards, the two northern valleys to the Bavarians. The latter valleys were divided into *gaus*, which ultimately became petty lordships, acknowledging the supremacy of the dukes of Bavaria. These lordships, however, in the course of time, came to be represented by two families who intermarried. Then the whole German Tyrol was governed by one family of counts, whose paternal abode was the mountain fortress of Terioli, or Tyrol, near Meran. The last count, who died in 1335, left one daughter, Margaret Maultasche. She bequeathed her rights to her cousins, the dukes of Austria, who, in consequence, acquired possession of the Tyrol in 1363. The Italian valley formed the bishopric of Trent. During the wars of Napoleon, the German Tyrol was ceded to Bavaria, much to the discontent of the population, who were warmly attached to the house of Austria. They made a gallant resistance to the French in 1809, under Andreas Hofer, but were defeated; and the northern Tyrol was not restored to Austria until the treaty of Paris in 1814. The southern Tyrol, which had been annexed to Italy, was restored to Austria in the following year. An application was

made by the inhabitants of the Italian Tyrol, a few years ago, to the Austrian government to be rendered entirely independent of the German inhabitants of the northern valleys; but it led to no important change in the administration. It showed, however, the desire of the southern Tyrolese to be considered Italians rather than Germans, and it was believed that on the event of a successful war for the recovery of Venice, the whole of the southern Tyrol would be handed over to the kingdom of Italy. This expectation has not been realized. By the treaty of peace between Austria and Italy at the conclusion of the war through which Venetia again became Italian, it is declared that the frontiers of the Venetian provinces ceded to Italy are the administrative frontiers of these provinces under the Austrian rule. Even the shores of lake Garda remained Austrian. How long this arrangement will last, it is hard to predict. The trade of the southern Tyrol is entirely with the south, its wood and cattle being exchanged for the corn of Lombardy, and it is asserted that if any attempt is made to enforce custom-house regulations on the frontier, the inhabitants will not rest satisfied until they have secured the annexation of their territory to Italy.

TYROLIENNE, a species of Ländler waltz. The Tyrolienne never had a distinctive existence as a dance. It is best heard in the Ziller Thal, in Switzerland. A characteristic feature as sung in the Austrian and Bavarian Tyrol is the Jodel, the term applied to the rapid changes from the chest voice to the falsetto. These adorn all Tyrolean melodies. A good example of a Tyrolienne is the Chorus Tyrolien in Rossini's *Guillaume Tell*. See Spaun's *Oesterreichischen Volksweisen* (Vienna, 1845); Süss-salzbürger, *Volkslieder* (Salzburg, 1865), and von Kobell's *Schnadahuffeln* (Munich, 1845); and Moscheles, *Tyrolese Melodies* (1827).

TYRONE (*Tir-owen*, "Owen's country"), an inland co. of Ulster, Ireland, bounded n. by Londonderry, e. by Armagh and lough Neagh, s. by Monaghan and Fermanagh, and w. by the last-named county and Donegal. A portion of lough Neagh is assigned by the ordnance survey to this county; and, including this portion, the whole area is 1260 sq. m., or 806,400 acres, of which 9672 acres are woods and plantations. The principal rivers of Tyrone are the Blackwater, the Camowen, and the Ballinderry, of which the two former are navigable. The county is traversed by railways, which connect it with Dublin, Belfast, and the sea-coast at Dundalk. The geological structure is very much diversified. The north-western mountains are chiefly mica-slate with primitive limestone, and rise in Slieve Sawel to a height of 2236 feet. Those on the n.e. are of greenstone, with granite and occasional red sandstone. The plain, of which Omagh is the center, is a tertiary formation, with irregular beds of lignite, red marl, and new red sandstone; and between Dungannon and Stewartstown there is a small coal-field, the produce of which is rich, and resembles the coal of Ayrshire. The rest of the plain belongs to the general limestone district. The climate is moist, and the low lands are often flooded. The soil of the plain is a fertile loam; that of the hilly districts sandy, or gravelly. There are manufactures of linens and coarse woollens and earthenware; besides breweries, distilleries and flour mills. Pop. 91,171,701.

The chief towns are Omagh, Strabane, Dungannon, Cookstown, Aughnacloy, Castle-derg, and Clogher, which gives its name to the Episcopal see. Tyrone returns four members to the imperial parliament.

Tyrone was anciently known as the district of Hy-Briun and Hy-Fiachra; and in later Celtic times was called Kinel Eogain, or Tir-owen, whence its modern name. See **ULSTER**.

TYRRELL, a co. in e. North Carolina, bounded on the n. by Albemarle sound; 380 sq. m.; pop. '90, 4225. Co. seat, Columbia.

TYRRHENIAN SEA (anc. *Tyrrhenum mare*), that part of the Mediterranean sea (q. v.) between the islands of Corsica, Sardinia, and Sicily on the w., and the Italian peninsula on the east.

TYRTÆUS, famed for his political elegies and marching-songs, was the son of Archembrotus, of Aphidnæ, in Attica; according to another conjecture he was a Lacedæmonian; while the story which represents him as a lame schoolmaster, of mean family, whom the Athenians (ignorant of his lyric power, and jealous of Lacedæmonian domination in the Peloponnesus) sent to the Lacedæmonians, during the second Messenian war, as the most inefficient commander they could select, must be received as a fiction of later times. He rendered, however, to the Lacedæmonians a kind of assistance which the Athenians little foresaw; and while by his elegies he stilled their dissensions at home, by his war-lyrics he so animated their courage in the field that they were finally triumphant in their conflict with the Messenians, whom they reduced to the condition of helots. This success of his poems Tyrtæus lived to see, and must accordingly have flourished down to 668 B.C., the last year of the second Messenian war. The best edition of the text of Tyrtæus is that of Bergk in his *Poeta Lyrici Græci*.

TYRWITT, THOMAS, 1730-86; b. England; educated at Oxford. He became under secretary of war in 1756, and clerk of the house of commons in 1762, resigning in 1768. He was appointed a curator of the British Museum in 1784. Among his works are *Observations on some Passages in Shakespeare* (1766); and an edition of Chaucer's *Canterbury Tales* (1775-78).

TYTLER, ALEXANDER FRASER, a historical writer, and a judge of the court of sessions in Scotland under the title of lord Woodhouselee. He was the eldest son of William Tytler (q.v.), the vindicator of Queen Mary, and was born at Edinburgh in 1747, educated principally in Edinburgh, and admitted to the Scottish bar in 1770. He obtained, in 1780, the professorship of history in the university of Edinburgh; in 1790, the office of judge-admiral of Scotland; and in 1802 was raised to the bench of the court of session. His acquirements were of the most varied kind, embracing most departments of literature and the fine arts. His writings include a biography of Henry Home, lord Kames; a Dictionary of Decisions of the Court of Session; and the work by which he is best known, his *Elements of General History*, first published in 1801, which has been translated into most of the languages of Europe, and even into Hindustani. He died in 1813.

TYTLER, PATRICK FRASER, an eminent historical writer, fourth son of Alexander Fraser Tytler, lord Woodhouselee. He was born in 1791, educated partly in Edinburgh, partly in England, and called to the Scottish bar in 1813. Of his various literary and historical works the most valuable is his *History of Scotland*, beginning at the accession of Alexander III., and terminating at the union of the crowns—a book of more critical research than any work on the same subject that had preceded it. His writings also include a life of the admirable Crichton, a life of Wyckliffe, a memoir of sir Thomas Craig, and a collection of original letters, illustrative of the reigns of Edward VI. and Mary. In consideration of his merits as a historian, sir Robert Peel's government conferred on him a pension of £200 a year. He died at Malvern Dec. 24, 1849. His talents were such as qualified him in a remarkable degree to shine in society, and his amiable and excellent private character have been the subject of deserved eulogy.—See Burgon's *Life of Patrick Fraser Tytler* (1859).

TYTLER, WILLIAM, the author of several literary works of considerable merit, the principal being an *Inquiry, Critical and Historical, into the Evidence against Mary Queen of Scots*, in which it is attempted to vindicate that unhappy princess from the charges brought against her by Robertson and Hume. Tytler was born at Edinburgh in 1711, educated in Edinburgh, admitted a member of the society of writers to the signet in 1742, and died in 1792. He was father of Alexander Fraser Tytler, lord Woodhouselee, and grandfather of Patrick Fraser Tytler, the historian. Tytler was an accomplished musician, and distinguished for his general culture and taste in the fine arts.

TZETZES, JOHANNES, a Byzantine (Greek) author, flourished during the latter half of the 12th c., is known as the author of certain works in prose and verse, which, though excessively dull, and without a vestige of literary genius, are valuable as store-houses of classical information, not elsewhere to be had. The principal are—1. *Iliaca*, consisting of three distinct poems, entitled *Ante-Homerica*, *Homerica*, and *Post-Homerica*; or in Greek, *Ta pro Homerou*, *ta Homerou*, *kai ta methi Homerou*; a complete edition of which was first published by Fr. Jacobs (Leip. 1793); but the most critical edition is that of Bekker (Berl. 1816). 2. *Biblos Istorike*, more commonly called *Chiliades*, or a collection of more than 600 stories—mythical, legendary, etc.; best edition that of Kiessling (Leip. 1826), written in that worthless sort of verse called *political*, which had regard only to syllables, and not to quantity; besides commentaries on Homer, Hesiod, and the *Cassandra* of Lycophron. Several poems and commentaries of Tzetzes exist in MS. that have never yet been published.—Tzetzes had a brother—ISAAC—who probably had some share in the commentary on the *Cassandra*.

TZAR. See **CZAR**.

TZSCHIRNER, HEINRICH GOTTLIEB, 1778–1828; b. Mittweida, Saxony; studied theology at Leipsic; ordained to the ministry, 1801; professor of theology, Wittenberg, 1805; at Leipsic, 1809; superintendent at Leipsic, 1815; prebendary of Meissen, 1818. He strongly opposed Roman Catholic reaction in Germany. He published *Protestantismus und Katholicismus aus dem Standpunkte der Politik betrachtet*; translated into English, French, and Dutch, *Das Reactionssystem*.

U

U, THE twenty-first letter of the English alphabet, represents in that language three distinct sounds, as heard in *tube*, *tub*, and *full*. The last is its primitive sound, which it had in Latin, and which it has preserved in German and Italian, but which is oftener denoted in English by *oo*. In *tube* it does not mark a pure vowel sound; it is aspirated, as if *y* were prefixed—*tyub*. The sound heard in *tub* is characteristic of English; and, owing, perhaps, to the decided emphasis given to one syllable of a word at the expense of the rest, there is a tendency to allow the other vowels, *a*, *e*, *o*, when unaccented, to degenerate into this indistinct, stifled sound: *cavalry*, *sister*, *fashion* are pronounced almost, if not altogether, as if written *gavulry*, *sistur*, *fashun*. This is especially the case with *o*; and in this vowel the degeneracy is not confined to unac-

cented syllables; in a whole host of words the accented *o* is exactly equivalent to *ü*—e.g., *come, money, among*. Perhaps a similar tendency in Latin may account for the prevalence of *u* in that language as compared with Greek—e.g., Lat. *genus* = Gr. *genos*; *volumus* = *boulometha*; *spatula* = *spatale*; *scopulus* = *skopelos*. *U*, in Latin, sometimes goes into the still thinner sound of *i*; thus *maximus, caputis*, degenerated into *maxinus, capitis*. Of the labial series of vowels (see LETTERS), *u* approaches nearest to the labial consonants; so much so that in Latin the vowel *u* and the consonant *v* were both denoted by the same character, *v*, of which *u* is only a later modification. In the middle ages the two characters were used indifferently whether as vowel or consonant; and it was only in the 16th c. that the Dutch scholars fixed the use of the character *u* for the vowel, as distinct from *v*.

UBE'DA, a t. of Spain, Andalusia, in the modern province of Jaen, stands on an olive-clad slope in a cultivated plain, 26 m. n.e. of the town of Jaen. It contains some fine specimens of architecture, of which the chief is the cathedral. It was built by the Moors, and under them it is said to have contained 70,000 inhabitants. There were in 1887 only 18,713, who were engaged in agriculture, in the manufacture of pottery, leather, soap, and woolen goods, and in trade in grain, wine, figs, and oil.

UCAYALI, a great river of South America, one of the chief head-waters of the Amazon. It joins the Amazon from the s., in s. lat. 4° 40', and w. long. 73° 30', opposite the town of Nauta in Ecuador; but the whole course of the river is in Peru. It is the largest river that joins the Amazon above the Brazilian territory, and on account of its length, has been regarded by some as the main stream of the Amazon, but at its mouth it is not above half the width of the Amazon. It is formed by the union of the Apurimac, Mantaro, Paucartomba and Vilcamayu, which all have their source in or near the eastern side of the western cordillera, and break through the Andes in narrow cañons. Taken together, these rivers water the finest and most thickly populated part of Peru, and all become navigable after passing the Andes. In Peru the name Ucayali is not applied to any of the head-waters, but only to the united flood, which lies wholly in the lowlands. Its course is winding but preserves a general northerly direction. Its total length is estimated at upwards of 1000 miles, affording means of communication between the western parts of Peru and the Atlantic ocean. It was partially explored by the count de Castelnau and others in 1846, by lieut. Herndon and Mr. Gibbon of the U. S. navy in 1851, and more recently by an expedition sent out by the Peruvian government. It has been found to be navigable by steamers from its mouth to towns not far distant from Lima, 3700 m. from the mouth of the Amazon. On the Apurimac, which rises in the neighborhood of the town of Cuzco and, after cutting through the Andes, joins the Mantaro, there are falls and rapids which form an impediment to navigation more than 100 m. below Cuzco. The greater part of the country through which the Ucayali flows is covered with forest and is frequented only by gatherers of rubber, and by a few wild Indians, but it seems very suitable for colonization, if easy communication with the rest of the world were established, the soil being fertile, while the mountains abound in valuable minerals. Compare Castelnau, *Expédition dans les Parties Centrales de l'Amérique du Sud* (1851); Löffler, in *Petermanns Mittheilungen* (1886, pt. 1).

UCHEES, a tribe of American Indians, inhabiting the shores of the Savannah river as far s. as its confluence with the Ogeechee. During the troubles which culminated in the Yemassee war, they moved to the Chattahoochee country, and as members of the Creek confederacy were given a reservation in the Indian territory, retaining their original language and customs.

UDALL, or **WOODALL**, NICHOLAS, 1505-56; b. England; graduated at, and fellow of Corpus Christi college, Oxford; was zealous for the reformation; master of Eton, 1534-43, noted for severe discipline, and dismissed for removing silver images from the chapel; vicar of Braintree; rector of Calbern; canon of Windsor, 1551-56; head master of Westminster, 1555. He wrote several Latin and English plays to be performed by his pupils, one of which, *Ralph Roister Doister*, is the earliest English comedy known to be extant, being identified as such by a quotation from it in *Wilson's Logic*, 1551. He was also the author of some other poems and of several school books.

UDAL RIGHT, in the law of Scotland, means that right in land which may be completed without charter and sasine by undisturbed possession provable by witnesses before an inquest. Though dependent on the crown as superior, the vassal pays only a tribute called skat. The right is said to have been the old tenure prevalent in Britain before the feudal system was introduced, and prevails chiefly in Orkney and Shetland. The lands held on udal right are now commonly converted into feus.

U'DINE, a province of Venetia in n.e. Italy, adjoining Austria and lying on the Adriatic sea; 2541 sq. m.; est. pop. '95, 532,359; drained by the Tagliamento and lesser rivers. The surface is low and marshy in the s., but rugged in the n.; the chief occupation is the production of silk, of which large quantities are exported.

U'DINE, a city of n. Italy, Venetia, in the province of the same name, situated in a fertile plain, about 75 m. n.e. of Venice by railway. It is a walled town, 4 m. in circumference, with wide, handsome streets and squares. The castle, which stands on a

hill in the midst of the city, was formerly the residence of the patriarchs of Aquileia, and is now the seat of the tribunals. The principal object of interest in Udine is its *Campo Santo*, regarded as one of the most beautiful cemeteries in Europe. Udine trades in silk, in copper utensils, and rosoglio. There are leather, paper, and silk factories. Two miles from Udine stands the village of Campoformio, where, in 1797, the treaty between Bonaparte and Austria was signed, by which Venice was ceded to the latter. Pop. '95, commune, 37,200.

UEBERWEG, FRIEDRICH, b. Prussia, 1826; educated at Göttingen and Berlin, and in 1862 was made professor of philosophy at Königsberg. He wrote a work on logic, and a standard history of philosophy, translated in America by Prof. G. S. Morris, etc. He d. 1871.

UFA, a government of Russia, formed in 1865 out of the five n.w. districts of Orenburg, and separated from the present government of Orenburg by the s.w. branch of the Ural mountains. Area 47,112 sq. m. Pop. '94, 2,156,939. See ORENBURG.

UFA, capital of the government of the same name, on the right bank of the Biëlaia, or White River. It was built in 1573, in the reign of Ivan IV. It contains numerous churches, a library and museum, a theater, and many manufactories, the principal articles of trade being honey, wax, fat, furs, and skins. The Biëlaia, an affluent of the Kama, and thus connected with the Volga, is here navigable for large ships. Pop. '97, 50,576.

UGANDA, a vast tract of country in Central Africa lying on the w. and n.w. banks of lake Victoria Nyanza, about 600 miles from the coast, with an area of about 90,000 sq. miles, and a population variously estimated at from 300,000 to 500,000. It is part of the British territory allotted to England by the Anglo-German agreements of 1886 and 1890. The region was opened up at the same time with Somali, the Equatorial province, Usoga, etc., by the imperial British East Africa Company, who, in 1888, obtained a concession of territory from the Sultan of Zanzibar and a charter from the British government. In 1895 the government took over the administration from the company and made the country a protectorate. It is a fertile region and the climate is fairly healthy in spite of the heavy annual rain. The natives are known as the Waganda, a tribe of the Bantu race, under the nominal rule of King Mwanga. The civil administrator of the protectorate is Mr. E. L. Berkeley. An active missionary propaganda has been carried on of late years, the Protestants and Catholics each claiming about 3000 converts. The capital is Mengo, near which is the British fort Kampala. The development of the country has progressed rapidly in the last two years, but outside trade will be impossible until the completion of the projected railroad to Victoria Nyanza, begun in 1895, which is to have its terminus at Port Victoria, 140 miles east of Mengo by road, and 100 by the lake.

UGLITCH, a t. of Great Russia, in the government of Jaroslav, on the right bank of the Volga, 488 m. s.e. of St. Petersburg. In early times it was the chief town of an independent principality of the same name. After the assassination at Uglitch of Prince Dmitri, son of Ivan IV., in 1592, the majority of the inhabitants of the town were banished to Siberia and other distant quarters, and the town, formerly prosperous, became deserted. Uglitch contains 24 churches, 2 cloisters, and numerous manufactories—linen weaving, and tanning being the principal branches of industry. Pop. '93, 12,769.

UGOCSA, a co. in n.e. Hungary, in the trans-Tibiscan circle; 458 sq. m., pop. '90, 75,461. Capital, Nagy-Szöllös.

UGRIANS, a Finnish people living in the district of Tobolsk, Siberia. They live a wandering life, supporting themselves by fishing and the chase. Though professedly Christians, their religious belief is a cross between Christianity, Shamanism, and Moham-medanism. Their language is a Finnic dialect.

UHLAND, LUDWIG, a celebrated German poet, was born at Tübingen, April 26, 1787, studied at the university of his native city, and first appeared as a writer of verse in Seckendorf's *Musen-almanach* (1807-8). For several years he continued to publish ballads and other lyrics in various periodicals, the first collection of which, under the title of *Gedichte*, appeared in 1815. To this he kept adding all the rest of his life, and it is on these *Gedichte* that his fame rests. Their popularity has been, and continues to be, as great as it is merited, upward of a dozen editions having been published. Other productions of Uhland's are his admirable essays, *Ueber Walther von der Vogelweide* (Stuttg. 1822), and *Der Mythos vom Thor nach nordischen Quellen* (Stuttg. 1836); a masterly collection of old popular songs, *Alter hoch- und nieder-deutscher Volkslieder* (Stuttg. 1844-45); and two dramas, *Herzog Ernst von Schwaben* (Heidelb. 1817), and *Ludwig der Bayer* (Berl. 1819). He died at Tübingen, Nov. 13, 1862. Uhland was a patriotic politician as well as a poet. He entered the representative assembly of Würtemberg in 1819 as a deputy from Tübingen, and proved an active member of the liberal party. He was also a delegate to the Frankfort assembly of 1848; but though Germany has reason to be grateful for his services to the cause of constitutional liberty, it is as a poet he will be best remembered. His pieces are full of

spirit, imagination, and truth, finely picturesque in their sketches of nature and exquisite in their varied tones of feeling. Nothing, indeed, can surpass the brevity, vigor, and suggestive beauty of his ballads, in which a romantic sweetness of sentiment and a classic purity of style are happily combined. Uhland is the acknowledged head of the "Swabian school" of German poets. See Pfizer's *Uhland and Rückert* (Stutt. 1837), and Mayer's *Uhland* (1867). Longfellow has translated some of Uhland's ballads, in his *Hyperion*, into English; and translations by Platt, Skeat, and Sanders have also appeared.

UHLANS (a Polish word signifying "lancers"), light cavalry of Asiatic origin, were introduced into the n. of Europe along with the colonies of Tartars who established themselves in Poland and Lithuania. They were mounted on light active Tartar horses, and armed with saber, lance, and latterly with pistols. Their lance was from 5½ to 6½ ft. in length, and, like that of the modern "lancers," was attached to a stout leather thong or cord, which was fastened to the left shoulder and passed around behind the back, so as to allow the lance to be couched under the right arm. Immediately below its point was attached a strip of gaudy-colored cloth, the fluttering of which was designed to frighten the enemies' horses. The early dress was similar to that of the Turks, and the regiments, or *polks*, were distinguished from each other by the red, green, yellow, or blue color of their uniforms. The Austrians and Prussians were the first to borrow this species of cavalry from the Poles. In 1734 an attempt was made by Marshal Saxe to introduce the uhlands into France, and a "polk" of 1000 men was formed; but it was disbanded at its author's death. The Prussian uhlands won great renown in the Franco-German war of 1870-71 by their bravery and marvelous activity. The Prussians applied the term, however, rather loosely, including all their light cavalry under the designation.

UINTA, a co. in Utah; formed 1880. Pop. '90, 2762. Area, 5834 sq.m. Co. seat, Ashley.

UINTA, a co. in w. Wyoming, containing Fremont's peak, the greater part of the Yellowstone national park, and the Uinta mountains; 14,830 sq. m.; pop. '90, 7881, chiefly of American birth, with colored. The direction of the Uinta range is nearly e. and west. It is composed of broad plateau-like masses carved into integral blocks or subdivided into many parts. The rocks are quartzites, sandstones, carboniferous limestones, etc. They continue over the border of Utah from the Wahsatch range. Among the highest peaks are Dawes peak, Cox's peak, and Logan's peak (10,004 feet above sea-level). Co. seat, Evanston.

UIST, **NORTH** AND **SOUTH**, two islands of the outer Hebrides, are situated from 15 to 18 m. w. of the isle of Skye, from which they are separated by the little Minch. Unlike the other islands of the Hebrides, the e. coasts of North and South Uist are much and deeply indented, while the w. coasts are, as a rule, almost unbroken.—**NORTH UIST**, between which and *South Uist* the island of Benbecula intervenes, is 18 m. long from w. to e., and from 10 to 3 m. in breadth. The eastern half of it is so cut up by lochs and water-courses as to have the appearance of an archipelago. This region is a brown, peaty, dreary bog, partly relieved, however, by a line of low hills running along the coast at the distance of about 2½ miles. In the w. part, which, as a rule, is hilly, there is a tract of uneven, low land, exceedingly beautiful in certain seasons, rendered fertile by the drifting of shell-sand from the coast, and producing good clover and grain crops. Pop. '81, 3,371.—**SOUTH UIST**, 20 m. long, and 7 m. broad. Its e. coast is much indented by the lochs Skipport, Eynort, and Boisdale. The eastern district is upland; the western is alluvial and productive, under proper treatment. Pop. '81, 3,825, engaged, like the inhabitants of North Uist, in fishing and agriculture.

UJEIN', one of the seven sacred cities of Hindustan, in Sindia's dominions, of which it was formerly capital, stands on the right bank of the Sipra, 35 m. n.n.w. of Indore. It is surrounded by walls with round towers, is six m. in circumference, contains the grand palace of the head of the Sindia family, several mosques and mausoleums, an observatory, and an antique gate, supposed to date from before the Christian era. An active trade is carried on in cloths, opium, etc. The number of the inhabitants is estimated at about 100,000.

U'JHELY-SÁTORALYA, or **SÁTORALYA-U'JHELY**, a market-t. of Hungary, 105 m. n.w. of Pesth. It stands on the Hegyalya mountains, contains several churches and a gymnasium, and is noted for its wine-culture. Pop. '90, 13,017.

UJI'JI, a t. in Africa, capital of a small region of the same name, on the e. shore of lake Tanganyika; pop. 8000. It is divided into two parts, Ugoy, inhabited by Arabs, and Kawele, by the natives. Here Stanley found Livingstone, Nov. 10, 1871.

UKASE', or **UKAS** (Russian *ukasat*, to speak), a term applied in Russia to all the orders or edicts, legislative or administrative, emanating from the government. The ukases either proceed directly from the emperor, and are then called *imenny ukas*, or are published as decisions of the directing senate. Both have the force of laws till they are annulled by subsequent decisions. Many ukases are issued in the course of one reign; and as an immense chaos of ukases had accumulated since 1649 (the date of the last codification of laws), the Czar Nicholas ordered (1827) that a collation of them should be made. The result was a collection of laws in 48 volumes, which has been supplemented year by year by volumes of new ukases, and which, after the elimination

of such ukases as are unimportant or of temporary authority, constitutes the present legal code (*swod*) of the Russian empire. The *prukases* are imperial "orders for the day," or military orders given during the campaign.

UKRAINE (Slav. a frontier country or march), the name given in Poland first to the frontiers toward the Tartars and other nomads, and then to the fertile regions lying on both sides of the middle Dnieper, without any very definite limits. The Ukraine was long a bone of contention between Poland and Russia. About 1686 the part on the e. side of the Dnieper was ceded to Russia (Russian Ukraine); and at the second partition of Poland the western portion (Polish Ukraine) also fell to Russia, and is mostly comprised in the government of Kiev. The historic Ukraine forms the greater part of what is called little Russia (a name which first appears about 1654), which is made up of the governments of Kiev, Tchernigov, Poltava, and Kharkov.

ULCERATION is "that part or effect of an inflammatory process in which the materials of inflamed tissues liquefy or degenerate, are cast off in solution or very minute particles from free surfaces, or, more rarely, are absorbed from the substance of the body."—Paget on "Ulcers," in Holmes's *System of Surgery*, vol. i. p. 197. Generally speaking, however, the name of ulcer is not applied to any inflammatory result, unless the substance of a tissue deeper than the epithelial is exposed; and when the cast-off particles are only epithelial, the result is termed desquamation, abrasion, or excoriation, although the process may be essentially the same. Ulceration is closely allied to gangrene, the two processes differing in degree rather than in kind. "When the degenerate or dead substance," says sir J. Paget, "is cast off in one or more portions visible to the naked eye, the process is usually called gangrene; when the portions are not so visible, or are quite dissolved, it is called ulceration." The degenerate tissues are always suspended or dissolved in a liquid, termed the "discharge," or "ichor," which varies in appearance and properties according to the cause and characters of the ulcerative process. "From some ulcers, e.g., the primary syphilitic, it is contagious; from many, it appears corrosive, exciting by its acridity inflammatory changes in the tissues with which it is in contact."

ULCERS (derived from the Latin *ulcus*, a wound) may be arranged either according to the constitutional or specific disease from which they are derived, or according to the characters which they present. According to the first system, we speak of ulcers as healthy, inflammatory, strumous, etc.; while, according to the second, they are named irritable, chronic, sloughing, etc. In this article, we shall adopt the former of these arrangements, as being, upon the whole, the most satisfactory, although each possesses its own advantages.

A *common, simple or healthy ulcer* is such as is left after the separation of an accidental slough in a healthy person, and is merely a healthy granulating surface, tending to cicatrization. Its edges shelve gently down to the base, and are scarcely harder than the adjacent healthy skin. Their surface near the border is of a purplish blue tint where the young epidermis modifies the color of the healing granulations; and within this, the granulations have a deeper hue than those at the center, being most vascular where the cuticle is being chiefly developed. The discharge from such an ulcer is healthy or "laudable" pus. The only treatment required is a little dry lint, if there is much discharge; or the water-dressing, if the sore is comparatively dry. When the granulations are too luxuriant, they must be touched with nitrate of silver, and dressed with dry lint. *Inflammatory ulcers* differ less than most kinds from the above-described common or healthy ulcers. They commonly arise from some trifling injury, such as a blow or slight abrasion of the skin, which, to a healthy person, would have done no harm. Their most common seat is on the lower half of the leg or shin. The surface is red, and bleeds easily; the discharge is thin and watery; the edges irregular or shreddy; and the surrounding skin shows a red tinge, and is the seat of a hot and aching sensation. This ulcer most commonly occurs in the infirm and old, the ill-fed and overworked. Hence constitutional treatment, good diet, and complete rest (with elevation of the limb) are here demanded, in addition to water-dressing or lead-lotion applied warm. *Senile ulcers* usually present very little discharge, exhibit granulations of a rusty red tint, and are surrounded by a dusky red area. Nourishing food, wine, bark and the mineral acids are here required, and opium in small repeated doses is often serviceable. The local treatment must be of a stimulating nature; and in bad cases sir J. Paget recommends strapping the leg daily with a mixture of resin ointment and Peruvian balsam spread on strips of lint. *Strumous or scrofulous ulcers* usually occur as the consequence of scrofulous inflammation in the subcutaneous tissue or lymphatic glands. They most commonly occur in the neck, groins, cheeks, scalp, and the neighborhood of the larger joints. The discharge is thin, and of a greenish-yellow tint. These ulcers are seldom very sensitive or painful. The general treatment must be that recommended for constitutional scrofula (q.v.). Iodine, in some form or other, is the best local application. A poultice of bruised and warmed sea-weed is a very popular remedy; but there is probably nothing so efficacious as tincture of iodine diluted with water till it causes only a slight discomfort, and applied three or four times a day. (About 30 drops of the tincture may be added to an ounce of water to begin with.) Of the numerous other species distinguished by sir J. Paget, we shall briefly notice the

varicose, indolent, and sloughing ulcer. *Varicose ulcers* are connected with an enlarged or varicose state of the veins of the lower extremity, which weakens the parts, and renders them especially liable to ulceration. See **VARICOSE VEINS**. The *chronic, indolent, or callous ulcer*, beyond all doubt, gives more trouble to the poor-law medical officer and the workhouse surgeon than any other half-dozen surgical affections. It is usually seated in the lower half of the leg, and is most commonly of an oval form, with its long axis parallel to that of the leg. "Its base lies deep, and is flat, pale, or tawny and dusky, with very minute or no visible granulations. The margin is usually abrupt, or unequally shelving, and in its most characteristic form, strictly overlaid with opaque, white, dense epidermis."—Paget, *op. cit.*, p. 217. Many volumes have been written on the proper means of treating this form of ulcer. The distinguished surgeon from whose memoir we have so largely quoted, especially recommends opium, regulated pressure, and blistering. A grain of opium night and morning is usually sufficient. The pressure is applied with straps of adhesive or lead plaster on linen. The object of blistering is not only to stimulate the ulcer, but to soften its callous edges by causing absorption of part of the exudation with which they are infiltrated, and desquamation of the cuticle which covers them. The expediency of healing old ulcers of this kind has often been called in question, inasmuch as apoplexy, palsy, mania, and other serious diseases are said to have followed the healing of such ulcers. In the following cases it may be decided that a cure should not be attempted. (1) If the ulcer be affected by the gout, having regular attacks of pain, returning at stated periods, and similar to what the patient has experienced from gout in other parts. (2) If an ulcer habitually occur whenever the constitution is disordered. (3) If the patient be very infirm and old; for under these circumstances the removal of a habitual source of irritation, or the diversion of a habitual efflux of blood may prove fatal; and especially as very old ulcers have been known to heal spontaneously a short time before death. To these cases, specified by sir E. Home, Dr. Druitt adds (4) that of ulcers on the legs of stout women about the critical period of life, and displaying a tendency to discharge profusely as the menstrual discharge diminishes. To counteract these dangerous tendencies, the bowels should be freely purged during, and for some time after, the cure of an old ulcer; and if there any symptoms of congestion in the head, a seton should be inserted in the back of the neck.

For the treatment of *sloughing ulcers*, we must refer to the article **SYPHILIS**.

U'LEABORG, a län of n. Finland in Russia, bounded by Norway and Sweden, containing lake Enare ; 63,955 sq.m. ; pop. '87, 234,015; later estimate, 253,886.

U LEABORG, a sea-port t. of Russian Finland, capital of the government of the same name, stands on the s. bank of the Ulea, on the eastern shore and near the head of the gulf of Bothnia. It was founded in 1605, and the privileges of a port were granted to it in 1715. In 1823 it suffered severely from fire. The harbor has of late years become so shallow, that vessels are obliged to unload in the roadstead, 4 m. from the town. Pop. '94, 13,145 who are engaged in the dockyards, sawmills, and breweries of the town. In 1854, an English flotilla burnt the government property in the place.

ULEMA, the collective name of a certain class of theological jurists in Turkey, who, as is the case in Mohammedan countries, derive their decisions from the Koran and its commentaries. The ulema enjoys many privileges; he pays no taxes, cannot be condemned to death or deprived of his property by any court of law. He can only—eventually—be deposed and banished. The ulemas have to recognize, save their two immediate superiors (the *kadiaskers* or *kadilesks*), only the mufti as their chief authority, while they are the superiors of all the mollahs (q.v.) in the different provinces. The kadis form the lowest judicial class, and are subject to the mollahs in every respect.

ULEX. See **FURZE**.

ULFILAS (*Ulphilas, wulfilas* = little wolf), the celebrated translator of the Bible into Gothic, was born about 310 A.D., of Marcomannian parents, n. of the Danube, among a Gothic population. Consecrated bishop in 341, he was expelled in 348 by his heathen compatriots from his native place, and went, together with a number of newly-converted Christians, to lower Moesia, at the foot of the Hæmus, where he remained for thirty years. In 383 he went to Constantinople (whither he had gone once before to assist at a council, in 360), and died there shortly afterward. He was one of the chief lights of Arianism (see **ARIUS**), in the interest of which he exerted himself with the utmost energy. Nor was his political influence less felt among his Gothic countrymen; and the contemporaneous Greek historians, no less than those that followed within a short time after his death, are unanimous in attributing to him the largest share in the religious and social development of the Gothic population. His greatest work, however—one which will render his name famous for all ages—is his Gothic translation of the Bible, a work by which he contrived both to fix the Gothic language and to perpetuate Christianity among the Gothic people. Familiar with Latin, Greek, and Gothic, and accustomed to write in each of them, he undertook to render the whole Bible, with the exception of the two warlike books of Samuel and Kings—the influence of which he feared for his easily inflammable people—into a language which till then had, as far as we know, never been used for any literary composition of importance. Up to the 3th c., this sacred and national work accompanied the Goths in all their migrations.

But from that period forth, nothing was known of it beyond what was found stated in the ancient ecclesiastical accounts. It was not till the end of the 16th c. that Arnold Mercator discovered in the abbey of Werden the four Gospels of Ulfilas. Thence it found its way to Prague, where it remained till 1648, when the Swedes took it as a spoil to Upsal, where it still remains in the university library, under the name of the *Codex Argenteus*. In 1818, further remnants of the work—a great portion of the letters of St. Paul—were discovered by A. Mai and Castiglioni, on palimpsests, in a Lombardian monastery, which, added to a few minor fragments, bring the New Testament somewhat near completion. But hardly anything—save a few passages from Ezra and Nehemiah—has survived of the Old Testament. The immense importance of this sole Gothic remnant for Teutonic philology cannot well be overrated. It is principally through it that the wonderfully fine structure of Gothic—a Germanic dialect of surpassing wealth and purity—has become known.

ULLASUTAI, a city in the n.w. part of Chinese Mongolia, situated on the Uliasutai river, and capital of the district of the same name. The inhabitants are partly Chinese and partly Mongolians. The place is an important station for the Chinese-Russian trade.

ULLMANN, KARL, 1796–1865, b. Bavaria; studied theology at Heidelberg and Tübingen; was a friend of Hegel, Daub, and Schleiermacher; appointed professor at Heidelberg in 1821, simultaneously with Neander and Schleiermacher; in connection with Umbreit established in 1828 the Protestant quarterly review, *Theologische Studien und Kritiken*, for which he wrote able essays afterward separately published; professor at Halle, 1829–36; after which he returned to Heidelberg; bishop of state church in Baden, 1853, and president of its supreme ecclesiastical council, 1856–60. Among his published writings are, *Gregory Nazianzen; History or Myth? The Worship of Genius; Sinless Character of Jesus; Reformers Before the Reformation*.

ULLOA, ANTONIO DE, 1716–95, b. Spain; entered the Spanish navy in which he became lieutenant in 1735. The same year he accompanied to South America the French scientific expedition sent out to measure a degree of the meridian at the equator. In 1744 he was captured on his way to Europe, imprisoned in England, but released at the instance of his scientific friends. He came to Louisiana as its governor in 1766, but was forced to leave on account of an insurrection. Afterward put in command of a fleet which was to take a British merchant fleet near the Azores, and then to proceed to Havana, and join an expedition against Florida. He neglected to open his sealed orders and was tried by court martial in 1780, and acquitted. He did not, however, again enter the service.

ULLSWATER, after Windermere, the largest of the English "lakes," lies between the counties of Cumberland and Westmoreland, 10 m. e. of Keswick. Length, 7½ m.; breadth, ¼ to ½ m. Its scenery has none of the soft beauty of that of Windermere, but is rugged and grand. One of the chief features of the landscape is the lofty mountain Helvellyn, which rises from the s.w. extremity of the lake.

ULM, the second city of Würtemberg, in 49° 54' n. lat., and 8° 8' e. long., was, till the war in 1866, a stronghold of the Germanic confederation, garrisoned by troops of Würtemberg, Austria, and Bavaria. It was long one of the most important imperial free cities. Ulm is situated at the junction of the Blau with the Danube, which then becomes navigable, 53 m. w. of Augsburg by railway. Two bridges unite the city with New Ulm, a village on the Bavarian side of the river. The streets are narrow, and the buildings old. Pop. '95, 39,304. The environs of Ulm are flat. The cathedral, which is a Protestant church, is remarkable for architectural beauty, and is, next to the cathedral of Cologne, the largest church in Germany. It is 405 ft. in length, 159 ft. in breadth, the nave is 136 ft. high, the spire (finished 1890) over the main entrance, 528 ft. high. The building was begun in 1377, and finished in 1494. There are good schools for the people, a gymnasium, high school, and trades' school, a public library, an agricultural society, and many charitable institutions. Leading industries are weaving linen, cotton, woolen, and mixed fabrics; bleaching; making paper, leather, beer-brewing, ship-building, book-printing, etc. Ulm is famed for ornamental pipe-bowls, and pastry called Ulmer bread. Around the city, gardening is extensively carried on, and asparagus especially cultivated.

The Romans had a settlement at this important point. In 1531, the city accepted the reformation, and the majority of the people have since been Lutherans. In 1802, Ulm was attached to Bavaria, and became part of Würtemberg in 1810.

ULMACEÆ, a natural order of exogenous plants, regarded by some botanists as a sub-order of *urticaceæ*. They are trees or shrubs, having rough alternate leaves, each leaf with a pair of deciduous stipules. The flowers are small and in loose clusters. The perianth is small, membranous, bell-shaped, irregular; the stamens equal in number to the lobes of the perianth, and inserted into their base; the ovary superior. The fruit is 1–2 celled, nut-like, or compressed and winged. There are about 60 known species, natives of temperate parts of the northern hemisphere. See **ELM**; **NETTLE TREE**.

ULMIN. See **HUMUS**.

ULNA. See ARM.

ULODENDRON, a singular genus of coal-plants, founded on stems which occur chiefly in the roof-shales. The stems are covered with small rhomboidal scars, as in *lepidodendron*, formed by the bases of leaves or scales; but they differ remarkably from that genus in having a double series of large oval or circular markings, arranged linearly on the opposite sides of the trunk. These markings are variously interpreted as representing the cicatrices produced by the bases of cones, by branches, or by leaf-stalks. It is, like many of the coal fossils, an extremely enigmatical plant; and it is difficult to determine its position in the vegetable kingdom. It is probably an ally of *lepidodendron*, and that is known to be a vascular cryptogam nearly related to *lycopodium*. Seven species are known.

ULPIANUS, DOMITIVS, a celebrated Roman jurist, of Tyrian extraction, flourished in the early part of the 3d century. The exact date of his birth, however, is unknown. He appears to have held juridical offices during the reign of Septimius Severus and Caracalla, of which he was deprived by Elagabalus; but on the accession of Alexander Severus (222 A.D.), he became the principal adviser of the emperor, who appointed him *scriniorum magister* (keeper of the public records), a *consiliarius* (public assessor), and *prefectus annonæ* (superintendent of the corn-market). He also held during the reign of Alexander Severus the important post of prefect of the prætorian guards, though it is uncertain whether that monarch first conferred it upon him. He was murdered by his own soldiery, 228 A.D. Ulpianus was both a voluminous and a valuable writer. In the *Digest* of Justinian, there are no fewer than 2,462 excerpts from him, many of which are of considerable length. Altogether they form about a third of the whole body of the *Digest*. Unfortunately the originals have almost entirely perished. The principal were—*Ad Edictum* (83 books), *Ad Sabinum* (51 books), *Ad Leges Juliam et Papiam* (20 books). The so-called *Fragmenta* of Ulpianus (first published at Paris by Tilius in 1549) consists of 29 titles, whence they are called in the vatican MS. *Tituli ex Corpore Ulpiani*. The best edition is Husch's (Leip., 1881). There is an Eng. trans. by Abdy and Walker (1884).

ULRIC, ST., Bishop of Augsburg, and venerated as one of the fathers of the German church, was b. at Augsburg about the year 890. His father, Hupald, was one of those counts of Dillingen who play so important a part in mediæval German history, and Ulric himself owed part at least of the extraordinary influence which he exercised in his time to the distinguished rank of his family. He was educated in the celebrated Benedictine monastery of St. Gall (q. v.) in Switzerland, but his later life, and the character of his mind, as well as the tendency of his religious views, appear to have been influenced less by his monastic instructors, than by the counsels of a remarkable female recluse named Wiborada, whose cell was in the vicinity of St. Gall, and with whom he formed a close association. It was by her counsel that, instead of adopting the Benedictine habit at St. Gall, he devoted himself to the secular ministry, and returned to his native diocese of Augsburg, where he received holy orders. In accordance with the usage of his time, he made a pilgrimage to Rome, and soon after his return, was consecrated bishop of Augsburg, on the death of Hilte in the year 923. The details of his history as administrator of this church, which had suffered serious disorganization through the Magyar invasion and other wars, would be out of place here; but they are related with much circumstantiality by his contemporary biographer; and they throw so much light as well on the externals of the religious life of the time, as on the moral and spiritual character of the people, laity as well as clergy, as to merit the most serious consideration of every student of mediæval history. Bishop Ulric bore an important part in the public affairs of the empire during the reign of Henry I. and his son Otho; and he was the guiding spirit of the several councils in Germany which, in the 10th c., labored at the work of reformation. He died in 973.—See the ancient *Vita S. Oudalrici Episcopi*, which is edited by Mabillon, by the Bollandists, and recently by Dr. Pertz. Some letters and sermons, still extant, have been ascribed to Ulric, but they are regarded as spurious by Mabillon and Pertz, as well as by the Bollandists.—See Braun's *Geschichte der Bischöfe von Augsburg*.

ULRICI, HERMANN, a German philosopher, b. at Pforten in lower Lusatia, Mar. 23, 1806, studied at Halle and Berlin, and after a brief career as a lawyer, devoted himself exclusively to literature and philosophy. In 1834 he was appointed a professor-extraordinary at Halle, where he resided till his death. His first work was his *Geschichte der Hellenischen Dichtkunst* (1835), which was followed by a very ingenious essay on the dramatic art of Shakespeare (*Ueber Shakespeare's dramatische Kunst*. 1839; Eng. transl., 1846). Other works of Ulrici's are his *Ueber Princip und Methode der Hegel'schen Philosophie* (1841); *Das Grundprincip der Philosophie* (1845-46); a *System der Logik* (1852); *Gott und die Natur* (1863; 2d ed., 1866), *Gott und der Mensch* (1866), in which Ulrici develops a system of theistic philosophy, in opposition to materialism and anti-ethical pantheistic speculation. Further Shakespearian studies we have in *Romeo und Julia*, and a *Geschichte Shakespeare's und seiner Dichtung* (1862). He d. 1884.

UL'STER (Lat. *Utonia*), a province of Ireland, the most northern of the four provinces which compose that kingdom (see IRELAND), is divided into nine counties—Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone, each of which is described under its proper head.

The territorial distribution under which Ulster formed a province, or at least a distinct territory, is of very ancient origin. It formed one of the five ancient divisions of Ireland, and was the seat of the Hy-Nialls or O'Neills, as well as of the lesser sept of O'Donnell, O'Cahan, O'Doherty, Maguire, MacMahon, etc. The north-eastern portion, now the county of Down, was early overrun by John de Courcy, and subsequently by Hugh de Lacy, and was the most permanent seat of English power in the north. The Antrim coast was occupied by a Celtic colony from Scotland and the Isles; but although various efforts were made by the English to effect a permanent settlement in the n. and n.w., the success was but nominal until the reigns of Elizabeth and of James I., when the plantation of Ulster was effected. Of this gigantic scheme of colonization, the chief seat was the county of Londonderry (q.v.). In Ulster, the Celtic race, owing to the frequent and large infusions of a foreign element, is found in a much smaller proportion. Pop. 1891, 1,619,814.

ULSTER, a co. in s.e. New York, having the Hudson river for its e. boundary; 1157 sq.m.; pop. '90, 87,062, chiefly of American birth, inclu. colored. It contains the Catskill mountains in the n.w., the Shawangunk mountains in the s., and lake Mohonk. Co. seat, Kingston.

ULSTER BADGE. On the institution of the order of baronets in England by James I., a sinister hand, erect, open, and couped at the wrist gules, the armorial ensign of the province of Ulster, was made their distinguishing badge, in respect of the order having been intended for the encouragement of plantations in the province of Ulster.

ULSTER KING-OF-ARMS, the king-of-arms or chief heraldic officer of Ireland. A king-of-arms called Ireland existed in the time of Richard II., but the office seems to have fallen into abeyance in the following century. Ulster was created to supply his place by letters-patent of Edward VI. in 1552. Ulster holds his appointment from the crown, and acts under the immediate direction of the lord-lieutenant of Ireland. His office is in the record tower of Dublin castle; and the professional staff under him consists of two heralds, four pursuivants, one registrar, and one clerk of records. The records of Ulster's office comprise pedigrees of the nobility and gentry of Ireland, certificates of their deaths and funerals, and grants of arms. The official arms of Ulster King-of-arms are: Argent, St. George's cross gules, on a chief of the last a lion passant gardant between a harp and a portcullis or.

ULSTER SETTLEMENT. A settlement in county Monaghan, in the province of Ulster, in the north of Ireland. The property was, in the year 1600, owned by Tyrone, one of the chieftains opposed to the armies of England, when finding the neighboring chiefs one by one submitting, and his own forces besieged at Kinsale, he also made his submission, and had his rank, power, and estates partially restored; but being afterwards suspected of attempting a new rebellion, he fled to Spain, leaving his property at the disposal of the king. In the spring of the year 1606, King James I., sent a colony composed of smiths, masons, carpenters, and other artisans, who composed the "settlement," and to whom the land was parceled out and possession given in the King's name.

ULTIMA THULE is a Latin phrase signifying "farthest Thule," and frequently used to express extremity, limit, or farthest range. See **THULE**.

ULTIMA'TUM, in diplomacy, the final conditions or terms offered by one government for the settlement of its disputes with another; the most favorable terms which a negotiator is prepared to offer, whose rejection will generally be considered to put an end to negotiation.

ULTRAMARINE, a beautiful blue pigment, formerly obtained only from the very valuable mineral, lapis-lazuli; but an artificial kind is now made so cheaply, and is so good, that it is generally used instead. The true ultramarine, from its costly nature, was only used by artists; the artificial sort is, however, extensively used by house and ship painters, and is as cheap as it is beautiful. Many artists still insist upon having the former kind, which is prepared as follows: Fine lapis-lazuli is broken up into very small pieces, so as to enable the operator to see and pick out the small white portions which occur in it. Of the pieces of pure blue which remain, a pound weight is then taken, and in a carefully covered crucible, is heated to redness, and then thrown into cold water. It is next reduced to an impalpable powder, and mixed with 6 oz. of finely powdered resin, as light in color as it can be obtained, and 2 oz. each of spirits of turpentine, bees-wax, and linseed oil, all previously melted together. When these ingredients are thoroughly worked into a mass, portions of it are taken and kneaded in clean water; as long as any blue color is given out, this is continued, until every portion has been so treated. The blue water is then allowed to rest, and the sediment is collected and washed in water several times. The first washing removes a considerable quantity of dirt and other foreign matters, and is consequently rejected. The second, after being well agitated, is decanted; and from it is obtained the highest quality of the pigment. That which remains usually has two other washings, each of which gives a product of a less value than the operation which preceded it. The product obtained by sediment from each of the waters used is carefully dried, and is then employed either to make cakes for water-color painting, or a mixture for oil-painting, the value being about £1

per ounce. **ARTIFICIAL ULTRAMARINE.**—The French chemists Clement and Desormes, in studying the curious process of obtaining ultramarine from lapis-lazuli by mixing it with resin, etc., were led to an analysis of the coloring matter that suggested to Guimet the idea of composing it artificially. In this he succeeded, and obtained for his discovery the prize of 6,000 francs offered by the *Société d'Encouragement des Arts*. Almost simultaneously, Gmelin in Tübingen gave an analysis and a synthetic process which also succeeded, and artificial ultramarine is now a regular article of manufacture. Chemical skill, however, is necessary to success, and the manufacturers' formulas are very various—differing in the quantities of the ingredients, and the order of mixing them. The German manufacturers are very successful, and some of them have recently produced a fine green ultramarine. The following formula is one of the simplest: 100 parts of finely-washed kaolin or porcelain clay (silicate of alumina), 100 of carbonate of soda, 60 of sulphur, and 12 of charcoal are mixed and exposed in a covered crucible to a bright heat for $3\frac{1}{2}$ hours, when a green, unfused residue should be left. This residue, after being well washed and dried, must be mixed with a fifth of its weight of sulphur, and exposed in a thin layer to a gentle heat, so as just to burn off the sulphur. When this is accomplished, more sulphur must be added, and the washing repeated; and so on, until the mass acquires a light blue color, which is usually the case after the third roasting. In 1872, however, Fürstenau introduced improvements into the manufacture of ultramarine, showing how the blue tint could be produced in one calcination. There is reason to believe, from the experiments of Wilkens, that ultramarine is composed of two portions—one of which is constant in its composition, and is the essential coloring matter, containing about 40 of silicic acid, 26 of alumina, 13 of sulphur, and 21 of soda, arranged as a mixture of two silicates of alumina, sulphite of soda, and sulphide of sodium—the blue coloring principle being a compound of the latter two; while the other portion differs from the former in resisting the action of hydrochloric acid, and contains a variable amount of sand, clay, oxide of iron, and sulphuric acid. Ultramarine, if heated in the air, gradually assumes a dull green tint; and it is quickly decomposed by the action of the mineral acids and chlorine.

The term *yellow ultramarine* is sometimes given commercially to chromate of baryta, a yellow insoluble powder used as a pigment.

ULTRAMONTANE (Lat. beyond the mountains—the Alps—viz., in relation to France), that party in the church of Rome which assigns the greatest weight to the papal prerogative. The pope, according to the Ultramontane doctrine, is superior to general councils, and independent of their decrees; he is considered to be the source of all jurisdiction in the church; and it is through him, and not directly in virtue of their episcopal office, that the bishops derive their powers of “jurisdiction,” as distinguished from those of “order.” See **ORDERS**. The Ultramontane school has been the opponent of those doctrines and views which favor the right of self-government by national churches. The school opposed to the Ultramontane is called the Gallican. See **GALLICAN CHURCH**.

ULTRA VIRES, a legal term meaning, literally, “beyond one's powers,” and employed since the law of corporations has become of great importance, to indicate acts or contracts entered into by corporate bodies, beyond the scope of the powers given them expressly or from implication in their charters. It is clear that the corporation can, itself, take no advantage from, or demand the enforcement of, such a contract; and, hence, the question commonly arising is, how far or in what cases will the corporation be allowed to set up its own lack of authority to enter into a contract as a valid defense against its enforcement by the other contracting party. The general rule is that the contract is void; but where the second party has performed his part of the agreement and the corporation has received benefit, as money or other valuable consideration, decisions differ widely. The extreme ground has been taken that the contract is not only void but illegal, as against public policy, and that no action growing out of it can be maintained. On the other hand, it has been held that the corporation is, on common law principles, *estopped* from setting up *ultra vires* as a defense, unless the contract be illegal in itself or expressly prohibited. But the most reasonable view is that which, while declaring that no action can be maintained on the contract itself, as it is void, allows the second party to recover by the appropriate legal action the money or consideration paid, after the contract has been rescinded. Where a corporation has acted *ultra vires* proceedings may be taken by the state by *quo warranto*, and it is no defense that the officers or agents of the company acted without the express authority of the corporation. The charter may be revoked as a penalty for acts *ultra vires*.

ULUGH-BEG, the grandson of Timûr (q.v.), governed w. Turkistan as regent for his father shah Rokh, while the latter was employed in regulating the affairs of the southern half of the empire, and succeeded, in 1447, to the imperial throne on his father's death. He was a successful warrior, as was of necessity every ruler of this period; but happening, unfortunately, to conceive suspicions of the loyalty of his eldest son, suspicions founded only upon astrological indications, the offended and injured prince rebelled, defeated and captured his father, and soon after caused him to be put to death, thus fulfilling the prediction, 1449 A.D.

Ulugh-Beg is known to posterity as the founder of the observatory at Samarcand, as the liberal patron of astronomers, and as himself a most diligent observer. The astro-

nomical tables which bear his name, in all probability compiled by himself and his two fellow-laborers, Salah-ed-din Cadizadeh al Roumi and Gaiathed-din Mohammed Jerusheid al Coushi, enjoy a high reputation for accuracy, considering the time when they were compiled, and the means of observation in the hands of astronomers. The astronomical works of Ulugh-Beg were written in Arabic, afterward translated into Persian, and thence the chronological portion of them rendered into Latin (Lond., 1650), by Greaves, who followed with a Latin version of the geographical part in 1652. An independent version of the same work in Latin and Persian was published by Dr. Thomas Hyde, at Oxford, in 1665. A new edition of Ulugh-Beg's catalogue of stars will be found in the *Memoirs of the Royal Astronomical Society*, vol. xiii.

ULULATION (Lat. howling). It sometimes happens that articulate sounds or cries resembling, perhaps imitative of those of animals, or mere shrieking and howling, form the sole or chief symptom and characteristic of a morbid mental state. The act is automatic, and may be regarded as indicative of grave changes in the physical and moral nature. In the Middle Ages, during great religious excitement, and those mental epidemics which involved large communities, such phenomena appear to have been of frequent occurrence. It appears that in the 18th c., a family of five sisters, in the county of Oxford, were affected with a modification of hysteria, during which they howled or barked like a dog; and that about the same period, a large religious community of females in France, one and all, and at the same hours, shrieked or mewed like cats; and were only reduced to sobriety and to silence by the presence of military.—Laycock on *Nervous Diseases of Females*, p. 286; Calmeil, *De la Folie considérée sous le point de Vue Pathologique, Philosophique, Historique, et Judiciaire*, t. ii. p. 310.

ULVÄ. See LAYER.

ULVERSTON, a small but important market-t. and sea-port of Lancashire, in the district of Furness, 25 m. by railway n.w. of Lancaster. It stands in an extensive agricultural and mining district, and is the center of commerce for Furness, and for parts of Cumberland and Westmoreland. It contains cotton and paper mills, and carries on manufactures of linen, ropes, and woolen yarn, and has a coasting-trade in iron and copper ores, limestones, grain, and gunpowder. Pop. '81, 10,001; '91, 9948.

ULYSSES, ULYXES, AND ULIXES, the Latin forms of the Greek ODYSSEUS, i.e., the "Angry," the name of one of the most celebrated heroes of the Trojan war. Different accounts are given of his parentage; but according to the oldest legend, the Homeric, he was the son of Laertes, prince of Ithaca (one of the Ionian isles), and of Anticleia, daughter of Autolycus. According to a later account, his father was the crafty Sisyphus; whence he is sometimes called, by way of reproach, Sisyphides. He married Penelope (q.v.), by whom he became the father of Telemachus. While still a youth, he had acquired a reputation for courage, eloquence, and address. When the expedition against Troy was resolved on, Agamemnon visited Ithaca, and prevailed on Ulysses, though with difficulty, to take part in it. Later traditions, or, as in this case, perhaps we ought to call them *inventions*, go on to exaggerate the reluctance of Ulysses to leave his home, and represent him as feigning madness—an artifice which did not, however, succeed. Before hostilities broke out, Ulysses, in conjunction with Menelaus and Palamedes, was sent to Troy, with the view of persuading the Trojans to give up Helen and her treasures; but this little bit of diplomacy having failed, the Greek princes assembled their fleets in the port of Aulis, and sailed for Troy, Ulysses bringing with him twelve ships. During the siege, Ulysses performed important services for the Greeks. In prudence, ingenuity of resource, and *finesse*, he was the foremost of the Hellenic chiefs, while in courage he was inferior to none. After the fall of Troy, the most interesting part of Ulysses's career begins, and forms the subject of the Homeric poem called the *Odyssey*. Several of his adventures are manifestly of eastern origin, and closely resemble those of *Sinbad the Sailor*. Setting sail for home, his ships were driven by a storm on the coast of Thrace; where he plundered the town of Ismarus, but lost a number of his crew. Having re-embarked, a north wind blew them across the Ægean and the Levant, to the country of the Lotophagi (the "Lotus-eaters"), on the coasts of Libya, where the companions of Ulysses ate of the wondrous fruit, and wished to rest forever. (Our readers will remember Tennyson's delicious rendering of this episode.) But their leader compelled them to leave the land "in which it alway seemeth afternoon;" and sailing n. again, they touched at the "island of goats," where Ulysses left all his ships but one. Thence he proceeded westward, till he reached the "island of the Cyclopes" (Sicily), where occurred the incident narrated under POLYPHEMUS (q.v.). The island of Æolus, and the city of the Læstrygones (a race of cannibals), whither fortune and the winds next carried the Hellenic chief, are supposed to be only names for particular parts of Sicily. Thence he sailed westward to the island of Ææa, inhabited by the sorceress Circe (q.v.). After a year's sojourn, he departed, and sailing still further w., crossed Oceanus, the "ocean-stream," into the country of the Cimmerians (q.v.), where darkness reigns perpetually. Here (following the advice of Circe) he descended into Hades (q.v.), and inquired at the blind seer Teiresias how he might get back to his native land. Teiresias disclosed to Ulysses the fact of the implacable enmity of Poseidon (Neptune), on account of his having rendered Polyphemus (who was a son of Poseidon by the nymph

Thoosa) blind, but encouraged him at the same time with the assurance that he would yet reach Ithaca in safety, if he would not meddle with the herds of Helios (the sun-god) in Thrinacia. Ulysses now retraced his course, and once more visited Circe, the kindly sorceress, who forewarned him of the dangers he would yet have to encounter, and how to act. A w. wind blew them past the perilous island of the Sirens (q.v.) to the coasts of Italy. In passing between Scylla and Charybdis, the monster that inhabited the first of these rocks devoured six of Ulysses' companions. He next came to Thrinacia, which he would fain have passed by, but his crew insisted on landing, and in spite of their oath, killed some of the cattle of Helios while Ulysses was asleep. The anger of Zeus was kindled. When they had sailed away, a fierce storm arose, and Zeus sent forth a flash of lightning that destroyed the ship. Every one on board was drowned except Ulysses himself, who, after many dangers, reached the island of Ogygia, the abode of the nymph Calypso, with whom he lived for eight years. After his departure (which was commanded by Zeus, who had promised to Athene that Ulysses should one day see Ithaca again—the poet always represents him as having a longing after his native isle), Poseidon persecuted him with a storm, and cast him on the shores of Scheria, the island of the Phæacians, in a very forlorn and indescribable condition. He was, however, very kindly received by Nausicaa, daughter of king Alcinous; and having revealed his name at a feast, the monarch provided him with a ship to carry him home. Ulysses was asleep when the vessel approached the coast of Ithaca; and the Phæacian sailors who had accompanied him bore the unconscious hero to the shore, and left him there. When he awoke, he did not at first recognize where he was; but Athene appearing, informed him, and of all that had happened to Penelope (q.v.) in his absence. Disguised as a beggar, he repaired to his own court, where he was recognized by his nurse, and, as Homer touchingly describes, by his old dog, Argus. Aided by Telemachus, and the swine-herd Eumæus, he took vengeance upon the insolent suitors of his wife, all of whom, without exception, he slew. Homer records nothing more of Ulysses's history; but he makes Teiresias prophesy, in the 11th book, that the hero would meet a painless death in a happy old age. Another tradition says that he was slain by Telegonus, his son by Circe. Later poets, e.g., Virgil and Ovid, represent Ulysses as a much less noble and valiant character than he appears in Homer; his wisdom and subtlety are changed into cunning and deceit; and instead of heroic courage, he displays the spirit of a coward.

UM is a Kaffir or Zulu word signifying river, and is used as prefix in the names of most of the rivers on the s.e. coast of Africa, from the Great Kei, where the names of Hottentot origin appear to cease, as far to the n.e. nearly as the Sofala coast, where the names Imhambane, Imhampoor, have the same prefix in a corrupted shape. Among the principal rivers on this coast bearing this prefix may be mentioned the Umgazi, Umbashee, Umtata, Umzimvoobo, and Umzimcula, draining Independent Kaffraria; the Umcomanzi and Umtugela, in the colony of Natal; and the Umfolusi, Umhlatozi, and Umapoora, between Natal and Delagoa bay. The Hottentot word Kei has the same meaning, and is still preserved in the Kei and Keiskamma rivers, the Keiriega, Keisuga, and other streams on the e. coast of Cape Colony.

UMĀ is, in the epic and Purāṇic mythology of India (see *religion*, under **INDIA**), one of the principal names of the consort of the god Śiva. Other names by which she is also usually designated are *Durgā*, *Devī*, *Kālī*, *Pārvatī*, *Bhavanī*, while there are many more belonging to her which are of less frequent occurrence, as *Kātyāyanī*, *Ambikā*, *Haimavatī*, *S'ivā*, etc. As Śiva is not yet a deity of the vedic period of India, such of these names as are met with in Vedic writings have there a different import from that assigned to them by the later mythology. Thus, *Ambikā* is, in the Yajurveda, a sister of *Rudra* (q.v.); *Kālī*, a word which occurs in the Mun'dāka Upanishad (q.v.), is there the name of one of the seven flickering tongues of Agni, the god of fire; *Durgā* in a hymn of the Taittiriya Aran'yaka, is an epithet of the sacrificial flame; and *Umā*, when mentioned in one recension of the same Aran'yaka (see **VEDA** and **UPANISHAD**), and in the Kena Upanishad, means the Brahma-science, or the knowledge of what is the nature of Brahman, the supreme soul; and in this sense she is identified in the Taittiriya Aran'yaka with *Ambikā*. But since Rudra is in later mythology a name of *Śiva*, and the Vedic Rudra is a form of Agni, the fire, more especially of the fire of the sun; and since Umā, in the Kena Upanishad probably designates the power of Śūrya, the sun, it becomes intelligible that Śiva (q.v.), who, at a later period of Hindu religion, is both the type of destruction and contemplation, had then associated with him deities which originally represented the energy of the fire and the power or wisdom of the sun, and that those deities were afterward held to be merely different forms or names of one and the same deity, viz., his female energy (see **ŚĀKTAS**), or wife. Though this double character of the consort of Śiva is not always discernible in the myths which are connected with special designations of hers, and though at a late period the popular creed looked upon her far more as the type of destruction than as that of divine wisdom, yet the works devoted to her praise never fail to extol her also as the personification of the highest knowledge. Thus, in the *Devīmāhātmya*, the Rishi Mārkan'd'eya, in reply to a question of king Suratha, says: "By Devī, this whole universe, with what is movable and immovable, has been created, and, when propitious, she who bestows blessings leads men to their eternal bliss; for she, the eter-

nal goddess, is the highest wisdom, the cause of eternal bliss, and also the cause of bondage for this world; she, who lords over the Lord of the universe." And in another passage of the same work, she is invoked thus: "O Devī, thou art the seed of the universe, the highest Māyā (q.v.); all this world is bewildered, but, descending on earth, thou art the cause of its final liberation: all the sciences are merely different modes of thyself." Similarly, also, in the *Mahābhārata* (q.v.), Arjuna says to her: "Of sciences thou art the Brahma-science," etc.; and in the *Harivans'a*, Vishn'u addresses her as Saraswati, the goddess of eloquence, as Smṛiti, tradition, and, of sciences, as the Brahma-science, etc.

The myths relating to this goddess, who is worshiped in various parts of India—particularly, however in Bengal (see S'ĀKTAS)—are met with in the great epic poems and Purān'as, in poetical works, such as the *Kumārasambhava* (see KĀLIDĀSA), and in modern popular compositions; but the text-book of her worshipers is the *Devīmāhātmya*, or, "the majesty of Devī"—a celebrated portion of the *Mārkan'd'eya Purān'a*, and considered to be of especial holiness by the worshipers of this goddess. In the *Rāmāyan'a* (q.v.), she is spoken of as the daughter of mount Himālaya (her names *Pār-vatī*, *Haimavatī*, *Ādrījā*, *Gīrījā*, and similar ones, mean "the mountainous or the mountain-born"), and of the nymph Menā, whose elder daughter, however, was the Ganges. According to the Vishn'u and other Purān'as, she was in a former life *Satī*, the daughter of Daksha, who abandoned her corporeal existence in consequence of having been slighted by her father when he performed a great sacrifice, and did not invite Śiva to share in it; but it was only as Umā that she bore children to her husband, viz., *Ganes'a*, the god of wisdom, and *Kārttikeya* (q.v.), the god of war. According to the *Harivans'a*, she was, in another life, born as the daughter of Yaś'odā, and exchanged for *Vishn'u*, when in his incarnation as *Kr'ishn'a*, he was born as a son of Devaki. See *VISHN'U*. On that occasion, she was killed by *Kansa* (q.v.); but as soon as he had dashed her to the ground, she rose to the sky, leaving behind her corporeal frame, and became a divine virgin, to whom the gods addressed their praises. Hence her names, *Kanyā*, *Kumārī*, etc., the virgin. This connection between the legendary history of Umā and Vishn'u is also briefly referred to in the *Devīmāhātmya*, though this work is chiefly concerned in the narrative of the martial feats of the goddess. The latter consisted in the destruction by her of two demons, *Madhu* and *Kait'abha*, who had endangered the existence of the god Brahma; and of the demon *Mahisha*, or *Mahishāsura*, who, having conquered all the gods, had expelled them from heaven, and who met Devī, assisted only by her lion, with a numberless host of demons; moreover, in her defeating the army of *Chan'd'a* and *Mun'd'a*, two demon-servants of *S'umbha* and *Nis'umbha*; in her killing the demon *Raktavīja*, who had a sort of charmed life, each drop of his blood, when shed, producing hundreds of demons like himself; and ultimately, in her destroying the demons *S'umbha* and *Nis'umbha* themselves. In commemoration of her victory over *Mahishāsura*, a festival called the *Durgāpūjā*, or *Durgotsava*, is annually celebrated in Bengal. "The goddess," the Rev. Mr. Banerjea relates in his introduction to the *Mārkan'd'eya Purān'a*, "is there represented with ten arms, trampling upon the demon, who is also attacked by her lion, and wounded in the chest by her spear. She has also laid hold of him by the hair, and is about to chop off his head. The most popular commemoration of this event takes place in the autumn, about the time of the equinox; and if the practice may be supposed to be 800 or 1000 years old, it is not inconceivable that it was originally fixed at the equinox, though the precession has since made it a few days later. The calculation of the day depends, however, on a certain lunar day; but it can never be earlier than the seventh of Ās'vin, which is about the time of our present equinox; nor can it be more than a month later than that date. The idea of the possible connection of the *Durgāpūjā* with the equinox, is suggested by the fact, that there is a corresponding festival about the time of the vernal equinox too, in which, though it is not so popular as the autumnal *pūjā*, the same group of figures is constructed, and the image of the goddess is in the same attitude, with the same attendance, and the same enemy." (For a somewhat more detailed account of this festival, see Moor's *Hindu Pantheon*, p. 156.) Three weeks after the *Durgāpūjā*, another festival in honor of this goddess, called the *Kālīpūjā*, takes place, to commemorate her victory over *Chan'd'a* and *Mun'd'a*. "The sable goddess," Mr. Banerjea says, "is represented holding the severed head of *Chan'd'a* in her hand, with the heads of his soldiers formed into a garland suspended from her neck, and their hands wreathed into a covering round her loins—the only covering she has in the image constructed for the *pūjā*. The worship of *Kālī* (i.e., the black), to which the narrative (of her victory over *Chan'd'a* and *Mun'd'a*) has given rise, is considered by the Hindus themselves as embodying the principle of *tamas*, or darkness. She is represented as delighting in the slaughter of her foes, though capable of kindlier feelings to her friends. She is, however styled the black goddess of terror, frequenting cemeteries, and presiding over terrible sprites, fond of bloody sacrifices; and her worship taking place in the darkest night of the month." (For this worship, see also the article *TRUTH*.) With Ś'iva, she resides on mount *Kailāsa*, the northern peak of the Himālaya, or in her own palace on the Vindhya mountain, where she amuses herself with hunting. Her representations are numerous and various. Sometimes she is seen riding on a bull, with a trident in her hand, a serpent as bracelet, and a half moon on her forehead; sometimes, when in

the act of fighting Mahishâsura, she rides on her lion (*Manastâla*), the latter standing between the frontal bones of her elephant. Or, as *Bhadra-Kâli*, she is represented "eight-handed, two of her hands being empty, pointing upward and downward, one of her right hands holding something like a caduceus, its corresponding left hand a cup; the next right and left hands a crooked sword, and a shield with an embossed flower or fruit; the superior right hand, an agricultural implement; and the left, the noose to strangle victims with [see *THUG.*] Her person is richly dressed and ornamented; between her full breasts, a five-headed serpent unpears itself; she has a necklace of human heads; her ear-drops are elephants; and a row of snake-heads peeps over her coronet. Her forehead is marked either with S'iva's third eye, or her own symbol; and her open mouth shows her teeth and tusks, giving her a fierce and threatening aspect." See Moor's *Hindu Pantheon*, where, besides, other descriptions of images of this goddess are given.—For the myths relating to her, see John Muir's excellent work, the *Original Sanskrit Texts*, vol. iv. (Lond. 1863); the *Harivans'a*, translated by A. Langlois (Paris, 1834-35); and the *Mârkand'eya Purân'a*, in the *Bibliotheca Indica*, edited, with an elaborate preface, by the Rev. K. M. Banerjea (Calcutta, 1862).

UMAN', a t. of Russia, in the government of Kiev, 120 m. s. of the town of Kiev, on the Umanka. It is inclosed by earthen ramparts. Pop. '85, 15,976.

UMATILLA, a co. in n.e. Oregon, having the Columbia river on the n.w., a range of the Blue mountains in the s.e.; 2885 sq. m.; pop. '90, 13,381, chiefly of American birth. Co. seat, Pendleton.

UMBAGOG LAKE, in Oxford co., Maine, and in the t. of Errol, Coos co., N. H.; 15 m. long, from 1 to 10 m. wide, discharging into the Androscoggin. It is famous for its fine trout, and is 1256 ft. above sea-level.

UMBALLA, or **AMBA'LA**, a walled t. of India, capital of the division of the same name in the Punjab, lies in a wide plain, on the Simla railway, 129 m. n.n.w. of Delhi. There is considerable export of grain, cotton-goods, and carpets. Pop. '91, 72,270.

UMBELLIFERÆ, *Apiaceæ* of Lindley, a large and important natural order of exogenous plants, containing more than 1000 species, abounding chiefly in the temperate regions of the northern hemisphere. A peculiar regularity distinguishes the inflorescence of most of this order; a number of stalks, radiating from a common center at the top of the stem, or of a branch, each of which bears a flower at its extremity, thus forming what is called an *umbel*. The umbel is often compound, the primary stalks dividing in a radiated manner, and forming *secondary umbels* or *umbellules*. The flowers are generally small, although the umbel which they compose is often large. They are generally white, rarely yellow, still more rarely red, though frequently tinged with pink at the edges; have a 5-toothed calyx, often obsolete, or nearly so; a corolla of five petals, inserted in the top of the calyx, and alternating with its teeth, five stamens, an inferior germen, and two styles. The fruit is very peculiar, and consists of two one-seeded, unopening carpels, rarely fleshy, touching one another on the inner side, and there attached to a little column (the *carpopore*), their common axis. Each carpel has five primary and four secondary longitudinal ridges, more or less distinct; and beneath the separating furrows there are often linear receptacles of essential oil, called *vittæ*. The umbelliferæ are mostly herbaceous plants, rarely shrubby. They generally have divided or compound, rarely simple leaves. They generally abound in a resinous secretion, and a volatile oil, from which many of them derive poisonous and medicinal properties, which are more or less common to all parts of the plant, and often highly developed in the seeds. Acridity is their general characteristic. Some are pleasantly aromatic, others have a powerful and disagreeable smell. In the roots of some, especially when enlarged by cultivation, starch and sugar are secreted, so that they become useful for food, although the peculiar flavor of the essential oil is still retained. The systematic arrangement of the umbelliferæ has been found difficult by botanists. Sprengel, De Candolle, Koch, and others, have devoted much attention to this order. Of esculent-rooted umbelliferæ, the carrot and parsnip are the best known examples. Skirret, earth-nut, and arracacha are also of some value. The roots of *anesorhiza capensis* and *feniculum capense* are used as esculents at the cape of Good Hope. The roots of *cherophyllum tuberosum*, or **SHAM**, are used in the Himalaya. The herbage of *prangos pabularia* is so bland that it is much used in the temperate parts of the East Indies for feeding cattle, and made into hay for winter fodder. It is said, however, to be injurious to horses, although oxen and sheep are rapidly fattened by it. The blanched stems of celery, enlarged by cultivation, are a favorite salad, and those of alexanders (*Smyrniolum olusatrum*) were formerly used in the same way. The candied stalks of eryngo were once much esteemed, and those of angelica are still used. The leaves of parsley, chervil, fennel, etc., are used for flavoring. Lovage (*levisticum officinale*) is sometimes cultivated as a salad plant. The seeds of anise, caraway, coriander, etc., are used as carminatives. Hemlock, water hemlock, water parsnip, fool's parsley, and many others, are narcotic poisons—asafetida, galbanum, sagapenum, and opoponax are medicinal products of this order.

UMBER, *Scopus umbretta*, an African bird of the family *ardeideæ*, allied to the storks, but having a compressed bill with sharp ridge, the tip of the upper mandible hooked,

and the nostrils situated in a furrow which extends all the length of the bill. It is about the size of a crow, with umber-colored plumage, and the male has a large crest on the back of the head.

UMBER, a mineral used as a pigment, a variety of the iron ore called hematite (q.v.), and consisting chiefly of oxide of iron, with some oxide of manganese, silica, alumina, and water. It is soft and earthy, of a dark brown color, and has a conchoidal fracture. It readily imbibes water, and falls to pieces, like newly-burnt lime. It is found in Cyprus in beds. When roasted, becomes reddish brown in color, and in that state is also used as an artist's color.

UMBILICAL CORD, in botany, the connecting link between the placenta of the ovary and the ovule through which pass the vessels which nourish the ovule till it ripens into the seed. In some plants, the ovules are so closely connected with the placenta, that no umbilical cord can be said to exist; in others it is of considerable length.

UMBILICAL CORD, or **NAVEL STRING**, the bond of communication between the fetus (which it enters at the umbilicus, or navel) and the placenta, which is attached to the inner surface of the maternal womb. It consists of the umbilical vein lying in the center, and the two umbilical arteries winding from left to right round the vein. Contrary to the usual course, the vein conveys arterial blood to the fetus, and the arteries return venous blood to the placenta. These vessels are imbedded in a yellow gelatinous matter, known from its first describer (in 1659) as Wharton's gelatine. Nervous filaments have been traced into the cord; but the presence of lymphatics is doubtful. The whole is invested by a membrane (the amnion), and its ordinary length is about 20 inches. As soon as a child is born, and its respiration fairly established, the umbilical cord is tied, and divided near the navel, which spontaneously closes, the fragment of attached cord dying away. See the articles **FÆTUS** and **PLACENTA**.

UMBILICAL HERNIA is the term applied to the protrusion of intestine at the navel or umbilicus. It is, for obvious anatomical reasons, of most frequent occurrence shortly after birth; but it is not uncommon in women who have been frequently pregnant. If the hernia is reducible, and the patient an infant, the ordinary course of treatment is, after returning the parts to their proper position, to place the convex surface of an ivory hemisphere on the navel, and to retain it there either with strips of adhesive plaster, or with a bandage. Special trusses are made for the treatment of this affection in adults. In cases of irreducible hernia, a large hollow pad should be worn. If it becomes strangulated, an operation may become necessary.

UMBILICUS is the anatomical term for the navel.

UMBREIT, **FRIEDRICH WILHELM KARL**, 1795-1860; b. Germany; received a theological education at Göttingen. In 1820 he was called to the chair of theology and philosophy at Heidelberg, where he remained till his death. His most important work is *Commentar über die Propheten des Alten Testaments*, 4 vols. (1841-46). In conjunction with Ullmann he established *Theologische Studien und Kritiken* (1828).

UMBRELLA (Lat. *umbra*, a shade). As a shade from the sun, the umbrella is of great antiquity. In the sculptures of Egypt, Nineveh, and Persepolis, umbrellas are frequently figured, closely resembling the chaise umbrella of the present day. In the east, however, its use seems to have been confined to royalty; but in Greece and Rome it was more extensive. The custom was probably continued in Italy from ancient times, but at the beginning of the 17th c. the invention seems to have been little if at all known in England. In that century, however, it came into use as a luxurious sun-shade; and in the reign of Queen Anne it had become common in London as a screen from the rain; but only for the weaker sex. The first person of the male sex who had the moral courage to carry an umbrella in the streets of London was Jonas Hanway, the founder of the Magdalene Hospital, who was newly returned from Persia, and in delicate health. Still, it was long regarded as a sign of infirmity or effeminacy to use them, and those who did so suffered much unpleasant jeering in consequence. They were at first all brought from abroad, chiefly from India, Spain, and France; now the manufacture of umbrellas has reached an enormous extent in the United States.

UMBRELLA BIRD, the *cephalopterus ornatus* of South America, the *coracina cephaloptera* of Vieillot. The coracina form a genus of birds separated from the crows (corvidæ) by Vieillot, and divided by him into four sections. The first comprises those species having velvety feathers at the base of the bill; the second, those whose nostrils are covered with hairy feathers directed forward, and with the upper mandible notched toward the end; the third having a bill naked at its base and notched at the point; and the fourth, that remarkable species on which Geoffroy Saint-Hilaire founded the genus *cephalopterus*. The *cephalopterus ornatus* of South America is of a uniform blue-black color. The head and base of the bill is ornamented with a crest forming a covering somewhat like a parasol, composed of straight elevated feathers with white and stiff shafts terminated by black beards which project forward forming altogether an umbrella.

like plume. The sides of the neck are naked, but long black glossy, metallic feathers forming a loose pelerine hanging below the breast spring from the throat and sides of the neck. The tail is long and slightly rounded. It is of the size of the common crow, and is the only species known.

UMBRELLA-SHELL, a genus of branchiferous gasteropod mollusks of the family *pleurobranchidae*, containing three known living, and two extinct, species. The small shell only covers the more important organs, and the shell is often covered by a mantle. See INVERTEBRATE ANIMALS.

UMBRELLA-TREE, a species of magnolia growing along the Alleghany mountains from Pennsylvania to Kentucky. It gets its name from the crowding of leaves on the summits of the flowing branches. See MAGNOLIA.

UMBRIA, one of the ancient divisions of Italy, w. of Etruria, and n. of the country of the Sabines. It is usually described as extending from the Tiber eastward to the Adriatic; but while this was probably the case in pre-historic times, it was not so during any part of the period of which we have authentic knowledge. Tradition, indeed, leads us to believe that at one time the Umbrian territory extended from sea to sea, embracing much, if not the whole, of the country subsequently occupied by the Etruscans; but when the Umbrians first come before us as a distinct people, we find them restricted to the ridges of the Apennines, the low-land region bordering on the Adriatic from the *Æsis* (mod. *Esino*) to the Rubicon, being held by a race of Gallic invaders, known as the Senones. The most notable towns of Umbria were Narnia, Interamna, Acriculum, Spoletium, Mevania, Fulginium, Assisium, Tifernum, Nuceria, Camerinum, Sentinum, Urbinum, Sena Gallica, Fanum, Fortunæ, and Ariminum.

The Umbrians were considered in ancient times to be the oldest people of Italy, and were in consequence, vaguely spoken of as "aborigines;" but neither the knowledge of the ancients, nor the methods of investigation which they pursued, allowed them to arrive at any trustworthy ethnological results. Modern researches into their language (of which we possess one important memorial in the tables of Iguvium; see EUGUBINE TABLES) have demonstrated that they spoke a tongue closely allied to the Oscan (see OSCI), and were therefore, in all probability, members of the Latino-Italian race. These researches further tend to confirm the tradition of their antiquity, for an analysis of the structure of the Umbrian language proves it to be the oldest of the Italian dialects.

The Umbrians make their first authentic appearance in the wars between the Romans and the Etruscans. They would seem to have been destitute of any political organization or unity, for we find that some of their tribes took part with the Romans, and others—probably the majority—with the Etruscans. At any rate, they were subjugated along with the latter people; and we do not read of them again until the third Samnite war, when in conjunction with the Etruscans and Gauls, they joined the Samnites in their last gallant struggle against the imperious supremacy of Rome (q.v.). The confederacy was utterly vanquished in the great battle of Sentinum (295 B.C.), and the Umbrians were again reduced to submission. The establishment of Roman colonies in the *Gallicus Ager*, or territory of the Senonian Gauls, seems to have completely overawed, and gradually even to have Romanized them. They stood faithfully by Rome in the dark years of the Hannibalic war, and were among the first to furnish Scipio with volunteers for the invasion of Africa. In 90 B.C., they obtained the Roman franchise, and thenceforth disappear from history as a distinct people.

UMPIRE is a third arbitrator appointed by two arbitrators in the event of their differing in opinion; and when the reference or arbitration has devolved upon the umpire, his award or umpirage becomes final and binding on the parties.

UMPQUA RIVER, a river rising in the Cascade mountains, Oregon, flowing in a general n.w. course, passing through the Coast range and emptying into the Pacific at Umpqua head about 22 m. n. of Empire City. The length of the river and its greater fork is about 200 m., and the valley through which it flows is very fertile. It is navigable by small steamers for about 100 m. above its mouth.

UMRO'HAH, a t. of British India, in the district of Moradabad, n.w. provinces, 80 m. e.n.e. of Delhi. Pop. 35,000.

UNAKA MOUNTAINS, the western and southern part of the Appalachians, along and near the boundary between North Carolina and Tennessee; length between the two states, about 200 m. in a s.w. course. North of the Watanga river the Unakas have three ridges divided by wide and beautiful valleys. In Virginia these ridges unite and are blended with the Alleghanies. The name signifies *white* in the Cherokee language. Where these mountains reach their greatest height in s.w. North Carolina, snow lies on their tops a large portion of the year. The Roan, about midway between Virginia and the French Broad river, is 6,306 ft. high; a bald mountain whose top is about 6 m. in length with three or four rocky knobs, and many acres level or gently sloping, covered with grass and flowers. Several species of plants are the same as on mount Washington, N. H. This is in many respects the most grand and beautiful of all the mountains e. of the Mississippi river. From it can be seen points in Virginia, Kentucky, Georgia, and Tennessee. Accommodations have been provided on it for the comfort of visitors in

summer. The great smoky range between the French Broad and Tennessee rivers has the highest of the Unakas; about twenty of their summits being higher than mount Washington. Among these the highest is Buckley's peak, 6599 ft., second only to mount Mitchell which is the highest of the Carolina mountains, and the highest e. of the Mississippi. This portion of the Unakas abounds in grand and rugged scenery, and many of the summits are difficult of access. The rocks are granite, gneiss, shales, sandstones, and rarely limestones of the archæan, Laurentian, lower, and upper Silurian periods. The climate is like that in southern Canada. The valleys of the Unakas have very many places suitable for summer resort; the streams abounding in trout, and the mountains with bear, deer, and smaller animals, while gnats and mosquitoes are rare.

UNALASH'KA, an island in the n. Pacific, belongs to the Fox group of the Aleutian islands, in lat. 55° 52' n., and 166° 32' west. It is 75 m. long, and in some parts 25 m. broad, has a rugged mountainous surface, and is thinly peopled.

UNCAS, d. 1683; sachem of the Mohegan Indians in Connecticut. He was a Pequot chief till 1635, when he revolted, and collected a number of Indians, who took the name of Mohegans which had once belonged to the Pequots, against whom he now fought as an ally of the English (1637). He was rewarded with a grant of Pequot lands. Several attempts to murder him were made by the Indians. In 1643 he defeated and put to death Miantonomoh. In 1648 the Mohawks and Pocotocks began an unsuccessful war against him. In 1657 he was besieged by the Narragansett sachem Pessacus, but was relieved by Ensign Leffingwell to whom he granted the present site of Norwich.

UNCIAL LETTERS—so called as being an inch (Lat. *uncia*) long—characters of a large and round form, used in some ancient MSS. The earliest form of an alphabet is its capitals, and the oldest Greek and Latin MSS. are written entirely in capitals. Uncial letters, which began to take the place of capitals in the middle of the 5th c., differ from them in being composed of rounded, and not straight lines, and exhibiting a tendency toward greater expedition in style. Uncial writing arose as writing on papyrus or velum became common, the necessity for more rapid execution leading to the practice of curving the lines. Its being more easily learned than the cursive style, was probably the cause of its becoming the favorite mode of writing books of importance among the monkish scribes; while legal instruments, which required greater dispatch, were executed by professional scribes in a corruptive form of the Roman cursive hand. Uncial writing prevailed from the 6th to the 8th, or even 10th century.

During the 6th and 7th centuries, a transitional style of writing prevailed in Italy, and to some extent elsewhere, in which the letters approximated more nearly to the Roman cursive hand; this passed by a gradual transition into the *minuscule* manner, or small hand, which from the beginning of the 10th c., became usual in MSS.—See Silvestre's *Universal Palæography*, translated and edited by sir F. Madden (Lond. 1850); *Traité de Diplomatique*, par deux Religieux Benedictins de la Congrégation de St. Maur (Par. 1755).

UNCLEANNESS, in the Old Testament, betokens a state of bodily infirmity which, for the time being, excluded the sufferer from the "holy community," and which, by the various ceremonies connected with the gradual recovery from this exceptional state, went far to impress the people with the constantly reiterated connection between them and God, and their own destination of being "a holy people." No less did the strict cleanliness enforced by the constant fear of becoming an "outcast" for however brief a period, and the strict supervision exercised by the priests, to whom the sanitary well-being was to a certain extent intrusted, act in a salutary manner. Birth, death, the different sexual functions and infirmities, were all, in different manner, causes of uncleanness, and treated according to their different degrees. To a certain extent, some incongruous admixtures of plants, animals, even materials in one garment, etc., may also be reckoned among things that "defiled" or gave rise to a certain uncleanness. Fruits of a tree during its first three years were not to be eaten, as "uncircumcised" or unclean. About the special ways in which uncleanness was treated, we have spoken under PURIFICATION, where also the similarity that has been found between the Jewish laws on these points and those of the Persians and Indians, is touched upon. The uncleanness of the leper is specially treated under LEPROSY.

UNCLE SAM. See NATIONAL NICKNAMES.

UNCLE TOM. See HENSON, JOSIAH.

UNCONFORMABLE STRATA are strata which rest on the more or less inclined edges of older beds. The existence of unconformability in a series of strata is an indication of an interval sufficiently long to permit of the consolidation, disturbance, and upheaval, denudation, and subsequent depression of the inferior beds. No indication of the period that has intervened is to be found in the unconformability itself; but some idea of it may be obtained by an examination of the strata that are known to have been deposited subsequent to the inferior rocks, and previous to the overlying unconformable deposits. Thus, in the n. of Annandale, the Silurian basement rocks, which have often

an almost perpendicular dip, are covered by permian sandstone, and this, again, by the bowlder-clay, or alluvial deposits. The first break in the strata represents the time during which the Devonian and carboniferous rocks were deposited, when, in all probability, the Silurian strata formed a dry land surface, and supplied some of the materials for these rocks. The second break is all the indication in that district of the lengthened period during which the whole of the secondary and tertiary strata were being deposited elsewhere. The temporal value of the break is not so easily determined, in the majority of cases. It is only in one place in Britain, in a cutting of the St. Helen's railway near Ormskirk, where any apparent unconformability exists between the Bunter and Keuper strata, and even there it is so slight that it was long overlooked; yet this break represents a gap which on the continent is filled by the important sets of strata, the muschelkalk and St. Cassian beds, containing two great assemblages of fossils perfectly distinct from each other. Very frequently, however, no beds are known which fill up the gap between the two unconformable series.

The not taking into account the existence of unconformable stratification, has frequently caused a useless expenditure of money in searching for minerals. It seemed natural to expect that the permian rocks of upper Annandale covered beds of the true coal-measures, but an examination of the numerous natural sections where the base of the permian sandstone is seen, shows that it rests on the Silurian rocks; and the necessarily abortive attempts that have been made to reach coal through the red sandstone have been simply a useless throwing away of money.

UNCONSCIOUS CEREBRATION. See CEREBRATION, UNCONSCIOUS.

UNCTION (Lat. *unctio*, an anointing, from *ungo*, I anoint), the practice of anointing the body, or certain portions of the body, with oil, especially with the oil of olives. It was resorted to by the ancients from motives of health (see OILS), of athletic development, or of luxury; but the practice is noticeable here chiefly in its relations to religion. Anointing with oil seems to have been supposed to carry with it the same effects in spiritual things which it produces in the natural world. It was a rite in frequent use among the Egyptians, as well as the Greeks and Romans; and the Scriptural narrative of the ante-Mosaic religion contains distinct evidence of its use (Gen. xxviii. 18, xxxi. 13). In the Mosaic ceremonial, its use is still more frequent. Priests and kings were anointed on being set apart for their several offices; as were also sacred vessels. The oil employed in these religious unctions was prepared of the most precious perfumes and balsams, and Ezekiel rebukes the Jews (xxiii. 41) for making a similar unguent for their personal uses. The special significance of the rite of unction may be inferred from the circumstance that the popular name of the expected Messiah was the Christos, i.e., the Anointed. In Christian use, anointing from a very early time possessed the same sacred significance. See EXTREME UNCTION. Besides the anointing of the sick, however, there are many other sacred unctions traceable in ancient Christian practice; namely, in baptism, in confirmation, in the ordination of priests and other clergy, in the consecration of churches and altars, the benediction of sacred vessels and utensils, etc. It has also been employed in the coronation of kings; and in some countries, curious traditions and legends are preserved connected with the unction of the king, or arising out of it. See RHEIMS.

UNDERGRADUATE, a student of a university or college who has not yet taken his first degree.

UNDERGROUND RAILROAD, a name in common use before the civil war, as applied to the arrangement by which fugitive slaves were enabled to reach Canada. The "stations," on this railroad, which had many branches, were the houses of abolitionists, who secreted the fugitives during the day, and at night passed them on, till by devious routes they crossed the United States border. One of the best patronized branches of the Underground Railroad began at Cincinnati.

UNDERGROUND RAILWAYS. See RAILWAYS; SUBWAYS.

UNDERHILL, JOHN, 1597-1672; b. England; a soldier, who emigrated to Boston with the elder John Winthrop. In 1637 he led the colonial force, which, in conjunction with Capt. Mason's force, burned the Pequot forts at Mystic, Conn., crushing the power of that tribe, of which he wrote a history in England, having been forced to leave Boston on account of his religious opinions. He was governor of Exeter and Dover in 1641, and afterwards settled in Connecticut. He was a member of the general court at New Haven in 1643, and conspicuous in the Dutch-Indian war, 1643-46.

UNDER-LEASE, an alienation by the tenant of a portion of his lease, with a reservation to himself of the reversion. An assignment, on the contrary, is a transfer of the tenant's entire interest in the lease. The tenant and the sub-lessee stand in the relation of landlord and tenant, but between the original landlord and his tenant's lessee there is no priority of estate or contract. The sub-tenant has the same rights to the possession of the premises as his landlord, the original lessee, and no more; so that the original lessor, entering for breach of condition, may dispossess the sub-lessee.

UNDERWOOD, ADIN BALLOU, b. Mass., 1828; graduated at Brown university, was admitted to the bar, and settled in Boston in 1855. He served in the civil war of 1861-65, was col. of the 33d Mass. infantry in 1862, was at Fredericksburg, Gettysburg, and other battles, and was severely wounded at Lookout Mountain. He was brevetted

maj.-gen. in 1865. He was appointed surveyor of the port of Boston in 1865, and long held that office. He d. 1888.

UNDERWRITER AND UNDERWRITING. See INSURANCE.

UNDINES' (perhaps from *unda*, a wave), the name given in the fanciful system of the Paracelsists to the elementary spirits of the water. They are of the female sex. Among all the different orders of elementary spirits, they intermarry most readily with human beings, and the Undine who gives birth to a child under such a union, receives with her babe a human soul. But the man who takes an Undine to wife must be careful not to go on the water with her, or at least not to anger her while there, for in that case she will return to her original element. Should this happen, the Undine is not disposed to consider her marriage dissolved; she will rather seek to destroy her husband, should he venture on a second marriage. Baron de la Motte Fouqué has made this Paracelsist fancy the basis of an exquisite tale, entitled *Undine*.

UNDULATORY THEORY OF LIGHT. Optics ranks next to dynamics in the category of nearly *exact* sciences—that is, of sciences whose fundamental principles are so well known, that the result of almost any new experimental combination can be predicted mathematically. Given the forces acting on a body, the laws of motion (q.v.) enable us, by purely mathematical processes, to determine the consequent motion. Though we have not as yet arrived at equal perfection in optics, we are certainly far on the way, and probably have now attained nearly all the progress (independent of improvements in our mathematical methods) which will be made until the next great step in molecular physics shall give us the clue to the nature of the minute motions on which light, heat, electric currents, and magnetism depend. The most extraordinary and almost incredible predictions of theory have been verified by experiment, and at present the differences between theory and experiment may be divided into two classes, corresponding to the above exceptions. The first are those depending on the imperfections of mathematical processes, where, because, for example, as we are yet unable to obtain the exact solution of a certain differential equation, we have to content ourselves with an approximate one. But every improvement in our means of approximation is found to introduce a closer agreement between theory and experiment. This difficulty may safely be left to mathematicians. It is otherwise with the second difficulty. This depends on our ignorance of the ultimate nature of matter, and our consequent inability to apply mathematical reasoning in a perfectly correct and sufficiently comprehensive manner. Here the experimenter's work is still required, and it is in this direction that we must in all probability now look for important extensions of our knowledge.

Optics is divided into two parts, *physical* and *geometrical*. Of these, the latter contents itself with assuming certain obvious experimental truths, such as the fact, that light in a uniform medium moves in straight lines, the ordinary laws of reflection and refraction, etc., and, making these its basis, employs mathematics to develop their further consequences. It is thus that theory has shown how to carry to their utmost perfection such exquisite specimens of art as the best telescopes and microscopes of the present day. But these investigations, and their practical application, are wholly independent of the nature of light, and cannot be affected by discoveries in that direction.

It is otherwise when we come to physical optics. This commences with the question: "*What is Light?*" and endeavors to deduce from the nature of light the experimental laws which, as we have seen, are assumed as the basis of geometrical optics.

By two perfectly distinct classes of astronomical observations—aberration (q.v.), and the eclipses of Jupiter's satellites—we know that light takes *time* to pass from one body to another—the velocity, however, being enormous—about 200,000 miles per second. Hence it follows, that either *matter* (q.v.) or *energy* (see FORCE) must be transferred from a body to the eye before we can see it. Here we have at once the rival physical theories of light, which have alternatively had the advantage of one another in explaining observed phenomena. It is only of late years that an *experimentum crucis* has finally decided between them—by showing one of them to be utterly incompatible with a result of observation.

Newton adopted the corpuscular theory, in which light is supposed to consist of material particles—i.e., he adopted the first of the two possible hypotheses; and he gave the first instance of the solution of a problem involving molecular forces, by deducing from this theory the laws of reflection and single refraction. We shall see immediately that this beautiful investigation led to the destruction of the theory from which it was deduced. But, independent of this, there are many grave and obvious objections to the corpuscular theory; for it involves essentially the supposition of material particles impinging on the eye with the astounding velocity of 200,000 m. per second! If such particles weighed but the millionth of a pound, each would have something like ten times the momentum (q.v.), (i.e., the battering power), and *six million* times the vis-viva (see WORK), or kinetic energy (i.e., the penetrating power), of a rifle-bullet. Suppose them a million times smaller—yet as millions of millions of them must be supposed to enter the eye at once, coming from every point of the surface of every visible object, it seems impossible to reconcile such a hypothesis with the excessive delicacy of the organs of vision.

It is not pretended by the advocates of the rival hypothesis, the undulatory theory of light, that they understand exactly the nature of the transference of energy on which they suppose light to depend; but they take from the analogy of sound in air, and of waves in water, the idea of the existence in all space of a highly elastic fluid (or quasi-solid), provisionally named the *ether* (q.v.), and they suppose light to consist in the propagation of waves in this fluid. Huygens has the credit of having propounded, and ably developed and illustrated, this theory.

As we have seen above, no third hypothesis as to the nature of light is admissible. Many strong arguments against the truth of the corpuscular theory had been furnished by experiment, especially in the early part of the present century; and as they were always met by further and more extraordinary properties which had to be attributed to the luminous corpuscles, the theory had become complicated in the most fearful manner; and this of itself was an almost complete disproof. Still, it held its ground, for Newton's old objection to the rival theory, viz., that on the undulatory hypothesis there should be no shadows at all (witness the analogy of sounds heard round a corner), was as yet unanswered. This difficulty was overcome by Young (q.v.), to whose sagacity we are indebted for the idea of *interference* (q.v.), which completely explained the apparent discrepancy. But the question between the rival theories was finally settled by Fizeau and Foucault, who, by processes entirely different, but agreeing in their results, determined the velocity of light in air and in water.

Now, Newton had shown that refraction, such as that of light by water, if predicated of moving *particles*, requires that they should move faster in water than in air. Huygens, again, had shown, that if such refraction be predicated of *waves*, they must move

FIG. 1.

FIG. 2.

slower in water than in air. Fizeau and Foucault found, by direct measurement, that light moves slower in water than in air. Hence it is certain that *light consists in the transference of energy, not of matter*; and the undulatory theory is based upon this fact.

But, as to the manner in which energy is thus transferred, we are entirely ignorant. The common assumption is, that waves of distortion are propagated in the *ether*. The nature of this motion will be described under *WAVE*. But many other modes have been suggested, one of the most notable of which is that of Rankine. Here the particles of *ether* are not supposed to be *displaced*, but each is merely made to turn about an axis as the wave of light passes it; the particles having polarity (q.v.), by virtue of which they arrange themselves in similar positions when no light is passing, and by which, also, any rotation of one particle produces a consequent rotation of those in its neighborhood. For the explanation of most of the common phenomena of optics, it is quite indifferent which of these assumptions we make, and, indeed, theory has not yet been carried far enough to enable us to devise experimental methods of testing which is the more likely to be the case in nature. It cannot be too strongly insisted on that all we know at present is, that light certainly depends on the transference of energy from one part of the luminiferous medium to another; what kind of energy is transferred, vibratory or oscillatory motion, or rotation, etc., is a problem which may possibly forever remain unsolved. But vibratory wave-motion being that with which we are most familiar, as in earthquakes, sound, waves in water, etc., we naturally choose this as the most easily intelligible basis of explanation and illustration. And we shall now briefly show how the laws of linear propagation, reflection, single refraction, interference, diffraction, dispersion, polarization, and double refraction may be accounted for.

We assume, then, that light consists in a succession of waves, and for our earlier inquiries it does not matter whether they be (like those of sound) waves of condensation and rarefaction, in which the vibrations take place *in* the direction of the ray, or (like those in water) waves of distortion or displacement without condensation, in which case the luminous vibrations must be assumed to take place in some direction *perpendicular*

describes 200,000 m. per second, the number of waves which enter the eye per second are:

|------------------|---------------------------|
| Extreme Red..... | 460 millions of millions. |
| “ Violet..... | 730 “ “ |

These numbers, compared with those of sonorous waves (see SOUND), show the extraordinary difference in delicacy between the optic and auditory nerves. But whereas the range of the ear is somewhere about 12 octaves, that of the eye is less than one.

Diffraction.—This has been already illustrated in a previous volume.

Dispersion.—We have just seen that, by Fresnel's interference experiment, waves of different length are separated (for in the last figure the position of the bright line, V, depends on the length of the waves which produce it). But the different colors are also separated by common refraction, as in Newton's celebrated experiment. See SPECTRUM. This shows, of course, that in refracting media, waves of different colors move with different velocities; and, as the violet are more refracted than the red, it appears that the shorter waves move more slowly in glass or water than the longer ones. In free space, waves of all lengths travel with equal speed, else (see ABBERRATION) all stars ought to appear drawn out into spectra, in consequence of the earth's annual motion. Also, a star suddenly breaking out, or suddenly vanishing (a phenomenon several times observed), should flash out first red, and gradually become white, or should gradually decay from white to violet, which is not observed to be the case. These facts are the most difficult to explain of any to which the undulatory theory has yet been applied. Fresnel, indeed, appears to have been in possession of a solution of the difficulty, but the appendix to one of his papers, to which he more than once refers as containing this explanation, was not found among his MSS. Cauchy and others have, however, by delicate investigations, shown that, *if the forces exerted by the molecules of a refracting body on the ether are exerted through distances comparable with the length of a wave*, the velocity of light will then depend on the wave-length. The velocity is, in fact, shown to be represented by a formula such as this:

$$A - \frac{B}{\lambda^2}$$

where A and B are constant quantities for a given medium, and λ is the length of a wave, The larger λ is, the less is the second term of the formula, and therefore the velocity is the greater. A very singular result follows from this formula—viz., that the velocity becomes

FIG. 6.

FIG. 7.

more and more nearly equal to A as the wave length is greater. Hence, waves of low radiant heat, which (see HEAT) are merely waves of light which are incapable of producing vision, must be crowded together toward a limit, not very far beyond the red end of the spectrum.

Polarization.—We now come to a set of phenomena which give us some further information as to the nature of luminiferous waves. When two beams of light, such as those in Fresnel's experiment, are polarized in planes perpendicular to each other (see POLARIZATION) before they meet, *they do not interfere*. This is in accordance with the assumption required for the explanation of the existence of polarization itself—viz., that the vibrations of the ether take place *transversely* to the direction of the ray.

Double Refraction.—Our assumptions, forced upon us by experimental results, are now so far complete that we may proceed, after Fresnel, to apply them to the explanation of double refraction. See POLARIZATION; REFRACTION, DOUBLE. This explanation is extremely beautiful, and when published, was justly hailed as the greatest step in physical science which had been made since Newton deduced the facts of physical astronomy from the law of gravitation.

As we have seen above, in treating of simple reflection and refraction, that the form and velocity in and with which a disturbance spreads from any point of a wave, is all

that is required for the determination of the course of a ray, we must endeavor to find the form in which a disturbance spreads in a double-refracting crystal; and this should lead us to a construction for each of the two rays.

Huygens had already pointed out that one of the two rays produced by Iceland spar follows the ordinary law of refraction. Hence the disturbances which give rise to this ray are propagated in spherical waves in the crystal. He showed also that the other ray could be accounted for, if the disturbances to which it is due were propagated in the form of an oblate spheroid touching the sphere with the extremities of its axis, that axis being parallel to the crystallographic axis of the mineral. The following diagram (fig. 6) will make this clear: P is the point where the ether is disturbed. Two waves spread from P in the form shown in the cut, the line ABP being the axis of rotation of the spheroid, and parallel to the axis of the crystal. Thus, let rays αA , etc. (fig. 7), of which AB is the wave-front, fall upon the surface Ab of such a crystal; and let AC be the direction of its axis. Draw, about A as a center, the sphere and spheroid into which the disturbance at A spreads in the crystal while light in air passes from B to b. Then if planes be drawn through the line b (perpendicular to the paper) so as to touch the sphere in β_1 , and the spheroid in β_2 , these planes will touch respectively all the intermediate spheres and spheroids produced by disturbances at points between A and b. [This is evident from simple geometry.] Thus, $b\beta_1$ and $b\beta_2$ are the new wave-fronts; and the ray αA , falling on the crystal, is divided into the two $A\beta_1$ and $A\beta_2$. Of these, $A\beta_1$ is the ordinary ray, and being produced by spherical waves, has all the properties of a ray ordinarily refracted. It obviously moves perpendicularly to its front, as $A\beta_1$ is perpendicular to $\beta_1 b$.

But it is otherwise with $A\beta_2$, which is, in general, *not perpendicular to its front*, $\beta_2 b$. Again, if AC, the axis of the crystal, be not in the plane of incidence, the ray $A\beta_2$ is not in that plane; so that here we have *refraction out of the plane of incidence*.

The exact accordance of this construction with observation was proved by the careful experiments of Wollaston. We have only to add, that the two rays $A\beta_1$ and $A\beta_2$ are, in all cases, completely polarized in planes at right angles to each other.

The experiments of Brewster showed that in by far the greater number of minerals and artificial crystals, *both* rays are extraordinary—i. e., neither of them can be accounted for by disturbances propagated spherically in the crystal. But no tentative process could lead to the form of the wave-surface in this most general case. Here Fresnel's genius supplied the necessary construction.

He assumes that the ether in a crystallized body is possessed of different rigidity, or different inertia, in different directions; a supposition in itself extremely probable, from the mechanical and other properties of crystals. In the general case there are shown to be three principal directions in a crystal, in any one of which, if the ether be displaced, the resulting elastic force is in the direction of the displacement. Each of these is, in all cases, perpendicular to the others. Any given displacement of the ether corresponds to partial calculable displacements parallel to each of these lines, and thus the elastic force consequent on any displacement whatever is known if we know those for the three rectangular directions. All the calculations are thus dependent on *three* numbers only, for each substance.

To find the form in which a disturbance will spread, Fresnel proceeds as follows: Let the plane of the paper represent the front of a wave in the crystal, and suppose a particle of ether to be displaced in it from A to B (fig. 8). This displacement may be resolved (by the law of the parallelogram of velocities, forces, etc.) into two components in any two directions in the plane of the paper. Assume AP to be one of these, and let PQ be the force produced by disturbing the particle of ether from A to P. In general PQ will *not* lie in the plane of the paper. Let fall a perpendicular, QR, upon the plane of the paper. In general the point R will not lie in AP. The portion RQ, of the elastic force of the ether, Fresnel neglects, because it would produce vibrations perpendicular to the wave-front, i. e., *similar to those of sound*, and he assumes that such normal vibrations do not produce visible light. We shall recur to this point. Fresnel now assumes that the vibrations which will be propagated continuously in the crystal are such as have PR coincident in direction with AP; and then the rate of their propagation will depend upon the ratio of PR to PA. He shows by mathematical reasoning that there are *two* such directions in every wave-front, and that they are always *perpendicular* to each other. This, of course, at once accounts for double refraction, the complete polarization of each of the two rays, and their being polarized in planes perpendicular to each other. The original plane wave is now broken into two, both parallel to the first, but in general moving at different rates. He next considers a disturbance at any point in a crystal as equivalent to waves having fronts in *every* plane passing through that point, and investigates mathematically the form of the surface which is touched by the planes of all the pairs of polarized rays which have (in any given time) proceeded from each of those wave-fronts. The form of this surface is very remarkable. It is symmetrical with reference to three planes at right angles to each other. These, of course together, cut it into eight parts, one of which is figured below (fig. 9). From this it appears, though Fresnel did not perceive it, that the surface has four *conical cusps*, as they are called, the inner portion seeming to be drawn through a hole, as it were, and then spreading out again to form the outer portion. The external appearance of these points very much

resembles the portion of an apple round the point of attachment of the stalk. Fresnel showed that, in particular cases, when two of the three principal elasticities are equal, this surface degenerates into the sphere and spheroid of Huyghens already described for Iceland spar; and that, when all three are equal, it becomes a single sphere, as in glass, water, and other singly refracting bodies. All this, of course, is in complete accord with experiment. But there is vastly more. If we use the wave-surface of Fresnel to construct the refracted rays, just as we employed the sphere for simple refraction, or the sphere and spheroid for Iceland spar, we find generally *two* definite refracted rays (both usually out of the plane of incidence) for one incident ray. But Hamilton, who was the first to perceive the existence of the cusps already described, saw that they indicated the existence of a very remarkable phenomenon, to which he gave the name of conical refraction (q. v.). The ray which, in the crystal, passes from A to C (the cusp, see last figure), has not, like other rays such as ApP, to definite wave-fronts. For if at p and P, where the line ApP meets the inner and outer portions of the wave-surface, we draw tangent planes, these are the definite fronts of the corresponding waves; so that such a ray will split into two only, on leaving the crystal. But AC intersects the surface at C, where it is *conical*, and has an *infinite* number of tangent planes, so that when it leaves the crystal it will split into an infinite number, forming a hollow cone. Hamilton's prediction then was: If a single ray of light be made to pass through a plate of a biaxial crystal in the direction AC (limiting it, for instance, by sheets of tin-foil with small holes in them properly fixed on each side), it will enter and emerge as a hollow cone. Also the plane of polarization will differ for different rays in this cone. Lloyd completely verified this wonderful prediction by experiments made with a plate of *aragonite* (q. v.). But more, Hamilton observed that (see last figure) the wave surface can be

FIG. 8.

FIG. 9.

touched by a tangent plane in a circle surrounding the cusp. If, then, we make the construction of fig. 7 with Fresnel's wave instead of the sphere and spheroid, there will be a definite direction of the incident ray αA , for which the tangent planes $b\beta_1$ and $b\beta_2$ in that figure will coincide, and will touch the wave-surface in the circle about the cusp. Any line drawn from A to a point in that circle will be a direction for a refracted ray. Hence the ray αA will be broken up into a hollow cone of rays, the vertex of the cone being A, and its base this circle. If the crystal be cut into a plate each ray will of course emerge parallel to αA , and the *ensemble* of them will form a hollow cylinder. The prediction, then, is that a single definite ray, falling in a given direction on such a plate of crystal, will emerge as a hollow cylinder. This and the predicted laws of the polarization of the light of the cylinder were also verified by Lloyd.

"The formulæ which led to such triumphantly successful predictions *may* have been deduced from incomplete or even erroneous premises; but they *represent a truth*, and must in time conduct us step by step back to ultimate proof of the truth of Fresnel's assumptions, and of the undulatory theory of light, as now understood, or show us what modifications may be required in the original conceptions."

It would unduly lengthen this article, and besides would lead us into discussions far too recondite for a work like this, to enter upon the question of whether the vibrations in polarized light are *perpendicular* to or *in* the plane of polarization, a subject which has recently been well investigated by Stokes (q. v.); or to consider the production of elliptically polarized light by reflection at the surface of metals, diamond, etc.; and various other most important points of the theory. We can only mention that Green, Cauchy, Stokes, and others, who have entered deeply into the mechanical question of luminiferous vibrations, have found themselves obliged to take into account the *normal* wave, which, as we have seen, Fresnel neglected.

Fluorescence (see PHOSPHORESCENCE), spectrum analysis (see SPECTRUM), and various other important recent additions to the theory, must be merely mentioned; as also the very remarkable observation of Maxwell, which appears to connect light and electricity, and was derived from a theory which assumes the ether to be the vehicle of electricity

and magnetism as well as of light and heat, and by which it appears that the velocity of light is expressible in terms of the static and kinetic units of electricity.

For further information, we refer the reader to Lloyd's *Wave-theory*, an excellent elementary treatise; while to the more advanced mathematician we may commend Airy's *Tract on the Undulatory Theory*.

UNDY, in heraldry, the same as wavy. See **HERALDRY**.

UNEARNED INCREMENT. A term used by Mr. Henry George (q.v.) in his economic writings to designate the rise in the value of land due to the general development of the community and to the gradual occupation of all the land in it. This rise in value being due to the industry, thrift, and activity of others, is thus a gift from the community as a whole, to the individual land owner. See **SINGLE TAX**.

UNFERMENTED BREAD. See **AERATED BREAD**.

UNG, a co. in n.e. Hungary, bordering on Galicia, 1176 sq. m.; pop. '90, 135,247, the majority of whom are Slavs, and Magyars. It is crossed by the Carpathian mountains, which are rich in deposits of coal, iron, and other valuable minerals. Capital, Ungvár.

UNGER, FRANZ, a German geologist and botanist, was born in Styria in 1800. He studied medicine, taking his degree in Vienna, in 1827, and practiced until 1836, when he left his profession and became professor of botany and director of the botanical garden at Gratz. He remained here until 1850, when he became professor in the university of Vienna. During the later years of his life he made several scientific journeys, notably in Denmark and the Scandinavian peninsula, in Egypt and Syria. He died in Gratz in 1870. His principal works are: *Anatomie und Physiologie der Pflanzen* (1855); *Botanische Streifzüge auf dem Gebiete der Kulturgeschichte* (1857 et seq.); *Sylloge Plantarum Fossilium* (1860); *Die Fossile Flora von Kumi in Eubœa* (1867); *Geologie der europäischen Waldbäume* (1869); and *Ueber Lieschkolben der Vorwelt* (1870).

UNGER, JOHANN FRIEDRICH, an eminent printer and wood-engraver, was born in Berlin, in 1750. He was the son of Johann Georg, and worked with his father until he became professor of wood-engraving in the Academy of Plastic Arts in Berlin. He was also the inventor of a peculiar kind of type. He died in 1804.

UNGER, JOHANN GEORG, an eminent wood-engraver, was born near Berlin, in 1715. He was particularly eminent for improvements in printing and engraving. Some of his engravings of landscapes are considered masterpieces even in these days. He died in 1788.

UNGER, JOSEPH, jurist and statesman, b. in Vienna, Austria, in 1828, studied law in that city and after holding a professorship at Prague, returned to Vienna to become a professor in the university. He was greatly interested in the constitutional questions of Austria, and, in collaboration with Fischhof, published *Zur Lösung der ungar. Frage* (1861). He became a member of the lower Austrian landtag, and later of the reichsrath, where he was active on behalf of the liberal programme. From 1871 to 1879 he was a minister without a portfolio, and in 1881 became the president of the imperial court. His chief work was an attempt to systematize the Austrian private law, and was published under the title of *System des österr. allgemeinen Privatrechts*. Among his other works are *Das österr. Erbrecht*; *Der Entwurf eines bürgerlichen Gesetzbuches für das Königreich Sachsen, mit besonderer Rücksicht auf das österr. allgemeine bürgerliche Gesetzbuch besprochen*; *Die rechtliche Natur der Inhaberpapiere*; *Die Verlassenschaftsabhandlung in Oesterreich*. With J. Glaser and others, he published *Sammlung von civilrechtlichen Entscheidungen des k. k. obersten Gerichtshof in Wien* (1859-92).

UNGUENTS, or **OINTMENTS**, are employed in medicine as external applications. They consist of some active agent in solution or in the form of a soft extract, or in fine powder, carefully rubbed up with some kind of fatty matter, or a mixture of several such matters, as prepared lard, prepared suet, white wax, yellow wax, olive-oil, and almond oil. There are no less than 28 ointments in the British *Pharmacopœia*. Some, as the ointments of aconitia, atropia, and belladonna, are employed to allay neuralgia and local pains; simple ointments (consisting of white wax, prepared lard, and almond oil) are employed in dressing raw and blistered surfaces; the ointments of cantharides and of savin are used to keep up the discharge from issues or blistered surfaces; the ointments of creosote, galls, carbonate of lead, oxide of zinc, etc., serve as astringents; those of ammoniated mercury, calomel, nitrate and red iodide of mercury, iodine, iodide of potassium, elemi, resin, and turpentine, act as astringents of varying power, and that of red oxide of mercury as a mild caustic. Many of the ointments are of special service in skin diseases, and sulphur ointment is the specific application for itch.

UNGUICULA TA (Lat. clawed), in zoology, a section of the class mammalia, consisting of those animals which have toes furnished with nails or claws. In the system of Linnæus, it includes the orders *bruta*, *glîres*, *primates*, and *feræ*; in that of Cuvier, the orders *bimana*, *quadrumanâ*, *carnaria*, *marsupialia*, *rodentia*, and *edentata*.

UNGULA TA (Lat. hoofed), in zoology, a section of the class mammalia, consisting of those animals which have hoofs. In the system of Linnæus, it includes the orders *belluæ* and *pecora*; in that of Cuvier, the orders *pachydermata* and *ruinantia*.

UNGULED, in heraldry, a term applied to the tincture of the hoofs of an animal; e.g., azure, a stag trippant or, attired and unguled gules, the arms of the family of Strachan in Scotland.

UNGVÁR', (slav. *Uzgorod*) an important market t. in the n.e. of Hungary, is charmingly situated on the river Ung, 90 miles n.n.e. of Debreczin. It is the residence of a bishop, and contains a very old castle, a beautiful church, a seminary, and gymnasium and important potteries. Trade is carried on in salt, cattle and wine, particularly the last, vines being extensively cultivated in the vicinity. Population, in 1890, 11,793.

UNICOL, a co. in e. Tennessee, separated from North Carolina by a range of the Iron mountains; about 196 sq. m.; pop. '90, 4619. Co. seat, Erwin.

UNICORN (Lat. *unum cornu*, one horn), an animal probably fabulous, mentioned by ancient Grecian and Roman authors as a native of India, and described as being of the size of a horse, or larger, the body resembling that of a horse, and with one horn of a cubit and a half or two cubits long on the forehead, the horn straight, its base white, the middle black, the tip red. The body of the animal was also said to be white, its head red, its eyes blue. It was said to be so swift that no horse could overtake it. The oldest author who describes it is Ctesias, who resided for many years as physician at the court of Artaxerxes Mnemon, and who wrote about 400 B.C. His information, however, was all at second-hand. He calls it the wild ass (*onos agrios*). Aristotle briefly mentions it under the name of Indian ass, saying: "We have never seen a solid-hoofed animal with two horns, and there are only a few of them that have one horn, as the Indian ass and the oryx." Pliny nearly follows Aristotle, but says that the Indian ass is one-hoofed, and the oryx two-hoofed. He speaks also of the *monokeros*, a very fierce animal, with the body of a horse, the head of a stag, the feet of an elephant, the tail of a wild boar, and a single horn. All these accounts are evidently untrustworthy, and much tinged with fable. Not more credible are those of more modern authors. Lobo, in his *History of Abyssinia*, describes the unicorn as resembling a beautiful horse; but there is no good evidence of the existence of any such animal there or in any part of the world. Its existence, however, is not to be decided against on any other grounds; for there does not appear to be anything monstrous or absurd in the notion. Although the descriptions of the unicorn given by the ancients are very unlike the Indian rhinoceros, yet probably that animal was the origin of them all. In like manner, it seems probable that the head of a unicorn, which Barrow saw depicted on the side of a cavern in south Africa, and the head of a unicorn described and figured by Campbell in his *Second Journey in South Africa*, are to be referred to some species of rhinoceros. The word unicorn is unhappily used in versions of the Old Testament for the Hebrew *rêem*. The Septuagint led the way in this, by using the Greek *monokeros*; and it has been supposed by many that the animal meant is a rhinoceros. The *rêem* was, however, certainly not a one-horned, but a two-horned animal. In Deut. xxxiii. 17, where the English version has "horns of unicorns," the correct translation is "horns of a *rêem*." Other circumstances, as an allusion to the gamboling of the young, are also unfavorable to the idea that a rhinoceros is intended.

The unicorn is perhaps best known as a heraldic charge or supporter. Two unicorns were borne as supporters of the Scottish royal arms for about a century before the union of the crowns; and the sinister supporter of the insignia of the United Kingdom is a unicorn argent, armed, crined, and unguled or, gorged with a coronet composed of crosses patée and fleurs-de-lis, with a chain affixed, passing between the fore-legs, and reflexed over the back, of the last.

UNIFORM (one form), in its military and naval sense, means the particular dress and equipment assigned by proper authority to each grade of officers and men. The clothing consists of one prevailing color, variously ornamented and "faced" according to the rank and corps. Although some regiments wear other colors, scarlet may be said to be the prevailing uniform of the British army; blue of the French; and white of the Austrian; dark blue is likewise the color of the British navy. It is surprising how late the introduction of compulsory uniforms took place. We find soldiers serving with corps and yet dressed after the dictates of their own fancy well into the 17th c.; while in the navy uniforms were not fixed with certainty until the beginning of the reign of king George III.

UNIFORMITY, ACT OF. See NONCONFORMISTS.

UNIGENITUS, BULL, one of the most important documents in the history of Jansenism. It was occasioned by the publication of the *Réflexions Morales* of Quesnel (q.v.), in which all the essential principles of Jansenism were revived, and although cautiously, yet systematically explained, so as to form the basis of that practical, moral, and religious teaching which it is the object of the *Réflexions Morales* to convey. The book was at first simply prohibited by a brief of pope Innocent XI., in the year 1708; but, as it found many patrons, and especially the archbishop of Paris, cardinal de Noailles, it was deemed necessary to subject it to a more detailed examination, the result of which was that 101 propositions were extracted from it, and formally condemned, in 1713, by a bull commencing with the word "Unigenitus." The mode of condemning these propositions was peculiar, being that which is technically called *damnatio in globo*. The whole body of propositions were condemned as "heretical," "false," "rash," "scandalous," "offensive to pious ears," etc.; without, at the same time, any particular propositions being pointed out as deserving any one of these specific forms of censure. This circumstance, with

others, gave rise to much controversy, and to a prolonged opposition to the bull. De Noailles and other bishops refused to accept it unless with certain qualifications; on the contrary, Louis XIV. insisted on unconditional acceptance; but on the death of Louis, the regent, the duke of Orleans, having given his countenance to the opponents of the bull, the resistance was persisted in; and eventually a declaration was put forth in 1717, by certain bishops, four in number, appealing from the pope to a general council. This appeal was condemned by the pope, nor was it countenanced even by the regent; but a more modified appeal "from the pope ill-informed to the pope better-informed," was afterward published by De Noailles, which obtained many adherents, and by which the opposition was kept alive to the end of the pontificate of Clement XI. in 1721, and even under his successors, Innocent XIII. and Benedict XIII. It was not till the year 1730 that, after the formal registration of the bull *Unigenitus* by the parliament of Paris, the party thus created in France, and known under the name of "appellants," received its final condemnation from the civil authority, after which it gradually died out, although some relics of it are still traceable, even after all the storms of the revolution, in the so-called "Petite Eglise." See GALLICAN CHURCH.

UNION, a co. in s. Arkansas, having the Ouachita river for its e. boundary; 1138 sq.m.; pop. '90, 14,977. Co. seat, Eldorado.

UNION, a co. in n. Georgia, containing a range of the Blue Ridge; 325 sq.m.; pop. '90, 7749. Co. seat, Blairsville.

UNION, a co. in s. Illinois, having the Mississippi river for its w. boundary, separating it from Missouri; 400 sq.m.; pop. '90, 21,549, chiefly of American birth, with colored. Co. seat, Jonesboro.

UNION, a co. in e. Indiana, bounded on the e. by the state-line of Ohio; 170 sq.m.; pop. '90, 7006. Co. seat, Liberty.

UNION, a co. in s. Iowa; 432 sq.m.; pop. '90, 16,900. Co. seat, Creston.

UNION, a co. in w. Kentucky, having the Ohio river for its w. and n.w. boundary, separating it from Indiana and Illinois; 380 sq.m.; pop. '90, 18,229. Co. seat, Morganfield.

UNION, a parish in n. Louisiana, having the Ouachita river for its e. boundary; 905 sq.m.; pop. '90, 17,304. Parish seat, Farmerville.

UNION, a co. in n. Mississippi; 424 sq.m.; pop. '90, 15,606, chiefly of American birth. Co. seat, New Albany.

UNION, a co. in n.e. New Jersey, having Newark bay and Staten Island sound for its e. boundary; about 102 sq.m.; pop. '90, 72,467. Co. seat, Elizabeth.

UNION, a co. in s. North Carolina; 640 sq.m.; pop. '90, 21,259, chiefly of American birth. Co. seat, Monroe.

UNION, a co. in central Ohio; 427 sq.m.; pop. '90, 22,860, chiefly of American birth. Co. seat, Marysville.

UNION, a co. in n.e. Oregon, separated from Idaho by the Snake river, and containing a range of the Blue mountains; about 3035 sq.m.; pop. '90, 12,044, chiefly of American birth. Co. seat, Union.

UNION, a co. in central Pennsylvania, having the w. branch of the Susquehanna river for its e. boundary; 315 sq.m.; pop. '90, 17,820. It is crossed by several ridges of the Alleghany mountains. Co. seat, Lewisburg.

UNION, a co. in n. South Carolina, having the Broad river for its e. boundary; 660 sq.m.; pop. '90, 25,363. Co. seat, Union.

UNION, a co. in s.e. S. Dakota, separated from Iowa by the Big Sioux river, and from Nebraska by the Missouri; traversed by Chicago, Milwaukee and St. Paul, and the Chicago and Northwestern railroads; about 430 sq.m.; pop. '90, 9130, chiefly of American birth. Co. seat, Elk Point.

UNION, a co. in e. Tennessee, intersected by the Clinch river; 220 sq. m.; pop. '90, 11,459. Co. seat, Maynardville.

UNION, a t. in Hudson co., N. J., on the Hudson river, 2 m. n. of the city of Hoboken. Pop. '90, 10,643.

UNION COLLEGE, Schenectady, N. Y., founded in 1795. Union college owes its name to the fact that it was established by the co-operation of several religious denominations. It was the first non-sectarian college in the United States, and has continued to be the representative of religious unity. The college was the first in New York state west of the Hudson river, and the first chartered after the establishment of the United States. The administrations of its three earliest presidents cover but nine years; they were, John Blair Smith (1795-1799), Jonathan Edwards, son of the famous New England divine (1799-1801), and Jonathan Maxcy (1802-1804). In 1804, Eliphalet Nott was made president, and during his presidency, which continued until his death, in 1866, the college became one of the foremost institutions of learning in the United States.

The foundation of the college was due largely to the national feeling of the beginning of the republic, and its national character and influence are indicated by the fact that among its alumni were William H. Seward, and President Arthur, as well as Robert Toombs, of Georgia. The presidents since Dr. Nott's death have been Laurens P. Hickok (1866-1868), Charles A. Aiken (1869-1871), Eliphalet Nott Potter, grandson of Dr. Nott (1871-1884), Harrison E. Webster (1888-1894), and Andrew V. V. Raymond, who entered upon the office in 1894. The college grounds comprise 200 acres of land within the city limits; the buildings include dormitories, chemical, physical and biological laboratories, library, chapel, memorial hall, gymnasium, professors' residences and fraternity chapter-houses. The library numbers about 30,000 volumes. The natural history museum is one of the best in the country. Courses are offered leading to the degrees of A.B., Ph.B., B.S., B.E., and C.E. Generous sums are given in scholarships to students from the proceeds of endowments made for that purpose. Many prizes and other honors are offered.

Union college received by its charter full university powers, but established no professional schools except the school of civil engineering, founded in 1845, the first established by any college in the United States. Independent professional schools were established in Albany, the medical college in 1838, the law school in 1851. The Dudley observatory was founded in Albany in 1856, not for instruction, but for the advancement of scientific knowledge. In 1873, all these institutions were united with Union college to form Union university, the president of Union college becoming chancellor of the university. In 1881, the Albany college of pharmacy was founded and incorporated with Union university. The school of civil engineering added in 1896 a course in electrical engineering, in which unusual advantages are offered by the co-operation of the General Electric Co., whose works are located in Schenectady. The college faculty consisted in 1897 of 27 professors and instructors; the university faculty of 89 professors, instructors, and lecturers. The students in the college numbered 221; medical college, 214; law school, 86; college of pharmacy, 47. Total, 568. Total number of graduates of Union college, 4940; total number living, 2470.

UNION GOODS, a general name for such textile fabrics as are composed of more than one material; but it is applied chiefly to those made from vegetable fibres, as mixtures of flax and hemp, or jute, cotton and flax, etc. This class of manufactures has immensely increased of late years.

UNION IDE. See FRESH-WATER MUSSEL.

UNIONISTS. See POLITICAL PARTIES, ENGLISH.

UNION-JACK (from the *jacque*, or surcoat, charged with a red cross, anciently worn by English soldiers—see JACK), the national banner of the united kingdom of Great Britain and Ireland, formed out of the combination of the crosses of St. George (argent, a cross gules), of St. Andrew (azure, a saltire argent), and of St. Patrick (argent, a saltire gules), these three crosses being the national banners of England, Scotland, and Ireland respectively. The first union-jack, which was introduced by a royal proclamation in 1606, three years after the union of the Scottish with the English crown, combined only the crosses of St. George and St. Andrew, and may be blazoned, azure, a saltire argent surmounted by a cross gules edged of the second. This combination was by royal proclamation of date July 28, 1707, constituted the national flag of Great Britain. On the union with Ireland, a new union ensign was devised, in which the cross of St. Patrick was introduced, with its four limbs edged with white on one side. This awkward specimen of heraldry forms the second and now existing union ensign. Generally speaking, it is displayed as a national ensign on flags only; but the reverse of the bronze coins of the realm contains a not very accurate representation of it on the shield of the seated figure of Britannia. The inaccuracy consists in the crosses of St. Andrew and St. Patrick being made to assume the appearance of a single saltire with a narrow border of equal width on each side.

UNION THEOLOGICAL SEMINARY, in New York City, founded 1836. Its buildings were on ground extending from Greene to Wooster streets, between 6th and 8th streets, then quite on the outskirts of the city. A few weeks before, the great fire of 1835 had greatly reduced the resources of its friends, and, not many months after, the financial troubles of 1837 spread bankruptcy among them and through the land simultaneously with the ecclesiastical troubles which rent asunder the Presbyterian church. Yet, after a little delay, the erection of the needful buildings was secured. Thomas McAuley, D.D., president; Henry White, D.D., professor of theology; and Edward Robinson, D.D., LL.D., professor of biblical literature, constituted the faculty, assisted by several professors and instructors extraordinary. The famous Van Ess library, opportunely offered for sale in Europe at a small fraction of its value, was bought as a nucleus. When the act of incorporation was obtained, the word "Union" was added to the name, in the legislature, for distinction's sake, but without having been desired by the directors. It has since proved an honorable distinction in a sense not then contemplated. The early history of the seminary was a continued struggle with inadequate financial resources; but by numerous and liberal subscriptions, in some instances several times repeated, and by legacies, it has gradually become well endowed. Its vested funds and other property amount now to about \$2,000,000. Its library has increased from 13,000

vols. to 71,000 vols. and 27,000 pamphlets. The location on University place was exchanged, 1884, for one on Park ave. and Murray hill, where fine buildings have been erected, including the Morgan library and the Adams chapel. During its first 40 years the institution sent forth 1778 students. Its faculty now consists of 7 professors and 5 instructors, and several courses of lectures are given on subjects by distinguished men specially appointed from time to time. The number of students for 1895-96 was 155.

UNION LABOR PARTY, a political party in the United States organized at a convention at Cincinnati on Feb. 22, 1887 and drawing its support largely from the Greenbackers, and the members of the older labor organizations and of the farmer organizations. The chief points in its platform during the campaign of 1888 were opposition to land monopoly in every form, a demand for national control of means of transportation and communication, a condemnation of a further issue of interest-bearing bonds and a demand for free coinage of silver, the abolition of national banks, the establishment of women's suffrage, the exclusion of the Chinese, the introduction of a graduated income tax, and the passage of a constitutional amendment making United States senators elective by direct vote of the people. In the election its vote was small, but the organization paved the way for the formation of the People's party.

UNIONTOWN, borough and co. seat of Fayette co., Pa.; on the Pennsylvania and the Baltimore and Ohio railroads; 70 miles s. by s.e. of Pittsburgh. It contains Mountain View park, electric light and street railroad plants, waterworks, national and state banks, about 15 churches, glassworks, iron and steel works, and flour and planing mills. It was laid out in 1783 and incorporated in 1796. Pop. '90, 6359.

UNION UNIVERSITY. See **UNION COLLEGE**.

UNIO PROLIUM is a phrase used in Germany to designate a form of adoption which frequently takes place when a widower having children marries a widow having children. The agreement between these parents is to the effect that these children of previous marriages shall have the same rights to their succession as any children which may be the fruits of their marriage.

UNIT is a magnitude or number regarded as an individual whole. A unit of weight or measure is a determined quantity or magnitude taken as a standard of comparison for others of the same kind. In Physics, the fundamental units are those of *length*, *mass*, and *time*, as all necessary measurements can be based on these quantities. In scientific measurements, the C. G. S. system (see J. D. Everett's *Units and Physical Constants*) suggested by the Unit Committee of the British Association, and generally accepted, adopts the *centimetre* as the unit of length, the *gramme* as the unit of mass, and the *second* as the unit of time. This system receives its name from the initial letters of these denominations. In the system of British weights and measures, based on Bird's standards, established in England during the years 1758 and 1760, and introduced later into the United States, the unit of length, the yard, is defined by the distance between two parallel lines on gold studs, sunk in a bar of bronze when at 62° Fahrenheit. This bar is preserved in the Standards Office, 7 Old Palace Yard, Westminster, London. The unit of weight, the pound, is defined by the attraction between the earth and the standard pound of platinum when in a vacuum at sea level at London; also preserved in the Standards Office. Platinum is used because capable of being exposed to pure air at an ordinary temperature for an indefinite length of time without increase or diminution of its mass. The unit of value in money in England is the *pound sterling*; in the United States, Mexico, and the Argentine Republic, the *dollar*; in Germany, the *mark*; in the Latin Union (q.v.), the *franc*; in the Scandinavian Union and Denmark, the *krone*; in Holland, the *guilder*; in Austria, the *guilder*. The unit of heat is the heat necessary to raise the temperature of one pound of ordinary cold water one degree Fahrenheit. The unit of power for a steam engine is the power required to raise 33,000 pounds of matter one foot in a minute, a horse power. In mechanics, the unit of work is the work expended in raising one pound of water to the height of one foot. The integral unit is 1, or the unit of integral numbers. The unit of a fraction is the unit to be divided into fractional parts. A fractional unit is one of the equal parts into which a unit is divided. Unit is the name of a small gold coin of the time of James I. of Scotland. The units adopted for electrical measurements are, the centimetre as the unit of length, the gramme as the unit of mass, and the mean solar second as the unit of time.

UNITARIANS, a name applied generally to all who maintain that God exists in one person only, and specially to a small Christian sect of recent times, whose distinguishing tenet is the unity as opposed to the trinity of the Godhead. In the more general sense, the name of course includes the Jews and the Mohammedans as well as those Christians who deny the doctrine of the trinity, and in this sense also there have been Unitarians from the earliest period of ecclesiastical history. Until the middle of the 2d c., there seems to have been no controversy upon the subject; but from that time to the end of the 3d c., there was a succession of eminent teachers who maintained, against the ecclesiastical doctrine of the Logos, the undivided unity—or, as they expressed it—the *monarchy* of God. From their use of this word, they are known in ecclesiastical history as the Monarchians. There are generally understood to have been two classes of them—those who taught that Christ was God in such a sense that it was the Father who became man, and was born and suffered, and who were, on this account, called by their opponents Patripassians; and secondly, those who held that

Christ was in nature a mere man, but exalted above all other prophets by the superior measure of divine wisdom with which he was endowed, and who therefore corresponded more nearly with the modern Unitarians. It is right to notice, however, that the doctrines of the Monarchians are known to us only through the statements of opponents, and it is probable they would have disowned the more extreme views ascribed to them. To the former of the two classes we have mentioned belonged Praxeas, against whom there is a treatise by Tertullian, and Noetus; and at a later period—about the middle of the 3d c.—the famous Sabellius taught very similar doctrines. The other class was represented by Theodotus, Artemon, and especially Paul of Samosata, bishop of Antioch, who was eventually deposed on account of his heresy. Beryllus, bishop of Bostra in Arabia, who is said to have been convinced of his error by Origen, would seem, from the single sentence which records his teaching, to have belonged to this class rather than the other. The Monarchians appealed in support of their doctrines to the Old and New Testaments, and to the early opinions of the church. They are said, by Tertullian, to have consisted of the simple and the unlearned—"always," he adds, "a majority of the faithful"—a statement which shows that they must have been tolerably numerous in his time; while a writer quoted by Eusebius brings against them the apparently opposite charge of being students of geometry and lovers of Aristotle.

The grand theological struggle which followed in the 4th c. between the Arians and the Athanasians may be regarded as but another phase of the Unitarian controversy, inasmuch as Arius held that the Son was a created being, and denied his consubstantiality with the Father. On this head, the reader may consult the articles **ARIUS** and **ATHANASIUS**. We now pass on to the post-reformation period.

It is not strange that in the great stir of thought which accompanied the reformation, some should have been found bold enough to question the grand Catholic doctrine of the trinity. Such there were even before the Socini. See **SOCINUS**. Among the earliest may be mentioned Hetzer and Bassen, both of whom were executed in 1529, the former, however, not exclusively for his religious opinions; Denck, Campanus, and the famous Spaniard, Michael Servetus (q.v.). So widely, indeed, was the Unitarian doctrine diffused that it was thought necessary, in the first article of the Augsburg confession, to condemn the modern Samosatans, who deny the personality of the Word and Spirit, declaring the former to be a proper spoken word, and the latter a divine influence; and as early as 1527, one Andr. Althamer published a work against "the modern Jews and Arians under a Christian name, who deny the deity of Christ." Under the influence of the elder Socinus, Unitarianism gained many adherents in Venetia. Poland and Transylvania, however, became its principal strongholds, and in those countries, favored by circumstances, it struck the deepest roots. In Poland, the nobility, protected from persecution by their class privileges, proved singularly favorable to a movement which seemed more destructive of the traditions of the Catholic church than any that had yet been entered upon; the Unitarian refugees from other countries found here a ready welcome; and in the reign of Sigismund II. (1548-72), this party of reformers was strong enough to form itself into a separate church. At a rather later period, Poland was the principal field of labor of the younger Socinus, and Unitarianism continued to flourish there until the middle of the 17th c., when, under John Casimir, who before his elevation to the throne had been a cardinal and a Jesuit, it was extirpated by force. In Transylvania, the Unitarians have succeeded in maintaining their existence, notwithstanding much opposition and persecution, from the reformation to the present day. The first who openly preached Unitarianism in that country were George Blandrata and Francis Davidis (1565), and under the influence of these distinguished men, large numbers, including the king himself, embraced the new opinions. But this period of prosperity was not of long duration. In 1572, though still permitted to worship according to their conscience, the Unitarians were forbidden to make any attempts at propaganda, or even to print their religious books. They were not, however, subjected to any violent persecution until after the incorporation of Transylvania with the Austrian empire, which took place in 1690; but after that time they were robbed by the Roman Catholics of all their churches and church property, forbidden to build new churches without the permission of the emperor, and by degrees excluded from all government offices, even the very lowest. On the accession of Joseph II., happier times returned. Their churches were forbidden to be seized, and an indemnity was even paid them for the loss of the cathedral church of Klausenburg. They were now enabled to build new churches, and their cathedral and college at Klausenburg are said to be still two of the finest buildings in that city. The Unitarians of Transylvania number about 60,000, and are said to be increasing. They have an organized system of church government, with a bishop at its head. They have three colleges—that of Klausenburg, with 12 professors and 273 students; that of Torda; and that of St. Keresztur.

In England, Unitarian opinions were somewhat later in making their appearance than on the continent. As early, indeed, as 1548, a priest named John Ashton was accused of Arianism, and escaped with his life only by recantation; and during the reigns of Edward VI., Mary, Elizabeth, and James I., a few suffered martyrdom on similar charges. But during the reign of James I., continental Socinianism began to exercise considerable influence in England, and continued to do so to the end of the century, so

much so that, in 1665, Dr. Owen wrote that "the evil is at the door, that there is not a city, a town, scarce a village, in England wherein some of this poison is not poured forth;" and how deeply the church of England was infected with it may be inferred from the no doubt exaggerated statement of Palmer, who, in 1705, spoke of "troops of Unitarian and Socinian writers, and not one dissenter is found among them." Many eminent men of the time, including Milton, Locke, and Newton, and in the next century, the famous apologist, Lardner, must be numbered among the Unitarians; but it was in the last decade of the 17th c. that the controversy on this subject was most active, and at this time were published the old Unitarian tracts—a series of anonymous writings marked by eminent learning and talent. Hitherto, however, the Unitarians, with the exception of the society formed in London by John Biddle (q.v.), which did not survive its founder, had no organized existence. But after the passing of the toleration act in 1689, whereby non-conformity was made legal, the way was prepared for that gradual change by which the orthodoxy of the English Presbyterians passed into Unitarianism. It was at this time that most of the old Presbyterian chapels were founded, and the trusts being open—i.e., not committed to any doctrinal system—ministers and people were left free to adopt and promulgate whatever new opinions should approve themselves to their conscience. Thus the Unitarians are the legitimate successors and representatives of the 2,000 Presbyterian divines who in 1662 left the church of England in consequence of their inability to comply conscientiously with the terms of the act of uniformity. The ground of this separation, it should be understood, was no difficulty about the doctrinal articles of the establishment. The English Presbyterians (so called from their preference for that form of church government, for they were never able to adopt it) were originally as orthodox as their Episcopal brethren; but having refused to commit themselves to any authoritative creed, they underwent a gradual change to Arian, and at length to Unitarian views. Many preached such views without exciting attention or controversy, and indeed, until 1813, the law which made it blasphemy to speak against the Trinity, though not strictly enforced, was still in existence. During the latter half of the 18th c., Dr. Priestley (q.v.) appeared as the champion of the humanitarian view of Christ's nature, and, by the influence of his writing, secured the more open advocacy of that doctrine. In 1773 Dr. Lindsey resigned his charge in the church of England, and became pastor of the Unitarian congregation of Essex street, London—an event which may be regarded as an epoch in the history of English Unitarianism. In 1813 the Unitarians were placed by law fully on a par with other dissenters, and since that time there has been no attempt at persecution, with the exception of the claim made to some of their properties by certain orthodox dissenters. This claim was met by the dissenters' chapels act in 1844. The Unitarians of England and Wales are purely congregational in their church government, their only organ for combined action being the British and foreign Unitarian association, which holds its meetings annually in London. Their principal place of education is Manchester New College, London, which is, however, an unsectarian institution. They have also a missionary college in Manchester, and the Presbyterian college, Caermarthen, educates Independent and Unitarian ministers. They have at present about 282 chapels and 20 mission stations.

In Scotland the religious atmosphere has never been very favorable to Unitarianism. It was in that country that the last execution for blasphemy against the Trinity took place in the person of the unfortunate Aikenhead. Nevertheless, toward the close of the 18th c., there was a certain amount of Arianism among the moderates in the Church of Scotland. Unitarianism, as a distinct system, was preached at Montrose as early as 1783; and, at the beginning of the present century, some attempts were made to diffuse it by means of missionary efforts. There are now ten congregations in the country. That at Edinburgh was originally a branch from the Cameronians, the strictest of Calvinists, but having adopted the principle of free inquiry, they gradually embraced Arian, and eventually humanitarian views. This last change took place during the ministry of the late Dr. Southwood Smith, about the year 1812.

In Ireland the history of Unitarianism is intimately connected with that of Presbyterianism. It flourishes principally in the n. of the island, where there is a strong infusion of Scotch blood, and where Roman Catholicism has the least influence. In 1891 there were forty churches in Ireland. The Unitarians of Ireland are Presbyterians in fact as well as in name.

The Unitarians first appeared, organically, in the United States in King's Chapel (now "Stone Chapel"), Boston, the first Episcopal church established in New England—where Mr. James Freeman, having been appointed a "lay reader" avowed Unitarian sentiments, inducing the congregation to declare themselves independent, alter the liturgy (1785), and ordain him, by the action of their wardens and vestry, as their pastor (1787). He ministered to them about fifty years. During this time other ministers, some of them in Harvard college, embraced and preached different shades of the same views, until in 1812 a controversy on the subject arose, between Dr. Worcester and Professor Stuart on the one side, and Dr. Channing and Prof. Ware on the other. This produced a crisis among the churches of Boston and the vicinity that had remained nominally evangelical; many of them were rent asunder, and congregations avowedly Unitarian were formed. The American Unitarian association, organized in Boston, 1825, was designed principally to publish and circulate tracts and books. It has also given aid in

building churches and sustaining preachers in this country, and has maintained a missionary in India in communication with the Brama Somaj and its thousand congregations. The first general gathering of American Unitarian ministers was at New York in 1865, where the question of adopting a creed was debated, but met with very little favor. Except the single tenet which their name indicates, there is little in which they are agreed. While some of their churches and ministers are divided from the evangelical by a scarcely visible line, others stand at the extreme of rationalism and naturalism. Their history, they say, is "a history of individual opinions rather than of organizations, or methods of action; it is biographical, not national; it takes the form of heresies, as they are called, rather than creeds; it is marked by protests rather than professions. It has been called by its opponents a system of negations; yet every negation implies an affirmation. The affirmations of the conference were that every man has a right to judge for himself, unbound by any set of articles; that while professing itself to be a Christian body, it left every one to decide for himself what Christianity is, i.e. to choose among the conflicting views of Christian doctrine and statement that which seemed to him to be true and right." "The stand taken by Unitarians," they say, "is for nature, for human nature, for everything that God has made, as being the manifestation of his will as truly as anything written in the Bible. Righteousness and not dogma is the everlasting condition of all welfare in this world and the next; the acceptance of Christianity is not the believing in a creed, but believing with the heart; Jesus Christ, himself, in his life and death, all dogmatizing apart, is the embodiment of his religion; he holds that supremacy in the beauty and power of his life which makes it of all that has appeared upon earth, the fittest to be imitated and followed; and the man who comes nearest to that is the best Christian." According to the statistical returns for 1896 there were 525 ministers, 458 churches, and 70,000 communicants. The divinity school at Harvard university and the theological seminary at Meadville, Pa., are connected with this denomination. The denomination has much literary culture and wealth; it is socially select, but shows no such rapid growth as characterizes several of the evangelical denominations. This is due doubtless to its continual attitude of negation and protest.

The Socinians assumed, as the fundamental principle of their theology, the sufficiency of Scripture, or rather of the New Testament, which, they held, had, for all matters of faith, superseded the Old. According to their system, Christ was a true man, but conceived of the Holy Spirit; and on account of the divine power which he has received from the Father, and his exaltation as head over all things, he is to have worship offered to him. The Holy Spirit is not a person, but a divine influence. The Socinians rejected also the doctrine of original sin. Man, they taught, was created with a mortal nature, but by the special gift of God, was endowed with a conditional immortality. He was created innocent, but not positively righteous. The gift of immortality he forfeited by disobedience. The fall of Adam, however, being a single act, could not deprave his own nature, much less that of his posterity; and in the latter, death was not a consequence of the fall, but was simply the condition of birth and life. Thus, the actual consequence of Adam's fall was not any radical corruption of human nature, whereby it was impossible for man to do any good thing, but rather a moral deterioration, producing, with repeated acts of disobedience, an increasing tendency to sin. Man, after the fall, retained his free will, and the power of abstaining from sin if he so pleased. On the question of the merits of Christ, the Socinian doctrine was essentially different from that of all the other Protestant sects. Christ's merits did not consist principally in his death, but in his life, his teachings, and his example. Nor was his death regarded as an atoning sacrifice, or as having any vicarious efficacy whatever, but simply as a confirmation of God's will, and the seal of the new covenant. Christ died for our sins—first, that all sinners might in this way have the assurance of forgiveness and of eternal life; secondly, that they might be drawn to Christ, and led to seek through him alone remission of their sins; and thirdly, that God might thus testify his boundless love to the human race, and might reconcile it to himself. But the crucifixion was important chiefly as preparing the way for the great crowning miracle of the resurrection. Here, in fact, not Christ's death, but his resurrection, is the central point of the Christian scheme. By this he confirmed his doctrine of immortality, and prepared for his ascension into heaven, where he now fills the office of our great high priest. Jesus "frees us from the punishment due to our sins, in that he continually protects us by the virtue and power which he has received from the Father, and by his intervention, defends us, as it were, from the wrath of God; and he frees us from servitude to our sins, by drawing us away from every kind of vice, and showing us in his own person the reward of him who abstains from sin." Predestination in this system means the decree of God, made before the foundation of the world, that they who believed and were obedient should be saved, and that they who believed not and were disobedient should be damned. Justification takes place when God pardons our sins and gives us eternal life. The Socinians regarded the sacraments as simply external signs testifying to Christian faith. Hence they held infant baptism to be irrational as well as unscriptural, but thought that a custom so old and established should be tolerated.

It need scarcely be said that the systematic theology of the early Socinians is in Great Britain quite a thing of the past; indeed, the English Unitarians, though undoubtedly

more or less influenced by their continental brethren of the reformation period, have with the latter no very direct historical connection. They seem rather to have arrived at independent conclusions, through their "rational" interpretation of Scripture, and their consistent rejection of human authority in matters of faith. The Unitarians of the present day, like almost all Christian sects, must be divided into two classes—a conservative and a progressive class—or, as they are often called, an old and a new school. The former adopt the old rule of the sufficiency of Scripture, though with many such qualifications as the scientific criticism of the Bible has rendered indispensable. The most conservative Unitarians, for example, would not contend for the literal truth of the first chapter of Genesis, nor for the doctrine of verbal inspiration in any shape. The Bible is *not*, but it *contains*, the Word of God, is the form which best expresses their position on this subject. They generally hold the simple humanity of Christ, and even reject the supernatural birth, thinking the parts of the gospels which record that event to be less authentic than the parts referring to the ministry, the death, and resurrection of Jesus. To the death of Christ they ascribe much the same kind of efficacy as we have seen was ascribed to it by the Socinians, regarding his teaching and example as the most essential part of his work, and his death as an attestation to the truth of his mission, and a preliminary to his resurrection. What, however, chiefly distinguishes the Unitarians of this school from those of the new or progressive school, is the place which they give to the miracles as supernatural sanctions of the truth of Christianity. In this respect they must be considered as still under the influence of Locke's philosophy and the theology of Dr. Priestley. Denying that man has any immediate knowledge or intuition of spiritual things, they regard Christianity as a system of moral and religious truth external to man's nature, and requiring, in proof of its divine origin, certain evidence beyond its inherent credibility and adaptation to human wants. This evidence they find in the miracles, which they accept as well-attested facts, on the same ground on which all historical facts are accepted. "If there be any truth in history," says Dr. Priestley, whose influence can still be traced in the Unitarians of this school, "Christ wrought unquestionable miracles, as a proof of his mission from God; he preached the great doctrine of the resurrection from the dead; he raised several persons from a state of death; and, what was more, he himself died and rose again in confirmation of his doctrine. The belief of these facts I call the belief of Christianity." According to this view, therefore, Christ is an ambassador from heaven to earth; the miracles he wrought are his credentials; and the moral and religious truths which he taught are his message. It is not indeed denied that many or all of those truths might be learned from the light of nature, but they have received from Christianity a sanction which gives them a greater degree of certainty than they could otherwise possess. The Unitarians of the progressive school, on the other hand, have abandoned the philosophy of Locke for more spiritual modes of thought. So far from regarding man as entirely dependent upon his reasoning powers for his knowledge of religion, they rather look upon him as standing in a living relationship with the one infinite source of all truth, and as having within his own nature the germs of the highest religious faith. Christianity, accordingly, they regard not as a *message* or a system of truth communicated and authenticated from without, but as the highest expression of the divine in humanity—an expression not necessarily preternatural, but connected with the previous history of mankind by the natural laws of moral and spiritual development. To this view of Christianity, the miracles are not felt to be essential as proofs; and the truths of the gospel are thought to be quite unaffected by any judgment regarding them. The Unitarians, however, of this school, while, from their point of view, they regard the question of the miraculous as one of critical rather than religious interest, yet generally accept the miracles as historical facts, considering that there is sufficient evidence to prove that they took place. A few, but an increasing number, agree with Theodore Parker and many of the German critics in rejecting them, on the twofold ground that they are intrinsically incredible, and that the evidence for them is conflicting and uncertain. Generally speaking, the Unitarians of this school, like the so-called Broad-church men, are disposed to regard with favor the freest criticism of the Bible. Holding that inspiration is a quality which is not peculiar to the Bible, but common to all the most elevated religious literature, and that it in no case implies immunity from error, they maintain that the Scriptures must be subjected to the same rules of criticism and interpretation as any other book, and that each book of Scripture is to be studied not as a collection of infallible oracles, but as a record of the mind of the age in which it was produced. In this light, however, and also as a record of the grandest religious movements of the world's history, they hold the Bible in the highest estimation. Such is a statement, necessarily imperfect, of the peculiarities of the two Unitarian schools in their extremest divergence from one another; it need scarcely be added that in fact they merge into each other by imperceptible gradations.

It will, of course, be understood that the Unitarians of all shades of opinion are agreed in rejecting the entire orthodox scheme—including the doctrines of the Trinity, the vicarious atonement, the deity of Christ, original sin, and everlasting punishment—as both unscriptural and irrational. They celebrate the Lord's supper in their churches, not as a sacrament, but as a service commemorative of Christ's death, and expressive of

spiritual communion with him. They also adhere generally to the rite of infant baptism, though there are a few Unitarian Baptist churches. In recent years, the Unitarians have given renewed prominence to the principles of comprehension and of free inquiry apart from the restraints of theological creeds, conceiving that in this they are conforming to the spirit of their Presbyterian forefathers; and many even object to the name Unitarian, as one which might be held to imply a doctrinal bond of union, and to be, to that extent, inconsistent with the fundamental principles of the body, which both now and in former times have always included unrestricted freedom of religious thought. It is impossible here to explain at greater length the Unitarian position; but it may be mentioned, as an important fact, that, when, at the meeting of the British and foreign Unitarian association in 1866, it was proposed to add to the rules a clause defining "Unitarian Christianity," the motion was almost unanimously rejected. The motion was intended as a protest against anti-supernaturalism. Its rejection, on the other hand, was an assertion of the principle of comprehension and freedom, and was voted for by those who sympathized doctrinally with the proposer, as well as by those who differed from him. For fuller information on the history and doctrines of the Unitarians, the reader may consult Dr. Beard's *Unitarianism in its Actual Condition*; the Rev. J. J. Tayler's *Religious Life of England*; Otto Fock's *Socinianismus*; and Lange's *Geschichte und Lehrbegriff der Unitarier vor der Nicänischen Synode*.

UNITED ARME'NIANS, that division of Armenian Christians who are under the ecclesiastical jurisdiction of the pope. The Armenian rite in the Roman Catholic church has a patriarch and primate in Cilicia, 4 archbishops at Constantinople, Aleppo, Diarbekr, and Lomberg, 2 in *partibus*, and 16 bishops. Their union was effected, 1314-44. They number 100,000, of whom 78,000 are in Turkey and Persia; more than 8000 in Austro-Hungary; and 14,000 in Russian Caucasasia and Siberia. In 1872 a part of the United Armenians of Turkey renounced the jurisdiction of the pope and joined the Old Catholics.

UNITED BRETHREN IN CHRIST, a church formed in 1760 among the Germans in Pennsylvania, by Philip William Otterbein, sent to America by the synod of Holland as a missionary. This church has often been confounded with the Moravians, with whom, however, it has no ecclesiastical connection. Otterbein commenced his labors at Lancaster, Penn., but removed to other places, and finally to Baltimore. He was a man of fervent piety, a remarkably effective preacher, and had great influence with the people. He held union-meetings, often in the woods, which were continued for several days. To one of these he invited all who had experienced a change of heart. Many came, among whom were Lutherans, Reformers, Mennonites, Moravians, and others. A Mennonite preacher—Martin Boehm—professing to have experienced what he called the new life, was present, and preached with great power. At the close of his sermon Mr. Otterbein embraced him, and said: "We are brethren." This was the origin of their name. These two labored together for 50 years, and as their converts multiplied and needed ministers, laymen were licensed to preach, and soon annual conferences were appointed for examining, licensing, and directing them in their work. The first annual conference was in 1800 at Baltimore; the first general conference, 1815. In 1889, 6 bishops, 4450 churches, 2050 ministers, 204,517 members, were reported. This church has 12 educational institutions in several western states. It has at Dayton, Ohio, a large printing establishment, which issues a number of periodicals and a variety of books in German and English. It has quarterly, annual, and general conferences, of which the latter is the highest, and meets quadrennially. Lay-delegates have been members since 1873. Bishops are elected for four years. No slave-holder, or member of secret society, or any one who manufactures, sells, or drinks intoxicating liquor is admitted to the church. Baptism is administered in the mode which the candidate prefers. Infant baptism is practised. The theology of the United Brethren is Arminian. Their service, formerly in German only, is now also in English. They have foreign missions in Germany and Africa.

UNITED COPTS are those Christian descendants of the ancient Egyptians in Egypt and Abyssinia, who, since 1732, have been united to the Roman Catholic church. See *Copts*.

UNITED EVANGELICAL CHURCH, established in Germany, 1817, by the union of portions of the Lutheran and Reformed Churches. Such a union had been attempted without success in 1529, 1631, 1661, and by Frederick I. of Prussia, 1703-22. Frederick William I. published several decrees having the same object in view. It was favored also toward the end of the 18th c. by the progress of rationalism, which made many theologians of both churches indifferent concerning doctrinal controversies, because they had lost faith in the doctrines themselves. Schleiermacher proposed to establish an outward church-unity, leaving disputed points in scientific theology still open for discussion. At the tercentenary of the reformation in 1817 a visible union was established, limited, however, at first, as many of its advocates supposed, to a common church government, and a common celebration of the Lord's-supper. In this movement the government of Prussia has always been the leader. The clergy in Berlin having published a declaration in favor of it, the minister of the interior confirmed it, and issued a decree that the organization should be called the Evangelical Christian church. The Lord's-supper was to be celebrated by adhering strictly to the scriptural words of institution. The progress

of the union was disturbed by the king's recommending the court liturgy to all the congregations of the kingdom; and when, in 1834, the royal decree ordered its introduction into all congregations—united and non-united—many strict Lutherans left the united church. During the rest of that reign the government endeavored to force them back, but Frederick William IV. having, in 1845, granted liberty of worship, they organized an independent Lutheran church; the rest of the old Lutheran, and the Reformed Church, including about 10,000,000 persons, being nominally connected with the United Evangelical Church. One party of these regarded the union as only an external subjection to a common church government, while in doctrine the churches might be Lutheran, Reformed, or United; a second party, comprising the chief theological faculties, built its doctrines on the Bible, together with the dogmas common to the Lutheran and Reformed symbols; and a third, rejecting the authority, both of the Lutheran and Reformed symbols, and professing to hold simply to the Bible, claimed the right of subjecting even its authenticity to critical inquiry. In 1846 the king convoked a general synod to complete the organization of the church; and the work, having been interrupted by the revolution of 1848, was resumed in 1856. A similar union of Lutherans with the Reformed has been accomplished in several other of the German states; while of the rest some are too exclusively Lutheran, and some too exclusively Reformed to warrant the attempt. In 1885 the United Evangelical Church of all Germany had 25,000,000 members. A branch of this church was organized in the United States at St. Louis in 1840, and, after several divisions and reunions, now includes 7 synods, having about 300 ministers and 40,000 members. As late as 1876 the German language was exclusively used in all its congregations.

UNITED GREEKS. See GREEK CHURCH.

UNITED METHODIST FREE CHURCH, a branch of the Methodists in England, was formed at Rochdale in 1857, by the union of two divisions of the denomination, whose history is as follows: The introduction, in 1827, of an organ into Brunswick Chapel at Leeds, led to the withdrawal of a portion of the congregation, and the organization of the Protestant Methodist Church. In 1836 this body united with the Wesleyan Methodist Association, which had been formed in that same year, and owed its origin to dissatisfaction with the efforts of the Methodist Conference to establish a theological seminary. In 1849, the expulsion from the Conference of three ministers, who had, it was claimed, been insubordinate, gave rise to the Wesleyan Reform Union. Attempts to secure the return of the expelled clergymen and their adherents, led to what was termed the "Mediation Movement," in which the memorialists, all within the Methodist Connection, asked for some sort of lay representation in the chief courts. This being denied, the agitators, who did not wish to establish a separate body, sought admission to the Conference of the New Connection, and failing in this were induced to confer with the Wesleyan Methodist Association, and in 1857 a union of the two bodies was formed, which took the name of the United Methodist Free Churches. By 1860 only a few societies were left to constitute the Reform Union, which in 1889 had only 14 ministers and about 8600 members. This branch of the English Methodist Church, which is the third in numerical importance, is represented in Scotland, and in its missionary stations in Jamaica, Australia, New Zealand, Eastern Africa, and China. In 1896 this body had 417 ministers, 3448 local preachers, 89,618 members, and 1350 Sunday schools, with 25,296 officers and 203,712 members.

The independence of the local church, and the free election of members to the annual assembly, constitute the most prominent features of this organization. Committees annually chosen have charge of the funds, institutions, and general work.

UNITED PRESBYTERIAN CHURCH, the name of a religious body in Scotland, which was constituted in 1847 by the amalgamation of the SECESSION and RELIEF CHURCHES, whose origin and history we propose briefly to narrate.

The SECESSION CHURCH.—The causes which led to the formation of the secession church, in order to be thoroughly understood, would require to be unfolded at much greater length than our space permits. But some notice of them, however brief, is absolutely necessary. It is well known that the reformation from popery in Scotland was a very radical and decisive affair in regard to both the doctrine and government of the church. The people became strongly Calvinistic and Presbyterian; and after the accession of James to the English throne (1603), their attachment to their ecclesiastical system became stronger still. The efforts of that monarch to supplant it by Episcopacy proved unavailing, so far as the great body of the commons and gentry were concerned; but moved by various considerations, into which religious conviction entered only as a very subordinate element, many of the Scottish nobles adopted the church principles of their sovereign, and after the restoration (1660), supported the governments of Charles and James in their persecution of the covenanters. See COVENANTS; SCOTLAND; SCOTLAND, CHURCH OF. At the meeting of the Scottish estates in 1690, Episcopacy, which in Scotland had obtained a temporary supremacy under the rule of Sharp (q.v.) and Lauderdale, and had, besides, become synonymous with adherence to the house of Stuart, was abolished, and Presbyterianism re-established. One unavoidable consequence of this was the abolition of the *right of patronage*, for in a multitude, probably the great majority of cases, the exercise of this right would have placed the nomination to ecclesi-

astical benefices in the hands of Episcopalian landholders, and thereby imperiled the existence of a sound Presbyterian ministry. But although there were still many zealous Presbyterians in Scotland, especially among the peasantry, the spirit of the nation as a whole had gradually undergone a great, and, in the opinion of some, a disastrous change, so far as religion was concerned. A kind of torpor seized the upper and middle classes after the "glorious revolution," and, earnestness growing unfashionable, was sneered at as fanaticism. A proof of the latitudinarianism of the times is the fact that some hundreds of Episcopalian curates were allowed to retain the parishes in which they had been arbitrarily stationed, on subscribing the *confession of faith*; and great numbers of laymen became elders in a church whose strict adherents they had themselves but recently hunted even to death. This obtrusion into the church of curates whom bishop Burnet describes as "the worst preachers I ever heard, ignorant to a reproach, and many of them openly vicious," produced, as may easily be conceived, a pernicious influence on the purity of ecclesiastical discipline; and in 1712, when the obnoxious *law of patronage* was restored, the triumph of the "court" or "moderate" party in the church may be regarded as complete. See MARROW CONTROVERSY. Violent settlements, effected by the agency of dragoons, now became frequent, and greatly irritated the people, whose petitions and appeals were almost invariably disregarded; and finally, in 1730, the assembly enacted that in future no reasons of dissent "against the determinations of church judicatures" should be entered on record. This attempt to gag the mouths of congregations was more than some could bear, and in Oct., 1732, the Rev. Ebenezer Erskine of Stirling, in a sermon delivered in his capacity of moderator before the synod of Stirling and Perth, denounced in solemn and impassioned words the recent legislation and spirit of the church. A committee was immediately appointed to consider the matter, and reported rather vaguely but unfavorably at the ensuing meeting of synod; in consequence of which Mr. Erskine, after three days' "warm reasonings," was found deserving of censure by a majority of six. He immediately protested (as did also twelve other ministers and two elders), and appealed to the next general assembly, which sustained the decision of the synod, and ordered the rebuke and admonition to be administered "in order to terminate the process." Erskine, of course, had to submit to censure, but left a written protest on the table of the assembly, in which he declared his intention to continue testifying against the "defections" of the time. This protest was also signed by William Wilson, minister of Perth; Alexander Moncrieff, minister of Abernethy; and James Fisher, minister of Kinclaven. The assembly was indignant, and next day ordained "that the four brethren appear before the commission in August next, to express sorrow for their conduct, and retract their protest;" on pain of being suspended from their ministry. This they refused to do, and in consequence were declared "no longer ministers of the church" (Nov., 1733), whereupon they handed in a final written protest, in which, after referring to the "defections from our reformed and covenanted principles" of the "prevailing party," they protested that they were obliged to MAKE A SECESSION FROM THEM, and appealed unto the first free, faithful, and reforming general assembly of the church of Scotland.

This was the origin of the famous "Secession Church," which has made so deep an impress on the religious life of Scotland. At first composed of only four ministers, it rapidly began to gather strength. Little Christian societies were everywhere formed, which were gradually supplied with pastors either from the establishment, or from pious youths trained to the work of the ministry by Erskine and his friends. Erskine and his friends drew up a statement of their reasons for separation, which was published under the title of *A Testimony to the Doctrine, Worship, Government, and Discipline of the Church of Scotland, or Reasons (by the Four Brethren) for their Protestation entered before the Commission of the General Assembly*. This document, which afterward came to be known as the "First or Extra-judicial Testimony," presented in a polemical or argumentative form those facts in the later history of the church of Scotland at which we have already glanced; and is of great value with reference to a proper understanding of the grounds of secession. From it we learn that it was *not* one thing only, not even the unpopular "law of patronage" (as has sometimes been carelessly imagined and asserted), that induced Erskine and his friends to leave the church of their fathers; but an accumulation of grievances that in their eyes had become insupportable. In short, the Secession church had a *religious*, and not a *political* origin. What the "four brethren" sought was the vindication of what they held to be evangelical truth, much more than of the mere right of "popular election." So much popular indignation was excited by the deposition of the "four brethren," that it was thought desirable by the majority of the "Moderate party" to make certain concessions to the "Evangelicals," or "Marrow party," lest the spirit of insurrection should grow, and perhaps overturn the establishment. Accordingly, the general assembly of 1734 passed some measures distinctly favorable to the latter party, and curiously contrasting with their former procedure; and finally, on the last day of the sittings, empowered the "synod of Perth and Stirling" to remove the censures from the four brethren, and to restore them to their respective charges. This was done; and to show how far their new-born cordiality could go, the synod proceeded, in Mr. Erskine's absence, to elect him "moderator;" but Mr. Erskine declined to be "reponed," and gave his reasons in a letter to the Stirling presbytery, and in a pamphlet subsequently published. In Dec., 1736, appeared the pamphlet entitled *An*

Act, Declaration, and Testimony for the Doctrine, Worship, Discipline, and Government of the Church of Scotland, commonly known as the "Judicial Testimony," which is a sort of survey of the whole ecclesiastical history of Scotland from the reformation downward, in which all the "instances of defection and relapse are marked and judicially condemned." In 1737 the Rev. Thomas Mair of Orwell, the Rev. Ralph Erskine of Dunfermline, the Rev. Thomas Nairn of Abbotshall, and the Rev. James Thomson of Burntisland, joined the original "four." The church authorities, filled with anger and alarm, now resolved to proceed to extremities against the seceders. In 1738 the "commission," obeying the injunctions of the assembly of that year, libeled the "Eight Brethren," and summoned them to appear before the assembly of 1739, which they did—having, however, first drawn up and passed an act entitled a *Declinature*, in which they disclaimed the authority of the established courts. One final effort was made by the assembly to bring them back to the bosom of the church, but it failed—the "brethren" adhering strictly to all their former protestations and testimonies; and after a "year of grace," the general assembly of 1740 solemnly pronounced their deposition, and the connection between Erskine and the church of his fathers was forever at an end.

It is not necessary to describe minutely the gradual extension of the "Secession movement" among the people of Scotland, but we may mention, that in spite of the frequent refusal of sites for churches, and other modes of persecution, the cause abundantly prospered; and after a few years, the "Secession Church" came to be recognized as a really important body, both from the number of its congregations, and the grave, serious, and solid character of its members.

In 1747 a rupture or "breach" took place in the new body on the question of the burghs-oath, some affirming that this oath could not be taken by any consistent seceder, and others insisting that it could, and that the question regarding it ought to be matter of mutual forbearance. The party condemning the religious clause in the burghs-oath formed the *General Associate Synod*, or popularly, the *Anti-burgher Synod*; the party tolerating it, the *Associate or Burgher Synod*. Subsequently, a second split occurred in each of these, and two other trivial denominations were formed, the one assuming the designation of the *Constitutional Associate Presbytery*, or *Old Light Anti-burghers* (1806); and the other, the designation of the *Original Burgher Presbytery*, or *Old Light Burghers* (1799). After holding aloof from each other for more than 70 years, the Burghers and Anti-Burghers began to approximate once more, and finally, on Sept. 8, 1820, in Bristo street meeting-house, Edinburgh, the synods of the two long separated branches of the Secession were solemnly reunited. At the date of the "breach" (1747), the number of Secession congregations was 32; when the reunion took place, it had increased to 262. Henceforward, the history of the Secession church exhibits a course of uninterrupted prosperity. A certain change, however, now begins to show itself in the character and spirit of the denomination. Hitherto, seceders had worn a sort of *old-world look*, if we may use these words respectfully; their thoughts and interests in matters ecclesiastical centered round bygone times and events; their very language, like their sentiments, was archaic, and fell coldly upon all but the devoutest ears. Now, however, the wants of the modern world made themselves felt even in the narrow circles of Scotch dissent. In a word, they came under the liberalizing influences of the new-born enthusiasm for foreign missions, and started "stations" in Canada, Jamaica, Trinidad, Calabar, etc. So vigorously was this important branch of Christian work carried on, that in 1847, at the period of the union of the Secession and Relief churches, the former was found to be supporting a staff of more than 60 missionaries in different parts of the world. Further, the *Secession* church began to assume an attitude more distinctly antagonistic to the establishment. Though it has never formally avowed the *voluntary* principle (see VOLUNTARIYISM), yet the fact that it has maintained itself *ab initio* by voluntary effort, has had the effect of determining the great majority of the pastors and people to adopt this principle. A variety of circumstances, partly political and partly ecclesiastical, led to a great controversy between leading divines of the Establishment and of the Secession, known as the *Voluntary Controversy* (1829-34), which served to strengthen the voluntarism of the seceders, and brought them more closely into connection with the Relief church (see below), whose theoretical voluntarism was perhaps still more pronounced. Next followed the famous *Atonement Controversy*, in which the Secession church signalized itself by an adherence to the liberal evangelical theology of the Marrow, and on this vital point also it had the sympathy and support of the Relief body. The desire for union between the two denominations now became stronger than ever. Committees were appointed, and conferences held; and at length on May 13, 1847, in Tanfield hall, Edinburgh, the union of the Secession and Relief was formally accomplished, and the two churches, abandoning the names by which they had hitherto been known, formed themselves into one body under the designation of the UNITED PRESBYTERIAN CHURCH.

We now revert to the RELIEF CHURCH, whose history and fortunes we shall briefly narrate. After the expulsion of Erskine and his friends from the church of Scotland, the assemblies (packed with "court of sessions elders") became more determinedly "moderate" than ever. The split that occurred among the seceders in 1747 convinced them that they had now little to fear from the aggressive zeal of their opponents, who had taken to quarreling among themselves; and, desiring to stand well with government

for various reasons, they boldly resolved to deprive the people of all right to elect, or in any way to interfere with the election of ministers. Never were forced settlements more shameless than about this period; but it has been well remarked, "there is a point at which oppression becomes intolerable; and to a religious people, no oppression is half so galling as that which is spiritual." *Relief* was felt to be a necessity, and relief came in the person of the Rev. Thomas Gillespie, minister of the parish of Carnock, near Dunfermline. The circumstances which brought him into collision with the general assembly were these: In 1749, the Rev. Andrew Richardson was presented to the parish of Inverkeithing by the patron, Capt. Philip Anstruther; but the presentation proved so extremely unpopular that the presbytery of Dunfermline refused to proceed with it. In 1750, the case came before that high-handed body, the "commission of the assembly," who ordered the presbytery to proceed at once to induct Mr. Richardson. This mandate they firmly refused to obey; and when, after much discussion, the affair again came before the commission in March, 1752, it was resolved to transfer the onus of the unpopular settlement from the shoulders of the presbytery of Dunfermline to those of the synod of Fife. This compromise did not satisfy the out-and-out moderates in the church of Scotland. It was, therefore, resolved to make an example of the presbytery of Dunfermline at the ensuing assembly. On May 18, the "Inverkeithing case" came on, and after a brief but animated debate, the conduct of the "commission" was condemned by the assembly without coming to a vote; the presbytery of Dunfermline was ordered to induct Mr. Richardson on Thursday the 21st, and on the day following to appear at the bar of the assembly. The presbytery did *not* meet on Thursday—at least a *quorum* did not—and Mr. Richardson was consequently not inducted. On Friday, six ministers of the presbytery—Robert Stark, David Hunter, Thomas Gillespie, Alexander Daling, Thomas Fernie, and John Spence—handed in a "representation," explaining why they could not obey the commands of the supreme court. They were warned by the moderator of the danger in which they stood, and were finally informed that if they remained obdurate, *one* of them should be deposed. Next day, they were called *singly*. Stark, Fernie, and Hunter all wavered and shifted their ground a little; Daling and Spence said nothing; but Gillespie was ready with a second "representation." This was enough. Gillespie was fixed on as the most suitable sacrifice, and almost without trial, without a libel or any formal process whatever, he was arraigned, cast, condemned, and deposed. The majority of the general assembly, corrupt as its composition undoubtedly was, seems to have shrunk from active participation in the deed. Out of 158 members present, only 56 ventured to vote, and these, it must be remarked, were mainly lawyers!

The *Relief Church*, it will be seen, was founded simply on an assertion of the right of congregations to elect their own ministers. In 1758, Mr. Thomas Boston, jr., minister of Jedburgh, and son of the great Boston, threw in his lot with Gillespie; in 1761, the congregation of Colinsburgh, in Fife, did the same. The relief had now got a footing; and steadily increased. "Societies" (as in the case of the seceders) sprung up everywhere, which were gradually formed into congregations, and obtained ministers from the Establishment, the Secession, the Reformed Presbytery, and the English Presbyterians; nevertheless, they had long to sustain a severe fire of attack from the Seceders and Reformed Presbyterians, on account of their firm adherence to the latitudinarian principle of "free communion," i.e., of holding Christian fellowship at the Lord's table with other denominations. It is unnecessary to prosecute the history of the Relief further than to state that at the union in 1847 it numbered 113 congregations, while the Secession numbered 384 congregations; so that the UNITED PRESBYTERIAN CHURCH commenced with 497 churches, and a membership estimated at more than 140,000.

UNITED PRESBYTERIAN CHURCH.—The career of this church as a corporate body has been one of uninterrupted prosperity, and scarcely more is necessary than to indicate its present attitude and condition. In point of doctrine, it adheres (like all the other Presbyterian churches of Scotland) to the Westminster confession of faith and the larger and shorter catechisms, "it being always understood that we do not approve of anything in these documents which teaches, or may be supposed to teach, compulsory, or persecuting and intolerant principles in religion"—a qualification supposed to refer more particularly to the 23d chapter of the confession of faith. Its form of church government is Presbyterian; but, unlike the Established and Free churches, it has no intermediate courts between presbyteries and the supreme court, the latter of which it does not call a general assembly, but only a synod; though, in point of fact, it partakes more of the nature of a "general" assembly than the bodies known by that name, since it is really an assembly of the whole clergy of the denomination, with one elder from each kirk-session. It has a theological hall and library in Edinburgh, and a staff of professors. The United Presbyterian church is also at present, not only in *practice*, but also in *theory*, a voluntary church. The voluntary principle, it is true, is not formally laid down in any portion of her standards, or "basis of union;" but a long experience of practical voluntarism has finally led, one may almost say, the whole body of United Presbyterians to the conviction that the interests of Christianity are best served by the total separation of the church from the state. Although inferior in point of wealth to the Established and Free churches, the United Presbyterian church has honorably distinguished itself by its general liberality and occasional munificence.

In the year 1875 about 100 congregations of the United Presbyterian church situated in England were transferred by the mother church in Scotland to the "Presbyterian church in England" (q.v.). Since the separation of its English branch the United Presbyterian church counted, 1896, 577 congregations and 191,881 members. Protracted negotiations for union between the United Presbyterian and Free churches have been without result.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA, was formed, 1858, by the union of the Associate and Associate Reformed churches.

I. *The Associate church* in the United States had its origin in the persecutions which drove parties of Scotch and Irish covenanters to the American colonies. In 1680 some of them settled at Port Royal, S. C., but were driven away by Spanish invaders. In 1750 the first minister of the Secession church of Scotland arrived in Philadelphia, and the Associate presbytery of Pennsylvania was formed. It soon had congregations in New York, Virginia, and the Carolinas. In 1776 the presbytery of New York was formed. In 1782 these presbyteries united with the Reformed presbytery in forming the Associate Reformed synod of North America. A small minority in both denominations were opposed to the union, and in them the Covenanter or Reformed and the Associate churches have been continued. The latter was increased by ministers from Scotland. In 1793 its first theological school was established in Beaver co., Penn. In 1798 the presbytery of Kentucky was formed, and the Associate synod of North America in 1801. In 1800 the presbytery of Pennsylvania declared slavery to be a moral evil, and unjustifiable; and in 1831 the synod excluded all slave-holders from its communion. This action led to the withdrawal of all the congregations in the southern states, but the loss was made up by accessions in western states. In 1858 the Associate synod included 21 presbyteries, 231 ministers, 293 congregations, and 23,500 communicants.

II. *The Associate Reformed church.* The Associate Reformed synod, formed 1782, organized itself in 1802 into a general synod, composed of the synods of New York, Pennsylvania, Scioto, and the Carolinas. In 1804 a theological seminary was established in New York city, with Dr. John M. Mason as prof. of theology. In 1820 the synod of Scioto withdrew from the general synod, and that of the Carolinas at its own request was set off as an independent body. In 1821 a union was formed with the general assembly of the Presbyterian church, but only a part of the denomination agreed to it. The synod of New York continued its separate existence, and in 1829 re-established the theological seminary at Newburgh. In 1855 it was united with the western synod (of Scioto), and the general synod of the Associate Reformed church was renewed, containing 4 synods, 28 presbyteries, 253 ministers, 367 congregations, and 31,284 members. They held to the Westminster confession, close communion, anti-slavery, and the use of only the psalms in praise.

III. In 1858 the Associate and the Associate Reformed churches were re-united under the name of The United Presbyterian church of North America. In addition to their adherence to the Westminster standards they have adopted a testimony against slavery and secret societies, and in favor of close communion, the exclusive use of the psalms in worship, and the duty of covenanting. They have three colleges, three theological and two missionary seminaries under their charge. In 1896 they reported to their general assembly 669 ministers, 948 congregations, 385 mission stations, and 109,408 members. They are active in mission work, both at home and abroad, and have successful missions in Egypt and India.

UNITED PROVINCES. See **NETHERLANDS**.

UNITED STATES OF AMERICA, THE, a federal republic composed (1897) of 45 states, 3 organized and 2 other territories, and a federal district, occupy the central portion of the continent of North America, from lat. 24° 20' to 49° n.; long. 66° 48' to 124° 32' w., bounded on the north by the British possessions of North America, from which it is partly separated by Lakes Superior, Huron, St. Clair, Erie, and Ontario, and the St. Clair, Detroit, Niagara, and St. Lawrence rivers; on the east by New Brunswick, the Atlantic Ocean, and Gulf of Mexico; on the south by the Gulf of Mexico and Mexico; and on the west by the Pacific Ocean. Its greatest length from the Atlantic to the Pacific excluding Alaska, is 3100 miles; greatest breadth, from Maine to Florida, 1780 miles; northern or British frontier, 3700 miles; Mexican, 2100 miles; ocean coast, including the various indentations, 21,354 miles, of which 12,359 are on the Atlantic, 5744 on the Gulf of Mexico, and 3251 on the Pacific. The territory of Alaska, long known as Russian America, between lat. 52° and 71° 27' n., and long. 130° 25' and 187° 36' w., now belongs to the United States.

The total area of the United States is 3,602,990 square miles, or 2,305,913,600 acres, obtained by successive annexations of territory. In 1783 the United States had an area of only 827,844 square miles; by the purchase of Louisiana from France in 1803, it acquired 1,171,931; by the cession of Florida by Spain in 1819, 59,268; by the annexation of Texas in 1845, 375,239; by the Oregon treaty with Great Britain in 1846, 280,425; by the Mexican treaties, 591,338; and by the purchase of Alaska from Russia in 1867, 577,390 square miles.

PHYSICAL CHARACTER.—Although occupying the central portion of a continent, more than two-thirds of the frontiers of the United States are shores of lakes and oceans, with numerous bays and sounds, rivers and lakes. On the Atlantic coast are Passamaquoddy Bay, Penobscot Bay, Massachusetts Bay, Long Island Sound, New York Bay, Chesapeake Bay, Albemarle and Pamlico Sounds, etc.; on the Gulf of Mexico—Tampa Bay, Apalachee Bay, Pensacola Bay, Mobile Bay, Atchafalaya Bay, Galveston Bay, Matagorda Bay, Corpus Christi Bay, etc.; and on the Pacific, the Channel of St. Barbara, Bay of Monterey, San Francisco Bay, Humboldt Harbor, Strait of Juan de Fuca, Puget's Sound, etc., and the bays and sounds of Alaska. The principal lakes, besides those divided with British America, are Lake Champlain, Lake Michigan, Great Salt Lake, Pyramid Lake, Mono Lake, Lake Tulare, and many beautiful clusters of smaller lakes in Maine, New York, Minnesota, and elsewhere.

The rivers of the United States may be classed in four divisions: 1. The Mississippi and its branches (q.v.); 2. The rivers emptying into the Atlantic or its bays and sounds—the St. Croix, Penobscot, Kennebec, Merrimac, Connecticut, Hudson, Delaware, Susquehanna, Potomac, James, Roanoke, Neuse, Cape Fear, Pedee, Santee, Savannah, Altamaha, St. John's, etc.; 3. Those, besides the Mississippi, emptying into the Gulf of Mexico—the Chattahoochee, Alabama, Tombigbee, Pearl, Sabine, Trinity, Brazos, Colorado, Nueces, and Rio Grande; 4. Those emptying into the Pacific—the Oregon or Columbia, Sacramento, San Joaquin, Colorado, etc. Besides these, there are many small rivers emptying into the great lakes, and finding their outlet through the St. Lawrence; and the rivers which empty into the salt lakes of the great interior basin of Utah. The chief mountains of America are those which belong to the great eastern chain of the Alleghanies (see APPALACHIANS) and the Rocky Mountains (q.v.).—The geology of the United States will be found described under the titles NORTH AMERICA, APPALACHIANS, ROCKY MOUNTAINS, and the several states and territories.—The soil is of every variety, from the sterile deserts of the great western plains and Utah, to the inexhaustible fertility of the bottom-lands of the Mississippi valley, where heavy crops of maize have grown for fifty successive years without manuring. The St. Lawrence basin is an elevated calcareous plain, fertile and well wooded. The Atlantic slope from Maine to New Jersey, east of the Hudson, is hilly, and best adapted for grazing; more southerly, the coast-belt is low, sandy, in places swampy, with pine-barrens, the inland region fertile, and among the best in the country. The Mississippi valley is generally level, and prairie-land of unsurpassed fertility, with a rich mold, in places 25 ft. deep. Northwest, the country rises to a high and sterile region, extending from 200 to 400 miles from the base of the Rocky Mountains. The Texas slope has rich bottom-lands on the coast, a fine rolling, fertile country, rising to a high plateau dry and sterile, except in the river-bottoms. The Pacific slope is generally sterile, except the great valleys between the mountain-ranges, and bordering the rivers, which are of great fertility. Utah, in the main, is an arid region with an abundance of alkaline substances, but has many tracts made fertile by artificial irrigation. The country east of the Mississippi, except the prairies of Illinois and Indiana, was, at its settlement, heavily wooded, and there are still vast forests of valuable timber—beech, birch, maple, oak, pine, hemlock, spruce, walnut, hickory, ash, elm, etc.; and in the south, live oak, water oak, magnolia, palmetto, tulip-tree, cypress, cotton-wood, cane, etc. West of the 97th meridian stretches a vast region of almost treeless prairies; forests again occur in the Rocky Mountains. California, Oregon, and Washington have the largest timber in the world. Information concerning the flora and fauna will be found under the head AMERICA (Botany, Zoölogy), and the names of the several states.

CLIMATE.—For a particular account of the climate of the United States, we refer to the articles RAIN and TERRESTRIAL TEMPERATURE. It is remarkable for wide transitions of cold and heat, rain and drought, except in the peninsula of Florida, where the temperature varies but 12° Fahr.; and western Oregon and Washington, where the climate is like that of England. With few exceptions, the summers are hot both north and south, the thermometer rising at times to 110° Fahr., and along the northern range of states sinking to -20°, and even sometimes as low as -40°. The whole Atlantic coast has a winter temperature 10° lower than that of western Europe in the same latitude. Thus, at New York in the latitude of Madrid, the Hudson River is frozen, and the harbor at times filled with floating ice. The causes modifying the climates of the different portions of the United States chiefly arise out of the physical features, of which the Rocky Mountains, the Gulf of Mexico, the Atlantic, and the lake system in the north are the most prominent. On the west, from the shores of the Pacific to the Cascade Mountains, one of the most important ranges of mountains in America, the climate resembles that of Great Britain more closely than that of any other country in the world, being mild and humid, with frequent showers at all seasons. But the great valley lying between the Cascade and the Rocky Mountains is almost entirely a rainless district, because the westerly winds are drained of their moisture in crossing the Cascade Mountains before arriving there. In winter it is covered with snow, but in summer is dry and arid. Owing, however, to the copious streams poured down from the melting snow, it presents abundant facilities for irrigation, so that its capabilities and resources are great if properly developed. The country east of the Rocky Mountains depends for its rain on the Gulf of Mexico, and the rainfall there is distributed most in the low

plains and least on the plateaux and mountains. Hence over this extensive district southerly winds are warm and moist, and westerly and northerly dry and cold. The result is rapid alternations of temperature, such as are never experienced in western Europe, the temperature having frequently a range in the course of a day of 50° or 60°. In the New England states, the northerly and easterly winds are cold, moist, and chilly, accompanied with frequent fogs; otherwise the climate resembles that of Great Britain. The climate of the states surrounding the great lakes in the north is mild and moist in summer as compared with the other northern states; but in winter, when the lakes are frozen over, a degree of cold is experienced greater, absolutely and relatively, than anywhere else in the states. This excessive cold is caused by the country being exposed in the north to the full sweep of the polar current from the north; but more particularly to its low-lying situation, thus forming, as it were, a vast basin into which is poured from all sides the cold, and therefore heavy, currents of air chilled by terrestrial radiation during the winter season.—The health of the United States varies with climate, elevation, etc. Swamps and river-bottoms in some regions, especially the more fertile, are malarious. The rice-swamps of Georgia and South Carolina are fatal to whites, but not to negroes. In vast tracts of new country, even the rolling and hilly, the disturbance of the soil causes intermittent fevers. Diseases of the lungs prevail in the northern and middle states; bilious fevers in the southern; in the western, intermittent and remittent bilious. The average mortality in 1890 was 19.06 per 1000; in 1896 it was 14.90. In 1890 the death-rate for native-born whites of native parentage was 17; while for native-born whites of foreign parents it was 24.42; for foreign-born whites, 19.85; and for the colored, 19.57. The high rate among the native-born whites of foreign parents probably arose from the large number of children in that class. The death-rate for the colored was nearly the same as that for all the whites, but in cities the death-rate of the colored was 34.52 as against 23.22 of the whites. In 1896 the rate was lowest in Arizona, 4, Mississippi, 6; Nebraska, 6.21; South Dakota, 7.62; Texas, 8.58; and Washington, 8.60; and highest in Louisiana, 27.14; South Carolina, 26.51; New Jersey, 21.13; District of Columbia, 20.96; Maryland, 19.57; Massachusetts, 19.35; Rhode Island, 19.31; and Tennessee, 19.21. The lowest rate in 1890 was in Mississippi, 5.88; and the highest in South Carolina, 33.41. Probably no portion of the world is more salubrious than Vermont and the eastern slope of the Alleghanies, Florida, the upper country around the Gulf of Mexico, the head-waters of the Mississippi, California and Oregon. See VITAL STATISTICS.

MINERALOGY.—The United States are rich in mineral productions. Coal is found in every state except Maine, New Hampshire, Vermont, New Jersey, Delaware, South Carolina, Louisiana, Mississippi, Minnesota, Wisconsin, and Nevada. The area of the coal-measures is estimated at 300,000 sq. miles. The whole extent of the coal area in the United States has been divided into four principal coal-fields or tracts, viz., the Great Central Alleghanian or Appalachian coal-field, extending from Tuscaloosa in Alabama, through eastern Tennessee and Kentucky, western Virginia, Maryland, Ohio, Pennsylvania, and reappearing in New Brunswick and Nova Scotia. This field has been computed to cover within the United States an area of 50,000 to 60,000 sq. miles, of which about 40,000 sq. miles area are considered workable area. It is subdivided into eight minor divisions, productive of bituminous coal. The second coal-field occupies the greater part of Illinois and Indiana, and in extent is nearly equal to the first. A third field covers a large portion of Missouri, and the fourth the greater part of the state of Michigan. The Chesterfield bituminous coal-field, a detached district of small area near Richmond, Va., contains the oldest worked collieries in America, and for many years furnished the only supply of coal for the sea-board towns. The total product in 1896 was, bituminous, 137,640,276 short tons, and anthracite, 48,010,616 long tons. Connected with the coal-fields are the petroleum springs, which form a source of great wealth to many localities. Beds of rich marl are found in a number of the eastern states, and in many, nitrates and carbonates of soda and potassia, gypsum, and marbles of great variety and some of rare beauty. Iron is found everywhere, from the pure metal in mountain masses, to bog-ore, and in many places in close proximity to coal. Lead exists in rich deposits in Missouri, Arkansas, Illinois, and Iowa. Copper is found in several states, and in great quantities of ores of 71 to 90 per cent. on the borders of lake Superior. Zinc exists in considerable quantities in New Jersey and Pennsylvania. Tin has been found in Maine and California. Silver is found in lead and copper, and in rich silver mines in New Mexico, Arizona, California, Utah, and Nevada. Gold is found in small quantities in the eastern states; in larger deposits in Virginia, North and South Carolina, and Georgia; and in great quantities in California, Oregon, Colorado, Nevada, Washington, Arizona, New Mexico, and Montana. In addition there are found platina in small, and mercury in large, quantities in California; osmium and iridium in Oregon; cobalt in North Carolina and Missouri; and nickel in Connecticut and Pennsylvania. In 1891, tin, chiefly the black oxide, was discovered in South Dakota and Wyoming; and in July of the same year, the Temescal mines in San Bernardino co., California, began shipping tin in bars to the market. These mines are claimed to have an ultimate capacity of some 2500 tons per annum, but have not as yet been fully developed. See TIN. Many valuable gems and precious stones are found in the United States, the beryl, tourmaline, garnet, corundum, agate, sapphire, and others, and a collection of these attracted much attention at the Paris Exposition of 1889.

The following table shows the mineral production of the United States in the calendar year 1896, as reported by the United States Geological Survey (May 15, 1897):

MINERAL PRODUCTS OF THE UNITED STATES.

| PRODUCTS. | 1896. | |
|--------------------------------------------------------|-------------|---------------|
| | Quantity. | Value. |
| METALLIC PRODUCTS. | | |
| Pig iron, spot value.....long tons | 8,623,127 | \$90,250,000 |
| Silver, coining value.....troy ounces | 58,834,800 | 76,069,236 |
| Gold, coining value....." | 2,568,132 | 53,088,000 |
| Copper, value at New York.....lbs. | 453,007,139 | 48,698,267 |
| Lead, value at New York.....short tons | 187,000 | 10,472,000 |
| Zinc, value at New York....." | 81,499 | 6,519,920 |
| Quicksilver, value at San Francisco.....flasks | 30,765 | 1,075,449 |
| Aluminum, value at Pittsburg.....lbs. | 1,300,000 | 520,000 |
| Antimony, value at San Francisco.....short tons | 601 | 84,290 |
| Nickel, value at Philadelphia.....lbs. | 17,170 | 4,464 |
| Platinum, value (crude), San Francisco.....troy ounces | 163 | 944 |
| Total value of metallic products..... | | \$286,782,570 |
| NON-METALLIC (SPOT VALUES.) | | |
| Bituminous coal.....short tons | 137,640,276 | \$114,891,515 |
| Pennsylvania anthracite.....long tons | 48,010,616 | 81,415,785 |
| Building stone..... | | 31,346,171 |
| Petroleum.....barrels | 60,960,361 | 58,518,709 |
| Natural gas..... | | 12,450,260 |
| Brick clay..... | | 9,000,000 |
| Clay (all other than brick).....long tons | 360,000 | 800,000 |
| Cement.....barrels | 9,479,473 | 6,378,385 |
| Mineral waters.....gallons sold | 25,446,312 | 4,129,862 |
| Phosphate rock.....long tons | 948,720 | 2,868,954 |
| Salt.....barrels | 13,850,726 | 4,040,839 |
| Limestone for iron flux.....long tons | 4,120,102 | 2,060,000 |
| Zinc-white.....short tons | 20,000 | 1,400,000 |
| Gypsum....." | 224,139 | 572,344 |
| Borax.....lbs. | 13,508,000 | 675,400 |
| Mineral paints.....short tons | 48,032 | 530,455 |
| Grindstones..... | | 326,826 |
| Fibrous talc.....short tons | 46,089 | 399,443 |
| Asphaltum....." | 80,503 | 577,563 |
| Soapstone....." | 22,183 | 354,065 |
| Precious stones..... | | 97,050 |
| Pyrites.....long tons | 115,483 | 320,163 |
| Corundum and emery.....short tons | 2,120 | 113,246 |
| Oilstones, etc.....lbs. | | 127,098 |
| Mica....." | | 57,041 |
| Barytes (crude).....long tons | 17,068 | 46,513 |
| Bromine.....lbs. | 546,580 | 144,501 |
| Fluorspar.....short tons | 6,500 | 52,000 |
| Feldspar.....long tons | 7,614 | 30,700 |
| Manganese ore....." | 9,979 | 88,812 |
| Flint....." | 12,274 | 21,038 |
| Monazite.....lbs. | 30,000 | 1,500 |
| Graphite..... | | 48,460 |
| Bauxite.....long tons | 18,364 | 47,338 |
| Sulphur.....short tons | 5,260 | 87,200 |
| Fuller's earth....." | 9,872 | 59,360 |
| Marls....." | 60,000 | 30,000 |
| Infusorial earth....." | 2,846 | 16,732 |
| Millstones..... | | 22,567 |
| Chromic iron ore.....long tons | 786 | 6,667 |
| Cobalt oxide.....lbs. | 10,700 | 15,301 |

The relative rank of the states and territories in population (1890) was: 1, New York; 2, Pennsylvania; 3, Illinois; 4, Ohio; 5, Missouri; 6, Massachusetts; 7, Texas; 8, Indiana; 9, Michigan; 10, Iowa; 11, Kentucky; 12, Georgia; 13, Tennessee; 14, Wisconsin; 15, Virginia; 16, North Carolina; 17, Alabama; 18, New Jersey; 19, Kansas; 20, Minnesota; 21, Mississippi; 22, California; 23, South Carolina; 24, Arkansas; 25, Louisiana; 26, Nebraska; 27, Maryland; 28, West Virginia; 29, Connecticut; 30, Maine; 31, Colorado; 32, Florida; 33, New Hampshire; 34, Washington; 35, Rhode Island; 36, Vermont; 37, South Dakota; 38, Oregon; 39, District of Columbia; 40, Utah; 41, North Dakota; 42, Delaware; 43, New Mexico; 44, Montana; 45, Idaho; 46, Oklahoma; 47, Wyoming; 48, Arizona; 49, Nevada.

| CENSUS YEARS. | Population of the United States. | Population of cities. | Inhabitants of cities in each 100 of the total population. |
|---------------|----------------------------------|-----------------------|------------------------------------------------------------|
| 1790..... | 3,929,214 | 131,472 | 3.35 |
| 1800..... | 5,308,483 | 210,873 | 3.97 |
| 1810..... | 7,239,881 | 356,920 | 4.93 |
| 1820..... | 9,633,822 | 475,135 | 4.93 |
| 1830..... | 12,866,020 | 864,509 | 6.72 |
| 1840..... | 17,069,453 | 1,453,994 | 8.52 |
| 1850..... | 23,191,876 | 2,897,586 | 12.49 |
| 1860..... | 31,443,321 | 5,072,256 | 16.13 |
| 1870..... | 38,558,371 | 8,071,875 | 20.93 |
| 1880..... | 50,155,783 | 11,318,547 | 22.57 |
| 1890..... | 62,622,250 | 18,284,385 | 29.12 |

The distribution in 1890 of the urban element by geographical divisions is shown by the following table:

| GEOGRAPHICAL DIVISIONS. | Urban population. | Per cent. of entire urban population. | GEOGRAPHICAL DIVISIONS. | Urban population. | Per cent. of entire urban population. |
|------------------------------|-------------------|---------------------------------------|-----------------------------|-------------------|---------------------------------------|
| Total..... | 18,284,385 | 100.00 | North Central division.... | 5,793,896 | 31.69 |
| North Atlantic division..... | 9,015,383 | 49.31 | South Central division..... | 1,147,089 | 6.27 |
| South Atlantic division..... | 1,419,964 | 7.76 | Western division..... | 908,053 | 4.97 |

In 1870 there were only 14 cities having a population of 100,000 or more; in 1880, there were 20; in 1890, 28. These were: New York, Chicago, Philadelphia, Brooklyn, St. Louis, Boston, Baltimore, San Francisco, Cincinnati, Cleveland, Buffalo, New Orleans, Pittsburg, Washington, Detroit, Milwaukee, Newark, Minneapolis, Jersey City, Louisville, Omaha, Rochester, St. Paul, Kansas City, Providence, Denver, Indianapolis, and Allegheny, the order being that of their relative rank in population. [For the names and population of the largest 50 cities of the United States in 1890, see the Appendix to vol. XV.]

Centre of Population.—On June 1, 1890, the geographical centre of population of the United States, was Greensburg, Decatur Co., Indiana. The following table shows the movement of the centre of population since 1790:

| YEARS. | North latitude. | West longitude. | Approximate location by important towns. | Westward movement during preceding decade. |
|--------|-----------------|-----------------|-----------------------------------------------------------|--------------------------------------------|
| 1790 | 39° 16.5' | 76° 11.2' | 23 miles east of Baltimore, Maryland. | |
| 1800 | 39 16.1 | 76 56.5 | 18 miles west of Baltimore, Maryland. | 41 miles |
| 1810 | 39 11.5 | 77 37.2 | 40 miles n.w. by west of Washington, District of Columbia | 36 do. |
| 1820 | 39 5.7 | 78 33.0 | 16 miles north of Woodstock, Virginia. | 50 do. |
| 1830 | 38 57.9 | 79 16.9 | 19 miles west-southwest of Moorefield, West Virginia. | 39 do. |
| 1840 | 39 2.0 | 80 18.0 | 16 miles south of Clarksburg, West Virginia. | 55 do. |
| 1850 | 38 59.0 | 81 19.0 | 23 miles southeast of Parkersburg, West Virginia. | 55 do. |
| 1860 | 39 0.4 | 82 48.8 | 20 miles south of Chillicothe, Ohio. | 81 do. |

IMMIGRATION.—No country has been peopled by such a variety of races as the United States. New England was settled by English Puritans, and a few Scotch and Welsh; New York by Dutch; Pennsylvania, by Quakers and Germans; Maryland, by English Roman Catholics; Delaware and New Jersey by Dutch and Swedes; Virginia, by English cavaliers; the Carolinas, in part by French Huguenots; Louisiana, by French; Florida, Texas, and California, by Spanish; Utah, by Mormons, chiefly from England, Wales, and Denmark. Immigration from Ireland, Germany, England, Italy, Hungary, Scotland, France, Switzerland, Sweden, has been large and progressive.

The following table shows the number of immigrants arriving in the United States, from 1820 to 1897 inclusive:

| | Total Alien Passengers per Year. | Total Alien Passengers per Year. | Total Alien Passengers per Year. | Total Immigrants for Fiscal Year ending June 30. | Total Immigrants for Fiscal Year ending June 30. |
|-----------|----------------------------------|----------------------------------|----------------------------------|--------------------------------------------------|--------------------------------------------------|
| 1820..... | 8,385 | 1837..... 79,340 | 1854..... 427,833 | 1867..... 298,967 | 1884..... 518,592 |
| 1821..... | 9,127 | 1838..... 38,914 | 1855..... 200,877 | 1868..... 282,189 | 1885..... 395,346 |

| 1835..... | 45,374 | 1852..... 371,603 | 1865..... 247,453 | 1882..... 788,992 | Total18,235,393 |
| 1836..... | 76,242 | 1853..... 368,645 | 1866..... 163,694 | 1883..... 603,322 | |

From 1821 to 1860 more than half of the immigrants came from England and Ireland, and over one-third were from Ireland. From 1841 to 1850 the Irish immigration was 45% of the whole; from 1851 to 1860 the Germans were 36.6% of the whole; and since then the relative number of Irish, Germans and English has declined, while that of the immigrants from s. and e. Europe has increased.

Of the largely decreased number of immigrants in the year ending June 30, 1897, (230,892), 216,397 were from Europe; 91 from Mexico; 6 from Central America; 290 from British North America; and the remainder from countries, provinces, and parts unspecified. The largest numbers were from Italy, 59,431; Ireland, 28,421; Russia, 22,750; Germany, 22,533; Hungary, 15,025; Sweden, 13,144; unspecified parts of Austria, 10,285; England, 9974; Norway, 5842; Galicia and Bukowina (Austria-Hungary), 5767; Turkey in Asia, 4732; Poland, 4165; Cuba, 3553; and China, 3363.

GOVERNMENT.—The form of government of the United States is based on the Constitution of Sept. 17, 1787, to which ten amendments were added Dec. 15, 1791; an eleventh amendment, Jan. 8, 1798; a twelfth amendment, Sept. 25, 1804; a thirteenth amendment, Dec. 18, 1865; a fourteenth amendment, July 28, 1868, and a fifteenth amendment, March 30, 1870. See CONSTITUTION.

By this Constitution, the government of the nation is intrusted to three separate authorities—the Executive, the Legislative, and the Judicial. The executive power is vested in a President, who holds his office during the term of four years, and is elected, together with a Vice-President chosen for the same term, in the mode prescribed as follows: “Each state shall appoint, in such manner as the Legislature thereof may direct, a number of electors, equal to the whole number of senators and representatives to which the State may be entitled in the Congress; but no senator or representative, or person holding an office of trust or profit under the United States, shall be appointed an elector.” The Constitution enacts that “the Congress may determine the time of choosing the electors, and the day on which they shall give their votes, which day shall be the same throughout the United States;” and further, that “no person, except a natural-born citizen, or a citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years a resident within the United States.”

The President is commander-in-chief of the army and navy, and of the militia in the service of the Union. He has the power of veto on all laws passed by Congress; but, notwithstanding his veto, any bill may become law on its being afterwards passed by each house of Congress by a two-thirds vote. The Vice-President is ex-officio President of the Senate; and in case of the death or resignation of the President, he becomes the President for the remainder of the term. The elections for President and Vice-President are at present held in all the states on Tuesday next after the first Monday in November, every leap-year; and on the 4th of March following the new President-elect assumes office.

The administrative business of the nation is conducted by eight Secretaries, or heads of departments, who form what is called the Cabinet. They are chosen by the President, but must be confirmed by the Senate. Each of them presides over a separate department, and must act under the immediate authority of the President.

Their official titles are: Secretary of State, Secretary of the Treasury, Secretary of War, Secretary of the Navy, Secretary of the Interior, Postmaster General, Attorney General, Secretary of Agriculture.

By the law which came into force Jan. 19, 1886, it is provided that in case of the death, resignation, or disability of both President and Vice-President, the members of the Cabinet in the following order shall act as President until the disability of the President is removed, or a President shall be elected: 1. Secretary of State; 2. Secretary of the Treasury; 3. Secretary of War; 4. Attorney General; 5. Postmaster General; 6. Secretary of the Navy; 7. Secretary of the Interior.

Each of the above Secretaries has an annual salary of \$8000, and holds office only during the pleasure of the President. The whole legislative power is vested by the Constitution in a Congress, consisting of a Senate and House of Representatives. The Senate consists of two members from each state, chosen by the state legislatures for six years. Senators must be not less than thirty years of age; must have been citizens of the United States for nine years, and residents in the states for which they are chosen. Besides its legislative capacity, the Senate is intrusted with the power of ratifying or rejecting all treaties made by the President with foreign powers, a two-thirds majority of senators present being required for ratification. The Senate is also invested with the power of confirming or rejecting all appointments to office made by the President, and its members constitute a High Court of Impeachment. The judgment in the latter case extends only to removal from office and disqualification. Representatives have the sole power of impeachment.

The House of Representatives is composed of members elected every second year by the vote of all male citizens over the age of 21 of the several states of the Union, who are duly qualified and registered in accordance with the laws of their respective states. By the 15th Amendment to the Constitution, neither race nor color affects the right of citizens. The franchise is not absolutely universal; residence for at least one year in most states (in Michigan and Maine three months) is necessary; in some states the payment of taxes, in others registration. Untaxed Indians are excluded from the franchise; in most states convicts, in some states duellists and fraudulent voters; in Massachusetts, voters are required to be able to read English. The number of members to which each state is entitled is determined by the census taken every ten years. By the Apportionment Bill consequent on the census of 1890, the number of representatives was 356, distributed as follows:

| | | | | | |
|-----------------------|----|-------------------------|----|-------------------------|----|
| Alabama | 9 | Illinois | 22 | Michigan | 12 |
| Arkansas | 6 | Indiana | 13 | Minnesota | 7 |
| California | 7 | Iowa | 11 | Mississippi | 7 |
| Colorado | 2 | Kansas | 8 | Missouri | 15 |
| Connecticut | 4 | Kentucky | 11 | Montana | 1 |
| Delaware | 1 | Louisiana | 6 | Nebraska | 6 |
| Florida | 2 | Maine | 4 | Nevada | 1 |
| Georgia | 11 | Maryland | 6 | New Hampshire | 2 |
| Idaho | 1 | Massachusetts | 13 | New Jersey | 8 |

| | | | | | |
|--------------------------|----|--------------------------|----|-------------------------|----|
| New York | 34 | Rhode Island | 2 | Virginia | 10 |
| North Carolina | 9 | South Carolina | 7 | Washington | 2 |
| North Dakota | 1 | South Dakota | 2 | West Virginia | 4 |
| Ohio | 21 | Tennessee | 10 | Wisconsin | 10 |
| Oregon | 2 | Texas | 13 | Wyoming | 1 |
| Pennsylvania | 30 | Vermont | 2 | | |

Total.... 356

This is 31 more than in the previous decade.

On the basis of the 1890 census there is one representative to every 173,901 inhabitants. The popular vote for President in 1896 was 13,923,643, or over one in five of the entire estimated population (71,468,000).

According to the terms of the Constitution, representatives must not be less than twenty-five years of age, must have been citizens of the United States for seven years, and be residents in the states from which they are chosen. In addition to the representatives from the states, the House admits a delegate from each organized Territory, who has the right to speak on any subject and to make motions, but not to vote. The delegates are elected in the same manner as the representatives. In Wyoming and Utah the franchise is accorded to women.

Every bill that has passed the House of Representatives and the Senate must, before it becomes a law, be presented to the President of the United States; if not approved, he may return it, with his objections, to the House in which it originated. If after reconsideration two-thirds of that House agree to pass the bill, it must be sent, together with the objections, to the other House, by which it must be likewise reconsidered, and if approved by two-thirds of that House, it becomes a law. But in all such cases the votes of both Houses are determined by yeas and nays, and the names of the persons voting for and against the bill are entered on the journal of each House. Should the President fail to return any Act presented to him for approval to the house of Congress in which it originated, within ten days prescribed by the Constitution, it becomes a law without his approval.

Each of the two houses of Congress is made by the Constitution the judge of the elections, returns, and qualifications of its own members; and each of the Houses may, with the concurrence of two-thirds, expel a member.

The Congress of the United States has the power to propose alterations in the Constitution by the 5th article of the same. This article orders that the Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to the Constitution, or, on the application of the Legislatures of two-thirds of all the States, shall call a convention for proposing the amendments, which in either case shall be valid to all intents and purposes as part of the Constitution when ratified by the Legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or other mode of ratification may be proposed by Congress.

By the constitution, the states granted to Congress power "to lay and collect taxes, duties, imports, and excises, to pay the debts and provide for the common defense and general welfare of the United States;" to borrow money; to regulate commerce; to establish uniform naturalization and bankruptcy laws; to coin money, and fix the standards of weights and measures, and punish counterfeiting; to establish post-offices and post roads; to secure patents and copyrights; punish piracies; declare war; raise armies and navy; to call out the militia, reserving to the states to appoint their officers, and to govern the District of Columbia, and all places purchased for forts, arsenals, etc., with the consent of the state legislatures. All powers not expressly granted are reserved to the states or the people; but the states, though sovereign and independent under the constitution, with all powers of local legislation, eminent domain (i.e., absolute possession of the soil), and power of life and death, with which neither President nor Congress can interfere, cannot make treaties, coin money, levy duties on imports, or exercise the powers granted to Congress.

Under an Act of Congress approved Jan. 20, 1874, the salary of a senator, representative, or delegate in Congress is \$5000 per annum, with traveling expenses. These expenses are calculated by the most direct route of usual travel, and for a similar return, one for each session of Congress. The salary of the Speaker of the House of Representatives is, under the same act of Congress, \$8000 per annum.

The times, places, and manner of holding elections for senators and representatives are by the Constitution allowed to be prescribed in each state by the legislature thereof; but Congress may at any time by law alter such regulations, or make new ones, except as to the places of choosing senators. Under this provision a law has been passed prescribing a method of choosing senators. No senator or representative can, during the time for which he is elected, be appointed to any civil office under authority of the United States which shall have been created, or the emoluments of which shall have been increased, during such time; and no person holding any office under the United States can be a member of either House during his continuance in office. No religious test is required as a qualification to any office or public trust under the United States.

The period usually termed a Congress, in legislative language, continues for two years; as, for example, from noon, March 4, 1897, until noon, March 4, 1899, at which

latter time the term of the representatives to the 55th Congress expires, and the term of the new House of Representatives commenced.

The power to enact laws which concern only the states directly and immediately, is among the reserved rights of the states, and as such is vested in the state legislatures. The constitutions of the several states all agree in their main features, and the modes of administration are virtually alike. In all there is the same form, and the same principles lie at the foundation. The executive in every state is vested in a Governor. The duties of the Governor are in general analogous to those of the President, as far as the several state governments are analogous to that of the Union. In some states the governors have the nomination, and, in conjunction with the senate, the appointment, of many important officers; but in most states appointments in the power of the Governors are comparatively unimportant; in New York, for example, nearly all officers and all judges are elected by the people. Like the President, governors make recommendations to the legislature, and take care that the laws are executed. Like the President, they may be impeached and removed for treason, bribery, or other crimes.

The District of Columbia is the seat of the United States government, and was provided by the State of Maryland for the purposes of the government in 1791. It is now co-extensive with the city of Washington, and embraces an area of 70 square miles. The District has no municipal legislative body, and its citizens have no right to vote either in national or municipal concerns. By an Act of Congress of 1878, its municipal government is administered by three commissioners, appointed by the President.

The judiciary consists of a Supreme Court, with one chief justice and eight associate justices, appointed by the President for life; nine circuit courts, each presided over by a justice of the supreme court, and having from one to three circuit judges each; a court of claims, with a chief justice and four associate judges; and a supreme court and a court of appeals exclusively for the District of Columbia. The Supreme Court has jurisdiction in all cases arising under the Constitution, laws, and treaties of the United States; causes affecting ambassadors and consuls, of admiralty and jurisdiction; controversies to which the United States is a party, or between a state and the citizens of another state, citizens of different states, citizens and foreign states. It has original jurisdiction in state cases, or those affecting ambassadors or consuls—in others appellate. A person may be tried for treason, both against the federal government, and against the state of which he is citizen. The President can reprieve or pardon a person condemned by a federal court; but has no power to interfere with the judgments of state tribunals. The citizens of each state are entitled to all privileges and immunities of the several states. Criminals escaping from one state to another are given up for trial on demand of the executive; and the constitution declared, before the civil war, that "no person held to service or labor in one state, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due." See DRED SCOTT CASE. In 1891 there were established nine district courts of appeal, one for each district, with a view to lightening the labors of the Supreme Court and hastening the disposal of cases.

MONEY.—Up to the year 1786, the circulating medium of the United States had been in a state of the greatest confusion. In colonial times, the standards of exchange and the monetary system had been those of England, though Spanish silver circulated extensively by reason of the colonial trade with the Spanish West Indies. As early as 1782, however, the Continental Congress took up the subject of a coinage, and at the request of Robert Morris, a report on the question of a national currency was prepared by Gouverneur Morris. Mr. Morris endeavored to harmonize the moneys of all the colonies, and starting with a definite fraction as a unit, he recommended the following table as the basis of our monetary system:

Ten units to equal one penny.
 Ten pence to equal one bill.
 Ten bills to equal one dollar (worth \$0.75).
 Ten dollars to equal one "crown."

A second report, however, was drawn up by Thomas Jefferson, which agreed with the report of Mr. Morris in recommending a decimal system, but proposing a different set of coins—a gold piece of ten dollars (the "eagle"), a silver dollar, a silver tenth of a dollar (a "dime"), and a copper hundredth of a dollar (a "cent"). This report was finally adopted by Congress in 1785, though no Mint was established until 1795. This system of Mr. Jefferson's still remains the base of the coinage of the United States, there having been added the double-eagle of gold (\$20), the half-eagle of gold (\$5), the quarter-eagle of gold (\$2.50), the gold dollar—the coinage of the last having been discontinued in 1890—and in silver, the half-dollar, the quarter-dollar, the five and three-cent pieces; and in metal, the five-cent and three-cent pieces. Half-cent pieces were at one time coined.

The United States has also a convenient system of paper money, redeemable in gold or silver at the National Treasury or Sub-Treasury; and special certificates entitling the bearer to gold or silver, known respectively as gold certificates and silver certificates. This system will be found described in detail under the title **MONEY**.

FINANCE.—The revenue of the United States is mainly derived from two sources—namely, duties on imports, and internal revenue taxes upon distilled spirits, fermented liquors, tobacco, banks, and bankers. The national expenditure is mainly on account of the war and navy departments, pensions, payment of interest of the public debt incurred by the civil war of 1861–66, and the civil service.

The following table exhibits the total ordinary revenue and the total ordinary expenditure of the United States in each of the fiscal years, ending June 30, from 1881 to 1896:

| REVENUE. | | EXPENDITURE. | REVENUE. | | EXPENDITURE. |
|----------------------|-------------|--------------|----------------------|-------------|--------------|
| Year ending June 30. | Dollars. | Dollars. | Year ending June 30. | Dollars. | Dollars. |
| 1881 | 360,782,292 | 260,712,887 | 1889 | 387,050,058 | 299,288,978 |
| 1882 | 403,525,250 | 257,981,440 | 1890 | 463,963,080 | 358,618,584 |
| 1883 | 398,287,581 | 265,408,138 | 1891 | 458,544,233 | 421,304,470 |
| 1884 | 348,519,869 | 244,126,244 | 1892 | 425,868,260 | 415,953,807 |
| 1885 | 323,690,706 | 260,226,935 | 1893 | 461,716,562 | 459,374,888 |
| 1886 | 336,439,727 | 242,483,138 | 1894 | 372,802,498 | 442,605,759 |
| 1887 | 371,403,277 | 267,932,180 | 1895 | 390,373,203 | 433,178,426 |
| 1888 | 379,266,074 | 267,924,801 | 1896 | 409,475,408 | 434,678,654 |

These figures are exclusive of loans in the revenue and expenditure, other than interest, and premiums in connection with the public debt.

The following table gives the actual sources of revenue and branches of expenditure for the fiscal year ending June 30, 1896.

| REVENUE. | 1896. | EXPENDITURE. | 1896. |
|-----------------------|---------------|--------------------------------|---------------|
| Customs revenue..... | \$160,021,752 | Legislative..... | \$9,460,958 |
| Internal revenue..... | 146,762,865 | Executive department..... | 192,919 |
| Postal service..... | 82,499,208 | State..... | 1,755,814 |
| Miscellaneous..... | 20,191,533 | Treasury..... | 77,108,089 |
| | | War..... | 52,947,075 |
| | | Navy..... | 27,554,733 |
| | | Interior..... | 160,194,984 |
| | | Post-office..... | 94,218,225 |
| | | Department of agriculture..... | 2,905,669 |
| | | “ labor..... | 163,945 |
| | | “ justice..... | 303,243 |
| | | Judicial..... | 7,873,000 |
| Total Receipts..... | \$409,475,408 | Total disbursements..... | \$434,678,654 |

The true valuation of real and personal property in the United States in 1890 was \$65,037,091,197; assessed valuation \$25,425,863,485. The aggregate national debt, including certificates and treasury notes on June 30, 1897, was \$1,818,672,665. (See DEBT, NATIONAL.)

The following statement shows the statistics of the circulating medium of various kinds on July 1, 1897.

| CIRCULATING MEDIUM. | General Stock, Coined or Issued. | In Treasury. | Amount in Circulation. |
|-----------------------------------|----------------------------------|---------------|------------------------|
| Gold coin..... | \$671,676,250 | \$152,529,575 | \$519,146,675 |
| Silver, standard dollars..... | 451,993,742 | 399,992,540 | 52,001,202 |
| Silver, subsidiary..... | 75,438,884 | 16,210,344 | 59,228,540 |
| Notes, United States..... | 346,681,016 | 98,097,438 | 248,583,578 |

On June 12, 1776, Congress passed a resolution organizing the war office ; or, as it was then termed, the Board of War and Ordnance, and which consisted of 5 members. In the following year this was reorganized, a board of war being provided for to consist of three persons not members of Congress. Afterwards a medical inspection and pay department were added ; and in 1781 the office of Secretary at War was created and his powers and duties defined. Gradually the entire official direction of the war establishment was placed in the hands of this official, subject to the orders of the President, *ex-officio* Commander-in-Chief, this latter provision occurring after the adoption of the constitution in 1789, when also the style and title of the secretary were changed from Secretary at War to Secretary of War, which it has remained ever since. In 1812 the Quartermaster-General's department, purchasing department, and ordnance department were organized. After the close of the war of the revolution, and when Washington had laid down his command, the continental army was soon disbanded. In 1798, when war with France was actually begun upon the sea, a new army was hastily organized to repel the anticipated invasion of the United States by a French force. Gen. Washington was placed in command, and preparations for a prolonged and doubtful struggle were carried into effect. But the army was not called into action, negotiations with Napoleon I. reconciling the differences between the two countries, and the men were presently again disbanded. The acts of the Congress of the Confederation concerning the organization of the army were, up to this time, as follows : The act of Sept. 29, 1789, by which " a corp of 700 rank and file (to be stationed on the frontier) to be organized, together with two companies of artillery, raised by resolve of Oct. 20, 1786," and the act of April 30, 1790, in lieu of the preceding act, to regulate and establish one battalion of artillery, and one regiment of infantry—in all, 1216 men. In 1791 an act was passed (March 3) organizing one additional regiment of infantry ; in 1792 to these were added one squadron of light dragoons and 3 regiments and 5 battalions of infantry ; in 1794 an act was passed to establish arsenals and military stores ; and another to organize a corps of artillerists and engineers ; and to this was added in 1798 a second regiment of artillerists and engineers. The act of May 28, 1798, in view of the prospective war with France, authorized the President to raise a provisional army of 10,000 rank and file, to be organized into corps of artillery, cavalry, and infantry, and authorized also the appointment of a Lieutenant General, " to command the armies of the United States," Gen. Washington being so appointed ; and a supplementary act (July 16, 1798), still further increased the authorization to the President by the number of 12 regiments of infantry, with the necessary commanding officers and staff, line officers, etc. The act of March 3, 1799 abolished the title and office of Lieutenant General, and directed that the commander of the army of the United States should be commissioned by the title of the " General of the armies of the United States." The opening of the war of 1812 with England brought about an increase of the army by Congress, and directed that it should include 25 regiments of infantry, with the necessary officers ; and 20 regiments of infantry in addition if needed, with 3 regiments of riflemen. The act of Feb. 8, 1815, organized the ordnance department ; and that of March 3, 1815, fixed the peace establishment at not exceeding 10,000 men. In 1821 a still greater reduction was made ; and when the Florida war broke out in 1834, the army comprised the staff, one regiment of dragoons, 4 regiments of artillery, and 7 of infantry, commanded by a Major General and two brigadiers.

During the civil war the number of men furnished to the northern armies was 2,778,304, or, reduced to a three years' standing, 2,326,168. They were organized into the Army of the Potomac, Army of the Tennessee, Army of the Cumberland, and Army of the Ohio; the last three being finally united into the Military Division of the Mississippi. These armies were raised under proclamation by the President—each state furnishing its quota, according to population, by voluntary enlistment, and by enforced draft. Regimental organizations, when formed, were mustered into the service of the United States, when they fell under the direction of the war department, and were assigned to brigades, divisions, corps, and armies, as required. All generals and general staff officers received their commissions from the President, line officers being appointed before mustering into the United States service. Toward the close of the war the difficulty of obtaining volunteers so increased that large bounties were offered, in some cases amounting to as much as \$1500 for one man. At the close of the war the volunteer army which was mustered out numbered about 1,100,000 men. The regular army was increased during the progress of the war from 18,000 men to 50,000; since the war it has been reduced to 25,000.

On Jan. 1, 1896, the army of the United States comprised 26,955 officers and enlisted men, divided as follows:

| | OFFICERS. | ENLISTED MEN. |
|------------------------------------------------------------------------------------------------------------------------------------|-----------|---------------|
| 10 cavalry regiments..... | 454 | 6,045 |
| 5 artillery regiments..... | 292 | 3,803 |
| 25 infantry regiments..... | 897 | 12,544 |
| Engineer battalion, recruiting parties, ordnance department, hospital service, Indian scouts, West Point, and general service..... | 528 | 2,392 |
| | 2,171 | 24,784 |

By an order of the Secretary of War, issued July 3, 1891, the old distribution of the army by Divisions was abolished, and a single organization by Departments left. On Jan. 1, 1897, these departments were as follows:

1. Department of the East: Headquarters, Governor's Island, N. Y. City, Maj.-Gen. Thomas H. Ruger, commanding.
2. Department of the Missouri (Michigan, Wisconsin, Indiana, Illinois, Missouri, Kansas, Arkansas, Oklahoma, Indian Territory): Headquarters, Chicago, Ill., Maj.-Gen. Wesley Merritt, commanding.
3. Department of the Platte: Headquarters, Omaha, Neb., Brig.-Gen. John J. Coppinger, commanding.
4. Department of Dakota: Headquarters, St. Paul, Minn., Brig.-Gen. John R. Brooke, commanding.
5. Department of Texas: Headquarters, San Antonio, Tex., Brig.-Gen. Zenas R. Bliss, commanding.

6. Department of California: Headquarters, Los Angeles, Cal., Brig.-Gen. James W. Forsyth, commanding.

7. Department of the Columbia: Headquarters, Vancouver Barracks, Wash., Brig.-Gen. Elwell S. Otis, commanding.

The medical department of the United States army is allowed by law to consist of 1 surgeon-general, with the rank of Brig.gen.; 1 assistant surgeon-gen., with the rank of col. of cavalry; 1 chief medical purveyor; 4 surgeons, with the rank of col.; 2 assistant medical purveyors; 8 surgeons, with the rank of lieut.col.; 50 surgeons, with the rank of maj.; 125 assistant surgeons, with the rank of lieuts. of cavalry for the first 5 years' service, and of capt. of cavalry after 5 years' service. No person shall be appointed an assistant surgeon unless he shall have been examined and approved by an army medical board, to consist of not less than three surgeons or assistant surgeons, who shall be designated for that purpose by the Secretary of War, and no person shall receive the appointment of surgeon unless he shall have served at least five years as an assistant surgeon. He must also be examined by an army medical board. All candidates for appointment in the medical corps of the army must apply to the Secretary of War to be admitted to examination, and such candidates must be between 21 and 28 years of age, and graduates of a regular medical college; and the morals, habits, physical and mental qualifications, and general aptitude for the service are subjects for examination by the board.

* Rank of Major-General. † General. ‡ Brigadier-General. Josiah Harmer was a Lieutenant-Colonel and General-in-Chief by brevet. ** Lieutenant-General.

NAVY OF THE UNITED STATES.—The Americans were a maritime people from the time of the first settlement of the colonies; and, as maritime commerce was conducted in the seventeenth century in the midst of constant danger from pirates, Indians, and freebooters, all vessels sailing out of American ports were armed, while most of the colonies fitted out special armed vessels for the general protection. In 1690 the Massachusetts colony fitted out eight armed vessels against the French privateers of Acadia; and in the same year a squadron of 40 vessels, with 2000 men, also from Massachusetts, made an unsuccessful descent on Quebec. The beginning of the eighteenth century, and the occurrence of the French war, brought the American colonies into hostilities, and, the crown and colonies acting together, expeditions were fitted out against the French, and a considerable American navy temporarily organized. After the peace of Utrecht in 1713, this force was reduced to a few armed vessels employed to guard the coast. In 1739 England declared war against Spain, and many expeditions were fitted out in the colonies, notably that against Carthage. In 1741 a similar enterprise was undertaken against Cuba, and four years later the expedition against Louisburg, in aid of the new British war against France. In this war there were as many as 400 privateers and letters-of-marque engaged on the part of the colonies. The French and English war of 1756 again involved the colonies, and numerous brilliant naval exploits on the part of the colonial navy are recorded in its history. After the peace of 1763, no further call for armed vessels was made on the colonies, until the breaking out of the war of the revolution. At this period (1775) there existed no naval force whatever in the American colonies; and although Massachusetts fitted out a few privateers at the beginning of hostilities, it was not until six months after the battle of Lexington that Congress took steps to organize a navy. Two small cruisers were equipped to intercept British supply ships; then two more, of a larger class; and by the close of the year the construction of about 20 cruisers had been authorized. The first ensign displayed by a regular American man-of-war was hoisted by John Paul Jones, in Dec., 1775, on board the *Alfred*, of which he was first-lieutenant, that ship then lying in the Delaware. It is believed that this flag contained the device of a pine-tree, with a rattlesnake at its root, about to strike, and the motto "Don't tread on me!" The present national ensign did not come into use until 1777, and is generally believed to have originated in the arms of the Washington family, as displayed on Gen. Washington's headquarters' flag. The first American squadron consisted of eight vessels, including the *Alfred*, and sailed on Feb. 17, 1776, on a cruise against the British naval force then ravaging the coast of Virginia. This cruise was unsuccessful, and the officer in command, Commodore Ezekiel Hopkins, was dismissed from the service. Paul Jones, who was promoted to command of the *Providence*, 12 guns, atoned for this ill-fortune, in a measure, by capturing 16 prizes in a single cruise. After the Declaration of Independence, Congress set vigorously to work to construct a navy, authorizing in 1776-77 the building of 7 frigates, 2 cutters, 2 sloops-of-war, and three 74-gun ships. At the same time congress regulated the rank of the different officers, and 24 captains were appointed to take precedence as their names stood on the list. The new navy did good work; not only as coasters, and upon the high seas, but by descents on the coasts of the British isles. The bold expedition of Paul Jones, with a squadron of which the *Bon Homme Richard* was the flagship, is historical. Meanwhile armed flotillas did good service on the great lakes, as to which brilliant exploits are recorded. On the ocean no less than 342 vessels were captured from the British during the first year of the war. During the second year they lost 467 merchantmen, captured by American cruisers and privateers. In 1779 the American navy encountered many disasters; and the three last years of the war witnessed no important naval engagements. The determination of the British government to exchange no more prisoners captured in American privateers demoralized that system of naval warfare, and but a few of that class of vessels remained, while the continental navy became greatly diminished. It is, however, the fact that British shipping suffered more heavily in this contest than in any other war in which England had previously been engaged. After the peace of 1783, what few public cruisers remained to the Americans were sold by order of the government. But about 1794 difficulties having broken out with the Barbary States, Congress authorized the construction of 6 frigates, and these were speedily built, including the *United States* and the immortal *Constitution*. In 1798 anxiety regarding the apparently impending war with France induced the American government to build 20 small armed vessels; and in this year the Department of the Navy was created, Benjamin Stoddart being its first secretary. Other ships were ordered, and on July 11, 1798, the formation of the marine corps was authorized. Before the close of this year 23 American men-of-war were at sea; and the capture of the French frigate *L'Insurgente* by the *Constellation* aroused the greatest enthusiasm: this was the first occasion since the establishment of the federal navy, when a national vessel had subdued one of equal force. In the beginning of 1800 the American government had a navy of 34 men-of-war at sea. Early in the following year peace with France was declared, and at once the government proceeded to sell the greater number of these ships—from a very mistaken theory of necessary economy. Hostilities with Tripoli began soon after the amicable settlement with France, and a squadron under Commodore Dale blockaded Tripoli, and captured several neutrals attempting to enter that port. Hostilities were not concluded until the summer of 1805, many important

captures having been in the mean time effected; the town of Tripoli bombarded and nearly captured; and good work having been accomplished in awakening the *esprit de corps* which has characterized the American navy ever since. From this period until 1812, the duty of American ships-of-war was confined chiefly to guarding the coast. In the latter year broke out the war with England, the American navy then consisting of but 17 efficient vessels, of which only 8 were frigates. The splendid capture of the British frigate *Guerriere* by the *Constitution* on Aug. 19, 1812, awakened renewed enthusiasm, however; and this was followed by that of the *Phœnix* by the American sloop *Wasp*, and by the American frigate *United States* capturing the British frigate *Macedonian*—three most spirited and well-matched encounters. Early in 1813 Congress ordered the building of 4 ships of the line and 6 frigates, to be immediately followed by the construction of 6 sloops-of-war; only the sloops, however, were completed in time to be of service in this war. The general success of the Americans on the sea during the war of 1812 was equalled by the occurrence of splendid victories on Lake Erie and Lake Champlain; and the reputation of the American navy was greatly increased, while that of the British was correspondingly diminished. This war was followed by a brief period of hostilities against Algiers; and from that time to the outbreak of the Mexican war, America was at peace with all the world. Meanwhile its navy was kept in a condition of efficiency; four squadrons were retained in the Mediterranean, Pacific, on the coast of Brazil, and in the West Indies; and in 1841 a home squadron was created to cruise on the coast of the United States. By this means the dignity of the nation was for a time maintained in every part of the world, and American commerce everywhere protected. The Wilkes government exploring expedition formed an incident of this period, which raised the United States to the front rank among nations which devoted their naval resources in time of peace to scientific investigation.

The war with Mexico, which broke out in 1846, at once proved the value of the more recent system of keeping American squadrons on service in the different waters. The squadron in the gulf proceeded to blockade Vera Cruz; while that in the Pacific was ordered to the California coast and seized Monterey and Los Angeles. At Vera Cruz the navy now kept up an incessant bombardment of the fort of San Juan de Ulloa, which was eventually captured; there was no other important use made of the navy in this war. The Japan expedition under the command of Com. Perry, which was sent out by the government in 1852, was an important event in connection with opening up the ports of that country to western commerce, and its court to western diplomacy. The outbreak of the civil war found the American navy scattered far abroad, and of practically little value had it been attainable, owing to the peculiar nature of the warfare in which the north and south were now about to be engaged. The character of naval warfare had long before this totally changed. The great improvements in ordnance and projectiles had rendered the old wooden ships useless; and the application of steam power to the navy had been accomplished. But the American steam frigates were incompetent to resist the force of the Whitworth and other modern guns of long range and heavy calibre. The emergency brought forth the necessary inventive faculty, whose expression in the turreted iron-clad was the means of saving the north from ignominious failure at a most desperate moment. The operations of the United States navy during the civil war will be found fully set forth under the title REBELLION.

The following table gives a list of all vessels in the U. S. navy, with details of their construction and condition, on Jan. 1, 1897.

EXPLANATION.—* Torpedo tubes. *Hull*: S., steel; I., iron; W., wood. *Propulsion*: S., screw; T. S., twin screw; Tr. S., triple screw; P., paddle; M. P., Mallory propeller.

During the first ten months of 1897, twelve new vessels were added to those in commission, viz.: the battleship *Iowa*; the gunboats *Nashville*, *Wilmington*, *Helena*, *Annapolis*, *Vicksburg*, *Newport*, *Wheeling*, and *Marietta*; and the torpedo boats *Foote*, *Porter*, and *Dupont* (the last indicated in the table by numerals).

The United States Navy was commanded in 1896 by 6 rear-admirals, 10 commodores, 45 captains, 85 commanders and 74 lieutenant-commanders, 250 lieutenants, 75 lieutenants, junior grade, and 167 ensigns.

PAY OF THE NAVY OF THE UNITED STATES.

| RANK. | At Sea. | On Shore Duty. | On Leave or Waiting Orders. |
|--------------------------------------------------------------------------------------------------------------------|-------------------|-------------------|-----------------------------------|
| Rear-Admirals..... | \$6,000 | \$5,000 | \$4,000 |
| Commodores..... | 5,000 | 4,000 | 3,000 |
| Captains..... | 4,500 | 3,500 | 2,800 |
| Commanders..... | 3,500 | 3,000 | 2,300 |
| Lieutenant-Commanders: | | | |
| First four years after date of commission..... | 2,800 | 2,400 | 2,000 |
| After four years from date of commission..... | 3,000 | 2,600 | 2,200 |
| Lieutenants: | | | |
| First five years after date of commission..... | 2,400 | 2,000 | 1,600 |
| After five years from date of commission..... | 2,600 | 2,200 | 1,800 |
| Lieutenants (Junior Grade): | | | |
| First five years after date of commission..... | 1,800 | 1,500 | 1,200 |
| After five years from date of commission..... | 2,000 | 1,700 | 1,400 |
| Ensigns: | | | |
| First five years after date of commission..... | 1,200 | 1,000 | 800 |
| After five years from date of commission..... | 1,400 | 1,200 | 1,000 |
| Naval Cadets..... | 500 | 500 | 500 |
| Mates..... | 1,200 | 900 | 700 |
| Medical and Pay Directors and Medical and Pay Inspectors and Chief Engi- neers having the same rank at sea..... | 4,400 | | |
| Fleet-Surgeons, Fleet-Paymasters and Fleet-Engineers..... | 4,440 | | |
| Surgeons, Paymasters and Chief Engineers..... | 2,800 to 4,200 | 2,400 to 4,000 | 2,000 to 3,000 |
| Chaplains..... | 2,500 to 2,800 | 2,000 to 2,300 | 1,600 to 1,900 |

Warrant officers are paid from \$700 to \$1800, and seamen \$228 to \$298 per annum.

The United States have navy yards, at Brooklyn, N. Y., Boston, Mass. (Charlestown), Norfolk, Va. (Gosport), Portsmouth, N. H. (Kittery), League Island (near Philadelphia), Mare Island (near San Francisco), Pensacola, Fla., and Washington, D. C. There are naval stations at Newport, R. I., New London, Conn., Port Royal, S. C., Key West, Fla., and Bremerton, Wash.; besides torpedo and training stations and a Naval War College at Newport, R. I.

Officers of the navy are retired from active service after sixty-two years of age, or may be retired after forty years' service, irrespective of age (except in certain grades). The pay of retired naval officers is 75 per cent. of the sea-pay of the rank held at the time of retirement.

In 1897 a naval militia was maintained in fifteen states, under federal aid. See NAVAL RESERVE.

EDUCATION.—Education is general in the United States, every possible effort being made to aid in its diffusion. Such illiteracy as exists is chiefly to be found (1) among the blacks of the south and (2) among the immigrants who form a comparatively large proportion of the inhabitants. In 1895 the population from 6 to 14 years of age was estimated at 20,328,147. The public school enrollment was 14,201,752; average attendance, 9,387,507; teachers, 396,327; school-houses, 237,416; estimated value of public school property, \$439,071,690; total revenue, \$177,597,691; total expenditure, \$178,215,556, of which \$113,664,874 was for salaries of teachers and superintendents. The enrollment in private schools was estimated at 1,211,220, making a total enrollment of 15,412,972. There were 4712 public high schools, with 14,122 teachers and 1,264,464 pupils; 2180 private secondary schools, with 8559 teachers, 232,225 elementary and secondary pupils, 1,637,127 volumes in the libraries, and grounds, buildings, and apparatus valued at \$51,865,512; 155 public normal schools, with 57,704 students; 201 private normal schools, with 54,076 students; 138 colleges, exclusively for men, with 22,503 students; 343 co-educational colleges, with 27,222 male and 13,552 female students; and 163 colleges exclusively for women.

The United States government makes no direct appropriations for the maintenance of the public schools, but has set aside for this purpose land in several of the newer states, the proceeds from the sale of which form a part of the permanent school fund, the income alone being used for the support of the schools. This income is supplemented by direct taxation in the separate states, or by local taxation in the towns, or by both.

Professional schools are numerous. All the great universities have departments of law and medicine, and separate schools for the study of each of these professions exist. In 1895 there were 151 medical schools in the United States, of which 20 were devoted to homoeopathy, and 72 schools of law. The United States government maintains a military academy at West Point and a naval academy at Annapolis. There are also a large number of schools for the education of Indian children; the most famous being those at Hampton, Va., and Carlisle, Pa.

In 1896 there were 4026 public, society, and school libraries of 1000 volumes each and upward, containing an aggregate of 33,051,872 bound volumes, and 5,444,788 pamphlets. There were 34 that contained upward of 100,000 volumes each. (See LIBRARIES.) The periodicals reported in 1897 aggregated 20,569, of which 2070 were daily, 14,673 weekly, and 2786 monthly publications. See AMERICAN JOURNALISM; NEWSPAPER.

RELIGION.—The Constitution guarantees the free exercise of religious profession and worship—a guarantee that each of the states repeats in its own constitution. The census of 1890 reported the existence of 143 distinct denominations, besides many independent and unassociated churches. The order of denominational families, according to number of communicants, was Catholic, 6,257,871; Methodist, 4,589,264; Baptist, 3,712,468; Presbyterian, 1,278,332; Lutheran, 1,231,072; Episcopalian, 540,509; all others, below 400,000. There were in all 165,177 organizations; 142,521 church edifices; 23,324 halls used for religious purposes; 20,612,806 communicants; and church property valued at \$679,630,139.

PAUPERISM AND CRIME.—The census of 1890 gave the number of paupers in the almshouses of the different states as 73,045 against 66,203 in 1880, an increase of 6842. Of these 40,741 were males and 32,304 females. The negro paupers numbered 6467; the paupers of foreign birth, 36,656. Besides the inmates of almshouses, there were reported to be 24,220 "out-door paupers," but these figures are confessedly incomplete.

In the year 1890, there were in the different penitentiaries of the United States, 45,233 convicts as against 35,538 in 1880, an increase of 9695. The ratio of convicts to population in 1880 was 709 in 1,000,000. In 1890 the ratio was 722 in 1,000,000. Of the convicts in 1890, 7267 were of foreign birth, and 14,687 were colored. The census gives the relative numbers of native-born and foreign-born criminals. It attributes 57 per cent. of the crimes committed by whites to the foreign-born and 43 per cent. to native-born. The number of foreign-born prisoners per 1,000,000 was 1,822.43; and of native-born prisoners per 1,000,000, 882.45; of foreign-born and those of foreign parentage, 1523.06 per 1,000,000; and of native-born whites of native parentage, 753.7 per 1,000,000. It must be borne in mind, however, that a heavier percentage of crime would naturally be expected among the foreign-born on account of the far greater proportion of adults among them. Only 1791 were women. See PRISONS.

INTERNAL COMMUNICATIONS.—The growth of the railway system of the United States dates from 1827, when the first line was opened for traffic at Quincy, Massachusetts. The extent of railways in operation in 1830 was 23 miles; it rose to 2818 miles in 1840; to 9021 miles in 1850; to 30,635 miles in 1860; to 53,399 miles in 1870; to 84,393 miles in 1880; and to 166,702 in 1890. The subsequent construction was, 1891, 4281 miles; 1892, 4192; 1893, 2635; 1894, 1949; 1895, 1803; 1896, 1802—making in the last year, approximately, 183,364 miles. Each of several authorities on railroad statistics has a different method or time of computation, consequently no two agree on total results. The capital stock of all corporations exceeds \$5,180,000,000; funded debt, \$5,640,000,000; total investment, \$11,240,000,000; cost of roads and equipments, \$9,860,000,000; gross earnings, \$1,093,000,000; net earnings, \$323,000,000; interest paid on bonds, \$239,000,000; and dividends paid on stocks, \$81,000,000. See RAILWAYS.

The telegraphs of the United States are almost entirely in the hands of the Western Union Telegraph Company, which had in 1896, 189,918 miles of poles and cables, 826,929 miles of wire, and 21,725 offices; the number of messages sent was 58,760,444, the receipts, \$22,612,736, and profits, \$5,897,980. In 1896 there were 459,728 miles of telephonic wire belonging to one company, with 927 exchanges, 686 branch offices, 281,695 subscribers, and 674,976 telephone instruments in use. The average of daily exchange connections was 2,351,420.

The canal system of the United States is very important and susceptible in the future of a much fuller development. The first canal in America was built in 1793 around the falls of the Connecticut river. The principal canals are now the Erie Canal (352 miles in length) from Albany to Buffalo; the Louisville and Portland, the Delaware and Raritan, the Morris, the Illinois and Michigan, the Chesapeake and Delaware, the Ohio, the Delaware and Hudson, the Albemarle and Chesapeake, the Champlain, the Miami and Erie, the Schuylkill, and the Sault Ste. Marie. Since 1880 a large number of canals has been abandoned, as no longer profitable, because of the development of railroads; and nearly all of those constructed since that day are of the character known as ship canals. See CANALS.

SHIPPING AND NAVIGATION. The shipping belonging to the United States on June 30, 1897, aggregated 22,633 vessels, of 4,769,020 gross tons, of which 2,647,796 tons were registered at Atlantic and gulf ports, and 1,410,103 tons at ports on the great lakes. The steam tonnage amounted to 2,358,558 gross tons (6599 vessels), the largest ever reported. During the fiscal year 1896-7, there were 68 iron and steel vessels of 124,395 tons built and documented, making the total vessels of that character 1023, of 1,207,222 tons. The shipments of seamen aggregated 72,000, of whom 22,500 were Americans, 18,000 Scandinavians, 13,000 British, 8,000 Germans, and the remainder of other nationalities.

The foreign carrying trade of the United States, has, in fact, steadily declined so far as concerns the employment of ships with an American register. This decline began at the outbreak of the Civil War in 1861, when the privateers of the Southern Confederacy made the seas unsafe for vessels flying the United States flag; but the close of the war only slightly and for the moment checked the waning of the American carrying trade, which has steadily continued, partly, as some assert, because of unwise navigation laws. The following table shows the value of the exports and imports from and to the United States carried respectively in American and foreign vessels for each year from 1860 to 1890:

| Year ending June 30. | In Ameri- can Vessels. | In Foreign Vessels. | Percent, in American Vessels. | Year ending June 30. | In Ameri- can Vessels. | In Foreign Vessels. | Per cent. in American Vessels. |
|-------------------------|---------------------------|------------------------|-------------------------------------|-------------------------|---------------------------|------------------------|--------------------------------------|
| 1860 | \$507,247,757 | \$255,040,793 | 66.5 | 1876 | \$311,076,171 | \$813,354,987 | 33.1 |
| 1861 | 381,516,788 | 203,478,278 | 65.2 | 1877 | 316,660,281 | 859,920,536 | 26.5 |
| 1862 | 217,695,418 | 218,015,296 | 50.0 | 1878 | 313,050,966 | 876,991,129 | 25.9 |
| 1863 | 241,872,471 | 343,056,081 | 41.4 | 1879 | 272,015,692 | 811,269,232 | 22.6 |
| 1864 | 184,061,486 | 485,793,548 | 27.5 | 1880 | 258,346,577 | 1,224,265,434 | 17.18 |

| 1871 | 353,634,172 | 755,822,576 | 31.2 | 1887 | 194,356,746 | 1,165,194,508 | 13.80 |
| 1872 | 345,331,101 | 830,346,392 | 28.5 | 1888 | 190,857,473 | 1,174,697,321 | 13.44 |
| 1873 | 346,306,592 | 966,723,651 | 25.8 | 1889 | 203,805,108 | 1,219,063,541 | 13.70 |
| 1874 | 350,451,994 | 939,206,106 | 26.7 | 1890 | 202,451,086 | 1,371,116,744 | 12.29 |
| 1875 | 314,257,792 | 884,788,517 | 25.8 | | | | |

In the year ending June 30, 1897, the entrances of the merchant marine at all ports of the United States were: sailing vessels, 5,086,660 tons, steam vessels, 20,322,326 tons; and the clearances were: sailing vessels, 4,977,514, steam vessels, 20,367,990.

COMMERCE.—The commerce of the United States has steadily increased since the year 1789-90, when the total value of its exports was \$20,194,794, and of its imports \$23,000,000, down to the year 1897, when its exports were valued at \$1,032,001,300, and its imports at \$764,717,609. The appended table shows the value of articles of import and export by groups for the fiscal year ending June 30, 1897:

IMPORTS AND EXPORTS OF MERCHANDISE.

| ARTICLES. | Value. | ARTICLES. | Value. |
|----------------------------------------------------------|---------------|-------------------------------------------|----------------------|
| IMPORTS. | | IMPORTS. | |
| FREE OF DUTY: | | Articles manufactured — | |
| Articles of food and live animals..... | \$124,012,968 | For mechanic arts..... | \$87,173,512 |
| Articles in a crude condition for domestic industry..... | 194,564,418 | For consumption..... | 134,375,126 |
| Articles manufactured — | | Articles of voluntary use, luxuries, etc. | 83,098,669 |
| For mechanic arts..... | 29,864,421 | Total imports of merchandise..... | \$764,717,609 |
| For consumption..... | 24,750,275 | | |
| Articles of voluntary use, luxuries, etc. | 8,746,339 | | |
| Total free of duty..... | \$381,938,421 | DUTIES COLLECTED..... | \$176,316,893 |
| DUTIABLE: | | EXPORTS. | |
| Articles of food and live animals..... | \$121,153,211 | DOMESTIC: | |
| Articles in a crude condition for domestic industry..... | 20,339,911 | Products of — Agriculture..... | \$683,878,990 |

AGRICULTURE, LIVE STOCK, ETC.—With an abundance of land, agriculture holds the first place in the list of national industries. The national lands are sold by the government for cash, for the most part at the ordinary price of \$1.25 per acre.

Vast quantities of land have been impoverished, exhausted, and abandoned; but improved systems of agriculture are promoted by the government, and widely introduced. Wheat and maize are grown in all the states; cotton, south of lat. 37°; sugar-cane in Louisiana, Texas, and Florida; hemp and tobacco chiefly between lat. 34° and 40°; rice, in South Carolina and Georgia; figs and oranges flourish in the Gulf States and California; and peaches, grapes, melons, and other delicious fruits are abundant and in great perfection south of lat. 43°.

GRAIN PRODUCTION OF THE UNITED STATES.

| Utah..... | 54,064,640 | 84,476 | 16,036,429 | 37,772,650 |
| Totals..... | 1,815,424,388 | 2,886,757 | 1,042,844,034 | 763,671,546 |

The total value of farm and ranch animals in the United States on Jan. 1, 1897, was estimated at \$1,655,414,632. The animals included 14,364,687 horses, 2,215,654 mules, 15,941,727 milch cows, 30,508,408 oxen and other cattle, 36,818,643 sheep, and 40,600,276 swine.

FORESTRY.—In connection with the great forests of the country, the preparation of lumber or timber is important. There were 25,708 establishments for this purpose in 1880, with a capital of \$180,000,000, employing 146,880 hands, using materials valued at \$146,000,000, the value of the produce being \$233,000,000. For 1888 the total product of lumber was estimated at 30,000,000,000 cubic feet, valued at \$600,000,000.

FISHERIES.—The value of the fisheries of the United States in the census year 1890 was as follows: General food and bait fisheries, \$21,242,956; menhaden fishery, \$638,668; oyster, clam, and scallop fisheries, \$18,100,598; crab, lobster, and shrimp fisheries, \$2,028,282; turtle and terrapin fisheries, \$215,316; whale fisheries, \$2,146,136; seal and sea-otter fisheries, \$502,180; and sponge fishery, \$438,682—total, \$45,312,818.

MANUFACTURES.—The great manufacturing states are New York, Pennsylvania, Ohio, Massachusetts, Illinois, Indiana, and Michigan. Since 1890, the southern states, formerly almost wholly agricultural, have developed great manufacturing industries that threaten to rival those of the north. This is especially true of Georgia and Alabama.

The following table gives the officially revised summary of the

MANUFACTURES OF THE UNITED STATES BY STATES AND TERRITORIES IN 1890.

| STATES AND TERRITORIES. | Establishments. | Aggregate Capital. | Persons Employed. | Wages Paid. | Cost of Materials. | Value of Products. |
|-------------------------|-----------------|--------------------|-------------------|-----------------|--------------------|--------------------|
| Alabama..... | 2,977 | \$46,122,571 | 33,821 | \$12,676,029 | \$28,432,281 | \$51,226,605 |
| Alaska..... | 10 | 105,727 | 86 | 22,173 | 30,198 | 58,440 |
| Arizona..... | 76 | 616,629 | 528 | 358,127 | 353,814 | 947,547 |

| Wyoming..... | 190 | 1,411,184 | 1,144 | 878,646 | 1,084,432 | 2,367,601 |
| Totals..... | 355,401 | \$6,524,475,305 | 4,711,832 | \$2,282,823,265 | \$5,158,868,353 | \$9,370,107,624 |

The most important manufactures according to value of output were: Boots and shoes, factory product, \$220,649,358; carriages and wagons, \$114,570,555; cars for steam railroads, \$129,461,698; clothing, men's, factory product, \$251,019,609; cotton goods, \$267,981,724; flour and grist-mill products, \$513,971,474; foundry and machine shop products, \$412,701,872; iron and steel, \$430,954,348; leather, tanned and curried, \$138,282,004; liquors, distilled, \$104,197,869; liquors, malt, \$182,731,622; lumber products from logs or bolts, \$403,667,575; lumber, planing-mill products, \$183,681,552; sugar and molasses, \$123,118,259; tobacco, cigars and cigarettes, \$129,693,275; and woolen goods, \$133,577,977.

Pennsylvania continues to occupy the position of the leading producer of steel in the United States, producing 57 per cent. of the total production in 1880 and 62 per cent. in 1890. Illinois was second in rank in both years and Ohio was third. From 1880 to 1890 the increase in production in Pennsylvania was 324 per cent., in Illinois 241 per cent., and in Ohio 314 per cent. Since 1880 the manufacture of steel has been abandoned in two states, viz., Rhode Island and Vermont, and seven states have engaged in its production, viz., Alabama, California, Colorado, Indiana, Michigan, Virginia, and West Virginia. See COPPER, TIN.

SYNOPSIS OF HISTORY.—COLONIAL PERIOD.—The territories now occupied by the United States of America, though they were probably visited on their north-eastern coast by Norse navigators about the year 1000, continued the sole possession of numerous tribes of Indians (who had succeeded earlier and extinct races), until the discovery of America by Columbus, 1492. In 1498 an English expedition, under the command of Sebastian Cabot, explored the eastern coast of America from Labrador to Virginia, perhaps to Florida. In 1513 Juan Ponce de Leon landed near St. Augustine in Florida, and explored a portion of that region in a romantic search for the fountain of youth. In 1520 some Spanish vessels from St. Domingo were driven upon the coast of Carolina. In 1521, by the conquests of Cortes and his followers, Mexico, including Texas, New Mexico, and California became a province of Spain. In 1539–42, Ferdinand de Soto led a Spanish expedition from the coast of Florida across Alabama and discovered the Mississippi river. In 1584–85, Sir Walter Raleigh sent two expeditions to the coast of North Carolina and attempted to form settlements on Roanoke island. A Spanish settlement was made at St. Augustine, Florida, 1565. Jamestown, Virginia, was settled in 1607; New York, then called the New Netherlands, 1613; Plymouth, Massachusetts, 1620. A large part of the country on the great lakes and on the Mississippi was explored by La Salle in 1682; and settlements were made by the French at Kaskaskia and Arkansas Post, 1685; Mobile and Vincennes, 1702. The early history of the various colonies which now constitute the United States will be found under the heads of the different states and territories. The first effort at a union of colonies was in 1643, when the settlements in Massachusetts, New Hampshire, Rhode Island, and Connecticut formed a confederacy for mutual defense against the French, Dutch, and Indians, under the title of "The United Colonies of New England." They experienced the benefits of united action in 1754, when an English grant of lands to the Ohio company brought on the French and Indian war—the French claiming, at that period, as the first explorers, northern New England, half of New York, and the entire Mississippi valley. George Washington was sent on his first expedition, to remonstrate with the French authorities; and the colonies being advised to unite for general defense, a plan for a general government of all the English colonies was drawn up by Benjamin Franklin; but it was rejected by both the colonies and the crown—by the colonies, who wished to preserve their separate independence, and by the crown from a jealousy of their united strength. The colonists, however, took an active part in the war. Under Maj. Washington, they joined Gen. Braddock in his unfortunate expedition against Fort du Quesne, now Pittsburg; they aided in the reduction of Louisburg, Ticonderoga, Crown Point, and Niagara; and rejoiced in the conquest of Quebec, by which the vast northern regions of America became the possessions of Great Britain.

The principles of a democratic or representative government were brought to America by the earliest colonists. The colonies themselves were founded by private adventure, with very little aid from government. The Plymouth colony was for eighteen years a strict democracy, and afterwards a republic under a charter from the crown. A representative and popular government was established in Virginia in 1620. It was not until the protectorate and the reign of Charles II. that the colonies were considered as portions of the empire, to be governed by parliament, when navigation acts were passed to give English ships a monopoly of commerce, when the produce of the colonies was required to be sent to England, and duties were levied on commodities sent from one colony to another. Protests were made against these assumptions; Virginia asserted her right of self-government; and it was not until the English revolution of 1688 that settled and uniform relations with the different colonies were established.

In 1713, by the treaty of Utrecht, England, which, since the reign of Elizabeth, had imported slaves from Africa into her American and West Indian colonies, obtained a monopoly of the slave-trade, engaging to furnish Spanish America, in 33 years, with 144,000 negroes. A great slave-trading company was formed in England, one-quarter of the stock being taken by Queen Anne, and one-quarter by the king of Spain, these two sovereigns becoming the greatest slave-dealers in Christendom. By this monopoly, slavery was extended in, and to some extent forced upon, all the American colonies.

At this period, there was a general feeling of loyalty toward the mother country. The sons of the more wealthy colonists, especially in the south, were educated in England; English literature pervaded the colonies; the British throne was the fountain of honor; the colonies, though distinct, and differing in origin and character—Puritan in the east, Dutch Reformed in New York, Quaker in Pennsylvania, Catholic in Maryland, and Church of England in Virginia—were yet united by language, common ties, fears, and interests. In 1761 the enforcement of the navigation act against illegal traders, by general search-warrants, caused a strong excitement against the government, especially

in Boston. The admiralty enforced the law ; many vessels were seized ; and the colonial trade with the West Indies was annihilated. In 1765 the passing of an act of parliament for collecting a colonial revenue by stamps caused general indignation and led to riots. Patrick Henry, in the Virginia Assembly, denied the right of parliament to tax America, and eloquently asserted the dogma, "no taxation without representation." The first impulse was to unite against a common danger ; and the first colonial Congress of twenty-eight delegates, representing nine colonies, made a statement of grievances and a declaration of rights. The stamps were destroyed or reshipped to England, and popular societies were formed in the chief towns, called "Sons of Liberty." In 1766 the stamp act was repealed, to the general joy of the colonists ; but the principle of colonial taxation was not abandoned ; and in 1767 duties were levied on glass, papers, printers' colors, and tea. This renewed attempt produced, in 1768, riots in Boston, and Governor Gage was furnished with a military force of 700 to preserve order and enforce the laws. In 1773 the duties were repealed, excepting 3d. a pound on tea. It was now a question of principle, and from north to south it was determined that this tax should not be paid. Some cargoes were stored in damp warehouses and spoiled ; some sent back ; in Boston, a mob, disguised as Indians, threw it into the harbor. To punish this outrage, parliament passed the Boston Port Bill, 1774, by which the chief town of New England was no longer a port of entry, and its trade transferred to Salem. The people were reduced to great distress, but received the sympathy of all the colonies, and liberal contributions of wheat from Virginia, and rice from Charleston, South Carolina.

WAR OF INDEPENDENCE.—It was now determined to enforce the government of the crown and parliament over the colonies ; and a fleet, containing several ships of the line, and 10,000 troops, was sent to America ; while the colonists, still asserting their loyalty, and with little or no thought of separation from the mother country, prepared to resist what they considered the unconstitutional assumptions of the government. Volunteers were drilling in every direction, and depots of provisions and military stores were being gathered. A small force being sent from Boston to seize one of these depots at Concord, Mass., led to what is called the battle of Lexington, and the beginning of the war of the revolution, April 19, 1775. The British troops were attacked on their return by the provincials, and compelled to a hasty retreat. The news of this event summoned 20,000 men to the vicinity of Boston. The royal forts and arsenals of the colonies were taken possession of, with their arms and munitions. Crown Point and Ticonderoga, the principal northern fortifications, were surprised, and their artillery and stores appropriated. A Congress of the colonies assembled at Philadelphia, which resolved to raise and equip an army of 20,000 men, and appointed George Washington commander-in-chief. On June 17, Breed's Hill, in Charleston, near Boston, where 1500 Americans had hastily intrenched themselves, was taken by assault by the British troops, but with so heavy a loss (1054) that the defeat had for the provincials the moral effect of a victory. After a winter of great privations the British were compelled to evacuate Boston, carrying away in their fleet to Halifax 1500 loyal families.

The British government now put forth a strong effort to reduce the colonies to submission. An army of 55,000, including 17,000 German mercenaries ("Hessians"), was sent, under the command of Sir William Howe, to put down this "wicked rebellion." The provincial Congress, declaring that the royal authority had ceased, recommended to the several colonies to adopt "such governments as might best conduce to the safety and happiness of the people ;" and the thirteen colonies soon adopted constitutions as independent and sovereign states. On June 7, 1776, Richard Henry Lee, of Virginia, offered a resolution in Congress, declaring that "the united colonies are, and ought to be, free and independent states : that they are absolved from all allegiance to the British crown ; and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved." This resolution, after an earnest debate, was adopted by the votes of nine out of thirteen colonies. A committee, consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston, was instructed to prepare a declaration in accordance with the above resolution ; and the celebrated Declaration of Independence, written by Mr. Jefferson, based upon the equality of men and the universal right of self-government, and asserting that "all government derives its just powers from the consent of the governed," on July 4, 1776, received the assent of the delegates of the colonies, which thus dissolved their allegiance to the British crown, and declared themselves free and independent states, under the general title of the thirteen United States of America—New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia—occupying a narrow line of the Atlantic coast between Canada and Florida, e. of the Alleghanies, with a population of about 2,500,000 souls.

After the evacuation of Boston, Gen. Washington, with the remains of his army, thinned by the hardships of winter, hastened to New York. On July 2, Gen. Howe, being joined by his brother, Admiral Lord Howe, and Sir Henry Clinton, found himself at the head of 35,000 men ; defeated the Americans on Long Island, Aug. 27, 1776, compelled the evacuation of New York, and secured the possession of its spacious harbor and the river Hudson. Gen. Washington, with inferior and undisciplined forces, retreated across New Jersey, closely followed by the English, hoping to save Phila-

delphia. Newark, New Brunswick, Princeton, the chief towns in New Jersey, were taken, and the British awaited the freezing of the Delaware to occupy Philadelphia. On Christmas night, Gen. Washington, by crossing in boats among floating ice, made a successful night attack upon a Hessian force at Trenton, and gave new courage to the desponding Americans, who recruited the army, and harassed the enemy with a winter campaign.

In the mean time Silas Deane and Benjamin Franklin had been sent to France to solicit recognition and aid. The recognition was delayed, but important aid was privately given in money and supplies, and European volunteers—the Marquis de Lafayette, Baron Steuben, Baron de Kalb, Kosciusko, and Pulaski—rendered the most important services. Efforts were made to induce the British colonies of Canada and Nova Scotia to unite in the struggle for independence, and an expedition was sent against Montreal and Quebec, led by Gens. Montgomery and Arnold. The Canadians refused their aid; Montgomery was killed, Arnold wounded, and the remains of the expedition returned after terrible sufferings. In 1777, after several severe actions in New Jersey, generally disastrous to the Americans, the British took possession of Philadelphia; and Washington, with the remnants of his army, went into winter-quarters at Valley Forge, where they suffered from cold, hunger, and nakedness.

While Washington was unsuccessfully contending against disciplined and overwhelming forces in New Jersey, Gen. Burgoyne was leading an army of 7000 British and German troops, with a large force of Canadians and Indians, from Canada into northern New York, to form a junction with the British on the Hudson, and separate New England from the rest of the Confederacy. His march was delayed by felled trees and destroyed roads; his foraging expeditions were defeated; and, after two sharp actions at Stillwater and Saratoga, with but three days' rations left, he was compelled to capitulate, Oct. 17; and England, in the midst of victories, heard with dismay of the loss of an entire army. The Americans gained 5000 muskets and a large train of artillery. Feeling the need of more unity of action, articles of confederation, proposed by Franklin in 1775, were adopted in 1777, which constituted a league of friendship between the states, but not a government which had any powers of coercion.

In 1778, Lord Carlisle was sent to America by the British government with offers of conciliation; it was too late. France, at the same time, recognized American independence, and sent a large fleet and supplies of clothing, arms, and munitions of war to their aid; and Gen. Clinton, who had superseded Gen. Howe, finding his supplies at Philadelphia threatened, retreated to New York, defeating the Americans at Monmouth.

The repeated victories of the British armies, the aid afforded by great numbers of Americans who still adhered to the royal cause, and furnished during the war not less than 20,000 troops, and the alliance of large tribes of Indians, who committed cruel ravages in the frontier settlements, did little toward subjugating the country. Portions of the sea-coast of New England and Virginia were laid waste; but the king's troops were worn out with long marches and tedious campaigns, and even weakened by victories. Spain, and then Holland, joined in the war against England, and aided the Americans. Paul Jones, with ships fitted out in French harbors, fought desperate battles under the American flag on the English coast. But the king and parliament were determined to maintain the honor of the crown and the integrity of the empire. In 1780, 85,000 seamen were raised, and 35,000 additional troops sent to America, and a strong effort was made to subjugate the Carolinas, where the war assumed a bitter partisan character, and was conducted with spirit by Sumpter, Marion, and other southern chieftains. Lord Cornwallis, with a large army, marched from Charleston, through North Carolina, pursuing, and sometimes defeating, the American Gen. Gates. Worn out with his success, he arrived in Virginia, where he was confronted by Gen. Lafayette. In the mean time, Admiral de Varney had arrived upon the coast with a powerful French fleet, and 6000 soldiers of the *élite* of the French army, under the Count de Rochambeau. Cornwallis was obliged to fortify himself at Yorktown, blockaded by the fleet of Count de Grasse, and besieged by the allied army of French and Americans, waiting for Sir Henry Clinton to send him relief from New York. Oct. 19, 1781, he was compelled to surrender his army of 7000 men—an event which produced such a change of feeling in England as to cause the resignation of the ministry, and the dispatch of Gen. Sir Guy Carleton to New York with offers of terms of peace. The preliminaries were signed at Paris, Nov. 30, 1782; and on Sept. 3, 1783, peace was concluded between England and France, Holland, and America. The independence of each of the several states was acknowledged, with a liberal settlement of territorial boundaries. In April, a cessation of hostilities had been proclaimed, and the American army disbanded; New York, which had been held by the English through the whole war, was evacuated Nov. 25; on Dec. 4, Gen. Washington took leave of his companions in arms, and Dec. 23, resigned into the hands of Congress his commission as commander.

From the retreat of Lexington, April 19, 1775, to the surrender of Yorktown, Oct. 19, 1781, in 24 engagements, including the surrender of two armies, the British losses in the field were not less than 25,000 men, while those of the Americans were about 8000. The expenditure of money in carrying on the war had been \$130,000,000, exclusive of personal losses and those of the individual states.

THE CONFEDERATION.—The long war had now ended; the colonies were free; but the

condition of the young confederacy seemed most discouraging. Its treasury was empty, it was burdened with a foreign debt of \$8,000,000, and domestic obligations (chiefly to the officers and soldiers of the continental army) of \$30,000,000, and a paper currency of nearly \$90,000,000 which no one would receive. Moreover, the Congress which had incurred these various obligations had no power to provide for discharging them. It could only make *recommendations* to the states and urge them to provide their share toward the expenses of the government; but the states were themselves in debt, and unwilling to respond to the demands of the Congress. The very treaty that the Congress had concluded with Great Britain, contained stipulations which it could not carry out, and in consequence the British garrisons on the frontier were not withdrawn, and the representatives of England treated the American government with open contempt. The lawlessness generated in all communities by a state of war, found vent in open resistance to constituted authority, and in Massachusetts, in 1786, a portion of the people actually organized to resist the collection of debts, and to close the local courts. This outbreak was known as Shays's Rebellion from its leader, one Daniel Shays, a captain in the Continental army, who at the head of a thousand men marched to Worcester, broke up the sitting of the Supreme Court and repeated the same daring act at Springfield. Through the firmness and courage of the governor, James Bowdoin, the insurrection was suppressed, but the most alarming fact was that Congress, although it raised troops in case such an emergency should again arise, did not venture openly to declare the object for which these troops were enlisted. In short, it dared not assert either the will or the power to deal with a rebellion.

The whole history of the war had, in fact, served to show the shortcomings of the Confederation. These came mainly from one great defect; its inability to force the citizens to comply with its wishes. After the war this was even more felt. Congress had no power of maintaining an army or navy, no control over trade, no means of raising public funds, and no mode of enforcing its will but by an appeal to arms. In the words of Washington, it was "little more than a shadow without the substance." Moreover, from its want of power, it was despised and neglected by those who should have been its chief supporters. The ablest men were occupied with the politics of their own states. Congress consisted of little more than twenty members. The evils of this were soon made evident. In 1786, after some difficulty, twelve states had assented to a general system of import duties. The thirteenth, however, New York, resisted, and thus one state was able to hinder a measure which was needful for the credit and security of the whole nation. So, too, articles in the treaty with England were set at naught by the different state governments. The treaty provided that all debts incurred up to that time between citizens of either country should still hold good; that no person should suffer any loss or damage for any part which he might have taken in the war. Laws, however, were passed by the various State Legislatures in direct defiance of these articles, and all that Congress could do was to exhort them to annul these laws and to comply with the treaty.

In this state of things, thoughtful men began to see that, if the United States were to exist as a nation, there must be a central government with direct power both in internal and external affairs; able to carry on foreign negotiations in the name of the nation; to issue commands to the citizens of the states, to enforce these commands, if necessary, and to punish those who neglected them. The first man clearly to perceive and boldly to declare this was Alexander Hamilton.

Though he had been among the most ardent supporters of American independence, he was no advocate of the system of government that had been the immediate result of the war. He wished his countrymen to secure the advantages of a strong central government, and the model that he had in mind was the English system, of course without the monarchical principle. In 1785 an opportunity occurred of effecting, or at least of suggesting, a radical change. In that year commissioners were appointed by Virginia and Maryland to settle certain difficulties about the navigation of the Potomac river and Chesapeake Bay. They met at Mount Vernon, Washington's home, and there a plan was proposed for maintaining a fleet on the Chesapeake, and for settling commercial duties. This led to the proposal made by the Assembly of Virginia for a general conference of commissioners from all the states to consider the state of trade. Hamilton saw that this conference might be made the instrument of wider changes, and he persuaded New York to send commissioners, himself among them. In 1786 commissioners from five states met at Annapolis in Maryland. Hamilton laid before them a report, giving reasons why it would be well if a convention of delegates from all the states should meet to consider the state of the national government. The proposal was adopted and a convention met at Philadelphia in 1787 under the presidency of George Washington.

Two rough plans were laid before the Convention, one by Edmund Randolph of Virginia, the other by William Patterson of New Jersey. The former which, with some changes, was finally accepted, represented the views of those who wanted a strong central Government, the Federal party, as they were afterwards called; the other, those of their opponents. Hamilton also brought forward a scheme, but this went so far beyond the wishes and views of the mass of the Federalists, that it met with no support. Finally Randolph's plan was adopted, and the Convention applied itself to casting it

into shape. The result, with some changes, has continued to be the Constitution of the United States to the present day. (See CONSTITUTION.)

When the constitution had been drawn up, the difficulties of its framers had little more than begun. The question at once arose, how was the Constitution to be put in force? Congress had no power to grant away its own authority to a new government, nor had the nation enough confidence in it to accept its decision. Accordingly the Convention resolved to lay it before the various states. The serious question then arose, What was to be done if some states accepted, some refused? Finally, it was decided that, if nine states accepted it, the constitution should take effect, and that, if any of the remaining states refused, they must be left out of the new confederation. Accordingly conventions of the various states were summoned. The contest was a hard one. Great service was done to the cause of the constitution by a series of essays called the *Federalist*. These were written by Hamilton, Madison, and a third Federal statesman, Jay. The struggle was most severe in New York and Virginia, but in both the constitution at length prevailed. In New York the result was mainly due to Hamilton. In Virginia Patrick Henry opposed it with the utmost animosity, and with the power and eloquence of his best days.

But on June 21st, 1788, the ninth state had ratified the constitution. New York and Virginia soon after accepted it, leaving only North Carolina and Rhode Island without the new Union. On July 14th, 1788, the Congress of the Confederation referred the ratification to a committee which arranged a plan for carrying the new government into operation. The first Wednesday of January, 1789, was selected for the choice of electors for President and Vice-President, and the first Wednesday in February for the voting of the electors. Soon after the adoption of the Constitution, eleven amendments, popularly known as the Bill of Rights were added to it in order the more explicitly to guard the rights of the individual citizen.

At this time and until 1805, each presidential elector voted by ballot for two persons. In case a majority of all the votes were cast for any person, he became President; and the person receiving the next greatest number became Vice-President. On the counting of the votes in 1789, George Washington was found to have received 69 votes, or one from each elector; and John Adams to have received 34.

I. and II. ADMINISTRATION OF GEORGE WASHINGTON (1789-1797). *Cabinets*.—*Secretary of State*, Thomas Jefferson, Virginia, September 26th, 1789; Edmund Randolph, Virginia, January 2d, 1794; Timothy Pickering, Pennsylvania, December 10th, 1795. *Secretary of Treasury*, Alexander Hamilton, New York, September 11th, 1789; Oliver Wolcott, Connecticut, February 2d, 1795. *Secretary of War*, Henry Knox, Massachusetts, September 12th, 1789; Timothy Pickering, Pennsylvania, January 2d, 1795; James McHenry, Maryland, January 27th, 1796. *Attorney-General*, Edmund Randolph, Virginia, September 26th, 1789; William Bradford, Pennsylvania, January 27th, 1794; Charles Lee, Virginia, December 10th, 1795. *Postmaster-General*,* Samuel Osgood, Massachusetts, September 26th, 1789; Timothy Pickering, Pennsylvania, August 12th, 1791; Joseph Habersham, Georgia, February 25th, 1795.

George Washington was sworn into office at the City Hall, New York, on April 30th, 1789. The Congress which was then in session elected Frederick A. Muhlenberg, of Pennsylvania, as the first Speaker of the House. The early days of the session witnessed a gradual formation of political parties on the lines of greater or less centralization, those favoring a liberal interpretation of the powers of the Federal government being known as Federalists, and those favoring a very strict interpretation and limitation of these powers, receiving at first the name of Anti-Federalists, but subsequently that of Democratic-Republicans. Washington endeavored to hold the balance even between the two conflicting factions, and in making up his cabinet, called to it both Hamilton, the greatest leader of the Federalists, and Jefferson, the ablest advocate of Anti-Federalist doctrine.

The chief events of Washington's first administration, were the adoption of a tariff (see TARIFF), the settlement of the public debt in accordance with the recommendations of Hamilton, who advised that the United States should assume in full all the debts incurred during the revolution, not only by the Confederation but by the States; the adoption of a site for the new capital of the nation; the ratification of the Constitution by North Carolina (Nov., 1789), and Rhode Island (May, 1790), the establishment of a National Bank (1791), and the admission of Vermont (March, 1791), and Kentucky (June, 1792), to the Union.

At the request of both Federalists and Republicans, Washington agreed to serve a second term as President, and was unanimously re-elected, as was John Adams to the office of Vice-President, though the latter was opposed by George Clinton, of New York, the Republican candidate. Washington's second term was one of much public turmoil and uneasiness, owing to the attitude of the two parties toward France and England, then at war. The Federalists expressed an open sympathy with England; the Republicans with France. The action of the French minister to the United States, known as "Citizen" Genet, did much to increase the popular excitement. He openly violated the President's proclamation of neutrality, endeavored to fit out French cruisers

* Not a member of the Cabinet until 1829, but attached to the Treasury.

ates in 1789.

in American ports, raised money and men for the service of France, and acted with such offensive and undisguised insolence toward Washington and his Cabinet, that the government demanded his recall. The turbulence resulting from his reckless course, however, had inflamed party passions to such an extent that even Washington's calm and dignified policy did not escape the bitterest partisan denunciation. This increased in volume and intensity when the so-called Jay Treaty with England, negotiated by Chief-Justice John Jay at the President's request, was laid before the Senate. England's course had been arrogant and far from conciliatory. She had impressed American seamen, had refused to evacuate the posts on the American frontiers, and had largely excluded American commerce from the West India trade. The Jay Treaty was far from securing the assurances from England that all believed to be justly due; but it embodied the best that could then be obtained, and the President signed it. It is almost impossible to believe how virulent became the aspersions now recklessly heaped upon the honored name of Washington. He was threatened with impeachment and even with assassination; he was accused of embezzlement, of treason, of usurpation, and the Republicans of the day styled him in ridicule, the "Step-father of his Country." Yet his action was soon justified by the general revival of commerce that followed the ratification of the Jay Treaty.

The other great events of Washington's second administration were the suppression of the so-called Whisky Insurrection (q.v.) in Pennsylvania (1794), the adoption of a plan for internal taxation (1795), the admission of Tennessee (June, 1796), and Washington's farewell address, which was given to the American people, Sept. 17, 1796. Its issuance was followed by the first contested Presidential election. As Washington declined again to be a candidate, the two great parties waged an open warfare for the election of his successor. The Federalist candidate, John Adams, received 71 votes, and the Anti-Federalist, Thomas Jefferson, 68 votes. Therefore, in accordance with the then prevailing system, John Adams became President—and Thomas Jefferson, Vice-President.

III. ADMINISTRATION OF JOHN ADAMS (1797–1801). *Cabinet.*—*Secretary of State*, Timothy Pickering, continued; John Marshall, Virginia, May 13th, 1800. *Secretary of Treasury*, Oliver Wolcott, continued; Samuel Dexter, Massachusetts, January 1st, 1801. *Secretary of War*, James McHenry, continued; Samuel Dexter, Massachusetts, May 13th, 1800; Roger Griswold, Connecticut, February 3d, 1801. *Secretary of Navy*,* George Cabot, Massachusetts, May 3d, 1798; Benjamin Stoddert, Maryland, May 21st, 1798. *Attorney-General*, Charles Lee, continued; Theophilus Parsons, Massachusetts, February 20th, 1801. *Postmaster-General*, Joseph Habersham, continued.

At first the prospects of the new administration and of the Federalist party seemed extremely favorable. The insolent action of the French Directory then at the head of affairs in France, in demanding of the American commissioners a bribe in return for a favorable hearing, inspired everywhere in the United States the most intense indignation. A war seemed imminent. General Washington was again summoned to command the army; an American frigate attacked and defeated a French one. But a change in the French government led to a reconciliation, and in 1800 a treaty removed the immediate cause of complaint. In the preceding year, the death of Washington caused universal lamentation.

Such popularity as the government had secured by its firm attitude toward France, was soon lost by the passage of the unwise "Alien and Sedition Laws" (1798). These empowered the President to order out of the United States, at his own discretion, any alien whose presence he should judge dangerous, and enforced penalties on any person who published false, scandalous, or malicious writings against the government, either House of Congress, or the President. Both these laws were generally felt to be opposed to the principles of the Constitution, and they brought the government into great disrepute. Congress, however, was still controlled by the Federalists, and hence the Republicans protested against the new enactments, through the medium of the state legislatures. Certain resolutions drawn by Jefferson were adopted in 1798 by the Kentucky legislature, and a second series written by Madison were passed by the legislature of Virginia. These, being essentially the same in principle, are known as the "Virginia and Kentucky Resolutions," or the "Resolutions of 1798." They are the first official statement of the party of State Rights and Strict Construction. The essential principle involved in them was that the Constitution is a compact between the states and the government; that each of the parties may be the judge of the infringement of the compact by the other; that the Alien and Sedition Laws being unconstitutional were such an infringement, and hence void. The Kentucky Resolutions specifically asserted the right of a state to "nullify" a Federal law—a doctrine that later led to momentous consequences. The immediate agitation against the obnoxious laws caused the defeat of the Federalist party in the presidential election of 1800. When the electoral votes were counted, there were found to be 73 for Thomas Jefferson, Republican, and the same number for Aaron Burr, while John Adams had 65. There being thus no choice, the election was thrown into the House of Representatives, which under the existing law was bound to choose between the first two candidates, each state having only a single

* Until this time the navy had been under the general direction of the War Department.

vote. After balloting for six days, Jefferson was elected, receiving the vote of ten states, while four states voted for Burr, and two voted in blank. Thomas Jefferson was thus made President, and Aaron Burr, Vice-President.

IV. and V. ADMINISTRATION OF THOMAS JEFFERSON (1801-1809). *Cabinet*.—*Secretary of State*, James Madison, Virginia, March 5th, 1801. *Secretary of Treasury*, Samuel Dexter, continued; Albert Gallatin, Pennsylvania, May 14th, 1801. *Secretary of War*, Henry Dearborn, Massachusetts, March 5th, 1801. *Secretary of Navy*, Benjamin Stoddert, continued; Robert Smith, Maryland, July 15th, 1801; Jacob Crowninshield, Massachusetts, May 3d, 1805. *Attorney-General*, Levi Lincoln, Massachusetts, March 5th, 1801; Robert Smith, Maryland, March 3d, 1805; John Breckinridge, Kentucky, August 7th, 1805; Cæsar A. Rodney, Pennsylvania, January 20th, 1807. *Postmaster-General*, Joseph Habersham, continued; Gideon Granger, Connecticut, November 28th, 1801.

The election of Jefferson marked the complete triumph of the Republicans. Jefferson made thirty-nine removals from office without cause, but chiefly of those whom Adams had appointed in the last hours of his administration and hence known as "midnight appointments." President Jefferson, whom his opponents described as "an atheist in religion and a fanatic in politics," began his term of power with the most extreme theories of the Loose Constructionists as his guide, but the force of circumstances led him to adopt and carry through measures that involved as liberal an interpretation of the Constitution as any that the Federalists had ever advanced. The first of these was the purchase from France in 1803 of the so-called Louisiana Territory recently acquired by France of Spain. This territory extended from the mouth of the Mississippi to its headwaters, and westward indefinitely to the Pacific. The price paid was \$15,000,000.

In 1801 the United States became engaged in their first foreign war. When the Federals came into power under Adams, the American navy was far too weak to protect the rapidly growing commerce of the country. In spite of the opposition of the Republicans, who were hostile to everything which strengthened the hands of the government, much had been done during Adams's presidency to put the navy on a better footing. The result of this was soon seen in the dealings of the American Government with the petty states on the coast of Barbary—namely, Tripoli, Algiers, Tunis, and Morocco. Pirates from these states, sanctioned by their rulers, harassed the commerce of civilized nations. The rapidly-growing trade of the United States was especially exposed to these attacks, and accordingly the American government, like some of the European governments, secured its citizens against the pirates by a yearly payment to the rulers of the Barbary States. In 1800, the Dey of Algiers, presuming on the weakness of the Americans, ordered the captain of the ship which brought the yearly tribute to take an ambassador for him to Constantinople. As the ship lay under the guns of the fort, the captain dared not endanger her by refusing. In 1801 the Pasha of Tripoli, thinking that his state had been treated with less respect than Algiers, threatened to declare war on America. In the following year the United States sent a fleet of four ships to pacify the Barbary States, or if war had been already declared, to attack them. The American commander found on his arrival that the Pasha of Tripoli had declared war. During the year the Americans took several ships belonging to Tripoli, but struck no serious blow. Next year a fleet of six ships was sent out to the Mediterranean under the command of Commodore Morris, to blockade Tripoli. In 1805 the naval operations were assisted by a land force under the command of Hamet Caramalli, the elder brother of the reigning Pasha, who had been deposed, and had fled to Egypt. With a mixed force, officered in part by Americans, he marched on Derne, a town in Tripoli, and took it. This is the only time that the American flag has ever been hoisted over any place in the Old World. Thus threatened both by land and sea, the Pasha was glad to make peace. No more tribute was to be paid, but the Pasha was to receive \$60,000 as ransom for American prisoners. Immediately afterwards, the Dey of Tunis threatened the American fleet with war, unless they restored a vessel which they had seized on its way into Tripoli. The American commander not only refused to do this, but told the Dey that no tribute would be paid in future. The Dey at first stormed, but, when the American fleet appeared before Tunis, he gave way entirely. These successes put an end, so far as the United States were concerned, to the practice of paying black-mail to the Mediterranean pirates.

In 1802 (Nov. 29th) Ohio was admitted to the Union; in 1803 the twelfth amendment to the Constitution was passed; and in 1804 Mr. Jefferson was re-elected President by the vote of all the states except Connecticut, Delaware, and a part of the votes of Maryland, which were cast for the Federalists, Charles C. Pinckney, of South Carolina and Rufus King, of New York. In July, 1804, Vice-President Burr shot Alexander Hamilton in a duel.

Jefferson's second administration began with overwhelming Republican majorities in both houses of Congress. The Napoleonic wars were still in progress, and it was impossible for so gigantic a struggle not to affect the interests of the United States. The commerce of America was highly prosperous, her ships enjoying much of the carrying trade of Europe; but in May, 1806, England declared a blockade from Brest to the Elbe, and Bonaparte, in November, decreed the blockade of the coasts of the United Kingdom. American vessels were captured by both parties, and were searched by

British ships for British subjects ; and those suspected of having been born on British soil, were, in accordance with the doctrine, "once a subject always a subject," impressed into the naval service. Even American men-of-war were not exempted from this process. The British frigate *Leopard* meeting the American frigate *Chesapeake*, demanded four of her men, and on refusal fired into her, and the surprised *Chesapeake* struck her flag. British ships were hereupon forbidden to enter American harbors.

In 1807 this measure was extended in the famous Embargo Bill, which forbade American vessels to leave foreign ports, and foreign vessels to take cargoes for American ports. This measure, which was intended to punish England and France for their contempt of American rights upon the sea, practically destroyed the commerce of the United States, and was violently opposed by the Federalists, especially in New England and New York, where the shipping interest was strongest. Jefferson's administration also witnessed the creation of a flotilla of gun-boats, the construction of a National Road from Maryland to Ohio (1806), and the abortive trial of Aaron Burr for treason (1807).

Following the example of Washington, Mr. Jefferson declined to be a candidate for a third term, and in the elections of 1808, James Madison, of Virginia, was elected President, and George Clinton, of New York, Vice-President, over the same Federalist candidates who had been defeated in 1804. In February, 1809, owing to the threatening attitude of the New England states, which menaced the government with secession, the Embargo was relaxed and the Non-Intercourse Act was substituted for it, repealing the provisions of the Embargo, except as against England and France.

VI. and VII. ADMINISTRATION OF JAMES MADISON (1809-1817). *Cabinet.*—*Secretary of State*, Robert Smith, Maryland, March 6th, 1809 ; James Monroe, Virginia, April 2d, 1811. *Secretary of Treasury*, Albert Gallatin, continued ; George W. Campbell, Tennessee, February 9th, 1814 ; A. J. Dallas, Pennsylvania, Oct. 6th, 1814 ; William H. Crawford, Georgia, October 22d, 1816. *Secretary of War*, William Eustis, Massachusetts, March 7th, 1809 ; John Armstrong, New York, January 13th, 1813 ; James Monroe, Virginia, September 27th, 1814 ; William H. Crawford, Georgia, August 1st, 1815. *Secretary of Navy*, Paul Hamilton, South Carolina, March 7th, 1809 ; William Jones, Pennsylvania, January 12th, 1813 ; B. W. Crowninshield, Massachusetts, December 19th, 1814. *Attorney-General*, C. A. Rodney, continued ; William Pinckney, Maryland, December 11th, 1811 ; Richard Rush, Pennsylvania, February 10th, 1814. *Postmaster-General*, Gideon Granger, continued ; Return J. Meigs, Ohio, March 17th, 1814.

The administration of Mr. Madison witnessed a further straining of the relations existing between the United States and England. Though the acts of France had been, in the main, no less unjust and arrogant than those of England, she had never attempted the impressment of American seamen, which had been made easy for England by identity of language, and by the fact that, in some cases, British deserters were actually found upon American ships. Moreover, the Republican party, now in power, had been traditionally the friend of France. Hence, as time went on, England was the nation especially singled out for American dislike, and this feeling increased when the West complained that British agents were exciting disaffection on the frontiers and intriguing with the Indians.

In 1810, England and France each professed a readiness to repeal the decrees that had so hampered American commerce, if the other would do so first. In 1811, Napoleon actually did withdraw the proclamations of which the United States complained. Meanwhile, an aggressive element had risen to prominence in the councils of the Republican party. Henry Clay, of Kentucky, was Speaker of the House ; and John C. Calhoun, of South Carolina, on the floor of the House was the master of the majority. Under the impulse of these two brilliant and impetuous spirits, the party in power became transformed into a war-party. Acts were passed to enlist soldiers, to organize the militia, to enlarge the navy, and to prepare in every way for war. The adoption of a war-policy was urged upon the President, who was himself reluctant to adopt it ; and his selection as the candidate of his party for a second term was plainly shown to be dependent upon his acceptance of the war. He yielded, and in Feb., 1812, was renominated, with Elbridge Gerry, of Massachusetts, for Vice-President. In the following month, England having refused to modify its policy toward neutrals, an embargo upon all American shipping was proclaimed for ninety days as a preliminary to war. Hence, on June 1st, Mr. Madison sent a message to Congress in which, after reviewing the American grievances against England, he recommended a formal declaration of war. On the 18th, Congress adopted the suggestion, and war was declared. Five days later, and before the declaration reached England, the British government withdrew its orders against commercial intercourse with France. Attempts were then made to restore peace, but each government stood firm on the point of the right of search, and reconciliation was impossible. Congress had voted to raise 25,000 enlisted soldiers, 50,000 volunteers, and 100,000 militia. Gen. Hull, with 2000 men at Detroit, invaded Canada ; but, on being met by a small force of British and Indians under Gen. Brock, recrossed the river, made a shameful surrender, and was sentenced to death for his cowardice, but pardoned by the President. A second invasion of Canada was made near Niagara Falls by Gen. Van Rensselaer. One thousand American militia stormed the heights of Queenstown, and the British general, Brock, was killed ; but re-enforcements arriving,

the heights were retaken, and nearly all the Americans were killed or driven into the Niagara, while the American general was in vain imploring a large body of militia on the opposite bank to cross over to the support of their brethren in arms. They refused, upon the ground that the government had no right to send the militia across the frontier. The Federal party, opposed to the war, defended this doctrine, and Gen. Van Rensselaer resigned in disgust. American disasters on the land were, however, compensated by victories at sea. On Aug. 19th, the United States frigate *Constitution* captured the British frigate *Guerrière*; on Oct. 18th the *Wasp* took the *Frolic*; on Oct. 25th the frigate *United States* captured the *Macedonian*; and on Dec. 29th the *Constitution* took the *Java*. The Americans, in most cases, had the larger ships and heavier ordnance; but the immense disparity in the losses showed also superior seamanship and gunnery. American privateers took 300 British vessels and 3000 prisoners. In 1813, Gen. Proctor crossed the Detroit River with a considerable force of British and Indians, and defeated Gen. Winchester, with the usual results of savage warfare. In April, an American army of 1700 men captured York, now Toronto, and about the same time another American force of 800 men was defeated with great loss by the Indians under Tecumseh; but the remainder of this campaign was wholly favorable to the Americans. The attempt of the British general, Prevost, on Sackett's Harbor, was repulsed; the British squadron on Lake Erie, consisting of 6 vessels, and 63 guns, was captured by Commodore Perry at the head of an American flotilla of 9 vessels and 54 guns; and this latter success enabled Gen. Harrison to invade Canada, where he defeated Gen. Proctor in the battle of the Thames, in which the great Indian warrior-chief Tecumseh was killed. In 1813 another invasion of Canada was attempted, York was taken by Gen. Dearborn, and an unsuccessful attempt was made to take Montreal. Villages were burned on both sides. The British also destroyed American shipping in Delaware Bay. At the same period Gen. Jackson defeated the Creek Indians in Alabama and Georgia, who had been excited to make war upon the frontier settlements.

In 1814, Gens. Scott and Ripley crossed the Niagara, and sharp actions, with no decisive results, were fought at Chippewa and Lundy's Lane, close by the great cataract. Gen. Wilkinson also invaded Canada on the Sorel River, but was easily repulsed. A British invasion, by Lake Champlain, by Gen. Sir George Prevost, with 14,000 men and a flotilla on the lake, was no more successful. On Sept. 6 the flotilla was defeated and captured in the harbor of Plattsburg, while the army was repulsed on shore, and retreated with heavy loss. In August, a British fleet ascended Chesapeake Bay, took Washington with but slight resistance, and burned the government buildings. A subsequent attack on Baltimore was unsuccessful. New York, New London, and Boston were blockaded, and a large expedition was sent against Mobile and New Orleans.

On Jan. 8th, 1815, Gen. Pakenham advanced with 12,000 men against the latter city, which was defended by Gen. Jackson at the head of 6000 militia, chiefly from Tennessee and Kentucky, and aided by a small force of artillery. The Americans were sheltered by a breastwork, and the British assault was met with so deadly a fire of rifle-men that it was repulsed, with the loss of Gen. Pakenham and several officers, with 700 killed and 1000 wounded, while the entire American loss is stated to have only amounted to 71. This ill-planned action was fought more than a month after peace had been concluded between England and America, and was followed by two naval actions in February and March. Though during this contest fortune at first favored the Americans on the high seas, she changed sides completely from June, 1813, as if to counterbalance the disasters of the British on land. On June 1st the *Chesapeake* was taken by the *Shannon*; on June 3d the *Growler* and *Eagle* were captured by British gun-boats; the *Argus* was taken by the *Pelican* on Aug. 14th; the *Essex* by the *Phæbe* and *Cherub* on Mar. 29th, 1814; the *President* by the *Endymion* on Jan. 15th, 1815; the only counterbalancing success being the sinking of the British sloop *Aton* by the *Wasp* on Sept. 8th, 1814. In Dec., 1814, the Federalists of New England held a convention at Hartford in opposition to the war and the administration, and threatened a secession of the New England states. (See HARTFORD CONVENTION.) In 1815, Commodore Decatur, who had taken a distinguished part in the recent war, commanded an expedition against the Algerians, whose corsairs had preyed on American commerce in the Mediterranean, and dictated terms to Algiers, Tunis, and Tripoli.

The treaty of peace with England was announced in February, 1815. The terms did not include the withdrawal of England's claim to search American ships, but none the less, all parties in this country hailed it with delight. With the end of the war, however, came the extinction of the Federalist Party, whose unpatriotic course during the struggle had made its name odious to the nation as a whole. It ceased, therefore, to take any public action, and for a time the country had the singular fortune to find all its citizens of one party, which was an amalgamation of both Federalists and Republicans, with principles derived from both the old party creeds. Perhaps the most marked influence left by the Federalists upon the political tenets of their opponents and upon the popular mind, was to be found in the now very general recognition of the perpetuity of the central government. This national idea had sustained the Republicans in the more liberal view which the war had compelled them to take of the inherent powers of the Federal government, and it became more apparent as time went on in the formation of a new party, known as the Whig Party led by Henry Clay, which

advocated a protective tariff, public improvements at the nation's expense, and a more aggressive foreign policy. But for the moment, the close of Madison's administration found the country, as a whole, scarcely divided by party differences, so that the presidential election of November, 1816, resulted in the choice of James Monroe, of Virginia, as President, and Daniel D. Tompkins, of New York, as Vice-President. These candidates received 183 electoral votes, while the votes of only three states—Massachusetts, Connecticut, and Delaware—were cast for the Federalist candidate, Rufus King, of New York. The Federalists made no formal nomination for the office of Vice-President.

VIII and IX. ADMINISTRATION OF JAMES MONROE (1817–1825). *Cabinet.*—*Secretary of State*, John Quincy Adams, Massachusetts, March 5th, 1817. *Secretary of Treasury*, William H. Crawford, continued. *Secretary of War*, George Graham, Virginia, April 7th, 1817; John C. Calhoun, South Carolina, October 8th, 1817. *Secretary of Navy*, B. W. Crowninshield, continued; Smith Thompson, New York, November 9th, 1818; John Rogers, Massachusetts, September 1st, 1823; Samuel L. Southard, New Jersey, September 16th, 1823. *Attorney-General*, Richard Rush, continued; William Wirt, Virginia, November 13th, 1817. *Postmaster-General*, R. J. Meigs, continued; John McLean, Ohio, June 26th, 1823.

The period of Mr. Monroe's term of office has been known in the annals of American political history as the Era of Good Feeling. Party questions were in abeyance, and when in May, 1817, the President began an extended tour in the Northern States, the warmth of the welcome given him by all classes of the people, showed that the nation was contented, prosperous, and loyal. On Dec. 10th of the same year, Mississippi was admitted to the Union. In accordance with the recommendations of the President's first message, the slightly protective tariff of 1816 was continued for seven years. (See *TARIFF*.) In 1818 (Dec. 3d) Illinois became a state, and on Feb. 22, 1819, the United States purchased of Spain the territory of Florida for \$5,000,000, besides abandoning all claim to the province west of the Sabine River, and afterwards known as Texas. At about the same time the people of the territory of Missouri which had been included in the purchase of Louisiana, applied for admission to the Union. A bill providing for such admission was framed, but amended in the House in such a way as to forbid slavery in the new state. As so amended, the bill passed the House by the votes of the members from the Free States, but was defeated in the Senate, where the Slave States had a controlling majority. This action brought the question of slavery prominently into the sphere of national politics, never again to disappear until the extinction of that institution as the result of the war between the states in 1861–65.

In 1819 (Dec. 14th) Alabama was admitted to the Union, and at the same session of Congress a protective tariff was passed by the House, but defeated in the Senate. The question of the admission of Missouri was again brought forward, coupled with the question of the admission of Maine. An arrangement known as the "Missouri Compromise" was effected (1820), by the action of Mr. Clay and the conservative members of both sections. This measure provided that Maine and Missouri should be voted upon separately, that slavery should be permitted in Missouri; but that for the future, slavery should not exist in new states lying north of the line of 36° 30'. Thirty-five Southern members who believed that Congress had no power to forbid slavery in the territories, voted against the Missouri Compromise, which nevertheless passed both Houses and became a law. Both Maine and Missouri were then admitted as states. In 1820 the presidential campaign resulted in the re-election of Messrs. Monroe and Tompkins, Monroe receiving all the electoral votes but one, which was cast for John Quincy Adams, of Massachusetts. Tradition says that this one vote was so given in order that Washington might be the only President to be unanimously elected.

In 1821 the Strict Constructionists defeated bills looking to a national canal system and a higher tariff; and the President vetoed an act for the preservation of the Cumberland National Road. In 1823, in his message to Congress, Mr. Monroe in mentioning the war then waging by Spain against her rebellious colonies in South America and Mexico, promulgated the famous declaration that has since been known as the Monroe Doctrine, in asserting that, as the United States would interfere in no European war, so would they allow no European power to gain a controlling influence in this hemisphere. In 1824 the party of Loose Constructionists being in a majority in both Houses, adopted a more strictly protective tariff, framed with the design of excluding foreign competitors from American markets. A bill for taking surveys for a national canal system also became a law.

As there were still no definitely organized political parties, the presidential election of 1824 was a personal contest. When the electoral votes were counted (Feb., 1825), 92 were for Andrew Jackson, of Tennessee, 84 for John Quincy Adams, of Massachusetts, 41 for William H. Crawford, of Georgia, and 37 for Henry Clay, there being no choice for President. By a coalition of the supporters of Clay and Adams, the latter was chosen in the House of Representatives, the vote being by states, and Adams receiving the votes of 13 states, while Jackson had those of 7, and Crawford those of 4. The electors had chosen John C. Calhoun, of South Carolina, to be Vice-President, by a vote of 182 to 78 for various other candidates.

X. ADMINISTRATION OF JOHN QUINCY ADAMS (1825–1829). *Cabinet.*—*Secretary of*

State, Henry Clay, Kentucky, March 7th, 1825. *Secretary of Treasury*, Richard Rush, Pennsylvania, March 7th, 1825. *Secretary of War*, James Barbour, Virginia, March 7th, 1825; Peter B. Porter, New York, May 26th, 1828. *Secretary of Navy*, S. L. Southard, continued. *Attorney-General*, William Wirt, continued. *Postmaster-General*, John McLean, continued.

A new division of the American people into parties dates from the beginning of this administration. The party previously known as Republicans or Republican-Democrats soon took the name of Democrats, while the Clay and Adams factions, who had been identified with the doctrine of Loose Constructions, after taking the name of National Republicans, changed it before long to that of Whigs, by which the party continued to be known for thirty years.

Owing to the determined obstruction which was made by the Democrats to the measures proposed by the supporters of the administration, few of them were successfully carried. In July, 1827, a National Convention of Protectionists at Harrisburg, Penn., advocated a strongly protective policy, and in 1828 a tariff framed in accordance with these views, became law. The South, being an agricultural rather than a manufacturing community, denounced this measure as being sectional legislation, intended to benefit New England and the Middle States at the expense of the South. Hence, the doctrine of Nullification, which had been promulgated in the Kentucky Resolutions of 1798, was revived, and began to be generally accepted in the Southern States. In 1828, the Democratic candidate for President, Andrew Jackson, of Tennessee, received 178 electoral votes to 83 cast for John Quincy Adams. John C. Calhoun was re-elected Vice-President, having 171 electoral votes.

XI. and XII. ADMINISTRATION OF ANDREW JACKSON (1829-1837). *Cabinet*.—*Secretary of State*, Martin Van Buren, New York, March 6th, 1829; Edward Livingston, Louisiana, May 24th, 1831; Louis McLane, Delaware, May 29th, 1833; John Forsyth, Georgia, June 27th, 1834. *Secretary of Treasury*, Samuel D. Ingham, Pennsylvania, March 6th, 1829; Louis McLane, Delaware, August 8th, 1831; William J. Duane, Pennsylvania, May 29th, 1833; Roger B. Taney, Maryland, September 23d, 1833; Levi Woodbury, New Hampshire, June 27th, 1834. *Secretary of War*, John H. Eaton, Tennessee, March 9th, 1829; Lewis Cass, Michigan, August 1st, 1831; Benjamin F. Butler, New York, March 3d, 1837. *Secretary of Navy*, John Branch, North Carolina, March 9th, 1829; Levi Woodbury, New Hampshire, May 23d, 1831; Mahlon Dickerson, New Jersey, June 30th, 1834. *Attorney-General*, John M. Berrien, Georgia, March 9th, 1829; Roger B. Taney, Maryland, July 20th, 1831; Benjamin F. Butler, New York, November 15th, 1833. *Postmaster-General*, William T. Barry, Kentucky, March 9th, 1829; Amos Kendall, Kentucky, May 1st, 1835.

The bold, decisive, and impetuous character of Gen. Jackson was shown in a general removal of those who had held office, down to small postmasters and tidewaiters, under the late administration, and the appointment of his own partisans. An act for the rechartering of the United States Bank was met by a veto of the President, who declared it unconstitutional and dangerous. In 1832 an Indian war, called the Black Hawk War, broke out in Wisconsin, but the passing of a high protective tariff act by Congress caused a more serious trouble. The state of South Carolina declared the act unconstitutional, and therefore null and void, threatening to withdraw from the Union if an attempt were made to collect the duties on foreign importations. The President prepared to execute the laws by force; Mr. Calhoun resigned his office of Vice-President and asserted the doctrine of state rights, including the right of secession, in the Senate. A collision seemed imminent, but the affair was settled by a compromise bill, introduced by Henry Clay, providing for a gradual reduction of duties until 1843, when they should not exceed 20 per cent. *ad valorem*.

During the first administration of Gen. Jackson occurred the famous debate (Feb., 1830) in the Senate between Daniel Webster of Massachusetts and Robert Y. Hayne of South Carolina, in which the two opposing views regarding slavery, nullification, and the true interpretation of the Constitution were advocated and discussed with such eloquence, learning, and enthusiasm as to make the debate an epoch in the constitutional development of the United States. The same period witnessed the rise of the Anti-Masonic Party. In 1826, one William Morgan, of Batavia, N. Y., who had written a book exposing the secrets of Free Masonry, disappeared and was never again seen. It was asserted that he had been kidnapped and murdered by the Free Masons; and a political party arose, pledged to oppose the election of Free Masons to political office.

The Presidential election of 1832 resulted in the reappointment of Jackson as President. He received 219 electoral votes, as against 49 for Henry Clay, 11 for John Floyd, of Virginia, and 7 for William Wirt, of Virginia. Martin Van Buren, who received 189 votes, was elected Vice-President.

The removal by order of the President of the government deposits from the United States Bank to certain state banks, led to the failure of the Bank, and, after some years, to the adoption of Mr. Van Buren's plan of an independent treasury. The Cherokee Indians in Georgia, who had attained to a certain degree of civilization, appealed to the President for protection against the seizure of their lands by the state; but they were told that he "had no power to oppose the exercise of the sovereignty of any state over all who may be within its limits;" and the Indians were obliged to remove to the ter-

The United S

tes in 1816.

ritory set apart for them west of the Mississippi. In 1835, the Seminole war broke out in Florida, and a tribe of Indians, insignificant in numbers, under the crafty leadership of Osceola (q.v.), kept up hostilities for years, at a cost to the United States of several thousands of men and some \$50,000,000. In 1833, the Senate which was controlled by the Whig Party led by Henry Clay, took the extraordinary step of passing formal resolutions of censure, in which the President was condemned for his order removing the government deposits from the Bank. The President protested against the resolutions of censure as being an indirect and illegal form of impeachment, and one against which he had no means of defense. This protest was, however, not allowed by the Senate to appear upon the record. The warfare between the President and Senate continued through the next two years, the latter frequently rejecting the nominations made by the Executive. In 1835 (Dec. 7th), the President announced to Congress that the national debt would soon be paid, and that provision should be made for the surplus revenue which was anticipated. In June, 1836, a bill was passed providing that after Jan. 1st, 1837, any surplus exceeding the sum of \$500,000,000 should be divided among the states as a loan, subject to a recall by Congress. In accordance with this act, some \$28,000,000 was divided in 1837, and has never yet been recalled. In July, 1836, the President caused the famous Specie Circular to be issued, which ordered the agents of the government to receive only gold or silver in payment for public lands. The sudden demand for specie which this order produced led to financial disturbances, culminating in the disastrous financial crisis known as the "Panic of 1837." In the same year the Senate, which had at last become Democratic, voted to expunge from its records the resolutions of censure already mentioned. The Mexican state of Texas, which had been colonized by Americans, was at this time endeavoring to shake itself free from Mexican control and to establish its independence. The South saw in this movement a prospect of annexing this large territory once more to the United States, and of carving from it new Slave States whose votes in the Senate would counterbalance those of the new Free States. Many manifestations of sympathy with the Texans were therefore made, and a resolution recognizing the independence of Texas passed the Senate but not the House. The Slavery question was now revived with much vigor. In 1833, the National Anti-Slavery Society had been formed, and from about this time we must date the formation of the Anti-Slavery Party, soon to be known as Abolitionists, later as Free Soilers, and finally as Republicans. Arkansas (June 15th, 1836) and Michigan (Jan. 26th, 1837) were admitted to the Union. The election of 1836 resulted in the success of the Democratic party, whose candidate for President, Martin Van Buren, of New York, received 170 electoral votes, against 73 for William Henry Harrison, of Indiana, and 51 scattering. No candidate for Vice-President received a clear majority, and so the choice fell to the Senate, which elected Richard M. Johnson, of Kentucky.

XIII. ADMINISTRATION OF MARTIN VAN BUREN (1837-1841). *Cabinet*.—*Secretary of State*, John Forsyth, continued. *Secretary of Treasury*, Levi Woodbury, continued. *Secretary of War*, Joel R. Poinsett, South Carolina, March 7th, 1837. *Secretary of Navy*, Mahlon Dickerson, continued; James K. Paulding, New York, June 25th, 1838. *Attorney-General*, Benjamin F. Butler, continued; Felix Grundy, Tennessee, July 5th, 1838; Henry D. Gilpin, Pennsylvania, January 11th, 1840. *Postmaster-General*, Amos Kendall, continued; John M. Niles, Connecticut, May 19th, 1840.

Mr. Van Buren, in accordance with his pledges, carried out and perpetuated the policy of his predecessor. As that policy on its financial side led to the panic of 1837 (May), the new administration was unfortunate in its beginnings. No such general financial disaster had until then been known in the United States. A suspension of specie payments occurred throughout the country, even in New York. Many banks suspended altogether, and innumerable corporations and individuals were ruined. Congress authorized the issue of \$10,000,000 in treasury notes, and gave merchants an extension of time on their revenue bonds. In December of the same year, the Specie Circular was canceled. The first important contested election question occurred at the session of Congress beginning Dec. 2d, 1839. Five Whig congressmen from New Jersey, where all congressmen were then elected on a general ticket, had received certificates of election from the state authorities. Their right was, however, contested by five Democrats on the ground of an alleged miscount in one county. On the discussion of this question rested the political complexion of the House, so narrow was the margin between the two parties. An exciting contest from December to March (1840) resulted in seating the Democrats. All these incidents hurt the dominant party in the country at large, so that in the campaign of 1840, the candidacy of the Whig nominee, Gen. William Henry Harrison, of Virginia, was supported with an enthusiasm such as no subsequent political campaign has ever witnessed. It has become known as the Log Cabin Campaign or the Hard Cider Campaign—log cabin and hard cider being taken as typifying the homely simplicity of Gen. Harrison's frontier life. The "Liberty Party," or Abolitionists, also made nominations, their candidates being James G. Birney, of New York, for President, and Francis Lemoyne, of Pennsylvania, for Vice-President. The Democrats renominated Mr. Van Buren and Mr. Johnson. Gen. Harrison received 234 electoral votes, to 60 for Mr. Van Buren; and for Vice-President, the Whig, John Tyler, of Virginia, received 234 against 48 for Mr. Johnson, and 12 scattering.

XIV. ADMINISTRATION OF WILLIAM HENRY HARRISON (1841) AND OF JOHN TYLER

(1841-1845). *Cabinet*.—*Secretary of State*, Daniel Webster, Massachusetts, March 5th, 1841; Hugh S. Legare, South Carolina, May 9th, 1843; A. P. Upshur, Virginia, July 24th, 1843; John C. Calhoun, South Carolina, March 6th, 1844. *Secretary of Treasury*, Thomas Ewing, Ohio, March 5th, 1841; Walter Forward, Pennsylvania, September 13th, 1841; John C. Spencer, New York, March 3d, 1843; George M. Bibb, Kentucky, June 15th, 1844. *Secretary of War*, John Bell, Tennessee, March 5th, 1841; John McLean, Ohio, September 13th, 1841; John C. Spencer, New York, October 12th, 1841; James M. Porter, Pennsylvania, March 8th, 1843; William Wilkins, Pennsylvania, February 15th, 1844. *Secretary of Navy*, G. E. Badger, North Carolina, March 5th, 1841; A. P. Upshur, Virginia, September 13th, 1841; David Henshaw, Massachusetts, July 24th, 1843; T. W. Gilmer, Virginia, February 15th, 1844; John Y. Mason, Virginia, March 14th, 1844. *Attorney-General*, John J. Crittenden, Kentucky, March 5th, 1841; Hugh S. Legare, South Carolina, September 13th, 1841; John Nelson, Maryland, July 1st, 1843. *Postmaster-General*, Francis Granger, New York, March 6th, 1841; Charles A. Wickliffe, Kentucky, September 13th, 1841.

Two weeks after his inauguration, President Harrison issued a proclamation calling an extra session of Congress to consider the financial distress prevailing throughout the country, and the like questions that beset the government itself. The extra session was called for May 31st, but on April 4th, the President died after a short illness—the first of our chief magistrates to die in office. The Vice-President therefore succeeded to the presidential chair, retaining his predecessor's cabinet. When Congress met in accordance with Gen. Harrison's call of March 17th, the Whigs, who had a majority in both houses, began to carry out the changes to which their party had pledged itself in the campaign of the preceding year. A bill was passed for the incorporation of a new United States Bank somewhat after the model of that which had been so vigorously attacked by President Jackson. To the consternation of the Whigs, the new President promptly vetoed it as being unconstitutional. The leading members of the party then conferred with Mr. Tyler and asked him to suggest the provisions of a bill that he would be willing to accept. He agreed to do so, yet after the bill of his own framing had passed the two Houses it met the fate of the former act. It now became evident that the President was at heart a Democrat, and that his political principles would prevent him from acting cordially with the party that had elected him to office. The indignation and chagrin of the Whigs were unbounded. The entire cabinet, with the exception of Secretary Webster, immediately resigned. The leaders of the Whig party issued a manifesto "reading" the President out of the party, and holding him responsible for the failure to effect the reforms that had been promised.

President Tyler immediately filled the places in his cabinet with conservative politicians; and having been cut off from political affiliation with his own party, turned to the Democrats for support. The session of Congress beginning Dec. 6th, 1841, was made noteworthy by the refusal of that body to receive petitions for the abolition of slavery. In March, 1842, Joshua Giddings, of Ohio, offered resolutions declaring that slavery exists only by the force of municipal law; and that in consequence, ownership based upon it cannot be enforced beyond the territory and jurisdiction of the power that established it. These resolutions looked to the denial of property in slaves in the territories, and for offering them, Mr. Giddings was censured by the House, resigned his seat, and was instantly re-elected by his constituents.

In 1843, the government arranged a treaty with the new republic of Texas, providing for the future annexation of that country to the United States. The Senate rejected this treaty by a vote of 35 to 16, seven Democrats voting with the Whigs for rejection. This question at once sprang to the front in all political discussion.

The desire for the annexation of Texas was very strong among the southern leaders. Up to this time the admission of a free state had been balanced by the admission of a slave state, and as all the states had equal representation in the Senate the balance of power between the sections was fairly well preserved. But the supply of territory from which future slave states might be carved was now exhausted, while in the Northwest there still remained the material for several free commonwealths. To maintain the *status quo*, the annexation of Texas became an actual necessity to those who watched over the interests of the South; for should the Free States ultimately acquire a dominant power in the Senate, as they had already done in the House, the time might come when the existence of slavery would be imperilled. The possibility of this was kept continually before the southern mind by the increasing activity at the North of the Liberty Party, which in 1843 held a national convention at Buffalo and there put forth a series of resolutions denouncing slavery, and calling on the Free States to pass penal laws to prevent the return of fugitive slaves. It also nominated James G. Birney, of Michigan, as its candidate for the presidency. The Whigs at their convention held at Baltimore in May, 1844, nominated Henry Clay, of Kentucky, with Theodore Frelinghuysen, of New York, as the candidate for Vice-President. The Democratic convention, in the same month, nominated James K. Polk, of Tennessee and George M. Dallas, of Pennsylvania. The platform called for the annexation of Texas. The election in November resulted in the choice of Polk and Dallas after a very close contest in which the Democrats succeeded only by the fact that several thousand votes in New York were cast for the abolition ticket. At the next session of Congress (Dec., 1844) a joint resolution for the

annexation of Texas was passed by both Houses and approved by the President. It renewed the Missouri Compromise as regards the Texan territory north of the compromise line, and as to the territory south of that line the question was left to the decision of the inhabitants of the future states.

An important event in the history of Mr. Tyler's administration is the conclusion of the so-called Ashburton Treaty between the United States and Great Britain (1842). Many subjects of dispute had arisen between the two countries, so that their relations had become more and more unfriendly. During an insurrection in Canada in 1837 a party of supporters of the Canadian government had crossed over to the American bank of the St. Lawrence and destroyed a vessel, the *Caroline*, owned by the friends of the insurgents. In the affair one American had been killed. Again, in 1841, an American vessel, the *Creole*, was sailing from Richmond to New Orleans with a cargo of slaves, when the slaves rose, seized the vessel, and took her into the British port of New Providence in the Bahamas. The authorities there assisted the slaves to escape. Thus, each nation was furnished with a grievance against the other, and such ill-feeling resulted that serious fears of war were entertained.

Fortunately Mr. Webster, who was Tyler's Secretary of State, was liked and respected by English statesmen; and in 1842 Lord Ashburton was sent out from England to negotiate a treaty. An important point to be settled was the boundary between Canada and the Northern States. A difficulty occurred which often meets our government in its dealings with foreign nations in the matter of territory. The question affected, not merely the whole American Union, but more especially the states of Maine and Massachusetts, to which the territory in dispute would belong. These states might reasonably suspect that their special interest would be sacrificed to that of the Union. The matter, however, was settled by a compromise. Great Britain gave up the larger and more valuable share of the disputed territory, and the United States government paid a sum of \$250,000 to the states of Maine and Massachusetts to make up for the loss of the rest. Two other points of importance were settled by this treaty. One was the suppression of the slave trade by the two governments. The other was the mutual surrender of criminals. This was beset by some difficulty. The United States desired that this arrangement should include fugitive slaves, a point on which the English government was resolved not to yield and which the United States ultimately withdrew. When Lord Ashburton had been satisfied on this point, the treaty was signed in August, 1842. Both in England and America, fault was found with the provisions of the treaty as giving too much to the other side; but Mr. Webster and the other defenders of the treaty appealed to this fact as a proof of its essential fairness.

XV.—ADMINISTRATION OF JAMES K. POLK. (1845-1849). *Cabinet*.—*Secretary of State*, James Buchanan, Pennsylvania, March 6th, 1845. *Secretary of Treasury*, Robert J. Walker, Mississippi, March 6th, 1845. *Secretary of War*, William L. Marcy, New York, March 6th, 1845. *Secretary of Navy*, George Bancroft, Massachusetts, March 10th, 1845; John Y. Mason, Virginia, September 9th, 1846. *Attorney-General*, John Y. Mason, Virginia, March 5th, 1845; Nathan Clifford, Maine, October 17th, 1846. *Postmaster-General*, Cave Johnson, Tennessee, March 6th, 1845.

As soon as the new administration came into office, United States troops under General Taylor were sent to the Nueces River, a point beyond the proper boundary of Texas. In the mean time, both the Texan Congress and a convention of the people had ratified the act of annexation. On Dec. 29th, 1845, Texas formally entered the Union. Up to this date, Mexico, being distracted by revolutions, had simply protested against the action of the United States and had recalled her Minister from Washington; but in March 1846, the further advance of General Taylor brought United States troops into conflict with a superior force of Mexicans at Palo Alto. The Mexicans were severely defeated in two battles, the second being at Resaca de la Palma (May 8th and 9th).

On the 11th of May, 1846, news of hostilities having reached Washington, the President officially informed Congress of the occurrence and asked that war be declared. Both Houses responded to the message and to the awakened war-spirit of the country by passing a bill whose preamble began as follows: "Whereas, by the act of Mexico, a state of war exists between that government and the United States"—a statement that provoked much criticism from the opponents of the administration, as false, in view of the fact that hostilities had been precipitated by the military occupation of territory claimed by Mexico. The bill appropriated \$10,000,000 for the prosecution of the war; and under it enlistment was actively begun. Volunteers to the number of 50,000 men were authorized.

Whatever view one may take of the political aspect of the war, the brilliant series of victories won by the armies of the United States, must always evoke a thrill of pride in every patriotic American. Against forces that outnumbered them, sometimes four to one and not inferior in training, in a hostile country, and against formidable obstacles both natural and artificial, the troops of Scott and Taylor, won triumph after triumph by dint of the most splendid courage and the most stubborn fighting.

On May 15th, Gen. Winfield Scott had completed his plans for the invasion and conquest of Mexico. They involved three distinct operations. A powerful fleet was to round Cape Horn and sweep down upon the Pacific coast of Mexico; an army was to be assembled at Fort Leavenworth with New Mexico and the Pacific provinces for its

object of attack in co-operation with the fleet ; while a second army was to be massed at San Antonio de Bexar in Texas, to penetrate the heart of Mexico by invasion from the North. On May 23d, the Mexican republic formally declared war upon the United States.

For some time after the declaration, hostilities were carried on with brilliant success by Gen. Taylor. Crossing the Rio Grande, he had already hurled his army upon the Mexicans in the city of Matamoras and had driven them from it on the 18th of May. In August, having received re-enforcements, he prepared for a march of conquest into the interior of the country. The first division of his army under Gen. William J. Worth moved upon the strongly defended city of Monterey (Aug. 20th) while Taylor himself, with 6000 men, followed a few days later. The forces united on Sept. 19th, within three miles of the city where the Mexican general, Ampudia, with nearly 10,000 troops, lay in waiting behind powerful fortifications. On Sept. 21st, Gen. Taylor invested the town ; on the fourth day after an assault, distinguished by the most stubborn fighting in the streets, Ampudia surrendered ; and after some minor operations in which Taylor was aided by a second army under Gen. Wool, acting in conjunction with his own, the city of Tampico yielded to the American fleet under Commodore Connor.

In January, 1847, Gen. Scott arrived with a fleet and an army off the fortress of Vera Cruz. To aid this force, a large number of Taylor's troops were detached and ordered to the coast. This left Taylor himself with only 5000 men, of whom but 500 were regular troops. The ablest of the Mexican generals, Antonio Lopez de Santa Anna (q.v.), learning of the depletion of Taylor's army, marched rapidly upon him with 20,000 men, the flower of the Mexican army. Taylor did not shrink from the unequal encounter. Falling back to the mountain pass of Buena Vista, he made his dispositions for battle, and rejecting Santa Anna's demand for his instant capitulation, faced the enemy on the anniversary of the birthday of Washington. Some preliminary manœuvring on the afternoon of the 22d, was followed by a combined assault upon the American lines on the morning of the 23d. Again and again the superior numbers of the Mexicans seemed certain to overwhelm the little force that fronted them ; but the desperate fighting of the Americans whom Taylor commanded in person, and the superior service of the American artillery under Bragg, Washington, and Sherman, beat back the assault until nightfall, when the Mexicans withdrew defeated, leaving the northern province in the control of the invading troops. In September, Gen. Taylor returned to the United States, leaving Gen. Wool in command, while Scott directed the general operations of the whole campaign.

The commander-in-chief had appeared before Vera Cruz on the 9th of March. This place was very strongly fortified, but the Americans were allowed to land unresisted. They threw up earthworks and opened fire on the place from sea and land. After a four days' bombardment, to which the besieged made an ineffectual reply, the place surrendered. Scott then marched inland and utterly defeated Santa Anna, who had taken up a strong position at Cerro Gordo. The Americans then advanced unchecked to within fifteen miles of the city of Mexico. Here the most serious operations began. At the time of the Spanish conquest the city of Mexico had been surrounded by a lake. This was drained by Cortez, and the city consequently now stood in the middle of a valley. The approaches to it were guarded by a number of strong fortresses ; and a canal, forming a moat, belted the city. One by one these outlying fortifications were captured, and on the 14th of September the American army fought its way into the capital. After this the Mexicans made no further resistance.

In the meantime, the army assembled at Fort Leavenworth under Gen. Stephen W. Kearney, had marched into New Mexico and secured possession of the country without resistance, while Lieut. Col. Frémont, with a force of volunteers operating in conjunction with the Pacific squadron under Commodore Sloat, had secured California, after defeating a Mexican army under Gen. Castro at Sonoma Pass (June 15th, 1846). On Feb. 8th, 1847, Frémont proclaimed at Monterey, the annexation of California to the United States.

Another successful expedition was that of Col. Doniphan who in 1846 with a thousand volunteers from Missouri had been sent by Gen. Kearney to effect a junction in Chihuahua with Gen. Wool. At Braceti he was intercepted by a large force of Mexicans under Gen. Ponce de Leon (Dec. 22d), who sent them a black flag with the message, " We neither ask quarter nor grant it." Doniphan in a sharp encounter drove this army before him after inflicting severe losses upon it, and was equally successful against a second army of 4000 Mexicans on Feb. 28, 1847, whom he utterly routed, and took possession of the city of Chihuahua March 2d.

On the 2d of February, 1848, peace was signed at Guadalupe Hidalgo. Mexico resigned her claim to Texas, and also handed over New Mexico and California to the United States for a payment of \$15,000,000. By far the most important part of the acquisition was California. This gave the United States the Pacific as well as the Atlantic seaboard. In fact, it may be looked on as, in some sort, the completion of that great westward movement which had been going on during the whole of the century. The possession of California made it certain that the American people must in time form one continuous community across the whole continent of America.

Other important events of Mr. Polk's administration were the treaty with England

(June 15th, 1846) by which the long-disputed question of the northwest boundary was settled; the so-called "Tariff of 1846," which limited its purpose to the collection of revenues alone, without protection to native industries; the admission of Iowa (Dec. 28th, 1846); the establishment of the new territory of Oregon without slavery, and the admission of Wisconsin (May 29th, 1848).

The opposing candidates at the presidential election of 1848 were Lewis Cass, of Michigan and William O. Butler, of Kentucky, Democrats, against Gen. Zachary Taylor, of Louisiana and Millard Fillmore, of New York, Whigs. The Free Soil Party nominated Martin Van Buren, of New York and Charles Francis Adams, of Massachusetts. Taylor and Fillmore received 163 electoral votes as against 127 cast for Cass and Butler.

XVI. ADMINISTRATION OF ZACHARY TAYLOR (1849-1850) AND OF MILLARD FILLMORE (1850-1853). *Cabinet.*—*Secretary of State*, John M. Clayton, Delaware, March 7th, 1849; Daniel Webster, Massachusetts, July 22d, 1850; Edward Everett, Massachusetts, December 6th, 1852. *Secretary of Treasury*, W. M. Meredith, Pennsylvania, March 8th, 1849; Thomas Corwin, Ohio, July 23d, 1850. *Secretary of War*, George W. Crawford, Georgia, March 8th, 1849; Winfield Scott (*ad interim*), July 23d, 1850; Charles M. Conrad, Louisiana, August 15th, 1850. *Secretary of Navy*, William B. Preston, Virginia, March 8th, 1849; William A. Graham, North Carolina, July 22d, 1850; J. P. Kennedy, Maryland, July 22d, 1852. *Secretary of Interior*, Thomas H. Ewing, Ohio, March 8th, 1849; A. H. H. Stuart, Virginia, September 12th, 1850. *Attorney-General*, Reverdy Johnson, Maryland, March 8th, 1849; John J. Crittenden, Kentucky, July 22d, 1850. *Postmaster-General*, Jacob Collamer, Vermont, March 8th, 1849; Nathan K. Hall, New York, July 23d, 1850; S. D. Hubbard, Connecticut, August 31st, 1852.

The course of American political history from the beginning of this administration down to the civil war, shows a gradual disintegration of the old Whig party, the increase in importance of the Free Soil movement, and the development of the Democratic Party into an organization whose first and foremost object was the maintenance of slavery and the perpetuation of the political power of the Slave States. The increase of territory out of which new states might be created made the South anxious to prevent these new states from inhibiting slavery, as would probably be done in some of them, especially in California, if the question were left to the inhabitants. There were various circumstances which made the South especially anxious that slavery should be admitted into California. They believed that, once admitted, it would become permanent, and that California would be added to the number of the Slave States. Moreover, the hostility to slavery was growing stronger in the North. The Northern states were showing themselves backward in helping the South to recover runaway slaves. Furthermore, two Free States, Wisconsin and Iowa, had been lately added to the Union; and the Slave States were anxious to recover the influence which had thus been lost. Hitherto they had taken up the ground that slavery was a question to be dealt with by each state for itself. Now they changed their ground, and declared that it was unjust to allow the government of any state or territory to prevent any citizen of the United States from emigrating with his property, that is to say, his slaves, into the newly-acquired lands. The contest had begun in 1846, while the acquisition of the land in question was still doubtful. In that year, David Wilmot, of Pennsylvania, brought forward a motion, providing that slavery should be excluded from all territories acquired by treaty. This, commonly called the "Wilmot Proviso," was carried in the House of Representatives, but defeated in the Senate. Next year it was again proposed with a like result. Mr. Calhoun met it by a series of resolutions, declaring that any such measure would deprive the slave-holding states of their rights, and would tend to subvert the Union. So fierce did the strife become, that many of the most thoughtful statesmen began to fear separation or a civil war. In this crisis Mr. Clay, now a man of seventy-two and in broken health, came forward as a peace-maker. Like Webster, who now supported him, Mr. Clay had always held a moderate position between the two extreme parties. His proposal was that the question of slavery in California and in the new territories should be left to the local governments; a principle that came to be known as "Squatter Sovereignty." This was a concession to the South in the matter of the Territories; to the North in the matter of California, whose inhabitants were known to be opposed to slavery. He also proposed that the inland slave-trade should be abolished in the District of Columbia, but that provision should be made for the stricter enforcement of the law for recovering runaway slaves in the Free States. The success of this scheme, called Clay's Omnibus Bill, or the Compromise Measures (q.v.) which afterwards became the subject of separate bills, was largely due to the vigorous support given it by Daniel Webster, whose speech, delivered in the Senate on March 7th, 1850, eloquently set forth the constitutional obligation of the North to allow the return to the South of fugitive slaves. At the same time Mr. Webster recurred with all his old fire and force to the paramount necessity of preserving the Union. This remarkable speech seriously impaired the orator's popularity at the North, and his motives at the time were impeached; but there is no reason to believe that he acted from any than a patriotic and statesmanlike desire to obliterate existing causes of partisan dispute and to unite again the two opposing sections of the country. The passage, however, of a more stringent

law for the recapture of fugitive slaves, excited at the North feelings of horror and disgust. Several of the state legislatures even passed specific laws intended for the protection of negroes.

President Taylor died on the 9th of July, 1850, and was succeeded by Vice-President Fillmore, who strictly carried out the policy of his party so that there was no break in the political continuity of the administration. The Compromise Measures had caused a temporary lull in the contest over the question of slavery. In June, 1852, the two great parties made their presidential nominations. The candidates of the Democracy were Franklin Pierce, of New Hampshire and William R. King, of Alabama. The Whigs nominated Gen. Winfield Scott, of Virginia and William A. Graham, of North Carolina. In August, the Free Soil Party nominated John P. Hale, of New Hampshire and George W. Julian, of Indiana.

The election resulted in the success of the Democratic ticket, which received 254 electoral votes, against 42 cast for the Whig nominees.

XVII. ADMINISTRATION OF FRANKLIN PIERCE (1853-1857). *Cabinet*.—*Secretary of State*, William L. Marcy, New York, March 7th, 1853. *Secretary of Treasury*, James Guthrie, Kentucky, March 7th, 1853. *Secretary of War*, Jefferson Davis, Mississippi, March 7th, 1853. *Secretary of Navy*, James C. Dobbin, North Carolina, March 7th, 1853. *Secretary of Interior*, Robert McClelland, Michigan, March 7th, 1853; Jacob Thompson, Mississippi, March 6th, 1856. *Attorney-General*, Caleb Cushing, Massachusetts, March 7th, 1853. *Postmaster-General*, James Campbell, Pennsylvania, March 7th, 1853.

The slavery question soon came once more to the front. In January, 1854, the famous Kansas-Nebraska Bill was introduced into Congress. This divided the territory previously known as Nebraska into two, one between parallels 37° and 40°, to be called Kansas, and the other between 40° and 43°, to be called Nebraska. Both these territories, by the Missouri Compromise of 1820, were barred to slavery; but the bill now introduced, practically proposed to repeal the Missouri Compromise as being unconstitutional in that it had allowed interference with slavery by Congress. The present bill left it to the people of each new territory to say whether or not slavery should be tolerated on its soil. The Senate promptly passed this bill. Two months later it was passed by the House. This marks the final disruption of the old Whig Party, of which many of the Northern members now repudiated the name, and after calling themselves for a time "Anti-Nebraska Men" joined the newly organized Republican Party (1856). The Southern Whigs on the other hand, before long united with the Southern Democrats. At about this time the so-called American Party, or Know-Nothings (q.v.), exercised some influence. It demanded more stringent naturalization laws and the election to high office of none but native-born citizens.

The virtual repeal of the Missouri Compromise, which left the new territories to decide for themselves whether they would admit slavery or not, turned Kansas, as the territory nearest the settled states, into a battle-ground for the two parties. The partisans of the North wished that a majority of the inhabitants should be against slavery; those of the South naturally hoped otherwise. Each kept pouring in fresh emigrants to outnumber the other. At first the South was successful, and a code of laws was established with many and stringent provisions on behalf of slavery. This was brought about, it is said, not by legitimate emigrants, but by a mob of Missourians, with no occupation and no real connection with Kansas, who passed across the border, took possession of the polling places, and carried the elections against the real citizens. A succession of outrages, amounting almost to a civil war on a small scale, followed. Kansas became practically divided into two districts, one for slavery and one against it. Each district established its own government and elected delegates to Congress. On January 24th, 1856, President Pierce sent a special message to Congress recognizing the pro-slavery government, and declaring the action of the Free-Soil government in Kansas to be rebellious. He next issued a proclamation to the same effect, and put United States troops at the disposal of the pro-slavery government. A species of civil war now actually existed in Kansas. The two anti-slavery towns, Lawrence and Ossawatimie, were sacked. The Free-Soil legislature was twice dispersed by Federal troops. In the mean time, public sentiment throughout the country was excited to a still greater intensity by the assault upon Senator Charles Sumner, of Massachusetts, by Mr. Preston S. Brooks, of South Carolina (May 22d, 1856), for utterances on the Kansas question. The House censured Brooks, who at once resigned and was unanimously re-elected by his constituents.

At the presidential election of 1856, the following tickets were in the field: Democratic, James Buchanan, of Pennsylvania and John C. Breckinridge, of Kentucky; Republican, John C. Frémont, of California and William L. Dayton, of New Jersey; Know-Nothing, Millard Fillmore, of New York and A. J. Donelson, of Tennessee. The Democratic ticket received 174 electoral votes; the Republican, 114; the Know-Nothing, 8.

XVIII. ADMINISTRATION OF JAMES BUCHANAN (1857-1861). *Cabinet*.—*Secretary of State*, Lewis Cass, Michigan, March 6th, 1857; J. S. Black, Pennsylvania, December 17th, 1860. *Secretary of Treasury*, Howell Cobb, Georgia, March 6th, 1859; Philip F. Thomas, Maryland, December 12th, 1860; John A. Dix, New York, January 11th.

ates in 1852.

1861. *Secretary of War*, John B. Floyd, Virginia, March 6th, 1857; Joseph Holt, Kentucky, January 18th, 1861. *Secretary of Navy*, Isaac Toucey, Connecticut, March 6th, 1857. *Secretary of Interior*, Jacob Thompson, Mississippi, March 6th, 1857. *Attorney-General*, J. S. Black, Pennsylvania, March 6th, 1857; E. M. Stanton, Pennsylvania, December 20th, 1860. *Postmaster-General*, Aaron V. Brown, Tennessee, March 6th, 1857; Joseph Holt, Kentucky, March 14th, 1859; Horatio King, Maine, February 12th, 1861.

President Buchanan's administration witnessed the culmination of the conflict that had for years been waged between the Free and the Slave States in the political arena. The elements of disorder, of dissension, of enmity, and of hate, that seemed seething in the minds of the extremists of both sections, were now concentrated in the prelude to a still greater and more tremendous conflict. It was during this administration that the leaders of the South appear to have definitely decided that the welfare of their section could not be satisfactorily conserved while the Southern States remained a part of the Federal Union. It must be remembered that ever since the foundation of the government, the statesmen of the South had consistently maintained that theory of the Federal Constitution which regarded the ultimate sovereignty as residing not in the nation as a whole, but rather in the individual states themselves which this theory—the theory of Calhoun and Hayne—held to be supreme and independent commonwealths. According to the view prevalent at the South, these sovereign states had entered into a league of union with the other states for purposes of mutual advantage; and this partnership, like others, was to endure only so long as its original purpose was maintained with regard to all the states. Events seemed now to indicate that the time for the dissolution of the compact had arrived. In the first place, the balance of political power was passing rapidly into the hands of a party inimical to the interests of the South, a party pledged to the ultimate abolition of slavery and to a commercial system of protection which was peculiarly unfavorable to an agricultural community such as the South then was. Regarding slavery, it is unfair to represent the South as, in the abstract, devoted to a servile system. The greatest statesmen of that section had always deplored the presence of the slaves as an economic and social injury; yet, inasmuch as slavery actually existed, the question was a practical one rather than a matter of speculative interest. Unmolested, and unsupported by the foreign slave-trade which the United States had taken a prominent part in abolishing, it is likely that the gradual extinction of slavery would have been brought about through natural causes. But at this time, the ill-judged zeal of Northern extremists had begun a crusade which, conducted with extreme bitterness and violence of denunciation, produced a most unfortunate effect. The sensitive and high-spirited people of the South heard with amazement the most indiscriminate abuse heaped upon them, because there existed among them an institution originally planted there largely through the instrumentality of the New England slave-dealers and Northern traders. They heard the purest and most kindly of their leaders attacked in language that would have been harsh if applied to branded criminals. It is not remarkable, therefore, that this ill-judged vituperation, led them to sink all their minor differences of opinion, and united them in defiant resistance to such wholesale onslaught. Men who believed thoroughly in the abstract wrongfulness of slavery, indignantly rushed to its defense, when the attack upon it took the form of an attack upon everything that the South revered. The Constitution itself distinctly recognized the existence of slavery, and the propaganda of the Abolition Party began to be accompanied by open denunciations of that instrument of government. It therefore appeared to the South that political peace with the people of the Northern States was likely to be best attained by separation; and this belief became crystallized into a definite purpose during the administration of James Buchanan. On the other hand, it must be confessed that the attitude of the Southern partisans was far from conciliatory. They had so long been accustomed to wield political power, and had met with so much subserviency from their associates at the North, whom Randolph had contemptuously nicknamed "Doughfaces," that they had acquired an arrogance of manner and of speech that justified a feeling of indignation. Their continual threats to destroy the Union, the violence to which so many of them were so ready to resort, as in the case of the assault upon Senator Sumner, and the high-handed proceedings that had marked the civil war in Kansas, all served to embitter and intensify the opposition at the North. It was very evident, therefore, that the political atmosphere was so charged with electricity as to render probable and perhaps even desirable, the storm that actually followed.

A few days after Mr. Buchanan's inauguration, the Supreme Court rendered its decision in the famous Dred Scott Case (q.v.) accompanied with the opinion of the majority of the justices, that Congress had no right to prohibit slavery in any territory and that slaves themselves were mere property whose secure possession in any state or territory was guaranteed by the Constitution.

Events now succeeded one another with exciting rapidity. The sympathizers with the South had made various attempts to extend the area of slavery by the acquisition of Cuba. In 1854 the American Ministers to England, France, and Spain met at the Belgian town of Ostend and there issued the so-called Ostend Manifesto to the effect that the safety of the United States demanded the annexation of Cuba. All hopes of

such an annexation, however, were frustrated by the united opposition of England, France, and Spain. Another attempt to acquire slave territory was in the direction of filibustering expeditions, the most famous of which were that of Lopez against Cuba in 1851, and that of William Walker (q.v.) from 1855 to 1858 against Central America. Both Lopez and Walker were taken prisoner and executed. Even the re-opening of the African slave-trade began to be discussed.

In December, 1857, a pro-slavery convention held at Lecompton, Kansas, submitted to the people a state constitution in such a way as to prevent its rejection, the only alternative offered being "for the constitution *with* slavery" and "for the constitution *without* slavery." The anti-slavery party generally abstained from voting, with the result that the constitution *with* slavery was adopted. A new territorial legislature with a Republican majority ordered a new election, at which the constitution was to be accepted or rejected. The national Congress passed a bill admitting Kansas under the Lecompton Constitution, but re-submitting that constitution to the vote of the Kansas people. They rejected it, and thus remained a territory. Two years later, a new convention adopted another constitution prohibiting slavery, and this being submitted to the people was adopted by them. Kansas, however, was not admitted as a state until 1861. Minnesota was admitted in May, 1858, and Oregon in February, 1859. In the last-named year a profound impression was made upon the country by the desperate deed of John Brown, a Connecticut man, who with a small party of followers seized the town of Harper's Ferry, Va., and the United States arsenal there, with the intention of exciting an insurrection among the slaves. He was surrounded and captured by Maryland and Virginia militia and executed December 2d, 1859.

In the presidential election of 1860 there were four tickets in the field. The Northern Democrats, who controlled the regular party convention, nominated Stephen A. Douglas, of Illinois and Herschel V. Johnson, of Georgia; the Southern Democrats, who had seceded from the convention, nominated John C. Breckinridge, of Kentucky and Joseph Lane, of Oregon; the remnants of the old Know-Nothing Party, now calling itself the Constitutional Union Party, nominated John Bell, of Tennessee and Edward Everett, of Massachusetts; while the Republicans nominated Abraham Lincoln, of Illinois and Hannibal Hamlin, of Maine. The Republican platform declared in favor of freedom in the territories, a protective tariff, internal improvements, and a Pacific railway. The result of the election was that Lincoln and Hamlin received 180 electoral votes; Breckinridge and Lane, 72; Bell and Everett, 39, and Douglas and Johnson, 12.

The election of Lincoln served as a signal for the consummation of the Southern plans for secession.

At the election of November, 1860, Mr. Lincoln had received every Northern vote in the electoral college, excepting the three of New Jersey, which were given to Mr. Douglas, 180 votes; while Mr. Breckinridge received the 72 electoral votes of the South. The North and South were arrayed against each other, and the South was beaten. Of the popular vote, Mr. Lincoln received 1,857,610; Mr. Douglas, 1,365,976; Mr. Breckinridge, 847,951; Mr. Bell, 590,631. Thus, while Mr. Lincoln gained an overwhelming majority of the electoral votes given by each state, the combined Democratic votes exceeded his by 356,317, and the whole popular vote against him exceeded his own by 946,948. A small majority, or even plurality, in the Northern states was sufficient to elect him.

Thus there was some ground for the taunt that Mr. Lincoln was a "minority President." But the true significance of the election was the fact which it revealed, that the sceptre of political power had finally departed from the South. The Slave States were at last confronted by an overwhelming opposition. The following figures from the census of each decade up to 1860 show the gradual growth of the power of the Free States:

| YEAR. | Free States. | Slave States. |
|------------|--------------|---------------|
| 1790 | 1,968,453 | 1,961,874 |
| 1800 | 2,684,616 | 2,621,316 |
| 1810 | 3,758,910 | 3,480,902 |
| 1820 | 5,152,372 | 4,485,810 |
| 1830 | 7,006,399 | 5,848,312 |
| 1840 | 9,733,922 | 7,334,433 |
| 1850 | 13,599,488 | 9,663,997 |
| 1860 | 19,128,418 | 12,315,872 |

The South lost no time in acting upon what her statesmen had declared would be the signal of their withdrawal from the Union. On November 10th, as soon as the result was known, the legislature of South Carolina ordered a state convention, which assembled December 17th, and on the 20th unanimously declared that "the Union now subsisting between South Carolina and other states, under the name of the United States, is hereby dissolved," giving as a reason that fourteen of these states had for years refused to fulfill their constitutional obligations. The example of South Carolina

was followed by Mississippi, January 8th, 1861; Florida, 10th; Alabama, 11th; Georgia, 19th; which were followed by Louisiana and Texas; and in 1861, by North Carolina, Virginia, Tennessee, and Arkansas. Kentucky and Missouri were divided, and had representatives in the governments and armies of both sections.

On February 4th, 1861, delegates from the seven then seceded states met at Montgomery, Ala., and formed a provisional government, under the title of the Confederate States of America. A constitution was adopted similar to that of the United States, and the government fully organized, February 18th, 1861; President, Jefferson Davis, of Mississippi; Vice-President, Alexander H. Stephens, of Georgia; and on May 24th, established at Richmond, Virginia. The secession movement appears to have been nearly unanimous in the more Southern states, and to have been carried in all by decided majorities. As state after state withdrew from the Union, its senators and representatives in Congress at Washington resigned their seats; and nearly all the officers of the army and navy, of Southern birth, believing that their first and final allegiance was due to their states, and that the action of each state carried with it all its citizens, also resigned their commissions, and tendered their swords to their respective states, and to the Confederacy which these had formed.

President Buchanan, doubting his constitutional power to compel the seceding states to return to the Union, made a feeble and ineffectual attempt to relieve the garrison of Fort Sumter, in Charleston harbor, closely besieged by the forces of South Carolina. Commissioners were sent to Washington to negotiate for the settlement of the claims of the Federal government, and great efforts were made to effect compromises of the difficulties, but without result.

Meanwhile, to the vacillation and incompetence of the President, the prompt and vigorous action of the Southern leaders formed a striking contrast. By their direction, armed forces were rapidly organized, United States arsenals and arms were seized, and batteries were planted for the reduction of such forts as threatened a firm resistance.

At about this time the territories of Nevada, Colorado, and Dakota were organized by Congress.

XIX. and XX. ADMINISTRATION OF ABRAHAM LINCOLN (1861-1865) and of ANDREW JOHNSON (1865-1869). *Cabinet*.—*Secretary of State*, William H. Seward, New York, March 5th, 1861. *Secretary of Treasury*, S. P. Chase, Ohio, March 5th, 1861; W. P. Fessenden, Maine, July 1st, 1864; Hugh McCulloch, Indiana, March 7th, 1865. *Secretary of War*, Simon Cameron, Pennsylvania, March 5th, 1861; Edwin M. Stanton, Pennsylvania, January 15th, 1862; U. S. Grant (*ad interim*), August 12th, 1867; Edwin M. Stanton (reinstated), January 14th, 1868; J. M. Schofield, Illinois, May 28th, 1868. *Secretary of Navy*, Gideon Welles, Connecticut, March 5th, 1861. *Secretary of Interior*, Caleb P. Smith, March 5th, 1861; John P. Usher, Indiana, January 8th, 1863; James Harlan, Iowa, May 15th, 1865; O. H. Browning, Illinois, July 27th, 1866. *Attorney-General*, Edward Bates, Missouri, March 5th, 1861; Titian J. Coffey, June 22d, 1863; James Speed, Kentucky, December 2d, 1864; Henry Stanbery, Ohio, July 23d, 1866; William M. Evarts, New York, July 15th, 1868; *Postmaster-General*, Montgomery Blair, Maryland, March 5th, 1861; William Dennison, Ohio, September 24th, 1864; Alexander W. Randall, Wisconsin, July 25th, 1866.

On the 4th of March, 1861, President Lincoln was inaugurated at Washington. In his inaugural address, he said: "I have no purpose, directly or indirectly, to interfere with the institution of slavery in the states where it exists. I believe that I have no lawful right to do so, and I have no inclination to do so." On the 7th of April, a naval expedition set sail from New York for the relief of Fort Sumter; and its arrival off Charleston harbor was the signal for the commencement of a bombardment of the fort by the confederate batteries of Gen. Beauregard. The surrender of the fort, April 13th, was followed by a sudden outburst of excited feeling in the North. The government called out 75,000 volunteers, large numbers of whom were in a few days marching to the defense of Washington. On April 18th, the Confederates seized the arsenal at Harper's Ferry, and took or destroyed a large quantity of arms and machinery. On the 20th, the navy-yard, near Norfolk, Va., was destroyed by the United States officers, and five large men-of-war burned or sunk, to prevent their falling into the hands of the Confederates. Opposed to the Union volunteers assembled at Washington, the Confederates took up a position at Bull Run, a few miles distant from the Potomac, under Gen. Beauregard, where they were attacked by Gen. McDowell. A severe action resulted in the repulse and complete panic of the Union forces, who hastily retreated to Washington. Congress saw that it must act in earnest, and that the war was not to be ended in 90 days by 75,000 volunteers. It voted to call out 500,000 men.

The Confederate States had a population of 5,582,122 free inhabitants, and 3,519,903 slaves; total, 9,102,024; and though the negroes were not called into the field except as laborers, they were not less useful in supplying the armies by carrying on the agricultural labor of the country. The Confederates had also the strong sympathy and aid of the four slaveholding border states, prevented by their position from seceding,—Delaware, Maryland, Kentucky, and Missouri. Holding their position in Virginia, the Confederates erected fortifications on the Tennessee and Cumberland Rivers and on important points of the Mississippi, from Columbus, in Kentucky, to its mouth. They also made a strong effort to secure the state of Missouri, as well as to defend the

sea-ports through which they must receive their most important supplies from abroad. The United States government, on its side, blockaded the whole line of coast from Virginia to Texas, and sent large forces to secure the doubtful states. Gun-boats were rapidly built for the rivers of the west, and vessels purchased and constructed for the navy. In December, 1861, the North had 640,000 men in the field, and the Confederates had 210,000, and had called for 400,000 volunteers.

The first important operation of 1862 was the taking of the defenses of the Cumberland and Tennessee Rivers (Feb. 6), which led to the occupation of Nashville, the capital of Tennessee, henceforth held by the United States troops—Andrew Johnson, formerly governor and senator, having been appointed military governor. Roanoke Island was also captured, on the coast of North Carolina. In March, Gen. McClellan, who had succeeded the aged Lieut.-Gen. Scott as commander-in-chief, commenced a movement on Richmond, the seat of the Confederate government, now defended by Gen. Lee. On the 8th of Mar., the Confederate iron-clad *Virginia*, constructed from the United States steamer *Merrimac*, which had been sunk at Norfolk and raised by the Confederates, attacked the federal fleet in Hampton Roads, and in forty minutes sunk the *Cumberland*, and set on fire and captured the *Congress* (frigates); while the other vessels took refuge in shoal water or in flight. The next day, the *Monitor*, a war vessel, of entirely novel construction, low and flat, with a revolving turret, invented by Capt. Ericsson, engaged the *Virginia*. The battle lasted two hours without result. On the 6th of April, a sanguinary but indecisive battle was fought near Corinth, Ala., the Federals being protected by gun-boats. Soon after, Admiral Farragut, with a fleet of 45 vessels, carried the forts at the mouth of the Mississippi River, and took New Orleans; while the armies and gun-boats captured the fortifications on the upper part of the river as low as Memphis, Tenn. In the mean time, Gen. McClellan had besieged and taken Yorktown, and fought his way up the peninsula of the James River, until within five m. of Richmond, when he was beaten in a series of sanguinary battles, and driven, with a loss, in six days, of 15,000 men, to the shelter of his gun-boats; while Gens. Banks and Pope, sent to co-operate with him in the Shenandoah valley, were defeated and driven back by Gen. "Stonewall" Jackson. On the 1st of July, the President called for 300,000, and on Aug. 4th, 300,000 more men for the Union army. Congress abolished slavery in the District of Columbia, prohibited it in the territories, and passed a resolution to compensate the masters in any state that would abolish slavery. They also authorized the President to employ negroes in the army, and to confiscate the slaves of insurgents. In August, the Northern forces were a second time defeated at Bull Run, and Gen. Lee crossed the Potomac into Maryland, creating great alarm in Washington, and even in Philadelphia. Gen. McClellan made a rapid march, and met him at Sharpsburg or Antietam. A drawn battle resulted in the retreat of Gen. Lee, covering an immense train of provisions, horses, cattle, etc., which was probably the object of his expedition. A Confederate invasion of Kentucky, about the same time, was attended with similar results. Another advance on Richmond was led by Gen. Burnside, who had superseded Gen. McClellan; but he was confronted by Gen. Lee at Fredericksburg, and defeated in one of the most sanguinary battles of the war. President Lincoln issued a proclamation declaring the freedom of all the slaves in insurgent states—a measure which was not justified by the Constitution, but which was professedly a "war measure," and to be defended on the plea of military necessity. In like manner, the suspension of the writ of habeas corpus (q.v.), the frequent seizure of newspapers, the dispersion of public meetings, and the imprisonment without trial, of opponents of the government at the North, were generally allowed to be essential to the security of the nation.

While the Army of the Potomac was vainly endeavoring to advance on Richmond, the army of Tennessee, under Gen. Rosecrans, with its base at Nashville, was trying to sever the Atlantic from the gulf states, and cut off the railways that supplied the confederate armies in Virginia. At Murfreesborough, Tenn., the Confederate Gen. Bragg attacked Gen. Rosecrans with the usual result of heavy losses on both sides, but no decided victory.

Early in May, 1863, Gen. Hooker, who had succeeded Gen. Burnside in the command of the Army of the Potomac, crossed the Rappahannock, and was defeated by Gen. Lee at Chancellorsville with great slaughter; but this victory was dearly bought by the loss of Gen. Jackson, mortally wounded in mistake by his own soldiers. Gen. Lee now took the offensive, and invaded Pennsylvania, advancing as far as Harrisburg; but being met by Gen. Meade, the new commander of the army of the Potomac, he attacked him in a strong position at Gettysburg without success, and was compelled to recross the Potomac. In the mean time, the two principal fortresses of the Mississippi—Vicksburg and Port Hudson—attacked by land and water, after a long siege, were starved into capitulation, and the entire river was open to the Union gun-boats. Charleston, blockaded since the beginning of the war, was now strongly besieged—its outworks, Forts Gregg and Wagner, taken, Fort Sumter battered in pieces, but still held as an earthwork, and shells thrown a distance of five miles into the inhabited part of the city. In September, Gen. Rosecrans had taken the strong position of Chattanooga, and penetrated into the n.w. corner of Georgia, where he was disastrously defeated by Gen. Bragg at the battle of Chickamauga. At this period, there were great peace-meetings in the North, terrible riots in New York against the conscription and the negroes; while the banks having sus-

pending specie payments, the paper-money of both Unionists and Confederates was largely depreciated. The sums of money appropriated by Congress for the expenses of this year amounted to \$972,000,0-0. The Confederates were, however, cut off from all foreign aid, except what came to them through the blockade, and their own resources, both of men and material, were becoming exhausted. The railways were worn, many destroyed or occupied by the Union troops, and it became difficult to transport supplies and feed armies. The North had command of the sea, and access to foreign markets.

At the commencement of 1864, the Northern forces held, including the garrisons on the Mississippi, nearly 100,000 prisoners of war. The Southerners also had about 40,000 Union prisoners, whom they could feed with difficulty, and who suffered great hardships. Gen. Ulysses S. Grant, who had been successful at Vicksburg, was appointed commander-in-chief of the Union armies, and commenced a vigorous campaign over an immense area—in Virginia, the Carolinas, Georgia, Louisiana, and Arkansas, with the determination “to hammer continuously against the armed forces of the enemy and his resources, until by mere attrition he should be forced to submit.” Of the Confederates, Gen. Lee defended Petersburg and Richmond; Gen. J. E. Johnston opposed the Army of Tennessee at Dalton, Georgia; Gen. Forrest was in Mississippi; Gen. Taylor and Kirby Smith commanded in Louisiana and Arkansas. In February, Gen. Sherman marched from Vicksburg, making a destructive raid across northern Mississippi to Alabama. In March, the United States had 1,000,000 of men raised and provided for. The entire Confederate forces probably numbered 250,000. The Army of the Potomac, commanded by Gen. Meade, under the personal superintendence of Gen. Grant, covered Washington, and advanced toward Richmond; Gen. Butler advanced from Fortress Monroe up the James river; Gen. Sigel marched up the Shenandoah. Sherman united the Armies of Tennessee, Cumberland, and Ohio, at Chattanooga, where he had nearly 100,000 men and 250 guns. Gen. Banks had 61,000 men in Louisiana. In March, Gen. Banks moved up the Red River, toward Shreveport, but was defeated on the 24th, and driven back to New Orleans. In May, the campaign of Virginia commenced, and the Army of the Potomac fought a series of battles at the Wilderness, Spotsylvania Court-house, Jericho’s Ford, North Anna, and Cold Harbor, with terrible losses. After each repulse the Union troops took up a new position further south, with a new base, until they had made half the circuit of the Confederate capital. Gen. Breckinridge defeated Sigel in the Shenandoah valley, and once more threatened Washington. Gen. Sheridan, with a strong cavalry force, drove back the Confederates and laid waste the valley. In September, Gen. Sherman, advancing with a superior force, captured Atlanta. Gen. Hood, superseding Johnston in the command of the Confederates, was outgeneraled and beaten. While he marched west to cut off Gen. Sherman’s base, and attack Nashville, where he was defeated, Sherman burned Atlanta, destroyed the railway, and marched boldly through Georgia to Savannah. The Confederates made strong efforts, and won victories, but with no permanent result.

In 1865, the United States government made a new draft for 500,000 men. Expeditions were organized against Mobile. Wilmington, the most important Confederate port, was taken by a naval and military expedition. Savannah and Charleston, approached in the rear by Sherman, were evacuated. Cavalry raids cut off the railways and canal that supplied the Confederate army in Petersburg and Richmond. Finally, on March 29th, 1865, a series of assaults was made upon the Confederate works, during ten days of almost continual fighting, until the Confederates were worn down with fatigue. Richmond and Petersburg were evacuated on April 2d; and on the 9th, after several conflicts, Gen. Lee surrendered at Appomattox Court-house, his army numbering 28,000. At this period, it is said that there was not lead enough remaining in the Confederate States to fight a single battle. On the 12th, Mobile surrendered with 3000 prisoners and 300 guns. Then Gen. Johnston, in North Carolina, surrendered a few days after to Gen. Sherman; and the trans-Mississippi Confederate army followed his example. The last battle took place at Boco Chico, Texas, May 10, in which a Union force under Gen. Barrett lost 75 men.

The war was scarcely ended when 800,000 men were paid off. During the war, the number of men called for by the Federal government was 2,759,049; the number actually furnished was 2,653,062. Of colored troops there were 186,097. The state of New York, with a population of less than 4,000,000, sent 223,836 volunteers. There was an annual waste of one-third, half of which was by wounds in battle. The Union losses during the war were estimated at 316,000. The statistics of the Confederate forces are imperfect; but in 1864, the army consisted of 20,000 artillery, 128,000 cavalry, 400,951 infantry; total, 549,226 men. The Confederate losses are unknown.

In 1864 Mr. Lincoln had been re-elected President, and Andrew Johnson, of Tennessee, Vice-President. The Democratic party had nominated Gen. George B. McClellan, of New Jersey and George H. Pendleton, of Ohio, on a platform which declared the conduct of the war to be a failure. Mr. Lincoln received 212 electoral votes, and McClellan 21. Only New Jersey, Delaware, and Kentucky were carried by the Democrats. West Virginia had been admitted to the Union, December 31st, 1862.

On April 14th, while the North was rejoicing over the capture of Richmond and the surrender of the Confederate armies, the President was assassinated at a theatre in Washington, by John Wilkes Booth, an actor; while an accomplice attacked and nearly

killed Mr. Seward, Secretary of State. The assassin was pursued and killed, and several of his accomplices tried and executed. Andrew Johnson became president. Jefferson Davis and other Confederate officials were mistakenly supposed to be privy to the assassination of President Lincoln, which was, in fact, regarded at the South with horror and regret, and large rewards were offered for their apprehension. Mr. Davis was captured in Georgia, and placed in Fortress Monroe, but released without trial in May, 1867. An amendment to the Constitution, forever abolishing slavery in the states and territories of the Union, was declared ratified by two-thirds of the states, December 18th, 1865.

The termination of the war imposed upon Congress the important duty of reconstructing the governments of the states that had seceded, which became the most important question before the national government. Here a difference grew up between President Johnson and Congress, the President having proclaimed a policy in the settlement of the southern question, which was obnoxious to the Republican leaders in both houses of Congress. The President recognized loyal governments as existing in the states of Virginia, Tennessee, Arkansas, and Louisiana, and appointed provisional governors for the other lately seceded states, with the power to call conventions for the purpose of establishing permanent governments. His policy was to recognize governments so organized, and to restore the states in question to their rights under the Constitution, whenever they should have repealed their several ordinances of secession, repudiated the Confederate debt, and ratified the thirteenth amendment to the Constitution, adopted in 1865, forever putting an end to slavery in the United States. This plan was unsatisfactory to Congress, which passed, in 1867, three acts, known as "the reconstruction acts," under which the southern states were divided into military districts, and placed under the military authority of the United States; while it became necessary for the states recently seceded, in order to regain their status among the other states, to ratify both the thirteenth and fourteenth amendments to the Constitution, the latter of which (adopted in 1868) gave the right of suffrage to the negro, denied to those persons previously in rebellion against the United States the right to hold office under the national or state governments, and repudiated the Confederate debt. The bitter struggle between the President and Congress continued during the remainder of his administration, and culminated in the resolution of the House of Representatives, passed Feb. 24, 1868, to impeach the President "of high crimes and misdemeanors." The immediate occasion of the passage of this resolution was the course of President Johnson in violating the "tenure-of-office act," as it was termed, which made requisite the consent of the Senate to removals from office by the President, and which was particularly intended to interfere with and prevent his removal of Mr. Stanton from the position of Secretary of War. The Senate formed itself into a high court of impeachment; and on Mar. 23d, 1868, the Chief-Justice presiding, proceeded to try Andrew Johnson on eleven articles of impeachment. The result was his acquittal, the prosecution lacking the necessary two-thirds majority, inasmuch as five Republicans voted with the Democrats against conviction. This led to the retirement of Mr. Stanton from the office of Secretary of War. It was not until 1868 that the states of Arkansas, Alabama, Florida, North and South Carolina, Georgia, and Louisiana were readmitted into the union. On March 1st, 1867, Nebraska had been admitted as a new state.

At the election of 1868, the Republican candidates were Ulysses S. Grant, of Illinois and Schuyler Colfax, of Indiana. The Democrats nominated Horatio Seymour, of New York and Francis P. Blair, of Missouri. Grant and Colfax received 240 electoral votes, and Seymour and Blair 80—the Democrats having carried nine states. On February 26th, the fifteenth amendment to the Constitution, guaranteeing the right of suffrage without regard to race, color, or previous condition of servitude, passed Congress, and was ratified March 30th, 1870.

XXI. and XXII. ADMINISTRATION OF ULYSSES S. GRANT (1869-1877). Cabinet.—*Secretary of State*, E. B. Washburne, Illinois, March 5th, 1869; Hamilton Fish, New York, March 11th, 1869. *Secretary of Treasury*, George S. Boutwell, Massachusetts, March 11th, 1869; William A. Richardson, Massachusetts, March 17th, 1873; Benjamin H. Bristow, Kentucky, June 2d, 1874; Lot M. Morrill, Maine, June 21st, 1876. *Secretary of War*, John A. Rawlins, Illinois, March 11th, 1869; William T. Sherman, Ohio, September 9th, 1869; William W. Belknap, Iowa, October 25th, 1869; Alphonso Taft, Ohio, March 8th, 1876; J. D. Cameron, Pennsylvania, May 22d, 1876. *Secretary of Navy*, Adolph E. Borie, Pennsylvania, March 5th, 1869; George M. Robeson, New Jersey, June 25th, 1869. *Secretary of Interior*, Jacob D. Cox, Ohio, March 5th, 1869; Columbus Delano, Ohio, November 1st, 1870; Zachariah Chandler, Michigan, October 19th, 1875. *Attorney-General*, E. R. Hoar, Massachusetts, March 5th, 1869; Amos T. Akerman, Georgia, June 23d, 1870; George H. Williams, Oregon, December 14th, 1871; Edwards Pierrepont, New York, April 26th, 1875; Alphonso Taft, Ohio, May 22d, 1876. *Postmaster-General*, J. A. J. Creswell, Maryland, March 5th, 1869; Marshall Jewell, Connecticut, August 24th, 1874; James M. Tyner, Indiana, July 12th, 1876.

One of the most important events of Pres. Grant's administration was the meeting of the Joint High Commission, appointed to consider the *Alabama* case, and which concluded the Treaty of Washington, so called, ratified by the Senate, May 24th, 1871.

The commission met in Washington, and the treaty provided that a tribunal of arbitration should be constituted, to consist of one member from Great Britain, one from the United States, and one each from Switzerland, Italy, and Brazil. The function of this tribunal was to decide on the *Alabama* claims, being the claims of the United States against the British government for damages on account of the injury done to American commerce by the *Alabama* and other Confederate cruisers, fitted out in British ports. The *Alabama* commission met at Geneva, in Switzerland, Dec. 15th, 1871, and after a presentation of the cases of the two governments adjourned to meet again June 15th, 1872. At the latter date, accordingly, the sessions were renewed, and at the thirty-second of these, Sept. 14th, the decision was announced, that "the tribunal, by a majority of four voices to one, awards to the United States a sum of \$15,500,000 in gold, as the indemnity to be paid by Great Britain to the United States for the satisfaction of all the claims referred to the consideration of the tribunal." The only dissenting voice was that of the representative of Great Britain.

Among other notable occurrences during this administration was the completion of the Union and Central Pacific railroads, 1869, providing a continuous line of railway from the Missouri to the Pacific, and completing the trans-continental system. Out of the connection of the government with the construction of these roads, arose the Credit Mobilier scandal, which involved the reputation of many prominent members of Congress. (See CREDIT MOBILIER OF AMERICA.) The enmity of the white population of the Southern States to the freedmen, particularly in regard to the exercise by the latter of their newly-acquired right of suffrage, attracted public attention, 1868-72, until the investigation by Congress, and consequent legislation, had made such outrages difficult. (See KU KLUX KLAN.) A movement by the government in the direction of the acquisition of Saint Domingo, at the desire of President Grant, deserves mention. The people of that country were willing to be annexed to the United States, but the American Senate rejected the proposal. In March, 1871, the first steps were taken toward the reform of the Civil Service by a bill authorizing the President to appoint a board of Civil Service Commissioners to provide for the appointment of applicants for minor offices on the basis of an examination.

During Gen. Grant's first administration a new party arose as the result of a reaction against the extreme centralization of power in the federal government that had resulted from the exigencies of war. This party was known as the Liberal Republican Party, and numbered among its adherents some of the most prominent names in the old Republican Party—Horace Greeley, Charles Francis Adams, Charles Sumner, Carl Schurz, and Chauncey M. Depew. This party nominated, in 1872, Horace Greeley of New York, for President, and B. Gratz Brown of Missouri, for Vice-President, on a platform deprecating any further interference by the government in the local affairs of the South. This ticket was ratified by the Convention of the Democratic Party held in the same year. The Republicans re-nominated Gen. Grant, with Henry Wilson, of Massachusetts, for Vice-President. The Republican ticket received 286 electoral votes, against 63 scattering, Mr. Greeley having died before the Electoral College met. The votes of Louisiana and Arkansas and three votes from Georgia were not counted.

A serious difficulty with Spain was near occurring in 1872, through the outrageous act of the Spanish steamer *Tornado*, in capturing, on October 31st, 1872, the *Virginian*, a vessel sailing on the high seas, under the American flag. The *Virginian* was engaged in transporting men and arms for the insurgents in Cuba, and had 170 men on board, including the crew; these were all taken prisoners, and 58 of them, including Capt. Fry, commanding the *Virginian*, and Gen. Ryan, an American, were summarily shot. The affair created great excitement throughout the United States, and was only peaceably settled after much negotiation, and while actual preparations for war were being made on both sides. Spain was forced to apologize, to salute the American flag, to give up the *Virginian*, and to pay an indemnity to the families of the murdered men. The remainder of Gen. Grant's administration was marked by no special event, excepting the celebration of the centennial of American independence, May-Nov., 1876, in Philadelphia, by an international exposition of arts, manufactures, and products. (See CENTENNIAL EXHIBITION.)

In 1873-74, the party known as "Grangers," or "Patrons of Husbandry" (see GRANGE), rose into some prominence; an act for the resumption of specie payment, in 1879, was passed in 1874; an extensive "Whisky Ring" was exposed in 1875, involving a corrupt association among distillers and federal officers to defraud the government of the tax on liquors; and much local disorder occurred in the Southern states between the so-called "carpet-bag" governments and the white citizens. Colorado was admitted as a state, August 1st, 1876.

In 1876, the Republican candidates were Rutherford B. Hayes, of Ohio and William A. Wheeler, of New York; the Democratic candidates were Samuel J. Tilden, of New York and Thomas A. Hendricks, of Indiana. On the face of the returns, Tilden and Hendricks had 184 electoral votes, to 172 for Hayes and Wheeler, with the votes of Florida, Louisiana, and Oregon in doubt. The scenes and incidents that followed this election have passed into history as among the most exciting in the annals of our country. An election so close as to hang upon a single electoral vote; charges of fraudulent voting in several states to a sufficient extent to render questionable not one

alone, but several votes in the Electoral College ; party feeling running so high as to threaten at each moment the performance of some overt act on one side or the other which might deluge the country with blood, and set back civilization for many years ; such were the elements which rendered this struggle one of the most momentous since the foundation of the government. Messrs. Hayes and Wheeler were finally declared elected by an Electoral Commission chosen from both houses of Congress and from the Supreme Court of the United States ; and whose decision was accepted by all concerned as final and irrevocable. (See ELECTORAL COMMISSION.) As finally counted, 185 electoral votes were given to Hayes and Wheeler, and 184 votes to Tilden and Hendricks.

XXIII.—ADMINISTRATION OF RUTHERFORD B. HAYES (1877-1881). *Cabinet*.—*Secretary of State*, William M. Evarts, New York, March 12th, 1877. *Secretary of Treasury*, John Sherman, Ohio, March 8th, 1877. *Secretary of War*, George W. McCrary, Iowa, March 12th, 1877 ; Alexander Ramsey, Minnesota, December 12th, 1879. *Secretary of Navy*, Richard W. Thompson, Indiana, March 12th, 1877 ; Nathan Goff, Jr., West Virginia, January 6th, 1881. *Secretary of Interior*, Carl Schurz, Missouri, March 12th, 1877. *Attorney-General*, Charles Devens, Massachusetts, March 12th, 1877. *Postmaster-General*, David M. Key, Tennessee, March 12th, 1877 ; Horace Maynard, Tennessee, August 25th, 1880.

The year 1877 was made memorable by the troubles in South Carolina and Louisiana, where rival state governments, each claiming to be legally elected, struggled for supremacy. In the former state the difficulty was settled by President Hayes, who ordered the withdrawal of the United States troops which had been stationed at Columbia, S. C., and had been an objectionable feature of the contest ; whereupon the Republican governor, Chamberlain, retired, and Gen. Wade Hampton took peaceful possession of the office. A settlement was also effected in Louisiana, a commission being sent thither by the President, when the Democratic governor, Nichols, was enabled to gain possession of his seat, the Federal troops being in this instance also withdrawn from New Orleans.

This action marked the end of federal interference in the local concerns of the Southern States—an interference that had become yearly more objectionable to moderate men at the North, who no longer cherished the animosities resulting from the civil war.

This year was further noteworthy by the occurrence, in July, of the railroad strikes and riots which prevailed throughout the country, to the injury of business, and with serious loss of property. (See STRIKES.) The question of the title of President Hayes to his seat attracted some attention during 1878, and resolutions and a memorial were laid before the legislature of the state of Maryland asking for legislative investigation on the part of Congress as to its legality. A committee of investigation as to the frauds alleged to have been committed in Florida, Louisiana, South Carolina, and Oregon, in connection with the election of the President, was afterwards appointed by Congress, and did so investigate ; but neither of these movements served to disturb Mr. Hayes's title. The excitement occasioned by the near approach of the period fixed by Congress for the resumption of specie payments produced a demand on the part of numbers of persons throughout the country for a party opposed to the prevailing sentiment with regard to financial questions. Such a party was, in fact, organized at Toledo, Ohio, Feb. 22d, 1878, under the name of the National Party, delegates being present from 28 states ; and its platform of principles duly enunciated. These included bi-metallism, the government to exercise exclusively the function of creating money and regulating its value ; suppression of national bank issues ; money to be provided by the government in accordance with the necessities of labor and trade ; bonds to be taxed ; a graduated income-tax to be levied ; reduction of the hours of labor, bureaus of labor and industrial statistics to be established ; opposition to the contract-system in prisons, and to Chinese labor. In the state elections of the same year, this party, which became popularly known as the "Greenback Party," polled upward of a million votes.

During the year 1878 an important event in foreign relations was the establishment of a permanent Chinese legation at Washington. This embassy was the result of the treaty with China, ratified at Washington on July 16th, 1878, and which had been negotiated by Mr. Burlingame, American minister at Peking. Special articles of this treaty were those permitting entire religious liberty in the two countries ; reprobating any but voluntary emigration from one to the other ; conferring mutual privileges, immunities, and exemptions, in respect to travel and residence, on citizens of the two treaty-making powers, and insuring all the advantages of the government educational institutions of the two countries to the citizens of either ; including also permission for the citizens of either country to establish and maintain schools, respectively, in each country, in accordance with the laws of each for such cases made and provided. The general course of the administration of President Hayes was uneventful. The country was in a fairly prosperous condition, chiefly owing to the continuance of abundant crops, and the year 1878 closed without any significant occurrence whatsoever to mar the equable flow of affairs, domestic and foreign. On Jan. 1st, 1879, specie payments were resumed throughout the United States, after a suspension of 17 years, and in accordance with the act of Congress approved Jan. 14th, 1875. The process of resumption was effected without excitement, there being but little demand for gold, and the New York Gold Room closed operations.

An extraordinary movement northward of the colored population of certain of the Southern States took place in 1879, and was the source of much uneasiness among the planters, and the subject of general discussion throughout the country. (See *NEGRO EXODUS*.) This year, also, saw the decline and fall of the labor agitation in San Francisco, which, under the leadership of Denis Kearney, had been continued with great virulence since 1877. So powerful did this movement become, that it was able to dictate a new constitution for the state of California, an act which resulted in driving capital from the state, and in bringing about a condition of business depression and general stagnation never before paralleled on the Pacific Coast. The conclusion of this agitation was the deposition of Kearney from leadership. The year 1880 opened with serious political trouble in Maine, where two legislatures (Fusion and Republican) declared themselves to be legally in session; two governors of the state were declared elected, and were inaugurated, and a serious situation ensued, threatening bloodshed and revolution for many weeks, concluded by the supreme court of the state declaring in favor of the Republican governor, Daniel F. Davis, who took possession of the office on Jan. 17th.

This being the year of the presidential election, conventions were held in every state by the different political parties; and on June 2d, the Republican national convention met in Chicago to nominate candidates for President and Vice-President. The names most prominent before this convention were those of Ulysses S. Grant, James G. Blaine, and John Sherman, for President. The excitement within the convention and throughout the country was intense. The opposition to Gen. Grant's re-election for a third term was extended throughout the Republican party, though several states at their conventions had chosen delegations favoring Grant to the national convention, and directed them to vote as a unit, notably, New York and Pennsylvania. The vote for Gen. Grant in the convention finally settled at 306, and it became obvious that it was impossible to effect any union of the conflicting delegations on either Blaine or Sherman with sufficient strength to insure a nomination. Through the efforts of William H. Robertson, a delegate from New York, the unit rule was broken by that delegation, and a compromise was effected on James A. Garfield, of Ohio, with Chester A. Arthur, of New York, for Vice-President. On June 11th, the Greenback national convention met in Chicago and nominated James B. Weaver for President, who was afterwards accepted as the candidate of the Socialist party. On June 23d the Democratic national convention assembled at Cincinnati, Ohio, and nominated Winfield S. Hancock, of Pennsylvania and William H. English, of Indiana. The result of the election was the choice of Messrs. Garfield and Arthur, who received 214 electoral votes as against 155 votes cast for Hancock and English.

XXIV.—ADMINISTRATION OF JAMES A. GARFIELD (1881) AND OF CHESTER A. ARTHUR (1881-1885). *Cabinet*.—*Secretary of State*, James G. Blaine, Maine, March 5th, 1881; Frederick T. Frelinghuysen, New Jersey, December 12th, 1881. *Secretary of Treasury*, William H. Windom, Minnesota, March 5th, 1881; Charles J. Folger, New York, October 27th, 1881. *Secretary of War*, Robert T. Lincoln, Illinois, March 5th, 1881. *Secretary of Navy*, W. H. Hunt, Louisiana, March 5th, 1881; Wm. E. Chandler, New Hampshire, April 12th, 1882. *Secretary of Interior*, S. J. Kirkwood, Iowa, March 5th, 1881; Henry M. Teller, Colo., April 6th, 1882. *Attorney-General*, Wayne MacVeagh, Pennsylvania, March 5th, 1881; Benjamin H. Brewster, Pennsylvania, December 16th, 1881. *Postmaster-General*, Thomas L. James, New York, March 5th, 1881; Timothy O. Howe, Wisconsin, December 20th, 1881; W. Q. Gresham, Indiana, April 3d, 1883; Frank Hatton, Iowa, October 14th, 1884.

Those members of the Republican party who had favored the election of Gen. Grant, for a third term of the presidency, and who were popularly known as "Stalwarts" had not been pleased with the nomination of Mr. Garfield. In the presidential campaign, they had with difficulty been induced to give his candidacy their support, and when they finally did so, it was with a general understanding that the candidate, if successful, should favor them with a liberal share of patronage. The new President had in various ways shown his desire to conciliate both wings of the party. Before the inauguration he had held many conferences with the leaders of each, and it was understood that his aim was to reach some satisfactory agreement in regard to the disposal of the presidential patronage. His first nominations were apparently dictated by a desire to conciliate the "Stalwarts." But his appointment of William H. Robertson (who had been largely instrumental in securing the President's nomination at Chicago) to the post of collector of the port of New York, aroused the opposition of the senator from that state, Mr. Roscoe Conkling, a leading "Stalwart." Finding that his opposition was ineffectual, Mr. Conkling and his colleague, Mr. Platt, resigned their seats in the Senate, May 16th, and appealed to the New York legislature for re-election as a justification of their course. The appeal was unsuccessful, and a bitter contest, lasting until the latter part of July, ended with the election of Messrs. Miller and Lapham to the Senate. Meanwhile the President's appointments had been confirmed. The new Postmaster-General had discovered colossal frauds in the Star Route Service of the postal department, and the president had directed him and the Attorney-General to bring the criminals to justice. The diplomacy of Mr. Blaine in regard to the war between Chili and Peru and the Panama Canal (see INTEROCEANIC SHIP CANAL) excited considerable newspaper criticism.

On July 2d, the country was astounded by the intelligence that President Garfield had been shot by an assassin as he was entering a railway station in Washington. The fight between the two rival factions of the Republican party had engendered so much bitterness that the first news awakened vague but terrible suspicions. It was a relief, therefore, to find that the assassin, who was immediately arrested, was acting entirely on his own responsibility. He proved to be an insignificant creature, named Charles J. Guiteau, who was consumed by a morbid passion for notoriety, and whose vanity had been offended by the refusal of an office. The President was taken to the White House. He lingered for seventy-nine days between life and death, receiving the sympathy of the civilized world, and died, Sept. 19th, at Elberon, N. J., whither he had been taken thirteen days before, as his last chance for life. On the same day Vice-President Arthur took the oath of office as President in New York, and subsequently repeated it before Chief Justice Waite in Washington.

The trial of the assassin Guiteau was begun on Nov. 14th, 1881. The only defense set up was insanity; but, after a protracted trial, in which the prisoner shocked the country by his exhibitions of callousness, malevolence, and vulgar buffoonery, a verdict of guilty was rendered on Jan. 25th, 1882. He was hanged June 30th, in the jail at Washington. The most important features of national legislation in 1882, were the Anti-Polygamy Bill, March 23d, the Apportionment Bill, increasing the number of congressional representatives to 325, and the Anti-Chinese Bill, suspending Chinese immigration for twenty years. The latter was vetoed by the President, who, however, signed a subsequent bill limiting the term of suspension to ten years. Among the several state elections of this year, one, at least, had a national significance. In New York the lukewarmness of that wing of the Republican Party which had sympathized with Gen. Garfield in his contest with the leaders of the faction to which Mr. Arthur was allied, and the indignation of the "Independents" at the political methods pursued by the President to secure the nomination and election of his friend, Charles J. Folger, as Governor of the state, resulted in the election of the Democratic candidate, Grover Cleveland, by an immense majority of 192,000 votes. The victory of the Democrats in Pennsylvania, was also looked upon as to some extent a rebuke of the administration, and especially of machine methods in politics. The question of civil-service reform (q.v.) was now pressed with renewed eagerness by its advocates. The public mind seemed to be in a fit temper to receive it, as it was recognized that the sacrifice of President Garfield's life was an indirect result of a petty squabble over the distribution of party spoils. The Civil-Service Bill, which had already passed the Senate, passed the house, 1883, Jan. 4, and was signed by the President. In the same year the Star Route trials ended with the acquittal of the defendants. This was generally looked upon as a gross miscarriage of justice, though the technical difficulties in the case were recognized by eminent lawyers. The most important event of the year 1884 was the presidential election. The Republican national convention met in Chicago during the first week of June, and the fourth ballot resulted in the nomination of James G. Blaine (q.v.) for the presidency. John A. Logan, of Illinois, was nominated for Vice-President. The nomination of Mr. Blaine was secured in the teeth of the bitter and organized opposition of the "Independent" faction in the Republican party, popularly known as "Mugwumps." The papers which represented the views of the "Independents" at once withdrew their support from Mr. Blaine, and indicated that they would cast their influence on the side of the Democratic candidate, in case some statesman of tried incorruptibility were chosen by the dem. convention. It was generally understood that either Grover Cleveland or Thomas F. Bayard would be acceptable to them. When the convention met in July, these two were the leading candidates on the first ballot. On the second ballot Mr. Cleveland secured the necessary two-thirds majority, and was declared the nominee. Thomas A. Hendricks, of Indiana, was nominated for Vice-President. Rival tickets were put in the field by the friends of total abstinence, who nominated John P. St. John, of Kansas, for President and William Daniel, of Maryland, for Vice-President; and by the Anti-monopoly and Greenback-Labor parties, both of which nominated Gen. Benjamin F. Butler, of Massachusetts, for President. The campaign which followed developed unusual excitement and party rancor. Charges of political immorality against one candidate were met with counter-charges of sexual immorality against the other. Mr. Blaine made a tour through the Western States, and spoke in the principal cities and towns. Mr. Cleveland preferred to let his friends electioneer, and appeared in only a few cities in New York, New Jersey, and Connecticut. The election was unexpectedly close, and the result for a few days hung in doubt over conflicting press returns in the pivotal state of New York; but the official count gave a plurality of 1047 to Mr. Cleveland.

The Democratic ticket received 219 electoral votes and the Republican ticket, 182. The Prohibition ticket had a popular vote of 151,809, and the Anti-Monopoly ticket of 133,825.

XXV.—ADMINISTRATION OF GROVER CLEVELAND (1885-1889). *Cabinet.*—*Secretary of State*, Thomas F. Bayard, Delaware, March 6th, 1885. *Secretary of Treasury*, Daniel Manning, New York, March 6th, 1885; Charles S. Fairchild, New York, April 1st, 1887. *Secretary of War*, William C. Endicott, Massachusetts, March 6th, 1885. *Secretary of Navy*, William C. Whitney, New York, March 6th, 1885. *Secretary of Interior*, Lucius Q. C. Lamar, Mississippi, March 6th, 1885; William F. Vilas, Wisconsin,

sin, January 16th, 1888. *Attorney-General*, Augustus H. Garland, Arkansas, March 6th, 1885. *Postmaster-General*, William F. Vilas, Wisconsin, March 6th, 1885; Don M. Dickinson, Michigan, January 16th, 1888.

Mr. Cleveland's administration from the outset was marked by a general application to the public service of the principles so long advocated by the friends of Civil Service reform. In 1882, the so-called Pendleton Civil Service bill had been passed, allowing the President to make his appointments on the basis of examinations conducted by a Board of Examiners established by him. Mr. Arthur had faithfully carried out the provisions of this act; and now Mr. Cleveland applied its principles to many offices not specifically covered by the act. For the first time in half a century, no sweeping changes were made in the public service on the accession to power of a new party.

In 1886, a bill passed Congress to regulate the succession to the presidential office—a question that assumed some special importance on the death of Vice-President Hendricks. For particulars, see under *Government* in this article. Among the important acts of this Congress were the Anti-Polygamy, or Edmunds Bill, making polygamy a criminal offense; and the Interstate Commerce (q. v.) Act, preventing discrimination in railroad freights and the practice of "pooling" freights by competing railroads. A tariff bill, known as the Morrison Bill, was defeated by Republicans and protection Democrats.

In December, 1887, President Cleveland sent to Congress a message devoted to the single question of the tariff. After stating that the estimated surplus in the Treasury in June, 1888, would be fully \$140,000,000, he declared the existing tariff laws to be the source of unnecessary taxation, and asked for a reduction of the duties on raw materials, especially on wool. In accordance with this recommendation, the so-called Mills Bill was introduced, and passed the House. It removed duties aggregating \$50,000,000 per annum, but failed to pass the Senate, which was Republican. At this session of Congress the largest appropriation for rivers and harbors ever known was made. It amounted to \$22,227,000, and became law without the President's signature. A new Chinese Exclusion Bill was also passed. An act was passed in 1889 for the admission of four new states—North Dakota, South Dakota, Washington, and Montana.

At the Democratic convention of 1888, Mr. Cleveland was renominated, with Allen G. Thurman, of Ohio, as the candidate for Vice-President. The Republicans nominated Benjamin Harrison, of Indiana, and Levi P. Morton, of New York. The Prohibition party put forward as its candidates, Clinton B. Fisk, of New Jersey, and John A. Brooks, of Missouri. The campaign was unusually free from offensive personalities, but was fought out largely on the tariff questions raised by Mr. Cleveland's message of 1887. Enormous sums of money, however, were used in the campaign. The election resulted in the choice of the Republican candidates, who received 233 electoral votes as against 168 cast for the Democratic nominees. The popular vote for Mr. Cleveland exceeded that of Mr. Harrison by 94,611. The Prohibition ticket received 246,406 votes.

XXVI.—ADMINISTRATION OF BENJAMIN HARRISON (1889-93). *Cabinet*.—*Secretary of State*, James G. Blaine, Maine, March 7th, 1889. *Secretary of the Treasury*, William Windom, Minnesota, March 7th, 1889; Charles Foster, Ohio, February 21st, 1891. *Secretary of War*, Redfield Proctor, Vermont, March 7th, 1889. *Attorney-General*, W. H. H. Miller, Indiana, March 7th, 1889. *Postmaster-General*, John Wanamaker, Pennsylvania, March 7th, 1889. *Secretary of the Navy*, Benj. F. Tracy, New York, March 7th, 1889. *Secretary of the Interior*, John W. Noble, Missouri, March 7th, 1889. *Secretary of Agriculture*, Jere. M. Rusk, Wisconsin, March 7th, 1889.

The administration of Mr. Harrison witnessed a remarkable growth of public interest in the foreign relations of the United States, both commercially and otherwise. One cause of this is to be found in the meeting of the so-called Pan-American Congress at Washington, Oct. 21st, 1890, under the presidency of Secretary Blaine, and which did much to foster a popular sentiment in favor of commercial reciprocity (q. v.) between the United States and the other American republics. This policy, warmly advocated by Mr. Blaine, found expression in the so-called "reciprocity section" of the bill for the revision of the tariff prepared by Mr. William McKinley (q. v.), of Ohio, which passed both houses of Congress and became a law, October 1st, 1890. Under this section, reciprocity treaties were negotiated with Brazil and Spain.

Several diplomatic difficulties of more or less seriousness had arisen between the United States and foreign powers within a few years. Among these had been a state of anarchy on the Isthmus of Panama, which required the United States government, in accordance with its treaty obligations, to send an armed force to protect the Isthmus. A dispute with Germany over the Samoan Islands (q. v.) in 1889 had also taken on a serious aspect, though finally arranged in an amicable manner by a treaty signed at Berlin (February 4th, 1890). A serious disagreement with England also arose in 1890-91, regarding the rights of this country acquired in Behring Sea by our treaty with Russia, and was referred to arbitration in 1891. The lynching of certain Italians by a mob in New Orleans, in the same year, led to something like a diplomatic rupture with Italy, which recalled its minister from Washington.

The same Congress arranged for holding a World's Fair at Chicago in 1893 in honor of the discovery of America by Columbus. On May 2d, 1890, the new territory of Oklahoma (q. v.) was organized, and Idaho (July 3d) and Wyoming (July 11th) were admitted as states.

The closing months of Mr. Harrison's administration were marked by some financial disturbances owing to the continued shipment of gold to Europe, which threatened to reduce the gold deposits in the United States Treasury below the limit of \$100,000,000, which had been held as a reserve fund to secure the payment of all treasury-notes in gold. Another event of interest was the overthrow of the monarchy in Hawaii by the foreign residents, and the application made by the new government for the annexation of the islands to the United States. Mr. Harrison sent a treaty of annexation to the Senate (Feb., 1893), but it was not acted upon. See SANDWICH ISLANDS.

The conventions of the two great political parties had been held in June, 1892. The Democrats nominated Grover Cleveland of New York for the presidency and Adlai E. Stevenson of Illinois for the vice-presidency. The Republican Convention renominated President Harrison for the presidency and selected Whitelaw Reid of New York as its choice for vice-president. The so-called People's Party (q.v.) nominated Gen. J. B. Weaver of Iowa and James G. Field of Virginia. The ensuing campaign was largely conducted on the question of the tariff, and resulted in the election of Cleveland and Stevenson, who received 277 electoral votes, as against 145 for Harrison and Reid, and 22 for Weaver and Field.

XXVII. SECOND ADMINISTRATION OF GROVER CLEVELAND (1893-97). *Cabinet.*—*Secretary of State*, Walter Q. Gresham, Indiana, March 6, 1893; Richard Olney, Mass. *Secretary of Treasury*, John G. Carlisle, Kentucky, March 6, 1893. *Secretary of War*, Daniel S. Lamont, New York, March 6, 1893. *Secretary of Navy*, Hilary A. Herbert, Alabama, March 6, 1893. *Secretary of Interior*, Hoke Smith, Georgia, March 6, 1893. *Attorney-General*, Richard Olney, Massachusetts, March 6, 1893; Judson Harmon, O.; *Postmaster-General*, Wilson S. Bissell, New York, March 6, 1893; William L. Wilson, W. Va., March, 1895; *Secretary of Agriculture*, J. Sterling Morton, Nebraska, March 6, 1893.

In his second administration the President applied himself particularly to the promotion of tariff and financial reforms, and this period was marked by the intense and persistent opposition of his own party in both houses of Congress. His earliest act of importance was the withdrawal from the Senate of the treaty for the annexation of Hawaii to the United States, which had been negotiated in the closing days of the previous administration. He also sent James H. Blount, ex-congressman from Georgia, to Hawaii as a special commissioner to investigate the circumstances of the overthrow of the royal government, and, on his report, took the ground that the U. S. government had through its representatives committed a grievous wrong against the kingdom.

The legislation on the tariff was the most exciting domestic incident of this term. A new bill, bearing the name of chairman Wilson, of the house committee on ways and means, and providing for free raw sugar, free wool, free coal, free lumber, and free iron ore, and reducing the duties on many articles in the existing schedules, was introduced Dec. 19, 1893. In the following month, a measure providing for an income tax was presented in the house, and that and others concerning the internal revenue were incorporated in the bill during the subsequent debate. When the bill reached the Senate it underwent radical alterations, many amendments being made, notably those imposing a tax on sugar, coal, and iron ore, and the house at first refused to concur in the Senate amendments. Finally, however, they withdrew from their position of non-concurrence and the bill was passed. Immediately afterward the house passed bills providing for free sugar, free coal, free iron ore, and free barbed wire. The President allowed the bill to become a law without his signature. On an appeal to the U. S. supreme court, that body, April 2, 1895, declared two provisions of the income-tax law unconstitutional, and upheld the remainder by a tie vote, and May 20, on a rehearing, declared the whole measure unconstitutional.

Early in the term occurred the great commercial panic of 1893 which was followed by a long period of depression. The financial feature of this administration (see MONEY), showed still greater opposition to the President, and provided the chief factor in the presidential campaign of 1896. In Jan., 1894, because of the heavy withdrawal of gold coin from the treasury and the large reduction in the gold reserve of \$100,000,000, Secretary Carlisle, of the treasury department, issued a call for the purchase of \$50,000,000 of 5 per cent. bonds, at \$117.223, and this sale resulted in the acquisition of \$58,660,917 in gold, which was added to the reserve. The drain on the reserve, however, continued, and in November following the secretary issued a second call for the purchase of \$50,000,000 bonds, when the subscriptions aggregated \$178,341,150 and the sale yielded \$53,538,500 in gold, which brought the reserve to \$111,142,021. In about two months after this sale the reserve declined to \$41,340,181. The President, in a special message to Congress, Jan. 28, 1895, recommended that authority be given the secretary of the treasury to issue bonds bearing a low rate of interest, to maintain the reserve and redeem outstanding notes issued for the purchase of silver; but Congress did not approve the recommendation. Secretary Carlisle then signed a contract with August Belmont & Co., and J. P. Morgan & Co., for themselves and others, to supply the government with 3,500,000 ounces of standard gold coin, at the rate of \$17.80441 per ounce, for 30-year 4 per cent. bonds, on the conditions that one-half of the coin should be obtained in Europe, and that if Congress should authorize their issue, bonds payable in gold and bearing 3 per cent. interest, might within 10 days be substituted at par for the 4 per cent. bonds. The President again urged Congress to authorize the issue of low rate

bonds, declaring in his message that more than \$16,000,000 in interest would be saved thereby, and Congress again withheld its sanction. Under the contract the secretary sold \$62,315,000 in bonds for a little over \$65,000,000 in gold. The subscriptions to this loan aggregated \$590,000,000 in London, and \$200,000,000 in New York. Under the continuance of the business depression, Secretary Carlisle was forced, in Jan., 1896, to invite proposals for the purchase of \$100,000,000 of 30-year 4 per cent. bonds. The awards were, to the Morgan syndicate \$37,911,350, and to other bidders the remainder.

The silver question came up again in Congress, Feb. 7, 1894, when the house committee on coinage, weights, and measures, reported a bill directing the coinage of the silver held in the treasury. A substitute by congressman Bland, providing for the coinage of the seigniorage was adopted, and passed in the house by a vote of 168 yeas to 129 nays, with 56 not voting, and in the Senate by 44 yeas to 31 nays, 10 not voting. This bill was vetoed by the President, and it failed of passage over the veto. In Dec., 1895, the house passed a bond bill prepared by the Republican members of its committee on ways and means, and when it reached the Senate the finance committee reported a free silver coinage substitute, which the Senate passed, Feb. 1, 1896, by a vote of 42 yeas to 35 nays. The house refused to concur in the substitute, and rejected it by a vote of 215 yeas to 90 nays. A few days afterward the Senate defeated the emergency revenue bill, prepared by Republican members of the house committee on ways and means, and passed by the house by a vote of 205 yeas to 61 nays, the Senate vote being 22 yeas to 33 nays.

A long standing dispute between Venezuela and Great Britain, over the British Guiana boundary line, was the cause of a presidential message to Congress in Dec., 1895, recommending the appointment of a commission to determine the divisional line between Venezuela and British Guiana. Both houses unanimously concurred in the recommendation, a commission was appointed Jan. 1, 1896, and the proceeding provoked great excitement in the countries interested for several months. Among other events of President Cleveland's second administration were the world's Columbian exposition at Chicago, and the great naval review at New York in 1893, the signing of treaties with China and Japan, in 1894, and the arbitration by the President of disputes between Brazil and the Argentine republic, Colombia and Italy, and Brazil and Italy.

The presidential campaign of 1896 was based principally on the problem: Sound money (gold) vs. the free coinage of silver at the ratio of 16 to 1. There were seven tickets in the field, viz., the Republican (sound money), William McKinley, of Ohio, and Garret A. Hobart, of New Jersey; the Democratic (free silver), William J. Bryan, of Nebraska, and Arthur Sewall, of Maine; the National Democratic (sound money), John M. Palmer of Illinois, and Simon B. Buckner, of Kentucky; the Prohibition, Joshua Levering and Hale Johnson; the Socialist Labor, Charles H. Matchett and Matthew Maguire; the Populist, William J. Bryan and Thomas E. Watson; and the Free Silver Prohibition, Charles E. Bentley and James H. Southgate. The total popular vote was 13,930,942 and the electoral, 447, of which the Republican candidates received 7,121,342 and 271 respectively, and the Democratic, 6,502,600 and 176. The Populist ticket received 144,928 votes; National Democratic, 134,731; Prohibition, 123,428; Socialist Labor, 35,306; and Free Silver Prohibition, 13,535.

XXVIII.—ADMINISTRATION OF WILLIAM MCKINLEY (1897—). *Cabinet*.—*Secretary of State*, John Sherman, Ohio; *Secretary of the Treasury*, Lyman J. Gage, Illinois; *Secretary of War*, Russell A. Alger, Michigan; *Secretary of the Navy*, John D. Long, Massachusetts; *Secretary of the Interior*, Cornelius N. Bliss, New York; *Attorney-General*, Joseph McKenna, California; and *Secretary of Agriculture*, James Wilson, Iowa.

Among the early important appointments of President McKinley were those of John Hay, to be ambassador to Great Britain; Horace Porter, ambassador to France; Andrew D. White, ambassador to Germany; William F. Draper, ambassador to Italy; James B. Angell, minister to Turkey; Stewart L. Woodford, minister to Spain; Whitelaw Reid, special ambassador to Great Britain on the occasion of the Queen's jubilee; William J. Calhoun, special commissioner to Cuba; and Ellis H. Roberts, treasurer of the United States.

In accordance with a proclamation by the President, Congress met in extraordinary session on March 15, 1897. A new tariff bill, bearing the name of Chairman Dingley of the house committee on ways and means, was introduced on the opening day, and was finally passed and signed by the President on July 24. In March the Senate Committee on Foreign Relations made a favorable report on the arbitration treaty between the United States and Great Britain, submitting several amendments with the report. These amendments were adopted; a large number of other amendments were subsequently proposed; and the treaty was rejected May 5 by a vote of 43 to 29. The President sent to the Senate, June 16, a new treaty with Hawaii for annexation; the Senate Committee on Foreign Relations reported a resolution for the ratification of the treaty, July 14; but Congress adjourned without further action on it. The treaty, however, was ratified by the unanimous vote of both houses of the Hawaiian legislature on Sept. 10, following. The Senate, May 17, passed a resolution recognizing the Cuban insurgents as belligerents by a vote of 41 to 14.

S.* (1893).

UNITED STATES, EXTENSION OF TERRITORY OF THE. Prior to 1781 only six of the 13 original states, viz. New Hampshire, Rhode Island, New Jersey, Pennsylvania, Maryland, and Delaware, had exactly defined boundaries. Of the remaining seven states, some claimed to extend to the Pacific ocean and others to the Mississippi river. The states within exact boundaries ceded their claim to lands w. of their present limits in succession, as follows: March 1, 1781, New York. March 1, 1784, Virginia; the cession including the state of Kentucky and the parts of the states of Illinois, Ohio, and Indiana which lie s. of the 41st parallel. Virginia reserved from this cession for

military bounty-lands the entire territory, 6,570 sq.m., between the Scioto and Little Miami rivers, from their source to the Ohio river. April 19, 1785, Massachusetts; including her claims to territory w. of the present boundary of New York. Sept. 14, 1786, Connecticut; the cession being the territory between the parallels of 41° and $40^{\circ} 2'$, and w. of a north and south line drawn 120 m. w. of the present w. boundary of Pennsylvania. Connecticut then ceded all land and jurisdiction w. of that territory, now situated in Ohio, and yet known as "the western reserve of Connecticut." Aug. 9, 1787, South Carolina; the territory ceded being a strip of land about 12 m. wide, s. of the 35th parallel and extending along the s. boundaries of North Carolina and Tennessee to the Mississippi. Feb. 25, 1790, North Carolina; the cession constituting Tennessee. May 30, 1800, Connecticut; yielding all territory and jurisdiction w. of her present area, and reserving the right of soil in the "western reserve," which lies between the parallels and meridians above recited. June 16, 1802, Georgia receiving that part of the cession of South Carolina lying within her present limits, ceded all between her present w. boundary and the Mississippi, and between the South Carolina cession and the 31st parallel. The foregoing cession secured to the general government all territory ceded by Great Britain, not included in the original 13 states, as in the main now bounded. Nov. 25, 1850, the state of Texas ceded all her claims to lands w. of the 26th meridian (103d Greenwich) and between 32° and $36^{\circ} 30'$ of latitude.

CESSIONS BY FOREIGN POWERS.—Sept. 3, 1783, by treaty with Great Britain, the territory of the United States was declared to extend from the Atlantic ocean w. to the Mississippi river, and from a line along the great lakes on the n. to the 31st parallel and the s. border of Georgia. April 30, 1803, by treaty with France, the "province of Louisiana" was ceded. Its w. boundary as finally adjusted, Feb. 22, 1819, by treaty with Spain, ran up the Sabine river, to and along the 17th meridian (94th Greenwich), to and along the Red river, to and along the 23d meridian (100th Greenwich), to and along the Arkansas river, to and along the Rocky Mountains, to and along the 29th meridian (106th Greenwich), to and along the 42d parallel, to the Pacific Ocean. Its n. boundary was conformed to the boundary established between the British possessions and the United States. On the e. it was bounded by the Mississippi as far s. as the 31st parallel, where different boundaries were claimed. The United States construed the cession of France to include all the territory between the 31st parallel and the gulf of Mexico, and between the Mississippi and Perdido, the latter of which is now the western boundary of Florida. Under this construction of the cession, the "province of Louisiana" is now covered by those portions of the states of Alabama and Mississippi which lie s. of the 31st parallel; by Louisiana, Arkansas, Iowa, Nebraska, Oregon, Minnesota w. of the Mississippi, Kansas, North and South Dakota, Montana, Idaho, Washington, and that country known as Indian territory; and by the portion of Colorado lying e. of the Rocky Mountains and n. of the Arkansas river, and all of Wyoming n. of the 42d parallel, and that portion of Wyoming which is s. of that parallel and e. of the Rocky Mountains. In 1800, however, the "province of Louisiana" had been ceded by Spain to France, Spain claiming that she ceded to France no territory e. of the Mississippi except the "island of New Orleans," and also contending that her province of west Florida included all of the territory s. of the 31st parallel and between the Perdido and Mississippi, except the "island of New Orleans." Under this construction, the "province of Louisiana" included on the e. of the Mississippi only the territory bounded on the n. and e. by the "rivers Iberville and Amite and by the lakes Maurepas and Ponchartrain." Feb. 22, 1819, Spain formally ceded the territory now covered by Florida and by portions of Alabama, and Mississippi, which lie s. of the 31st parallel, and by that portion of Louisiana which lies e. of the Mississippi and is not included in the "island of New Orleans." This territory was styled by Spain the "provinces of East and West Florida." Previous to this cession, by the authority of the joint resolution of Jan. 15, 1811, and the acts of Jan. 15, 1811 and Mar. 3, 1811, passed in secret session and first published in 1818, the United States had taken possession of the East and West Floridas. By treaty of Jan. 12, 1828, between the United States and the United Mexican states, the boundary of the "province of Louisiana," which was established by treaty with Spain when Mexico was a part of the Spanish monarchy, was agreed upon as the boundary between the two republics. Dec. 29, 1845, Texas, formerly a portion of Mexico, and later an independent republic, was admitted to the union. Feb. 2, 1848, Mexico ceded the territory now covered by California and Nevada; also her claims to the territory covered by the present Texas, by Utah, Arizona, and New Mexico, by portions of Wyoming and Colorado, and by the unorganized territory w. of the Indian country, except that part of Arizona and that part of New Mexico lying s. of the Gila and w. of the old boundary of New Mexico, which lands were ceded by Mexico Dec. 30, 1853, and are known as the Gadsden purchase. By treaty of March 30, 1867, exchange of ratification and transfer of title having been made June 20, 1867, Russia ceded Alaska. This cession made the line between the continent of Asia and America the n.w. boundary of the territory of the United States, and extending the territory of the United States northward to the Arctic ocean. On the e. this cession was bounded by a line beginning at the s. point of Prince of Wales island (parallel $54^{\circ} 40'$) and running n. along Portland channel to the junction of the 56th parallel of n. latitude with the continent, and thence along the summit of the mountains parallel to the coast, to and along the 141st meridian to the Arctic ocean.

But where the crest of the mountains skirting the coast from the specified parallel to the meridian is more than ten marine leagues from the ocean, there the boundary is a line not more than ten marine leagues from the coast and parallel to its windings. This cession is separated from the main territory of the United States by the w. part of the British possessions between the parallels of $54^{\circ} 40'$ and 49° n. latitude. At the close of the revolutionary war the territory really occupied by the old 13 states covered scarcely a quarter of a million sq.m.; according to the most trustworthy measurements and estimates in 1890 the land surface was 3,603,884 sq.m., and the water areas included made an area in round numbers of 4,000,000 sq.m., or 2,560,000,000 of acres.

UNITED STATES MILITARY ACADEMY, West Point, N. Y., founded by act of Congress approved Mar. 16, 1802. The experience of the country in the war of the revolution convinced Washington and other statesmen of the need of such an institution, and the act above referred to was the result of much thought and discussion. The special object of the academy is to fit young men for appointment as officers of the army. It combines in one school all the purposes usually aimed at in the several schools of engineering and other military branches in foreign countries. Its graduates, upon receiving diplomas, are recommended for, and usually appointed into, the corps or arm of service in the army for which their qualifications fit them. It has no endowment, but is maintained by annual appropriations. It is beautifully located in the highlands upon the w. side of the Hudson river, at a point which, during the war of the revolution, was deemed of great military strength and strategic importance. Its buildings, valued at \$2,500,000, stand upon a plateau of 160 acres, flanked by mountains at the w. and n., and elevated 180 ft. above the river. The chemical and ordnance laboratories, and the apparatus pertaining to the department of natural and experimental philosophy, are complete. The library contains 39,000 vols. and over 6000 pamphlets. One cadet is allowed by law to be appointed from each congressional district; also one from the district of Columbia, and one from each territory; and ten "at large" are appointed by the president of the United States. The appointments (excepting those *at large*) are made by the secretary of war at the request of the representative, or delegate, in congress from the district or territory; and the person appointed must be an actual resident of the district or territory from which the appointment is made. Candidates must be between 17 and 22 years of age, and must be at least 5 ft. in height, and free from any infectious or immoral disorder, and, generally, from any deformity, disease, or infirmity which may render them unfit for military service. They must be well versed in reading, in writing, including orthography, and in arithmetic, and have a knowledge of the elements of English grammar, of descriptive geography, particularly of our own country, and of the history of the United States. The course of study occupies four years, and the teaching is very thorough. Examinations are held semi-annually, and no cadet is graduated without having passed a satisfactory examination in all the branches taught. The institution, during the first ten or fifteen years of its existence, was of a tentative character; but in 1817 its organization began to improve under the superintendence of Maj. Sylvanus Thayer, who administered its affairs for 16 years with great success. In many of its best features the institution is to-day what it became under his management. The mode of selecting the cadets, while it serves to awaken and diffuse an interest in the institution in every part of the country, is not perhaps so well adapted to secure the highest order of ability. There is a constant tendency, difficult to be resisted, to make appointments on political or local grounds; and it is doubtless owing to this that so large a proportion of the cadets fail to reach the high standard of scholarship requisite for graduation. The monthly pay of cadets at first was \$28 per month; it is now \$45. On this sum they are required to support themselves without aid from other sources. A board of visitors, consisting of seven persons appointed by the President of the United States, two senators appointed by the president of the Senate, and three representatives appointed by the speaker of the house, attends the annual examinations and makes an annual report on the condition of the academy. The number of the staff (1897) was 66; other instructors are assigned by the war department from time to time as they are needed. The average number of students since 1876 has been about 270. Each cadet is required to pledge himself to serve the United States eight years from the date of his admission unless sooner discharged. Col. O. H. Ernest was (1897) the Superintendent.

UNITED STATES NAVAL ACADEMY, founded in 1845, and opened at Annapolis, Md., on Oct. 10, in that year. The idea originated with George Bancroft, who was Secretary of the Navy in the cabinet of Pres. Polk; and the institution was at first called the Naval School, under the direction of Commander Franklin Buchanan. It occupied Fort Severn, with its grounds and buildings, which had been transferred for the purpose from the war to the navy department; and though the barracks and other minor buildings have since been removed, the old fort and officers' quarters, with about 160 acres of land, are still appropriated to the uses of the academy. The institution bears the same relation to the U. S. navy, that the Military Academy at West Point does to the army. Its pupils are chosen under special provisions of the law, and educated expressly for the naval service. It resembles in its purpose and methods the Royal Naval College at Greenwich, Eng.; the *École Navale* at Brest, France; and the Marine Academy and School at

Kiel, in Germany. After numerous changes in the nature and length of the studies at the academy, a course of four years was adopted in 1850, to be followed by sea service as a midshipman; the length of the latter term being fixed at two years in 1873. From May, 1861, to Sept., 1865, during the war of the secession, the academy was temporarily placed at Newport, R. I. The naval academy is under the general patronage and control of the U. S. government, and is governed by special acts of Congress, and by regulations established by the secretary of the navy. Candidates for cadet-midshipmen are appointed by this official, from the congressional districts, on nomination by members of the house of representatives, and there is one from the District of Columbia. Ten candidates at large are appointed by the President. The examinations for admission are held at Annapolis in May and September. The applicant must pass examinations in the ordinary branches of education and must be free from defects of a physical nature. The academy is sustained by an annual appropriation by Congress, which usually amounts to about \$184,000; this is exclusive of the pay of naval officers acting under appointment as instructors, etc., which amounts to \$140,000 per annum; while the pay of cadets averages \$200,000; the whole being included in the general congressional appropriation. The buildings include cadets' quarters; physical and chemical laboratories; a steam-engineering department, observatory, gunnery-hall, seamanship hall, recitation hall, chapel, library, armory, gymnasium, store, and hospital. Attached to the academy for purposes of drill and practical exercise, are the *Monongahela*, a wooden sailing-vessel, and the *Bancroft*, a steel barkentine-rigged vessel with triple expansion engines and twin screws. On the latter vessel are torpedo and other guns of the latest pattern. The collection of working models of vessels of war, etc., is remarkably complete; and there is an ample supply of all needed apparatus and appliances for professional and general scientific instruction, including a thoroughly appointed astronomical observatory. The officers of the academy are the superintendent, commandant of cadets, and instructors and assistants in seamanship, ordnance, fencing, navigation, steam engineering, mechanics, physics, mathematics, English, languages, drawing, and physical training. The superintendent, commandant of cadets, and ten heads of departments form the academic board. There are also surgeons, paymasters, a chaplain, secretary, librarian, and marine officers, attached to the station. The number of students in 1896 was 255, including cadet engineers. The average annual number of graduates is 41, but in 1883 the number rose to 54. Graduates from the naval academy receive appointments as midshipmen or assistant engineers in the U. S. navy. The present (1897) superintendent of the academy is Capt. Philip H. Cooper.

UNITED STATES NAVY. See UNITED STATES.

UNITED STATES OF COLOMBIA. See COLOMBIA, THE REPUBLIC OF.

UNITY, a township in Allegheny co., Pa.; on the Allegheny Valley railroad; 14 miles e. of Pittsburg. It contains West Latrobe village and a part of Pleasant Unity village. Pop. '90, 5494.

UNIVALVES, in conchology, are those shells which consist of only one piece. They are mostly the shells of gasteropodous mollusks, but some cephalopodous mollusks also have univalve shells, as the argonaut and nautilus, and even animals belonging to other divisions of the animal kingdom, particularly a few annelids, as *serpula*; and the *foraminifera*. In systems of conchology, when the shell alone was regarded, the usual division of univalves was into *unilocular* and *multilocular*, the latter being the shells divided into chambers, as in the nautilus. The whole arrangement, however, was unnatural, bringing together in one group creatures widely different, and separating groups which in reality are very closely allied; for the mere presence or absence of a shell is often comparatively an unimportant circumstance, as in the case of snails and slugs. Yet by the mere shell, recent or fossil, the naturalist knows the group and order to which its occupant belonged, and can pronounce with confidence as to some of the habits of the animal. There are marked peculiarities in the univalves of different geological periods, well known and of great interest to geologists. See GASTEROPODA and MOLLUSCA.

UNIVERSALISTS, a body of Christians whose distinctive peculiarity consists in their belief that "evil" will ultimately be eradicated from the world, and that all erring creatures will be brought back to God through the irresistible efficacy of Christ's divine love. The grounds on which their faith in the final salvation of all men rests are derived more, perhaps, from reason than from Scripture; and when they *do* appeal to the latter, it is rather to the spirit and design of the Gospel than to particular passages. They argue, that when an infinitely wise, holy, and benevolent God resolved to create man, it could only be with a view to his everlasting good; that if he did allow him to be tempted and fall, it must have been because he foresaw that through sorrow and suffering man could rise to higher degrees of perfection; that therefore all punishment (or what, with our limited knowledge, we conceive to be such) is of necessity designed as a remedial agent, and not intended to satisfy God's indignation as a sovereign at the disobedience of his subjects; that no other view of the subject is compatible with the Scriptural, and especially the New Testament representation of God as a "Father," or with the oft-repeated declaration (in various terms) that Jesus Christ was a propitiation for the sins of the whole world. In answer to those who adduce against them the express language of

Scripture; e.g., "And these shall go away into everlasting punishment; but the righteous into life eternal" (Matthew, xxv. 46), they reply, that the word *aiónios*, translated "everlasting," does not necessarily bear that signification; that properly it does not express the idea of duration at all, either finite or infinite, but was rather used by the sacred writers to denote a mode of existence distinct from and wholly dissimilar to any mere *chronic* state; in proof of which they point to such passages as—"This is life eternal, that they might know thee, the only true God, and Jesus Christ, whom thou hast sent" (John, xvii. 3), where eternal life is affirmed to be *knowledge*—that is, a present state of mind, and not a perpetual hereafter of duration.

Universalists, it may be observed, generally differ from the prevalent bodies of Christians in other important doctrines, though it is not because of such differences that they have received their name, nor is it necessary to merit the name that one should share these differences. Most of them agree with Unitarians—but there are eminent examples to the contrary—in rejecting the doctrine of the trinity; they are also Pelagian in the matter of original sin, and reject the notion that the new birth is something supernatural.

Universalism, as a mode of belief, is of very ancient origin, and its modern adherents, besides urging its congruity with the divine plan of redemption, as revealed in Scripture, point to the earliest Christian writings; e.g., the *Sibylline oracles* (150 A.D.—see *SIBYL*)—expressly composed to convert pagans to Christianity—as evidence that the doctrine was recognized from the first. Passages in favor of the doctrine are cited from many of the church fathers—Clemens Alexandrinus; Origen; Marcellus, bishop of Ancyra; Titus, bishop of Bostra; Gregory, bishop of Nyssa; Didymus the Blind, president of the Catechetical School of Alexandria; Diodorus, bishop of Tarsus; Theodore, bishop of Mopsuestia; and Fabius Marius Victorinus. It is said to have been held by some of the Albigenses and Waldenses, the Lollards and the Anabaptists, and it probably had isolated supporters in most of the countries into which the reformation penetrated. Nor has it wanted illustrious adherents belonging to the church of England and the Non-conformists, among whom it is customary to rank archbishop Tillotson, Dr. Burnet, bishop Newton, Dr. Henry More, William Whiston, Jeremy White (chaplain to Oliver Cromwell), Soame Jenyns, David Hartley, William Law, and (in our own day) Thomas de Quincy and professor Maurice. The same remark is applicable to the French Protestant and German churches, and indeed it may safely be asserted that the *non-clerical* mind in all ages is disposed to look favorably upon the doctrine of the universal restoration to holiness and happiness of all fallen intelligences, whether human or angelic. But the existence of Universalism as a distinct religious sect is a feature of American rather than of English religious society. Universalists claim that their doctrine was preached in America by Dr. George de Benneville in 1741; that the Rev. Richard Clarke, an Episcopal clergyman of Charleston, S. C., maintained it for many years; and that Dr. Mayhew, a Congregational pastor in Boston, advocated it in 1762. The first Universalist church in the United States was organized by the Rev. John Murray, Gloucester, Mass., 1780. The first convention of Universalist ministers and parishes was held in 1785, and was followed by the general convention, whose present organization was formed in 1870. It secures a uniform system of fellowship, and is the ultimate tribunal. The state conventions have jurisdiction over clergymen and parishes within their respective limits, subject to the right of appeal. The Winchester confession, adopted in 1803, is as follows: "I. We believe that the holy Scriptures of the Old and New Testament contain a revelation of the character of God, and of the duty, interest, and final destination of mankind. II. We believe that there is one God, whose nature is love, revealed in one Lord Jesus Christ, by one Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness. III. We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practice good works; for these things are good and profitable unto men." "Accepting this confession, the Universalist church claims to be thoroughly Christian in belief, holding inflexibly to the authority of the Bible, the divine mission and office of Christ, the absolute necessity of a holy life, the certainty of a just retribution for sin, and the assurance of the final triumph of good over evil, and holiness over sin, in all worlds, and all souls." The general convention holds funds, including the Murray Centenary Fund (amounting in 1889 to \$193,559), the interest of which is appropriated for the education of candidates for the ministry, for the support of missions, and for the distribution of denominational literature.

The statistical tables of the *Universal Register* for 1896 gave the following statistics: parishes, 1006; families, 45,405; members, 40,441; 59,370 Sunday-school scholars; value of church property, \$9,260,321. In 1891 the churches numbered 732 and the ministers 685. There are four colleges, including Tufts college at Medford, Mass., with an endowment of \$1,000,000; St. Lawrence university, Canton, N. Y.; and Buchtel college, Akron, O.; three theological schools and five academies, one of which, Dean academy, Franklin, Mass., has resources amounting to \$350,000. The theological and literary institutions have property valued at more than \$2,500,000. Six periodicals, the oldest of which is the *Christian Leader*, are published by the denomination. In 1886 a board of foreign missions was established, and in 1889 it was voted to hold the meetings of the general

convention biennially, and in the intervening year to hold a church conference, to discuss religion, morals, and education.

Hosea Ballou*, by Whittemore and by Maturin M. Ballou.

UNIVERSAL LANGUAGE has been a subject of interest and attempt for more than 200 years. In 1650 a reward of 300 crowns was offered by one of the German princes for such a language. This was followed by the publication of a work of this character by the German linguist, Becker, in 1661, but with little result. In the same year a work appeared by George Habgarno, of Aberdeen; but the most noteworthy of these efforts was that of John Wilkins (q.v.), Bishop of Chester, in his "Essay Toward a Philosophical Language," published in 1668. Dr. Wilkins's language was entirely regular; but it was based on anthesis, and as all words do not suggest a well-defined anthesis, this principle involved a complexity and detail that amounted to an enormous folio volume, thereby rendering the language in the highest degree impracticable. Other attempts equally unsuccessful were made by Leibnitz, Faignet, Letellier, and the Englishman, Babbage. Others who have despaired of inventing a *spoken* language that should ever come into actual use, have attempted to arrange a universal written tongue, by means of which natives of different countries might be able to communicate by paper, even though they knew no word of each others' language. These attempts were based on the hieroglyphic system of expressing ideas by signs. Another system gave a verbal meaning to numbers; but all of these have failed by reason of their complex character. The most recent invention, and one which from its simplicity and uniformity promises to assume practical importance is the *Volapük* (q.v.), published in 1879 by Father Schleyer.

UNIVERSITY (Latin, *universitas*) is a term which, as originally used, denoted any corporate body, community, or association, regarded as a whole. The term, in its modern sense, began to be common in the fourteenth and fifteenth centuries to characterize a corporate body devoted to study, learning, and teaching, with the sanction of the church and state. The mediæval terms most usually found employed to describe a university are *universitas magistrorum et scholarium*, *studium generale*, *studii universitas*, and *universitatis collegium*.

UNIVERSITIES IN ANCIENT TIMES. It may seem odd to one unfamiliar with the subject to speak of the university in ancient times; but there was in reality at Athens, at the time of the Roman Empire, a university not only in all the essentials of a great centre of learning, but one that closely corresponded even to what we now mean by that word. Athens had always been what Pericles called "the school of Greece;" and in the early centuries of the Christian era it contained an organized faculty of accomplished professors who lectured to a body of students drawn from all portions of the civilized world. The university at Athens was the result of two previously existing institutions—the organization of the *Ephebi*, and the schools of the philosophers and sophists. The Ephebi, or free Athenian youths, were in early times enrolled into a body that was primarily intended for the defense of the State. They were educated both physically and mentally, and they formed the nucleus of what after became the student body of the university. Two changes in the constitution of this body prepared the way for its transformation from a quasi-military organization to a university. These changes were:

(1) The neglect of the principle of compulsion. Not all were enrolled, but only those who chose.

(2) Membership was no longer confined to Athenians or even Greeks.

These changes left a body of young men, organized and regularly enrolled, free to follow such a course of training as best suited their inclinations and capacities, and ready to be turned to any line of study that had the advocacy of brilliant, energetic, and popular men. The schools of the philosophers supplied the influence necessary for completing the change from a military college to a great university.

Four schools of philosophy had since the time of the Macedonian wars been flourishing at Athens. These were the Academic or Platonic School, the Peripatetic or Aristotelian School, the Stoic School and the Epicurean. Each of these schools from the time of its foundation had received an endowment sufficient to maintain and perpetuate it. Plato (q.v.) had purchased a small garden near the Eleusinian Way, in the grove of Academe, for 3000 drachmas. His philosophic successors, Xenocrates and Polemon, continued to teach in the same spot; their wealthy pupils and the friends of learning added to the grounds and bequeathed sufficient funds for the support of the philosopher, and thus practically endowed an academic chair. In like manner, Aristotle (q.v.) left to his successor, Theophrastus, the valuable property near the Ilissus; and Theophrastus in the will whose text has come down to us in Diogenes Laertius (V. 2.14) completed the permanent endowment of the Peripatetic chair. So Epicurus left his property in the Keramicus to be the nucleus of an endowment for his school (Diog. Laert., xx. 10), and the Stoics were probably in like manner made independent. Around these four schools of philosophy which, being endowed, taught gratuitously, a multitude

of teachers of rhetoric, grammar, literature, logic, physics, and mathematics clustered. The world soon learned to think of Athens as a great seat of learning and culture, brilliant and renowned. Students flocked to her from every quarter of the world. It appears to have been necessary to become enrolled among the *Éphebi*, but the scholars selected for themselves their own instructors, and attended such lectures as they chose. The number of these students became enormous. Theophrastus alone lectured to as many as 2000 men. The records show the names of many foreign students, some of them being of the Semitic race. The most noted writers of Rome had studied at this university, of whom Cicero, Ovid and Horace are perhaps the most brilliant names. The customs of the university may be gathered from a perusal of the works of Aulus Gellius, Libanius (A.D. 314), and Philostratus, author of the *Lives of the Sophists* (250 A.D.). From these sources we learn that matriculation took place early in the year; that the students wore a black gown like that of the undergraduates at the English universities; that they pursued athletic sports with much ardor; that at the theatre a special gallery was reserved for them; that certificates of attendance at the courses of lectures were required; that they were under the general direction of a President (*Cosmētēs*); that fees were exacted in the shape of an annual contribution to the University Library; that breaches of discipline were punished, as at Oxford, by fines; that the relation between student and Professor was very close, so that for a student to cease to take a course was very cutting; and that the students themselves "touted" for the Professors. "Most of the young enthusiasts for learning," says Gregory Nazianzen, "become mere partisans of their Professors. They are all anxiety to get their audiences larger and their fees increased. This they carry to portentous lengths. They post themselves over the city at the beginning of the year; as each new comer disembarks he falls into their hands; they carry him off at once to the house of some countryman or friend who is best at trumpeting the praises of his own Professor." (See Libanius, 1.13.)

Private tutors (*phylakes*) were often employed. They looked over the students' notes, "coached" them on the subjects in which they were most interested, and helped them at the exercises. At the end of the year there seems to have been an examination.

Freshmen seem to have been subject to a sort of hazing. Gregory, in a funeral address over his friend Basil, recalls some of the memories of their sport with freshmen. We find one of the Professors, Proëresius, asking his class not to haze a new student, Eunapius, because of his feeble health. Sometimes the inferior officers of the university were subject to similar annoyances, and Libanius tells of one of the tutors who was tossed in a blanket.

Many of the coincidences between ancient and modern university life are interesting. The following is a quotation from this same Libanius, who gives an account of how his classes conducted themselves:

"I send my Proctor to summon the students to my lecture, but they are in no mood to hurry, though they ought to be. They stay outside to sing songs which we have all heard till we are tired, or else amuse themselves with foolish merriment and jesting. This they do until the lecture has actually begun. Then they come in and keep whispering to one another, to the annoyance of the real students, about the races, or actresses, or opera dancers; or about some contest either past or future." And he adds very naively: "I had a very different class of students once. Perhaps some one may say that the fault is mine, and that my lectures are not as good as they used to be; but some of my best students now do not think so; they declare solemnly that I now quite surpass myself; and that while my lectures were always admirable, there is more in them now than there ever was before." (I. 199.)

Schools of philosophy and letters similar to those at Athens sprang up at other great cities in the later Roman empire—at Constantinople, at Alexandria, at Rhodes, and at Apollonia. See Capes, *University Life at Ancient Athens*; Mahaffy, *Greek Education* (1882); id. *The Greek World Under Roman sway* (1890); Painter, *History of Education* (1886).

MEDIEVAL UNIVERSITIES.—The university, in a modern sense, is usually considered to have originated in the 12th or 13th century, and to have grown out of the schools which, prior to that period, were attached to most of the cathedrals and monasteries, providing the means of education both to churchmen and laymen, and bringing together the few learned and scientific men who were to be found in Europe. Such an institute of the higher learning was at first called *studium* or *studium generale*. When a teacher of eminence appeared, such as Abélard or Peter Lombard at Paris, or Irnerius at Bologna, a concourse of admiring students flocked around him; and the members of the *studium generale* formed themselves, for mutual support, into a corporation on which the general name of *universitas* came to be bestowed. In this way the oldest universities arose spontaneously. The crowds drawn from every country of Europe to Paris, Bologna, and other educational resorts, had first local immunities bestowed on them for the encouragement of learning, and to prevent removal elsewhere; and the academical societies thus formed were, by papal bulls and royal charters, constituted an integral part of the church and state. One great difference existed between the constitution of the two most important universities of early times. In Paris, the teachers alone constituted the corporation; in Bologna, the university consisted of the students or scholars,

who at first held the supreme power, and appointed the academic officials. In this respect, Bologna became the model of the subsequent universities of Italy and the provincial universities of France, which were corporations of students; while the universities of Great Britain, Germany, Holland, and Scandinavia were, like that of Paris, corporations of teachers. The Spanish universities occupied an intermediate position. Along with a general resemblance, there was much difference in the constitution and character of the pre-reformation universities, the form of each being the result of a combination of various circumstances and ideas acting on an originally spontaneous convocation of teachers and scholars.

The several faculties of a university were subordinate corporations, consisting of the aggregate of students or teachers in a particular department of knowledge. The number of faculties has varied much in different universities. The University of Paris had at first only a Faculty of Arts, which, as early as 1169, existed as a separate body, with an organization of its own. Faculties of Theology, Medicine, and Canon Law were added in the 13th century. Bologna was at first exclusively, as it continued to be pre-eminently, a school of law. Oxford and Cambridge, in their origin, existed only in the Faculty of Arts. Some of the smaller French universities, as Orléans and Montpellier, were prohibited from teaching theology, lest they should become rivals to Paris.

The granting of degrees was the mode in which the university reproduced itself. A degree was the recognition of the fact that a student had made a certain advance in his career, the degree of doctor or master, in its original idea, entitling the person on whom it was conferred to teach within the limits of the university. Toward the end of the 13th century, Pope Nicholas I. granted to the University of Paris the right of endowing its graduates with the power of teaching everywhere; and this universal degree, making the recipient of it a member of the community of the learned throughout Christendom, became a link of connection between the universities of Europe. The designation of Bachelor, borrowed from the term indicating the probationary stage of knighthood, and implying the lowest stage of university honor, or the condition of an imperfect graduate, was first introduced in the 13th century in the University of Paris, where the bachelor, though intrusted with certain tutorial functions, possessed no legislative power. The right of teaching (*regendi*) belonged to the master, doctor, or other perfect graduate; and a period of necessary regency was generally fixed, during which the graduates were bound to teach, and after the expiration of which they were at liberty to become non-regents. It, in the course of time, became the practice to endow a select number of the graduates as public teachers; these privileged and salaried graduates were designated Professors, and instruction by Professors more or less supplanted the original plan of teaching by graduates.

The poverty of a proportion of the students, and the desirability of domestic superintendence, suggested the institution of Halls endowed with property and corporate privileges, called Colleges. Though originally a provision for poor scholars, they soon assumed the character of boarding-houses for all classes of students, where they were privately trained and prepared for the public lectures. Colleges seem to have been first introduced in Paris, where most of them became appropriated to a particular faculty, or department of a faculty. The College of the Sorbonne (q.v.), founded in 1250, came to be in a great measure identified with the Theological Faculty. Regent-masters were named by the faculties as lecturers in the colleges, attendance on whom was made equivalent to attendance on the public courses in the schools of the university; and eventually the college lectures were thrown open to all members of the university, and it became obligatory in the Faculty of Arts, and usual in the other faculties, to become a member of some college.

The highest university officers have generally been the Rector and the Chancellor, the former being the head of the university in everything except the granting of degrees, which are conferred by the latter as the fountain of honor. Besides the division into faculties, there was in most of the continental universities a division of the graduates and students into *nations*, in respect of the countries to which they belonged. In Paris, the Faculty of Arts was divided into four nations, known as French, Picard, Norman, and German or English; and after the 13th century, these four nations, under their respective procurators, and the three subsequently added faculties under their deans, constituted the seven component parts of the university. The Rector, with the Procurators and Deans, formed a court having cognizance of all matters relating to discipline, from which there was an appeal to the university, and from thence to the parliament of Paris. In Bologna, after faculties of philosophy, medicine, and theology had been added to those of civil and canon law, the students were classed as *ultramontani* and *citramontani*, and each class was divided into nations, presided over by their several Counselors or Procurators.

Details regarding the mediæval history of the universities of Europe will be found in the following sections of this article.

THE ENGLISH UNIVERSITIES. *Oxford.*—At the time when Oxford (q.v.) as a city, was losing its political and strategical importance, there was growing up within it a distinct, and destined often to be a hostile, corporation, which was to make it for centuries the intellectual capital of England. The word "university" implies now a corporate body of teachers and students, established for the pursuit of the higher branches

of learning, endowed with privileges and protected by charters granted by sovereign powers; and we find by the end of the 12th century and the beginning of the 13th, a corporation of this kind established in Oxford. But this corporation must have been only the official recognition of a guild of teachers with their pupils, which was already in existence in the city; and a guild of this kind must, in its turn, have been the development of accidental, and perhaps temporary, assemblages of teachers and students. The beginning of the University of Oxford, is therefore, to be carried as far back as the earlier third of the 12th century; Thibaut d'Estampes (Theobaldus Stampensis), about 1120, and Robert Pullein in 1133, being recorded as having taught in Oxford. The university, thus begun under Henry I. (who in 1130 built as a royal residence Beaumont Palace in the north suburb of Oxford, in which palace Richard Cœur de Lion was born in 1157), rapidly grew in numbers and in prestige; and by the beginning of the 13th century we find popes and kings interested in its fortunes, its scholars were numbered by thousands and not by hundreds, and the feuds between it and the town became often events of almost national importance. Teachers and scholars in this early university were of the secular clergy; they lived and taught in houses (Halls) and lecture-rooms (Schools) hired from the townsmen, and discipline was practically non-existent. The fame of the university attracted to Oxford the four great orders of mendicant friars immediately after their arrival in England—the Dominican (Black) Friars, coming in 1221, the Franciscan (Grey) Friars, in 1224, the Carmelite (White) Friars, in 1253, and the Austrian Friars, in 1268. The friars, unlike the older orders of monks who had stood aloof from secular learning, threw themselves with enthusiasm into the studies of the university; and the "schools" in their convents and their lecturers, soon eclipsed the fame of the secular schools and teachers. That Oxford can boast the greatest names in mediæval learning and legend, Roger Bacon and Friar Bungay, is due to these conventual schools. So threatening did the supremacy of the friars become, that the university in the early 14th century had a hard fight with them to retain the control of its own education.

The intellectual triumphs of the friars kindled the spark of emulation in the older monastic orders, and they in turn began to found conventual schools at Oxford for students of their own body. The Benedictines had four colleges in Oxford: Gloucester College, founded in 1283, part of whose buildings are now in Worcester College; Durham College, perhaps begun in 1290, partly now in Trinity College; Canterbury College, founded in 1363, now taken into the site of Christ Church, and St. Mary's College, founded in 1435, now a dwelling-house belonging to Brasenose. For the Cistercians, St. Bernard's College was founded in 1437, and parts of this building are still found in St. John's College.

The introduction into the university of the conventual system, with the severity of its discipline, the penetrating stimulus of its common life, and the efficiency of its personal tuition, suggested a change in the university of secular students, which was to effect in time an entire revolution in its form. In 1264, Walter de Merton conceived the plan of bringing together into a common home a number of secular students, engaged in academic studies, but subject to something like conventual discipline. In 1274 he moved his college which he had established at Malden in Surrey to Oxford. Two other institutions, which had been founded in Oxford at a slightly earlier date, soon, under the influence of the new idea, took the shape of Balliol and University Colleges. By 1525 ten other colleges had been instituted, among them such great designs as New College, Magdalen College, and Wolsey's Cardinal College, afterwards reconstructed by Henry VIII. as Christ Church, with a fraction of its former endowment. The Reformation, and the dissolution of the monasteries which it carried with it, destroyed half the glory of Oxford. Two abbeys, five friaries, and five monastic colleges ceased to exist; and the western and south-western quarters, which had contained the finest buildings of the city, became heaps of stones out of which the citizens of Oxford quarried building material. During the Romanist reaction under Queen Mary, something was done to repair the loss thus inflicted: Trinity College in 1554, and St. John's in 1555, restoring to Oxford Durham College and St. Bernard's College. Jesus College, founded nearly twenty years later, in Elizabeth's reign, was the first of the Protestant colleges. The more settled times of the early Stuarts patronized the gown more liberally; Wadham College coming in 1613, Pembroke in 1624. Then came the great catastrophe of the civil war, when learning and the encouragement of learning ceased. The years passed to 1714 before a new foundation arose in Oxford, in Sir Thomas Cooke's Worcester College; and, except for the abortive attempt (1740-1818) to erect Hart Hall into a college, that example found no imitator till our own times, when the foundations of Keble College in 1870 and of Hertford College in 1874, followed by the transference to Oxford of Mansfield College and of Manchester New College (though these two colleges are not incorporated in the university), bear witness to the new life which has begun to throb alike in the Anglican Church and in Nonconformity.

In Elizabeth's reign, and still more under the Stuarts, we have to mark a very strong desire on the part of the supreme power to compel all students in the university to reside within the walls of the colleges and the halls (then five in number, now reduced to two). The strong opposition of minorities, in matters both of polity and faith, rendered English sovereigns and their ministers suspicious and intolerant of students and teachers who were not directly under their control; and to secure this control they

required that all students should reside in the colleges where they were under the charge of governors appointed by court influence and responsible to the court. From this time, therefore, we have to date the disappearance of the old university and the development of that peculiarly English form, a university of colleges.

In the following six features the two great English universities stand in marked contrast to the universities out of England: (1) *The College System*. Before a person becomes a member of the university he must first of all become a member of one of the twenty-one colleges or two halls; and the moment he ceases to be a member of one of these societies, his actual membership of the university is also terminated. This means that the undergraduate is not left as a unit in a great body of two or three thousand, but is made a member of a much smaller body of perhaps eighty to two hundred members, and is therefore subject to closer personal scrutiny and to stronger influences of social opinion than would be possible in universities differently constructed. It is true that the influence of this common life is partially discounted in the case of students from the public schools, where similar influences have already formed their character; but in the case of students from small schools or solitary homes, the vigorous social life of a good college is wonderfully efficacious in converting the raw, diffident, or morose boy into the frank, self-reliant, and sociable man. (2) *The Fellowship System*. Formerly every first-class man (and many in the second class) could count with certainty on his fellowship, that is, on a secure endowment (for a shorter or longer period) which would enable him to pursue his studies, or to prepare himself for professional life. Some few of these fellowships are still open to competition; but the regulations of the Commission of 1877, which suppressed many fellowships to found professorships, coinciding with the loss of more than a third of the annual revenues of the colleges from the fall in agricultural rents, have seriously reduced their number, and so far, deprived Oxford of her best feature. (3) *The System of Tuition*. In American and Continental universities the work of tuition is undertaken by university teachers, i.e., by the professors. In Oxford and Cambridge the professoriate has withdrawn itself from any real share in this work, and, so far as concerns the mass of students, might be entirely suppressed without in any way affecting their studies. In all ordinary subjects, speaking generally, the professors have long ceased to give systematic instruction, and have at most expounded some small, and to the ordinary student often unnecessary, point in their subject. It is plain that from two lectures a week, delivered through at most three terms of seven weeks each, a student can learn little in language, in history, in philosophy, or in science. The work of tuition, which in other universities is discharged by the professors, is in Oxford and Cambridge discharged by the college lecturers. Formerly a college lecturer lectured only to the men of his own college; a system which was terribly unfair to the students of an inefficient college. Of late years, the better college lectures have become practically open to the whole university, and, especially in lectures connected with the honor schools, frequently without fee. The college lecturers of Oxford are therefore the professors of Oxford, except that they are not called by that name, and that they are paid by their college, not by the university. At the same time, the old Oxford tradition of a college tutor devoting himself to the interests of the men of his own college still continues. Apart from attendance at lectures, a large portion of the Oxford tuition consists in taking compositions, translations, papers, and essays, either individually or in very small classes, to one's tutor or lecturer. This individual instruction involves, it is true, an expenditure of time and talent which seems out of all proportion to the results it achieves, yet the happiest memories of Oxford men are probably those half-hours or hours in their tutor's rooms, when their individual faults were exposed by the large scholarship, and their individual eccentricities corrected by the unsparing but good-natured chaff of a kindly mentor. One result of the remarkable improvement in college tuition of the last few years has been the almost total disappearance of the "private coach" from the honor-work of the university. Private coaching continues to a great extent in the pass schools, partly because some candidates have been very badly taught at school and are below the level of their fellows, but chiefly because candidates are too idle to read by themselves. Quite a recent development of the professoriate deserves notice here. When the university has resident in it a man of special reputation in a given branch of study, the common university fund has of late years appointed him to lecture for three or five years in his own subject. In some cases undergraduate-Oxford has not seconded this by attendance at these lectures, but the approval of maturer scholars has followed this public recognition of learning. Such lecturers are known by the new title of Readers. (4) *Discipline*. The discipline of the English universities is much stricter than that of any university outside of England. Within college the government of the college deans, and without college the vigilance of the proctors and their deputies, repress disorder and immorality. (5) At the same time, Oxford and Cambridge, but especially Oxford, must be noted for the excessive luxury and idleness of the students. The common life of the colleges has this disadvantage, that it requires considerable force of character for a poor student to live in proportion to his poverty, there being every inducement for a man of weak character to live after the fashion of his richer and more careless contemporaries. Hence, the son of a man of £400 a year often spends during his course at the rate of the son of £4000 a year, and begins his after-life under a heavy burden of debt. And, lastly,

amusements of different kinds—football, rowing, cricket, tennis, billiards, card-playing, debating, the theatre, to say nothing of the baser kinds, such as betting, wine, worrying rats and rabbits, are thought of, talked of, and pursued by many undergraduates, till barely an hour a day in the eight weeks of term is left for any serious or intellectual pursuit. For this devotion to amusements the public schools are largely responsible. (6) The course is entirely out of touch with the professional education of the country. The Oxford undergraduate, for instance, entering the university at nineteen or twenty, finds himself at twenty-three or twenty-four, after the expenditure of £800 or £1000, and the formation of idle habits and expensive tastes, with his whole life to begin afresh. If he wishes to enter the church, he has generally to spend some years in a theological college; if he desires to go to the bar, he must proceed to the Inns of Court; if he intends to practice medicine, the long and expensive training of the London hospital schools has to be gone through.

Scholars and exhibitioners are admitted to a college without a special entrance examination; intending commoners are examined in some form or another by the college tutors. In some colleges it is enough to have passed Responsions, or equivalent examination; in others a further test is imposed, and some few colleges accept candidates in the hope that they will in the course of a term or two pass Responsions. But the practice of colleges varies so much from year to year that personal inquiry about the exact nature of the entrance examination is always advisable and generally necessary.

At Oxford, after admission, there opens up a perplexing variety of courses which lead to the degree; but the general rule will be found to hold good: "avoid any new-fangled course introduced by council, and proceed along the old beaten paths." Under present arrangements the degree is reached by three examinations: (1) Responsions, familiarly termed "smalls." This is a preliminary examination in the elements of Latin, Greek, and mathematics. It can be passed before coming into residence by means of various school examinations, or presenting one's self as a candidate for matriculation from a college. It ought always to be passed before matriculation, except in those cases where the instruction available is so bad that a pass is hopeless under it. (2) After Responsions the candidate has before him the examination which the statutes call the "First Public Examination," but which men call Moderations ("Mods"), or an equivalent examination. Here it is necessary to decide whether a candidate shall (a) take an *Honors examination* in the middle of his course, (b) take a *Pass examination* at that point, or (c) take an examination which implies taking an Honors examination at the end of the course. The decision must be made according to the candidate's attainments, guided by the shrewd advice of his college tutor. In the first case (a) there are honors to be had in classics and mathematics (or in both, if the candidate read double) in the course of the second year; in the second case (b) a further examination in classics, with the addition of the elements of logic or some further mathematics has to be passed, and this ought to be done in the fourth term of residence; in the third case (c) there is what is called a preliminary examination in law or in science giving admission to the final honor schools. All candidates, whether pass or honors, have at this stage to pass an examination in a small portion of Scripture, or an alternative examination provided for those who object to this examination in religion. (3) In the final examinations, officially termed the "Second Public Examination," but colloquially "Greats," the distinction between pass and honors is very marked. For the pass degree a candidate has to obtain a pass in three schools, of which one must be a language school (Classics, French, or German), and the other two may be chosen from divinity, history (ancient or modern), political economy, law, or various branches of natural sciences. For the honors degree the candidate may choose one or more of the schools of classics (officially termed "*Litteræ Humaniores*," including not only the languages, but the history and philosophy of Greece and Rome), mathematics, natural science, law, modern history, theology, oriental languages. Of these the most coveted distinction is the first "*in Classical Greats*," traditionally the chief Oxford school, for which most scholars and exhibitioners are required to read, and by examination in the subjects of which most of the few open or "prize" fellowships are awarded.

The traditional "double first," i.e., a first-class in classics and mathematics, when there were no modifications and only these two final schools, such as was won by W. E. Gladstone in 1831 and by Dean Liddell in 1833, is now forgotten; and as many as three, four, or even five firsts are attained without bringing the successful candidate much reputation in the university, or even a fellowship.

Candidates entering for an Honor School, and failing to get honors, may be either "ploughed," i.e., rejected entirely, or "gulfed," i.e., allowed a stage in the pass degree. If a candidate in any school despairs of his chances, he can "scratch," i.e., remove his name from the list of candidates. In many of the schools, both pass and honors, there is a *viva voce* examination, as well as a written examination. In the final honor schools candidates who have broken down in health may obtain an "ægrotat" certificate allowing them to proceed to their degree.

Recent statistics regarding the university will be found in the article, OXFORD UNIVERSITY.

Cambridge.—Authentic records relating to the origin of a university at Cambridge are entirely wanting, and their place has been supplied by tradition. But, overlooking

the various legendary accounts of its origin, it is probable that the true history of the university begins in the 12th century. Certain writs of Henry III. of 1231, are the earliest record of an attempt to introduce discipline amongst the students attending the lectures. It was about this time that the students, who had previously lived each in his own lodging at his own charges, began to live together in hostels under the rule of a principal. These hostels were named after the saints to whom they were dedicated, and the churches which they adjoined, or the persons who built or formerly possessed them. In the year 1280 there were as many as 27, and some of them contained from 20 to 40 masters of arts, and a proportionate number of younger students; but all these hostels decayed by degrees, when endowed colleges began to appear. Some were absorbed by the colleges, and some ceased to exist. Trinity Hostel survived all the rest, and continued till 1540.

A college is at Cambridge an incorporated body of teachers and students enjoying the benefactions of a generous founder. Peterhouse, the oldest college in the university, was founded in 1286; and it was between the middle of the 13th and the close of the 16th century that, with one exception, all those royal and religious foundations were endowed which superseded the hostels and now constitute the university.

The colleges were to a large extent modeled on the pattern of the monasteries. In some instances the colleges were united with "religious houses" already existing, as in the case of Magdalen College, at Oxford and Emmanuel College, at Cambridge. Hence arose some of the peculiarities of the college-system, which survived till a very recent date. To this cause is to be traced the condition of celibacy, upon which, with few exceptions, the fellowships were formerly tenable. The final abolition of restrictions as to marriage and as to holy orders (except in the case of offices with clerical functions) took place in 1881, when new statutes were issued by the Cambridge commissioners under the Universities of Oxford and Cambridge Act, 1877. These statutes take the place of those confirmed by the queen in council in 1858.

The endowment of university professorships dates from the 16th century. In 1502, Lady Margaret, mother of Henry VII., founded the Lady Margaret professorship of divinity. Henry VIII., in 1540, founded the five regius professorships of divinity, civil law, physic, Hebrew, and Greek. The earliest mathematical professorship was that founded by Henry Lucas in 1663. The university has 35 professors, increased to 40 by the statutes of 1881, in addition to readers, demonstrators, and assistants.

During the last half century the university has been reformed to meet modern needs, both by external authority and upon its own motions. Religious tests have been abolished, the field of study has been widened, non-collegiate students (see below) have been admitted, and the examinations have been thrown open to women.

In order to understand the constitution and organization of the university, it is necessary to bear in mind the fundamental distinction between the university and the colleges, due to the historical conditions of their respective origins. The governing body of the university is the Senate, which is composed of persons of the standing of masters of arts. The matters of which the Senate has cognizance are the management of the property of the university, the courses of study and examinations to be pursued by those who seek a degree, and public discipline and morals. But all proposals submitted to the Senate must be approved by the Council—a body elected by the resident members of the Senate. After the Chancellor and High-steward, the chief executive power is vested in the Vice-chancellor, who is elected annually from among the heads of colleges, but in practice holds office for two years. The Public Orator is the voice of the Senate upon public occasions. The Proctors superintend the discipline and morals of all persons *in statu pupillari*; they are present at all congregations of the Senate, read the graces, and take the votes. The Registry is responsible for the graces being offered in due form, and has charge of the university records. There are three terms in this university—the Michaelmas or October term, the Lent term, and the Easter term. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows, without examination, about four years after. Dissenters are not now excluded from taking degrees, except in divinity. The university sends two members to parliament, who are elected by the Senate.

Each college is governed by its Master and Fellows, or by the Master and Council, a select committee of the Fellows. When questions arise as to the interpretation of the statutes, they are referred to the Visitor of the College. The college officers concerned with questions of discipline are the Dean and Tutor. The Tutor of the college is *in loco parentis* to his pupils; the Dean has the oversight of religion and morals.

With respect to the admission of students, their university course, expenses, and proceedings in degrees, the following information may be useful: There are five classes of students, viz.: *Fellow Commoners* and *Noblemen*, *Scholars*, *Pensioners*, *Sizars* and *Subsizars*, and *Non-collegiate Students*. The first class (now almost obsolete) are so called from their dining at the Fellows' table; they wear silk or embroidered gowns, and pay heavier fees. The Scholars are members of the foundation, and are elected, after examination, from the Pensioners and Sizars, or from students who have not yet begun residence. The Pensioners are the great body of students, are not in the foundation, and pay for their own commons—dinners in hall, etc., and for their rooms. The Sizars are poorer students, selected, however, by examination, who receive free com-

mons and certain money payments, are admitted at lower charges than the Pensioners, but wear the same dress, and are no longer subject to the performance of menial offices, as they once were. Some of the colleges, especially St. John's and Trinity, have very liberal endowments for the Sizar, and very considerable pecuniary assistance is given to the more deserving of them. Non-collegiate students are not members of any college, but are entitled to the privileges of members of the university, and are placed under the charge of the Censor of non-collegiate students. The system of non-collegiate students dates from 1869. The usual age of admission is from 17 to 20. Before a student can be admitted, he must at nearly all the larger colleges pass an elementary entrance examination. Where there is no entrance examination, the student is required to furnish satisfactory evidence that he is qualified for admission. It is also necessary to deposit a certain sum of money (£15 in the case of the Pensioners) with the tutor of the college as caution money. The Fellows are elected from the students who have distinguished themselves in the Tripos examinations, or in a special fellowship examination. Vacancies are, as a rule, filled up from members of the college, but fellowships are sometimes open to the competition of the whole university. Fellowships vary greatly as to value and conditions of tenure at the different colleges. The stipend, which can seldom exceed £250 per annum, has in many instances been seriously reduced through agricultural depression. Under the statutes of 1881, restrictions as to marriage and holy orders are done away with, and the length of tenure is limited to six years. The last regulation does not apply to Fellows holding a university or college office.

About half of the total number of undergraduates have rooms in college; the remainder reside in lodgings, but under the same rule as to discipline. Residence is usually commenced in the October term. The undergraduate in his first year of residence is called a "Freshman," in his second year, a "Junior Soph.," in his third year, a "Senior Soph." The Ordinary B.A., or Bachelor of Arts degree, may be taken in the ninth term of residence—viz., in the third June after coming up. The examinations required are: (1) The Previous Examination or "Little-go" (usually taken in the first or third term of residence), the subjects for which are a Gospel in Greek, a Greek classic, a Latin classic, Greek and Latin Grammar, unprepared passages of Latin to be translated; Paley's *Evidences of Christianity*; Euclid, Books I., II., III., and parts of V. and VI.; Arithmetic and Elementary Algebra. Those who wish may substitute a Greek classic and logic for the Greek Gospel and Paley. (2) The General Examination in more advanced Classics and Mathematics. (3) A Special Examination in one of the following subjects: Theology, Logic, and Political Economy, Law and Modern History, Chemistry, Botany, Zoology, Geology, Applied Science, Music. Candidates for Honors have to pass certain additional mathematical subjects in their "Little-go," and then have no further examination till the "Tripos." Honors may be taken in any of the following Triposes: Mathematics, Classics, Moral Sciences, Theology, Law, History, Semitic Languages, Indian Languages, Mediæval and Modern Languages. The lists of the Mathematical Tripos have been preserved since 1747; the Classical was established in 1824; the others are more recent. Previous to 1851, candidates for classical honors must first have obtained a place in the Mathematical Tripos. The system upon which the Mathematical and Classical Triposes are conducted dates from 1882, though the regulations for the Mathematical Tripos have been somewhat modified since that year. The Mathematical Tripos is divided into two parts. The first part takes place in May at the close of the third year, or ninth term of residence, and the successful candidates are arranged in three classes, called Wranglers (q.v.), Senior Optimes, and Junior Optimes, the members of each class being also placed in order of merit. Only those who have obtained honors in the first part may proceed to the second part of the examination in the following May. The subjects for this part are divided into eight divisions, excellence in any two of which entitles to the highest honors. According to their success in this examination, the candidates will be re-arranged in three classes, each class containing one or more divisions, the names in each division being, however, in alphabetical order. The Classical Tripos consists of two parts—the first in general classical scholarship, and taking place at the end either of the second or of the third year of residence; the other at the end either of the third or of the fourth year, and including, besides a further examination in pure classics, obligatory on all candidates, a special knowledge of one or two, but not more than two, of the following subjects: Ancient Philosophy, History, Archæology, Philology. The successful candidates in each part are arranged in three classes. In the first part, the examiners may indicate differences of merit within the classes by subdividing the classes into divisions; in the second part the names are given in alphabetical order, the subjects being indicated in which the student has specially distinguished himself. The Natural and Moral Sciences Triposes, the Theological Tripos, and (after 1889) the Law Tripos are also divided into two parts—a general and a special. The Mathematical and Classical Triposes were formerly followed by examinations for the Smith Prizes for Mathematics and the Chancellor's classical medal. The former are now awarded for the best dissertation on a mathematical subject, the latter by an examination in the student's ninth term.

Girton and Newnham Colleges for ladies are no part of the university. (See COLLEGIATE EDUCATION FOR WOMEN.)

Durham.—As early as the year 1650, an endeavor had been made to bring about the

foundation of a university in the north of England for the benefit of the counties remote from Oxford and Cambridge. Manchester and York both petitioned to be made the seat of the new centre. Oliver Cromwell, however, rejected both petitions, and decided in favor of Durham. Here he founded the University of Durham (1657), endowing it with the confiscated revenues of the Dean and Chapter of the cathedral, and entitling the corporation "The Mentor or Provost, Fellows and Scholars of the College of Durham, of the foundation of Oliver Cromwell." This scheme was canceled at the Restoration, and not revived until the present century; but on the 4th of July, 1832, a bill for the foundation of a university at Durham received the royal assent, the Dean and Chapter being empowered to appropriate an estate at South Shields for the establishment and maintenance of a university. The foundation was to be directly connected with the cathedral, the bishop of the diocese being appointed visitor, and the Dean and Chapter, governors; while the direct control was vested in a Warden, a Senate, and a Convocation. A college modeled on the plan of those at the older universities and designated University College, Durham, was founded in 1837, Bishop Hatfield's Hall in 1846, and Bishop Cosin's Hall in 1851. The last-named no longer exists. The university includes all the faculties, and in 1865 there was added to the Faculty of Arts, a School of Physical Science, including pure and applied mathematics, chemistry, geology, mining, engineering, etc. In 1871, the corporation of the university, in conjunction with some of the leading landed proprietors in the adjacent counties, gave further extension to this design by the foundation of a College of Physical Science at Newcastle-upon-Tyne, designed to teach scientific principles in their application to engineering, mining, manufactures, and agriculture. Students who had passed the required examinations were made admissible as associates in physical science of the university. There is also a medical college which stands in similar relations to Durham, of which university Codrington College, Barbadoes, and Fourah Bay College, in Sierra Leone, are likewise affiliated colleges.

London.—The University of London had its origin in a movement set on foot in 1825 by Thomas Campbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Mr. (afterwards Sir) Isaac Lyon Goldsmid, Joseph Hume, and some influential gentlemen, most of them connected with the congregation of Dr. Cox, of Hackney. The scheme was originally suggested by the fact that dissenters were practically excluded from the older universities, but the conception, as it took shape, was distinctly unsectarian. The first Council, appointed in December, 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned), Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Dudley and Ward, Dr. Olinthus Gregory, Lord Lansdowne, Lord John Russell, and the Duke of Norfolk. On the 11th of February, 1826, the deed of settlement was drawn up; and in the course of the year seven acres, constituting the site of University College, were purchased, the foundation stone of the new buildings being laid by the Duke of Sussex, April 30th, 1827. The course of instruction was designed to include "languages, mathematics, physics, the mental and moral sciences, together with the laws of England, history and political economy, and the various branches of knowledge, which are the objects of medical education." In October, 1828, the college was opened as the University of London. But in the mean time a certain section of the supporters of the movement, while satisfied as to the essential soundness of the primary design as a development of national education, entertained considerable scruples as to the propriety of altogether dissociating such an institution from the National Church. This feeling found expression in the foundation and incorporation of King's College (August, 1829), opened Oct. 8th, 1831, and designed to combine with the original plan, instruction in "the doctrines and duties of Christianity as the same are inculcated by the United Church of England and Ireland." This new phase of the movement was so far successful that in 1836 it was deemed expedient to dissociate the University of London from University College as a "teaching body," and to limit its action simply to the institution of examinations and the conferring of degrees—the college itself receiving a new charter, and being thenceforth designated as University College, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's College, London. In the charter now given to the university it was stated that the king "deems it to be the duty of his royal office to hold forth to all classes and denominations of his faithful subjects, without any distinction whatsoever, an encouragement for pursuing a regular and liberal course of education." The charters of the University of London and of University College, London, were signed on the same day, November 28th, 1836. In 1869 both colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880, ladies were for the first time admitted to degrees. (See COLLEGIATE EDUCATION FOR WOMEN.) It will be seen, therefore, that the University of London, properly so called, closely resembles the examining body known as the University of the State of New York. See REGENT.

Victoria University.—The Victoria University took its origin in the institution known as Owens College, Manchester—so called after a wealthy citizen of that name to whom it owed its foundation. The college was founded March 12th, 1851, for the purpose of affording to students who were unable, on the ground of expense, to resort to

Oxford or Cambridge, an education of an equally high class with that given at those universities. The institution was, from the first, unsectarian in character. In July, 1877, a memorial was presented to the Privy Council praying for the grant of a charter to the college, conferring on it the rank of a university, to be called the "University of Manchester." The localization implied in this title having met with opposition from the Yorkshire College at Leeds, it was resolved that the university should be called the "Victoria University." Under this name the foundation received its charter April 20th, 1880. The characteristic features of the Victoria University, as compared with other British universities are these: (1) it does not, like the University of London, confer its degrees on candidates who have passed certain examinations only, but it also requires attendance on prescribed courses of academic study in a college of the university; (2) the constitution of the university contemplates its becoming a federation of colleges; only these colleges will not be situated, like those of Oxford and Cambridge, in one town, but wherever a college of adequate efficiency and stability shall have arisen. University College, Liverpool, and the Yorkshire College, Leeds, having fulfilled these requirements, have become affiliated with the university. The Victoria University, like the other bodies in England and Scotland, is at once a teaching and an examining body, and there is an intimate relation between the teaching and the examining functions. To give it a general or national character, the governing body consists partly of persons nominated by the Crown, and partly of representatives of the governing and teaching bodies of the colleges and of the graduates of the university. External examiners are appointed who conduct the examinations in conjunction with examiners representing the teaching body. The graduates of the university meet its teachers in convocation to discuss the affairs of the university. Convocation will elect future chancellors and a certain number of representatives on the court. Like the Johns Hopkins University in the United States, the Victoria University has instituted certain fellowships (styled the Berkeley fellowships) for the encouragement of original research.

SCOTCH UNIVERSITIES.—The universities of Scotland, mostly founded in the 15th century, approach much more nearly to the type of Germany and the Low Countries than of England. The teaching as well as governing body were the professors, and the *college* was a building for the accommodation not of the students or fellows, but of the professors, as public lecturers. Though nearly all the students were Scotchmen, they were nevertheless divided, according to continental usage into four nations, named from the parts of Scotland to which they belonged. In St. Andrew's, there were from the first the separate faculties of divinity, arts, and canon law. A *pædagogium* was erected in 1430 for the Faculty of Arts. In 1450, Kennedy, Bishop of St. Andrew's, established and endowed the College of St. Salvator, to which Pope Paul II. accorded the privilege of conferring degrees in theology and the arts, constituting it to that effect a separate university. St. Leonard's College was founded in 1512, and St. Mary's in 1537, with power of conferring degrees. After the Reformation, St. Mary's was restricted to the study of theology; and in 1747, St. Salvator and St. Leonard were united. Glasgow had its lecturers in canon and civil law and theology from the beginning. The Faculty of Arts, however, alone received a definite shape and constitution; it had, as at St. Andrew's, a *pædagogium*, and, prior to the Reformation, had nearly absorbed the university. During the Reformation period, Glasgow University was nearly annihilated; but it was restored by the exertions of Queen Mary and James VI. The University of Aberdeen, as now constituted, derives its origin from two different foundations—one, the university and King's College at Aberdeen, founded in 1494 by William Elphinstone, bishop of Aberdeen, under the authority of a papal bull obtained at the instance of King James IV.; the other, Marischal College and University of Aberdeen, founded in 1593 by George Keith, Earl Marischal, by a charter ratified by act of parliament. By the universities (Scotland) act of 1859, King's and Marischal Colleges were incorporated into one university and college, as the University of Aberdeen—King's College being reserved for the faculties of arts and divinity, and Marischal College for law and medicine. The University of Edinburgh, founded after the Reformation, had but little of the ancient university character, being a professorial seminary on a royal foundation, rather than a society of graduates or students. James VI.'s charter of foundation placed it in the hands of the magistrates of the city, who remained its patrons till 1858. Besides a large number of small bursaries, there are now a few more considerable scholarships at the Scotch universities; but the endowments of this kind are still inconsiderable compared with those of the universities of England.

The Scotch universities have been much modified in various respects by a statute passed in 1858. For some time previous there had been a growing conviction that they were not keeping pace with the intelligence of the country. The absence of sufficient preparation on the part of the students obliged the professors of languages and mathematics to discharge inefficiently the functions of schoolmasters rather than their proper duties. Scholarship had declined, and a Scottish degree in arts had fallen into disrepute. These evils were sought to be cured by establishing an entrance examination, by grafting a certain amount of the tutorial on the professorial element, and by raising the standard of examination for degrees, so as to make them objects of ambition. The act of 1858 placed the Scottish universities under the superintendence of a Board of Commissioners for the space of four years, who had power to carry the statutory provi-

sions into effect. A uniform constitution was given to all the universities, each of which has now three governing bodies, the *Senatus Academicus*, the University Court, and the General Council, the chief officers being the Chancellor, the Vice-Chancellor, and the Rector. The *Senatus Academicus*, composed of the principal and professors, superintends the teaching and discipline, and administers the property and revenues of the university, one-third being a quorum, and the deliberations being subject to the control of the University Court. The principal presides, and has both a deliberative and a casting vote. The University Court consists of the Rector, the Principal, and Assessors named by the Chancellor, Rector, General Council, and *Senatus Academicus* (in Edinburgh, the Lord Provost and an Assessor elected by the town-council are also members of the court). The Rector, and the Assessor nominated by him, continue in office for three years; the other assessors for four years. The functions of this body include the reviewing of the decisions of the *Senatus*, the regulation of the internal arrangements of the university, in conjunction with the *Senatus*, the Chancellor, and the University Court, and the exercise of patronage to the chairs whose patronage was formerly in the *Senatus*. The General Council consists of the Chancellor, the members of the University Court, the professors, masters of arts, doctors of medicine who have attended four sessions, and all persons who, prior to August, 1861, produced evidence of attendance for four complete sessions, two of them being in the Faculty of Arts. The Council meets twice a year, the Chancellor, whom failing, the Rector or Principal, or senior professor present, presiding with a deliberative and casting vote. The duties of the Council are not legislative, but only deliberative; it may entertain any question affecting the university, and make representations regarding them to the University Court. The Chancellor is elected by the General Council, and holds office for life; he appoints a Vice-Chancellor, who may act for him in conferring degrees, which is his principal function. The Rector is elected by the matriculated students, and holds office for three years. At Edinburgh the patronage of those chairs which were in the gift of the town-council has been transferred to seven curators, three of them nominated by the University Court, and four by the town-council. Entrance examinations have been instituted in all the universities, and assistants appointed to several of the professors, with functions somewhat analogous to those of tutors in England.

The degrees now conferred in the Scotch universities are Master of Arts, Bachelor of Divinity, Bachelor of Laws, Bachelor of Medicine, Master in Surgery, and Doctor of Medicine; besides Doctor of Divinity and Doctor of Laws, which are purely honorary. Edinburgh grants, in addition, the degrees of Bachelor of Science and Doctor of Science, and Glasgow that of Bachelor of Science. The degree of Bachelor of Arts is not now given in any of the universities of Scotland.

IRISH UNIVERSITIES, *Dublin*.—Trinity College, Dublin, was founded in 1591, under the auspices of Sir John Perrot, the Irish viceroy. A royal charter nominated a Provost and a minimum number of three fellows and three scholars as a body corporate, empowered to establish among themselves "whatever laws of either of the universities of Cambridge or Oxford they may judge to be apt and suitable; and especially that no other persons should teach or profess the liberal arts in Ireland without the Queen's special license." The first five provosts of Trinity College were all Cambridge men, and under the influence of Archbishop Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias. Prior to the year 1873 the provostship, fellowships, and foundation scholarships could be held only by members of the Church of Ireland; but all such restrictions were abolished by Act 35, Vict. c. 21, whereby the requirement of subscription to any article or formulary of faith was finally abrogated. As at present constituted, the ordinary government is in the hands of the provost and senior fellows in conjunction with the Visitors and Council, the supreme authority being the Crown, except so far as limited by Act of Parliament. See DUBLIN, UNIVERSITY OF.

Queen's.—The first departure in Ireland from the exclusive system of education formerly represented by the foundation at Dublin, dates from the creation of Queen's University, incorporated by royal charter, September 3d, 1850. By this charter, the general legislation of the university, together with its government and administration, was vested in the University Senate. In 1864 the charter of 1850 was superseded by a supplementary charter, and the university reconstituted "in order to render more complete and satisfactory the courses of education to be followed by students in the colleges;" and finally, in 1880, by virtue of the Act of Parliament known as the University Education (Ireland) Act of 1879, the Queen's University gave place to the Royal University of Ireland, which was practically a reconstitution of the former foundation, the dissolution of the Queen's University being decreed so soon as the newly constituted body should be in a position to confer degrees; at the same time all graduates of the Queen's University were recognized as graduates of the new university, with corresponding degrees, and all matriculated students of the former as entitled to the same status in the latter. The university confers degrees in arts (B.A., M.A., D. Litt.), science, engineering, music, medicine, surgery, obstetrics, and law. The preliminary pass-examinations in arts are held at annually selected centres—those chosen in 1885 being Dublin, Belfast, Carlow, Cork, Galway, Limerick, and Londonderry. All honor examinations, and all examinations in other faculties, are held in Dublin. The Queen's

Colleges at Belfast, Cork, and Galway were founded in December, 1845, under an Act of Parliament "to enable Her Majesty to endow new colleges for the advancement of learning in Ireland," and were subsequently incorporated as colleges of the university. Their professors were at the same time constituted professors in the university, and conducted the examinations. But in the reconstruction of 1880, the chief share in the conduct of the examinations, and advising the Senate with respect to them, was vested in a Board of Fellows, elected by the Senate in equal numbers from the non-denominational colleges and the purely Catholic institutions. The colleges retain, however, their independence, being in no way subject to the control of the University Senate, except in the regulations with respect to the requirements for degrees and other academic distinctions. On the other hand, the obligation formerly imposed of a preliminary course of study at one or other of the colleges, before admission to degrees, was abolished at the foundation of the Royal University, the examinations being now open, like those of the University of London, to all matriculated students on payment of certain fees.

WALES.—There is at present no University of Wales, although the bestowal of a royal charter before long is confidently anticipated. The oldest college, that of St. David's at Lampeter, possesses the right of conferring degrees. It was founded in 1822 for the purpose of educating clergymen in the principles of the Established Church of England and Wales, mainly for the supply of the Welsh dioceses. The next college in order of foundation is Aberystwith. It was founded October 6th, 1872, but possesses no charter, and is mainly supported by the dissenting bodies. The University College of South Wales and Monmouthshire at Cardiff was founded in 1883. The University College of North Wales at Bangor received its charter, June 4th, 1885, its object being to "provide instruction in all the branches of a liberal education except theology." There is a hall of residence for women students. At each of these three last-named colleges, students proceeding to degrees have to go through either a London, Edinburgh, Glasgow, or Dublin course of study; but at Edinburgh, Glasgow, and Dublin, a certain proportion of the term of residence ordinarily required is remitted in their favor.

General Statistics.—The following table gives the statistics of the British universities for the year 1890-91:

ITALIAN UNIVERSITIES.—In Italy, at a very early period of the Middle Ages, it was decided that the formal scholastic disputes were useless, and that their effects were pernicious. It was resolved, accordingly, to expel logic, and allow its place to be filled by rhetoric. It was by virtue of this decision, which was of a tacit rather than a formal character, that the expounders of the new learning in the fifteenth century, men like Em-

manuel Chrysoloras, Guarino, Leonardo Bruni, Bessarion, Argyropulus, and Valla, carried into effect that important revolution in academic studies which constituted a new era in university learning, and largely helped to pave the way for the Reformation. This discouragement of the controversial spirit, continued as it was in relation to theological questions after the Reformation, obtained for the Italian universities a fortunate immunity from dissensions like those which, as we shall shortly see, distracted the centres of learning in Germany. The professorial body also attained to an almost unrivaled reputation. It was exceptionally select, only those who were in receipt of salaries being permitted, as a rule, to lecture; it was also famed for its ability, the institution of concurrent chairs proving an excellent stimulus. These chairs were of two kinds—"ordinary" and "extraordinary"—the former being the more liberally endowed and fewer in number. For each subject of importance there were thus always two and sometimes three rival chairs, and a powerful and continuous emulation was thus maintained among the teachers. "From the integrity of their patrons, and the lofty standard by which they were judged," says Sir William Hamilton, "the call to a Paduan or Pisan chair was deemed the highest of all literary honors. The status of professor was in Italy elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were in them no bar—the latter not even a reason of preference. Foreigners of every nation are to be found among their professors; and the most learned man in Scotland (Dempster) sought in a Pisan chair that theatre for his abilities which he could not find at home."

In modern Italy the universities are numerically much in excess of the requirements of the population, there being no less than seventeen state universities and four free universities. Very few of these possess theological faculties, and in no country are theological studies less valued. Education for the church is almost entirely given at the numerous seminaries, where it is of an almost entirely elementary character. In 1875 an effort was made by Bonghi, the minister of education, to introduce reforms and to assimilate the universities in their organization and methods to the German type. His plans were, however, to a great extent reversed by his successor, Coppino.

The following is a list of the twenty-one universities of Italy, with statistics for 1888 :

GERMAN UNIVERSITIES. History.—The earliest known foundation of a German university dates from the years 1347 and 1348. In the former year Pope Clement VI. issued a bull authorizing and directing the establishment of a *studium generale* at Prague, which should possess the four faculties of theology, law, medicine and arts, and of which the Archbishop of Prague should be the chancellor. Charles, King of Bohemia, issued a charter for the new university in 1348, and, as Emperor Charles IV., confirmed it in the following year.

The most famous universities already existing were those at Bologna and Paris. Of widely different type, they had come into being in very different ways. The former was governed by the foreign students, who alone elected the rector, and upon whom the professors and masters were dependent. It had grown up independently of papal or imperial authority, until, in 1158, Frederick Barbarossa granted it extensive privileges. The University of Paris, on the other hand, belonged to the class known as "Chancellor-Universities," as being practically subject to the authority of the chancellor of the diocese, or at least licensed by him; the *magistri* and *scholares* of Paris were united into a corporation early in the 13th century. The internal control of the university devolved entirely upon the active teachers. A prominent feature of Italian and French universities alike was the division of the students into *nations*, generally four, each comprising students from several neighboring countries more closely united by ties of blood and language.

It was the University of Paris that was chosen as the model for Prague, and for every German university subsequently founded, until the time of the Reformation. In many charters it is expressly mentioned as the pattern after which the new institution is to be constructed. The list of these universities is as follows: Vienna, 1365, Heidelberg, 1386, Cologne, 1388, Erfurt, 1393, Leipsic, 1409, Rostock, 1419, Greifswald, 1456, Freiburg, 1457, Basle, 1460, Ingolstadt, 1472, Mayence, 1477, Tübingen, 1477, Wittenberg, 1502, Frankfort-on-the-Oder, 1506.

The prince who wished to establish a *studium generale* within his dominions applied to the Pope for a charter. The bulls granting such petitions closely resemble each other, indeed, are generally identical in substance. In many cases application was also made to the German Emperor, as the civil power to whom all were subject; still, the imperial confirmation does not seem to have been felt as a necessity until the time of Maximilian I., there being several universities for which no imperial sanction can be found to have been given (Vienna, Heidelberg, Leipsic, and others). This emperor, however, at the Diet of Worms in 1495, proposed that a university should be established in the dominions of each Elector of the Empire; and from that time until the extinction of the Holy Roman Empire, the emperors reserved for themselves the right of conceding permission to found a university. On the other hand it is very doubtful whether a papal bull was still considered essential. The foundation of Wittenberg and that of Frankfort were by grant of the emperor, followed up by a papal bull. Naturally for the Protestant foundations the protection of a bull was not sought.*

Of the universities in the period preceding the Reformation it has been well said by Tholuck that the promotion of learning accomplished by them consisted more in diffusing the knowledge already gained at the time of their foundation than in the increase of knowledge, more in progress along lines already marked out than in the opening up of new paths; and that down to the time of the Reformation they are completely mastered by the inertia of tradition. "Hardly any other corporations were able to offer such a tenacious resistance to the influences of the altering spirit of the times as the universities. Nevertheless it may be affirmed that after the Reformation the universities exhibit themselves to us in an essentially different phase, which, however, is not clearly discernible until the foundation of the University of Göttingen in the 18th century; within institutions originally quite ecclesiastical in character, secular interests begin to rival ecclesiastical interests, until finally the latter are subordinated to the former."[†]

The division into *four nations* was adopted in the older universities at their foundation, but hardly at all in those established later than Leipsic. At Leipsic the "nations" were retained as a mere form until 1830; elsewhere the long antiquated division had been abandoned much earlier. The very foundation of the University at Leipsic was due to bitter dissensions between German and Slav students at Prague, resulting in the secession of 5000 German students and teachers. Similarly in 1582 the jealousies and quarrels between Germans and Bohemians at Prague culminated in the separation of the university into two—a Bohemian and a German university.

The division into *four faculties* was everywhere adopted, and has maintained itself to this day. At Paris the rector had to be chosen from the Faculty of Arts, which was at first the case at some German universities, while at others, as Tübingen, this faculty occupied a subordinate position. The studies in the Faculty of Arts consisted of the *Trivium*: grammar, rhetoric, dialectics; and the *Quadrivium*: arithmetic, music, geometry, astronomy (and astrology). The works of Aristotle, in Latin translations, formed the chief basis of instruction in the *Trivium*, as far as they covered the ground; for the *Quadrivium* numerous text-books were prescribed. The use of Latin was obligatory, even for informal intercourse, in all the faculties. In the Theological Faculty the prescribed subjects were but two: the Holy Scriptures and the *Sentences* of Petrus Lombardus. The Faculty of Law, though comprising the two independent studies of Canon Law and Civil Law, was regarded as a unit. In the Faculty of Medicine the works prescribed were chiefly those of Joannicius, Avicenna, Rasis, Almansor, Hippocrates, Galen. The degrees conferred were those of bachelor, licentiate, and master or doctor, the latter terms being considered equivalent, except that during most of the 15th century the title of doctor was used chiefly in the faculties of law and medicine, that of master in the others. The time necessary to the attainment of these degrees varied in the different faculties.

The University of Wittenberg rapidly attained a commanding position. Cologne was at this time a stronghold of the moribund scholasticism, and especially ultramontane in character, while the Classicists rallied chiefly at Heidelberg and Tübingen. For men of the stamp of Agricola, Reuchlin, and Melanchthon, the study of the Greek and Roman classics formed but a stepping-stone to the investigation of the Holy Scriptures in the original Hebrew and Greek. At Wittenberg, where the principles of the Reformation

* Yet in 1544, when the creation of a university at Königsberg was contemplated, the Margrave Albert, after granting a charter wholly Protestant in character, applied to the Vatican for the right of granting degrees. The issuing of the bull was made dependent upon the procurement of the imperial sanction, but as this was never given, the bull was not issued; and in 1556 the King of Poland, on Albert's application, gave his sanction to the university, conferring upon it all the usual rights and privileges.

† Tholuck in Herzog's *Realencyclopädie für protestantische Theologie und Kirche*, vol. XVI, p. 723-4

were adopted from the first, lectures were given upon the original text of the Old and the New Testaments: the *Loci* of Melancthon supplanted the *Sentences* of Lombardus. Aristotle was read in the original, and rhetoric, under Melancthon's influence, advanced to a position of equality with dialectics, and finally superseded it. The changes in the study of "grammar" were not less important: the Greek and Latin classics, which hitherto had been almost entirely neglected, being now advanced to a position of great prominence. Wittenberg became the model for the Protestant universities subsequently founded. The majority of the older universities became Protestant; to the Lutheran confession were joined Erfurt in 1525, Rostock in 1531, Tübingen in 1535, Leipsic in 1539, Greifswald in 1545. Heidelberg attached herself to the German Reformed Church in 1559, but suffered afterwards many changes of religious complexion, even having at times Roman Catholic professors imposed upon her; Frankfort joined the Reformed Church in 1591. The first Protestant university to be established after the Reformation was Marburg, in 1527; it was intended to be a stronghold of Lutheranism, but became Calvinistic in 1607. The others of Lutheran tendencies, established in the 16th century, were Königsberg (1544), Jena (1558), Helmstädt (1576), Altdorf (1578). The University of Dillingen, founded in 1549 by Otto von Truchsess, Bishop of Augsburg, became, after 1564, in the hands of the Jesuits, one of the strongest defenses against the advance of Protestantism; the other Catholic foundations of this century were Olmütz (1581), Würzburg (1582), and Gratz (1586).

During the 17th century no fewer than thirteen universities were founded in German-speaking countries, but only six* of these attained any great prominence, and only five still survive. The Protestant foundations were Giessen (1607), Rinteln (1621), Strassburg (1621), Dorpat (1632), Herborn (1654), Duisburg (1656), Kiel (1665), Halle (1694)—all Lutheran, except Duisburg, which was a foundation of the German Reformed Church. The Catholic establishments were Paderborn (1615—suppressed in 1625), Salsburg (1623), Osnabrück (1630—suppressed three years later), Bamberg (1648), and Innsbruck (1672). The Catholic reaction and counter-reformation of this century exerted a marked influence upon the ancient universities which had remained Catholic, and which were now reorganized and rejuvenated; and the Jesuits gained almost complete control.

The demoralizing effect of the Thirty Years' War upon the universities of Germany was extremely great; while other elements conspired to work equal harm to them from the inside. In none of the universities of Europe were the students, as a whole, noted for decency of life; the accounts of Jacques de Vitry and others, and the statutes of the universities, show in a very strong light the profligacy, of masters and students alike, which prevailed during the thirteenth and following centuries. Throughout the 16th and 17th centuries there existed in the German universities a curious custom known as *Deposition* or *Beania*, a sort of initiation with wildly grotesque and often degrading ceremonies, which, however, received official sanction, and was even prescribed by the authorities for entering students. It was abolished at Tübingen only in 1717, at Wittenberg not until 1733, though the statutes of Halle in 1694 expressly prohibited it. At the beginning of the 17th century, or about 1610, there suddenly appeared in the majority of the German universities a strange phenomenon known as *Pennalism* (q. v.), an extremely brutal parody of the ceremonies of *Deposition*, which soon became an organized conspiracy among the older students for the maltreatment of the younger. The excesses of the *Pennales* became so great that the authorities were forced to make a determined stand against the shameful practice, but it was not completely stamped out until after 1660.†

A turning-point in the history of the German universities is marked by the foundation of the University of Halle in 1693-4. It was established in the expressed interest of Lutheranism, as Frankfort had come into the hands of the Reformed Church, but the new university soon outgrew the bounds originally set for it, especially under the influence of the famous Thomasius and Francke. Thomasius was the first to abandon the use of Latin in the lecture-room, an example soon followed to a greater or less extent throughout Germany. In 1702 was founded the University of Breslau, at the instance of the Jesuits, yet without papal sanction. In 1737 the University of Göttingen was opened, planned on lines even more liberal than those of Halle; the excellence of its library, the great attention now for the first time paid to the study of history, and the enlightened efforts of Münchhausen in its behalf, during his curatorship of 32 years, were all powerful factors in the rapid growth of the new university. Göttingen and Halle may truly be said to have dominated the intellectual life of Germany during the 18th century. The Lutheran University of Erlangen was opened in 1743.

The thirty years from 1790 to 1820 witnessed great changes in the German universities. No fewer than nine—Mayence, Cologne, Bamberg, Dillingen, Duisburg, Rinteln, Helmstädt, Salzburg, and Erfurt—were suppressed; Altdorf was fused with Erlangen in 1809, Frankfort with Breslau in 1809, Wittenberg with Halle in 1815. The university at Ingolstadt was transferred to Landshut in 1802, and thence to Munich in 1826. Only

* Giessen, Bamberg, Dorpat, Kiel, Innsbruck, Halle.

† The term *Pennaler* survives in Germany as a half-contemptuous name applied to boys still at the gymnasium.

the University of Mayence had retained any importance, and the changes were of great benefit to the cause of higher education in Germany.

The necessity of a reformation of the Prussian universities, in the direction of still greater liberality of thought and teaching than was represented at Halle and Königsberg, had already been recognized by Frederick William III. and his ministers as early as 1800. After the Peace of Tilsit had left Prussia in a greatly humbled condition, one of the first means devised by the ministers, notably by W. von Humboldt, for the regeneration of the fallen state, was the establishment of a university at Berlin. The plans were drawn with singular foresight; to the newly chosen professors complete liberty was granted, that the university might not seem committed to any one school of thought. The result soon justified this course. The favorable situation in the capital and the eminence of the lecturers combined to render the growth of the new institution, which was opened in 1809, not less than phenomenal. In 1813 the teachers numbered 55; in 1891, 335. The list of rectors and deans reads like a muster-roll of scholarly fame; Fichte, von Savigny, Schleiermacher, Hufeland, Reil, Boeckh, Neander, von Raumer, Hegel, Bopp, Osann, Lachmann, Zumpt, Dieterici, Ranke, Trendelenburg, Puchta, Weiss, Nitzsch, Dove, Haupt, Mommsen, Curtius: these are some of the names there recorded.

The other entirely new foundation of this century in Germany is Bonn, opened in 1818, which has rapidly gained eminence, especially as a school of philosophy and philology, ranking in 1890 as sixth in size among the universities of the German Empire. The University of Munich, starting in 1826 with the union of the university transferred from Landshut with the Royal Academy of Sciences, has for many years ranked as second or third in size, surpassed only by Berlin and Vienna, and occasionally by Leipzig. In 1872 the University of Strassburg, lost to Germany in 1681 and suppressed at the time of the French Revolution as dangerously German in character and tendency, was reopened, and great pains were bestowed upon its equipment. Its rank in size was eleventh in 1890-91. In 1875 the University of Czernowitz, in the Bukovina, was opened, the theological faculty of which belongs to the Orthodox Greek Church, though the language of the university is German. In 1889 the Roman Catholic University of Freiburg in Switzerland was opened, in which lectures are given in French and German. In 1890 the Academy at Lausanne, which had existed as such since 1537, was changed into a university by the addition of a medical faculty; the elevation to university rank was celebrated with great splendor in May, 1891.

The influence of Berlin upon the other Prussian universities, indeed upon all the others of Germany, has been very great. The present century has witnessed the establishment in the German universities of professorships in almost every branch of learning, and the discarding of many antiquated and useless features still tolerated in other lands; it has seen the completion of their transformation from chiefly ecclesiastical into thoroughly secular institutions, bound, except for the theological faculties, to no particular form of religion, to no particular scientific doctrine, and unrestricted in their freedom of research and teaching. But the Germans do not intend that their universities shall fail to share further in the general advancement of the age; they are keenly conscious that the true and lasting strength of a university lies in its teachers, not in its beautiful buildings or luxurious life; they look to the universities to lead the van of scientific progress; and propositions for the reform of still existing abuses are eagerly proposed, and discussed with a vigor characteristic of the important position which the universities hold in the estimation of the intelligent public.

General Account.—The universities of the countries comprising the German Empire are strictly state institutions, subject directly to the "Minister of Ecclesiastical, Educational, and Medical Affairs" of the state in which each is situated; only the university of Strassburg is subject to the imperial Minister of Education. Of the same essential character with them are the universities of Austria and Switzerland, in which German is the official language; in Austria these are Czernowitz, Gratz, Innsbruck, Prague, Vienna; in Switzerland, Basle, Bern, Zürich. The Austrian universities of Cracow and Lemberg, whose official language is Polish, and the Swiss universities of Freiburg (Fribourg), Geneva, Lausanne (with the institution at Neuchatel, called academy, because lacking the faculty of medicine), at which French is used prevalently or entirely, are also modeled on the German plan. The university at Dorpat, in the Russian province of Livonia, is similarly constituted, and though viewed with a jealous eye by the Russian authorities, has thus far resisted more or less successfully the attempts at its Russification.*

Complete parity exists among the universities of the German Empire, and, to a lesser degree, between them and the German-speaking universities of Austria and Switzerland. Courses of lectures count as much at any other university as at the one where they are taken; a student once entered at one university is thereby entitled to enter any other without the formality of proving himself "mature" (see below); and the cost of matriculation is considerably smaller when the applicant comes from another university.

* A decree issued in May, 1887, prescribed the use of Russian as the language of instruction throughout the Baltic Provinces, but in the summer of 1891 out of over 160 courses of lectures only 21 were advertised to be read in Russian.

In Germany the term "university" is applied with great strictness,* only those institutions which are provided with at least the four faculties of theology, law, medicine, and philosophy being entitled to be thus designated. Consequently the Lyceum Hosianum at Braunsberg, in the province of East Prussia, and the Academy at Münster in Westphalia, each of which comprises only the faculties of Roman Catholic theology and of philosophy, are never designated as universities.

Most of the German and Austrian universities are designated in official communications by names originally given in honor of sovereigns by whom they were founded; thus the university at Berlin is styled the "Königliche Friedrich-Wilhelms-Universität" that at Heidelberg the "Ruprecht-Carls-Universität," but ordinarily they are called "Die Universität Berlin," "Die Universität Heidelberg," etc. But the universities at Breslau, Greifswald, Leipsic, Marburg, and Rostock, and the Swiss universities, bear the simple designations "Universität Breslau," etc.

The universities at present existing in the German Empire, and the German universities of Austria, Switzerland, and Russia, with the year of their establishment, are as follows:

A. GERMAN EMPIRE

Prussia:

Berlin, 1809.
Bonn, 1818.
[Braunsberg, 1568, 1818.]
Breslau, 1702.
Göttingen, 1737.
Greifswald, 1456.
Halle, 1694.
Kiel, 1665.
Königsberg, 1544.
Marburg, 1527
[Münster, 1786.]

Bavaria:

Erlangen, 1743.
Munich, 1826.
Würzburg, 1582.

Baden:

Freiburg, 1457.
Heidelberg, 1386.

Kingdom of Saxony:

Leipsic, 1409.

Saxon Duchies:

Jena, 1558.

Württemberg:

Tübingen, 1477.

Hessen:

Reichslande:

Strassburg, 1621, 1872.

B. AUSTRIA.

Czernowitz, 1875.
Graz, 1586.
Innsbruck, 1672.
Prague, 1348.
Vienna, 1365.

C. SWITZERLAND.

Basle, 1460.
Berne, 1834.
Zürich, 1832.

D. RUSSIA, BALTIC PROVINCES.

Dorpat, 1632, 1802.

The purpose of the German university is twofold: First, to afford the theoretical part of that special training which is in Germany a prerequisite for admission to the professions of the Church, the Bar, Medicine, Forestry, the higher Civil Service, Pharmacy, and the profession of teaching in the universities or the higher schools (*Gymnasien, Progymnasien, Realschulen, höhere Bürgerschulen*); and, secondly, to equip its students in the most thorough manner possible for the work of independent scientific research. In brief, such a university is at one and the same time a group of professional schools and an association for the advancement of science in all its branches.† The strictly technical professions of civil and mining engineering, applied chemistry, architecture, etc., are assigned entirely to the Polytechnic and Mining Schools. The subject of forestry is in Bavaria, Württemberg, and Hessen taught at the universities; in Prussia it is not under the control of the Minister of Education, but assigned to the Department of Finance, and separate Academies of Forestry are maintained. The scientific teaching of agriculture is provided for partly by independent academies, as at Poppelsdorf (near Bonn), partly by institutions called *Landwirthschaftliche Hochschulen*, as at Berlin, and partly by special departments at the universities, as at Leipsic, Göttingen, and other places.

The German universities do *not* aim at giving simply a good general education, or at exerting a definite moral or religious influence upon those who attend them; that is the work of the schools, candidates for entrance to the university being supposed to be *maturi*. For this reason a German university does not offer definitely arranged courses, to be taken in a prescribed order, and in a prescribed number of years, as in the schools

* Another name sometimes used is *Hochschule*.

† "If we ask more particularly what they (i.e., English and French observers) find to praise in our conditions, what moment appears to them to be the foundation of the excellence of our universities, their unanimous answer is: 'The constant union and amalgamation of research and instruction.'" Von Sybel, *Die deutschen Universitäten*, p. 11.

and in American colleges. It assumes no responsibility for the performances of the individual student, for his success in obtaining a degree; it simply says to its frequenters: "Here are all the helps to a thorough training which we can afford you; you may make use of them or not. We shall give you, however, no certificate of proficiency for work done in a perfunctory manner, nor any degree on a mere passing of examinations." The students do not receive names indicating the length of their stay at the university, nor are they graduated in classes. As Matthew Arnold puts it (*Higher Schools and Universities in Germany*, p. 152): "*Lehrfreiheit* and *Lernfreiheit*, liberty for the teacher and liberty for the learner; and *Wissenschaft*, science, knowledge, systematically pursued and prized in and for itself, are the fundamental ideas of that system."

Though the universities are subject to the Ministers of Education of their respective states, each enjoys a high degree of autonomy, and of each the constitution is essentially republican. Few of them have any great resources of their own; what they have consists partly of endowments, partly of lecture-fees and other fees paid by the students, the balance of the expenses of management being paid by the state. There are no "trustees" or "overseers," their place being taken by the Minister of Education; no permanent presidents, and no system of "departments," wherein one professor has other instructors dependent on him.

The internal administration of each university is in the hands of a Rector, a Dean for each faculty, the *Senatus Academicus*, and the *Quæstor*. The Rector and Deans are chosen annually by the full professors, from among their own number. In some universities the title of Rector is borne by the sovereign (so at Heidelberg the Grand Duke of Baden is the titular Rector), when the *de facto* Rector, chosen annually, bears the title of "Pro-rector." In official documents the Rector is called *rector magnificus*, and the formal mode of addressing him is "Ihre Magnificenz;" at Leipsic the King of Saxony is *rector magnificentissimus*. At each university the government is represented by an official, called in Prussia Curator, at Tübingen Chancellor, at Leipsic Government Plenipotentiary, whose duty it is to watch over the observance of the laws and regulations concerning the universities.

The Rector is the visible head of the university; he has an *assessor* in the person of the *Universitätsrichter*, whose office is permanent, and whose co-operation is requisite where fines are to be inflicted, and in some other cases. The *Senatus Academicus* is in some universities composed of all the full professors, in others of delegates elected by them from their own number; the Rector is its president. It has jurisdiction over the conduct of the university, but the consent of the government is necessary when new regulations are proposed. The Deans stand in about the same relation to each faculty as that borne by the Rector to the whole university; in particular, the business of attending to applications for degrees, and of arranging for the examinations therefor, devolves upon them. The *Quæstor* is a sort of university treasurer; he receives from the students the fees for matriculation and ex-matriculation, and for the courses of lectures, and pays to the lecturers the proportion of lecture-fees due them. There are also several inferior officials called *Pedelle* (beadles), a sort of university police.

The discipline of the university over its students is maintained by means of the "University Court," composed exclusively of certain members of the faculty of law; a student accused of any serious misdemeanor is summoned before this body, where he may defend himself with the assistance of counsel. The punishments inflicted are as follows: reprimand, fine, imprisonment in the university *Carcer*, deprivation of the right to count the current academic year among the number prescribed for a degree, threat of removal from the university rolls, *consilium abeundi* (i.e., suspension for a fixed time, during which, however, the offender may enter another university), and, in extreme cases, "relegation," i.e., expulsion, which renders it practically impossible for the offender to enter any other German university, notice being sent to each and every one.

The term "faculty," as used in Germany, signifies (1) the teaching body, especially the full professors, and (2) the total of teachers and students in one of the great divisions of the university. A student as well as a professor thus belongs to this or that faculty. The traditional division of faculties is the fourfold one into the theological, the legal, the medical, and the philosophical. At every German university there is a faculty of either Protestant or Roman Catholic theology; Protestant faculties only are at Berlin, Erlangen, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipsic, Marburg, Rostock, Strassburg; Roman Catholic only are at Freiburg, Munich, Würzburg, at the Academy at Münster and the Lyceum at Braunsberg; while at Bonn, Breslau, and Tübingen there are *paritetic* faculties, i.e., one each of Roman Catholic and of Protestant theology. The philosophical faculty, in the majority of universities, comprises all the courses of lectures which do not belong in any one of the other three; but the extraordinary growth and ramification of physical, social, and philological science in the present century has made the philosophical faculty a very unwieldy body, so that in different universities, particularly in South Germany, different remedies have been sought. At Munich there are distinguished five: theology, law, political science (including forestry), medicine, and philosophy; at Strassburg five, the philosophical faculty having been divided into (a) philosophy and (b) mathematics and natural

science ; at Tübingen seven : Protestant and Roman Catholic theology, law, medicine, philosophy, political science (including forestry and agriculture), natural science ; at Würzburg the philosophical faculty is divided as at Strassburg, with, however, but one dean for the two sections. The other universities retain the philosophical faculty undivided.

The teaching body of a German university consists of (1) Full Professors (*ordinarii*, *ordentliche Professoren*), (2) Extraordinary Professors (*ausserordentliche*), and (3) *Privatdozenten*. To these are to be added (4) Readers (*Lectoren*), appointed to give practical instruction in modern languages ; there are also (5) Masters of dancing, fencing, riding, etc., whose connection with the university is often merely nominal.

The *full professors* are the occupants of chairs intended to be permanent foundations ; they alone sit in the *Senatus Academicus*, and are alone eligible to the rectorship and deanships. The *extraordinary professors* are either younger men, to whom the professorial title has been granted by the Government for distinguished work, or they represent subjects in which no permanent chairs have been established ; sometimes both conditions are exemplified in the same individual. On the other hand there are often to be found extraordinary professors of advanced age ; in such cases the Government may never have deemed it expedient to create full professorships in their respective branches, or may for particular reasons have been unwilling to advance the individual to a permanent place of honor, or the individual may have so far failed to fulfill the promise of his earlier years that no other university has been willing to extend him a call. Occasionally *honorary ordinary professors* are to be found ; this title is bestowed when the Government regards the extraordinary professor as entitled to a higher rank, but is not ready to create a full professorship for him. The *Privatdozenten* form an institution peculiar to German universities and to the universities modeled after them. They have no official connection with the university beyond the privilege of lecturing (*venia docendi* or *legendi*) and of receiving the lecture-fees ; in other words, they are not appointed, but permitted, to lecture. The *ordinarii* and *extraordinarii* receive a stated salary from the Government, the latter considerably less than the former, but there are no fixed salaries attaching to each position, the Government arranging with each individual separately. The *Privatdozenten*, in the great majority of cases, receive no salary at all ; of late years the practice has arisen of paying them a small stipend, but the advisability of this custom has been and still is violently debated in Germany. The two classes of professors, and the *Privatdozenten* as well, receive the fees paid by the students for their respective lectures, less a small percentage which goes into the university chest. The salaries vary greatly, the income from fees even more. An average salary for an *ordinarius* is perhaps 7000 to 9000 marks per annum (\$1750 to \$2250) ; for the principal positions of the medical and legal faculties of the largest universities the figures are much higher. The amounts received from lecture-fees vary, of course, with the number of students attending, and with the faculty, the fees being lowest in the theological faculty, and highest in the medical. In the philosophical faculty a course of four hours weekly throughout the semester costs on an average about \$4 ; in the medical faculty often as much as \$8 or \$9. Consequently a lecturer whose courses were attended by 300 students in each semester would in the former faculty receive about \$2400, in the latter about \$4800 or \$5000 annually in fees ; and there are a very few positions which the writer has heard estimated as worth \$15,000 per annum in salary and fees combined. The income of a *Privatdozent* from university sources is often ludicrously small.

It is important to remark that the extraordinary professors and *Privatdozenten* are in no sense subject to the authority of the full professors. The organization by "departments," so common in America, is unknown in German universities. Each professor receives his appointment, and each *Privatdozent* his *venia legendi*, for some branch of learning ;* the choice of subjects for his lectures in each semester, and the method of treatment, is his own privilege exclusively. This is the *Lehrfreiheit*, of which the Germans are justly so proud. As a matter of fact the different lecturers generally arrange their subjects so as to cover the whole field as well as possible, and so as to relieve each one of the drudgery of repeating the same course in successive semesters. There is, however, nothing to prevent a *Privatdozent* from announcing a course on a subject chosen for the same semester by an ordinary or extraordinary professor. This would, of course, be looked upon as extremely discourteous ; but it not infrequently happens that the same subject is treated, or nearly the same ground covered, by professor and *Privatdozent* respectively, in successive semesters, and often from very different points of view. The *Privatdozenten* play an extremely important part in the economy of a German university ; the Germans rightly look upon them as forming one of the strongest buttresses of their admirable system of higher education. They are in no sense *tutors*, least of all private tutors, their whole energy being devoted to research, and to the presentation of the results ; and they represent the coming generation of professors, cases being extremely rare where professors are chosen except from among the ranks of *Privatdozenten*. In this way they serve the extremely useful purpose of keeping the professors fully abreast of the times in scientific investigation, for with the

* It is interesting to note, for example, that appointments are not made for Latin or Greek exclusively, but for classical philology, or archeology, or comparative philology.

almost complete freedom allowed the students in the choice of lectures (the *Lernfreiheit*), these are extremely quick to detect any failure on the part of the lecturer to keep up with the advance of science, and are apt to desert him for the younger and more enterprising man, particularly as the courses given by all three classes of lecturers count as of equal value. Such a comparison of men and lectures is also rendered easier by the wide prevalence of the custom known as *hospitieren*, which is this: at the beginning of each semester a student in doubt as to what courses to select will attend a great number of different ones for a few days before subscribing his name to the lists which are sent around in the lecture-room.

With regard to the choice of professors, as in almost every other respect, complete reciprocity exists among the German universities. Calls from one university to another are much more frequent than promotions in the same university.* Of late years, however, the authorities of Bavaria and Württemberg have been accused—not always without reason—of undue preference shown for their own countrymen. In this respect Prussia has been most liberal. Appointments are made by the *Cultusminister*, except for the faculty of Protestant theology, for which the Consistory makes the appointments. When a full professorship becomes vacant, the *Senatus Academicus* recommends three names to the *Cultusminister*, who then makes the choice, though he is not bound to appoint one of the three. A vacant full professorship, or one newly created, is almost always filled by the choice of a full professor elsewhere, or an *extraordinarius* at home or elsewhere; very rarely the choice falls upon a *Privatdocent*, and still more rarely are men chosen from outside the universities. In making the choice regard is paid more to the scientific prominence of the candidates than to their skill as lecturers—a striking testimony to the importance attached by the Germans to the idea that the universities should lead the way in scientific investigation. The rank of *extraordinarius* is almost exclusively conferred upon *Privatdozenten* who have distinguished themselves; the extraordinary professors who have not been *Privatdozenten* are extremely few.†

The *Privatdozenten* become such by a process called *Habilitation*. A young man who has finished his university studies with distinction, and has received the doctor's degree (though this is not always requisite), undertakes some more extended and difficult investigation, the results of which, embodied in an essay or book, he hands in to the authorities of the university and of the faculty for which he seeks the *venia docendi*, along with a number of *theses*, propositions calculated to excite opposition, which he undertakes to defend in public. If his work is found satisfactory, he is invited to defend his theses before the Rector of the university and any one who wishes to attend. This having been successfully done, the desired *venia* is granted him. In most universities the public disputation is a mere form, but at Tübingen it is sometimes a very serious matter.‡ In the theological faculty the *venia docendi* is granted to those who pass the examination for *Licentiate*, the doctor's degree being rarely bestowed in this faculty except as an honorary degree, and then very sparingly.

A peculiar class of *Privatdozenten* is found in the medical faculties of the larger universities, notably of Berlin; medical practitioners, often of very mature age, obtain for themselves the *venia docendi* in some special branch of medicine, largely for the sake of increased practice, but without any intention of pursuing the academic career. In this way the number of *Privatdozenten* in the medical faculty at Berlin for the summer-semester of 1891 amounts to 62.

It is not uncommon for *Privatdozenten* to act simultaneously as teachers in the *Gymnasias*, especially when their own means are not sufficient to support them. This is sometimes the case with extraordinary, sometimes even with ordinary, professors. The *Privatdozenten* are not bound to deliver any lectures at all; but one who should fail to lecture during several semesters, unless with some valid excuse, would be likely to receive a request from the authorities to announce some lectures or to withdraw from the university.

The chief modes of instruction in the German universities are (1) by lecture, and (2) by the *Seminare*. There are two semesters or terms; in the majority of universities the winter semester extends officially from October 15th to March 15th, the summer semester from April 15th to Aug. 15th. In effect the semesters are sometimes considerably shorter, the lectures not beginning promptly, and terminating a week or more before the official close of the term. The winter semester, being a month longer, is regarded as the more important of the two.

1. Lectures are given *publice*, *privatim*, or *privatissime*. The lectures *publice* are delivered gratis, and in most universities each full professor is expected to deliver in each semester one such course of one or two hours weekly. The lectures *privatim* are the ordinary lectures; they are by far the most numerous, and for them the regular fees

* It is no uncommon thing for a professor to be attached to four or five universities in the course of his career.

† The most recent case that has come to the knowledge of the writer occurred at Heidelberg in the early part of 1890; and even then the appointee was about to become a *Privatdocent*, and had already made an honorable name for himself in Semitic languages.

‡ At a disputation of this sort attended by the writer at Tübingen in 1878, the argumentation was kept up for over three hours.

are charged. Any matriculated student, and any one who though unmatriculated has received especial permission to attend lectures, may take them on putting his name to the subscription list (*Belegbogen*). The lectures *privatissime* must be arranged for directly with the lecturer; they are for advanced students, and are sometimes given at the lecturer's rooms, but not infrequently are gratis. The lectures always begin about a quarter of an hour after the advertised time; this "academic quarter" has become a fixed custom. The students assemble a few moments beforehand; in the South German universities they rise at the entrance and departure of the lecturer. The nature of the lecture, of course, varies according to the subject treated, and even more with the personality of the lecturer. Where the subject is a new one to the students, as, for example, one of the Oriental languages, a text-book is often used, and the lecture assumes more the character of a recitation, but no student is held to the performance of prescribed tasks. Disorder in lecture-rooms is unheard of. The students have a curious custom of scraping their feet on the floor when they have not understood the lecturer, or when he "reads" beyond the proper time.

The number of lectures delivered weekly by each professor, of course, varies greatly. In the theological faculty at Berlin some lecturers offer courses amounting to twelve or fourteen hours per week; in the other faculties the average is lower, a German professor considering himself amply occupied with eight to ten hours weekly of lectures, or even less. In addition to this, however, he may have duties in connection with *Seminare*, with examinations, or in laboratories, and the like, which increase considerably the number of hours claimed by the university. It is very common for a lecturer to have five or six comprehensive courses of lectures on different branches of his subject, which he delivers in rotation, so that each course comes to be read about once in three years, the intervals being taken to bring the lectures closely up to date. Herein lies, according to German ideas, one of the chief advantages of the lecture-system; with the rapid advance of science in modern times, the best text-books often become antiquated in a very short time after their appearance; but the lecturer is able, and is supposed, to keep abreast of the very latest investigations in his line of work. The lists of lectures for each semester are made up about the middle of the preceding semester, and published in pamphlet form; they are also commonly advertised in several learned and other periodicals (such as the *Literarisches Centralblatt*, published at Leipsic). The *Deutscher Universitätskalender*, published semi-annually at Berlin, contains the lists of lectures for all the universities of Germany and Switzerland, the German-speaking universities of Austria, and Dorpat.

2. The *Seminare* partake more of the nature of classes. They are designed particularly for the better training of intending teachers. The number of students attending each as regular members is limited, generally, to twelve. Most of them are permanent foundations, royal, grand-ducal, or ducal, which pay a small annual stipend to their members, on the condition of satisfactory performance of their prescribed duties. Each *Seminar* has a director in the person of a professor, who usually varies with successive semesters. Admission is obtained, when vacancies occur, generally by competition, essays on stipulated subjects connected with the work of the *Seminar* being submitted by the candidates. The meetings are held at stated intervals, generally weekly, and may be attended, with the permission of the professor in charge, by others than the regular members. Sometimes *extraordinary members* are admitted, but these receive no stipend, nor have they the full duties or privileges of the regular members. A subject of discussion is assigned for each meeting; one of the members, previously designated, and called the *Referent*, reads an essay on the subject given out; another, the *Rezensent* or *Opponent*, designated at the same time with the *Referent*, criticises it, for which purpose the *Referent* is obliged to submit his essay to him a certain number of days before the meeting. After this a general discussion of the subject is held, the professor in charge acting as chairman. The amount of work required of the members of such a *Seminar* is very considerable; and the *Seminare* themselves are rightly regarded as forming an invaluable auxiliary to the work of instruction as otherwise carried on. There are sometimes also *Proseminare*, which give a preparation for the work of the *Seminare* proper. Other societies are formed on the model of the *Seminare*, sometimes by the professors, who then invite their most promising students to join them, sometimes among the students, different professors being in turn invited to attend and address the meetings. Some of the most valuable contributions to science have emanated from these societies; thus the well-known *Studien* edited by G. Curtius consist largely of essays read at the meetings of his *Grammatische Gesellschaft* at Leipsic.*

* The following is a list of the *Seminare*, etc., at Leipsic, in 1891:

a. Theological. 1. *Sem.* for Practical Theology. Homiletic and Liturgical Section: Director, Prof. Rietschel. Catechetical Section: Prof. Schnedermann. Paedagogical Section: Prof. Hofmann. 2. *Sem.* for Ecclesiastical History: Prof. Brieger.
b. Legal. *Seminar*: Professors Binding, Wach, Bülow.
c. Medical. 17 "Institutes," medical and surgical, clinics, etc.
d. Philosophical. 1. *Philological Seminar and Proseminar*: Professors Ribbeck, Lipsius, Wachsmuth. 2. *Archaeological Sem.*: Prof. Overbeck. 3. *Germanistic Sem.*: Prof. Zarncke. 4. *Philological Institutes*. i. *Classical Philology*: Prof. Wachsmuth; ii. *Germanistic Philology*: Prof. Zarncke. 5. *Institute for Experimental Psychology*: Prof. Wundt. 6. *Historical Sem.*: Prof. Maurenbrecher. 7. *Geographical Sem.*: Prof. Ratzel. 8. *Paedagogical Sem.*: Professors Masius and Richter. 9. *Sem.* for Political Science: Prof. Brentano. 10, 11. *Two Agricultural Institutes*: Professors Kirchner and Stohmann. 12. *Mathematical Sem.*: Professors Lie and Mayer.

For the natural sciences and the medical faculty museums, laboratories, operating theatres, etc., are provided in great completeness, and these generally form the only buildings of any architectural importance which a German university can boast. The attempt is rarely made to group together all the buildings belonging to one university, and even in a small university town they may be at a considerable distance apart, the laboratories, botanical gardens, hospitals, and the like, being naturally placed on the outskirts of the town, while the lecture rooms for the other faculties are commonly situated in the heart of the town. Only a few universities have very modern buildings for their theological, legal, and philological or strictly philosophical lectures, old palaces or monasteries being generally utilized for the purpose.

For a German subject, there is but one door to matriculation in the university: the graduating examination (*Abiturienten-Examen*) of the *Gymnasia*; but if he wishes to pursue certain courses in natural science, or in mathematics, the similar examination of the *Realschulen* may be substituted. (To pass these examinations it is not absolutely necessary that the candidate should have attended either *Gymnasium* or *Realschule*, but few attempt to pass them except after such attendance.) The universities never hold any entrance-examinations; the necessary certificates from the gymnasial authorities, which are regarded as of an equivalent minimal value all over Germany, are presented to the university authorities. If these papers are found to be in order, the applicant is admitted to "academic citizenship" by the rector, to whom he gives his hand in token of agreement to observe all the laws of the university. The entering student is registered in the university as a whole, and in one of the faculties.

Foreigners are very freely admitted to the full privileges of the university if they give evidence of proper qualifications; thus the diploma of an American college of any prominence is accepted without hesitation, though the A.B. degree of an American college by no means always represents as extensive or thorough training as the *Maturitätszeugniß* of a German *Gymnasium*, which is fully the equivalent of the ordinary B.A. degree of the English universities. Permission to attend lectures, without matriculation, is given freely, especially to foreigners, the consent of the lecturer being generally required; but such attendance has no official value as entitling to admission to the State Examinations. A candidate who presents an incomplete "certificate of maturity" may attend lectures in the philosophical faculty only, but these count for no purpose for which the university degree is required. Of late years some of the universities have shown themselves unwilling to confer degrees in philosophy upon foreigners who cannot show themselves possessed of a good classical training. A candidate for matriculation who has attended another university must show his papers in due form of ex-matriculation from that university; these are not granted until the student has satisfied all his obligations toward the university which he proposes to leave.*

When matriculated the student receives a card bearing his name, faculty, and address. This must be renewed at certain intervals, and whenever his address is changed; it is to be always carried on the person, under penalty of a fine. This card gives the bearer certain privileges, which were much greater formerly than at present. In former times a student, if arrested for any misdemeanor by a civil officer, could be detained by the town authorities only until the arrival of a university beadle, who then took the offender into custody for trial before the university court. If found guilty, the offender was punished by the university authorities. Since 1879, the exclusive jurisdiction of the university authorities over the students embraces only matters of discipline.

Since the extension to all German states of the laws rendering military service compulsory upon all German subjects physically able to serve, but accepting a service "with the colors" of only one year from those who can pass a certain examination, it has become very common to serve out this year during the university course. The military authorities have made this easier by establishing small garrisons in the university-towns where formerly none were stationed. The *Einjährigen* are not obliged to live in barracks, and their military exercises are so timed as to leave them opportunity for university work.

The student is free to select whatever courses of lectures he chooses, and there is no penalty for non-attendance of these.† During their first semester probably only a small minority of students expect to do much serious work; the sudden sense of freedom, following the rigorous discipline and restraint of the gymnasial course (nine years in its full extent) is too intoxicating for the student to resist its temptations to idleness. But it should be remembered that the entering German student is not often under nineteen years of age, and that students who waste much time in their first semester often make very brilliant reputations afterwards. Matthew Arnold was of the opinion that the proportion of students who really work, is considerably larger in a German than in an English university, notwithstanding the closer watch kept over the English students. In the choice of lectures he may seek the advice of one or more professors; but often the new student, especially if he be enrolled in the philosophical faculty, subscribes to a great number of courses before deciding upon his particular line of work. A record is kept of all the courses of lectures chosen during his university course, but

* Except when *Stundung* is granted, as explained below.

† For failure to subscribe for any courses at all the penalty of dropping from the rolls is prescribed; in 1891, 161 students were thus dropped at Berlin.

not of his attendance upon each lecture. He receives a blank-book in which he enters the names of the courses; payment of the necessary fees is then certified therein by the *Quæstor*, and at the end of the semester the lecturer inserts his certificate of the student's attendance, generally without the formality of ascertaining whether the student has attended or not. Students in the faculties of theology, law, and medicine often attend courses in the faculty of philosophy; indeed, in the Bavarian universities such attendance, for one or two semesters, is obligatory.

Change from one university to another during the student's academical career is extremely common. The North German students are especially migratory, Heidelberg, Freiburg, Tübingen, and other places, proving very attractive in summer through the beauty of their surroundings, so that such universities are often nicknamed the "summer universities."* The result of this migratoriness is an entire want of loyalty to any one university, it sometimes happening that one may take his degree where he has studied least. The entire absence of athletic contests between the universities and, in fact, of athletic sports among the students at all, is one of the first points of difference between the German universities and those of his native land to strike the student who comes from England or America.

In general, the universities exercise no control over the mode of living of their students, each being completely free to live where he wishes. There are no college rooms, as in English and American colleges, nor any common table. Provision is, however, made for poor students in various ways. Thus at Leipsic there exists the so-called *Convict*, which supplies dinner and supper daily during the term to about 280 students free of charge; and some of the professors receive deserving students at their own tables. A custom called *Stundung* exists in some universities, and is as follows: on presentation of the *testimonium paupertatis* the student is excused from the immediate payment of a part or even the whole of the lecture-fees, but engages to pay them within a certain time after receiving an appointment under the government. It is also in the power of the lecturer to remit the fees entirely to any individual student. At Berlin the *Melanchthoneum* and *Johanneum* are institutions of similar character, containing also rooms at low prices for a limited number. At Tübingen there exist two institutions which have at present no parallel in other universities of Germany. These are royal foundations for the maintenance of Protestant and Roman Catholic students of theology. The foundation for Protestants is called the "Evangelical-Theological Seminary," but locally the *Stift*, and dates from 1536; that for Catholics, the *Wilhelmsstift* (but locally the *Konvikt*), was established in Tübingen in 1817, in which year the faculty of R. C. theology, which had previously existed at Ellwangen, was transferred to Tübingen. Residence in these institutions, which bear some resemblance in constitution to the colleges at Oxford and Cambridge, is obligatory upon theological students (the *Stift* receives also a number of students from the faculty of philosophy), who are under the control of officers called *Repetenten*, and are rather strictly governed—almost the only survival in German universities of a system which once prevailed extensively.

The students in the faculties of theology, law, and philosophy are not held to any examinations during their stay at the universities. Medical students have to pass, about two years after entrance, the so-called *tentamen physicum*, an examination in anatomy, physiology, physics, chemistry, botany, and zoology. It is held publicly and orally, in the presence of the dean of the medical faculty, and is extremely strict. The examiners are professors of the university, in their capacity as such, and not as members of the State Examining Commission. Those students who intend to proceed to a degree make application for the examination at their own pleasure, after passing the required number of semesters. For the faculties of theology and law the minimum is six semesters, or three years. In the philosophical faculty the number of semesters usually gone through is also six, though here there is no prescribed minimum; but it is always at the option of the faculties to refuse an application, and only a student of unusual attainments would be admitted to examination in less than three years after his entrance to the university. Still, in the case of foreign students, who are generally older men, exceptions are more readily made. In the medical faculty the minimum is nine or ten semesters.

The only degrees given by the German universities at the present day are those of *doctor* and *licentiate*;† the latter is given only in theology. The university degrees do not, as such, admit the recipient to the exercise of his profession in the church, the law, medicine, or the higher teaching-service; for this, the passing of the State Examination is necessary. Attempts have been made to give the university degrees this power, but thus far without success; and it is extremely unlikely that any of the German states will make such a concession.

The process of obtaining the doctor's degree in the faculty of law differs slightly from

* Thus, while the total number of matriculated students at the twenty universities of the German Empire (excluding Braunsberg and Münster) was in the S. S., 1890, 28,921; in the W. S., 1890-91, 28,326, a decrease of 595, an increase was shown by the following: Berlin (746), Leipsic (281), Erlangen (48), Strassburg (45), Rostock (41), all the rest exhibiting a decrease. The most considerable decrease was shown by Freiburg (323), Bonn (205), Tübingen (172), Munich (169), Kiel (145).

† Some universities (e.g. Tübingen) still word their diplomas *artium liberalium magistrum et doctorem philosophiæ*, but the master's title is never used by the recipient.

that followed in the faculties of medicine and philosophy.* In all, the presentation and acceptance of a dissertation is the prerequisite to examination. The difference just mentioned consists in this, that in the legal faculty the subject of the dissertation is assigned to the candidate on his application for an examination, and a certain time, generally six weeks, is given him for its completion, while in the other faculties the candidate selects his own subject, of course with the advice of the professor with whom he has chiefly pursued his studies. The dissertation must be an entirely original investigation (a declaration to this effect being signed by the candidate), and it must be an actual contribution to science; no mere compilation, however much learning it might embody, would be accepted. Formerly the dissertation was required to be written in Latin, but nowadays this is obligatory only for dissertations in the field of classical philology; and the university authorities are generally very tolerant in this respect, dissertations in German, English, French, or Italian, and sometimes in other modern languages, being accepted without objection. The printing of the dissertation is obligatory in most universities; there are varying regulations concerning the number of copies to be presented free of cost to the university. The candidate must first receive his exmatriculation in due form; he then hands to the dean of his faculty the certificate to this effect, the certificates of attendance upon lectures, *Seminare*, etc., his dissertation, and a brief sketch of his school and university career. This *vita*, as it is called, is generally required to be written in Latin. At the same time he makes formal application for examination, and, if he seeks the degree of Doctor of Philosophy, states the subjects (*Fächer*) in which he wishes to be examined. The chief subject (*Hauptfach*) is the one with which his dissertation concerns itself. In most universities three subjects are required, and these are expected to be broad enough to insure a very thorough test of the candidate's knowledge. If the papers are found to be in order, and the dissertation accepted, the dean after consultation with the professors appoints a time for the examination. There is no time of year especially set apart for examinations. The examination is oral, and in the presence of as many of the faculty as choose to attend, and any professor has the right to question the candidate. In some universities (e.g., at Bonn) the candidate is bound to defend his dissertation publicly, but this has become a pure formality. The customs attending the actual conferring of the degree vary; in general they are extremely simple. Different universities have different formulæ which are employed in the diplomas to indicate the degree of excellence which the candidate has displayed in dissertation and examination. Generally three grades are recognized: *cum laude*, *magna cum laude*, *summa cum laude*; but at some universities (e.g., at Tübingen) *cum laude* denotes the highest grade, the lowest being indicated by the words *post comprobatam eruditionem*, the second by *post eruditionem bene comprobatam*.

It is felt in all the German universities that the real test of the candidate's worthiness lies in the courses of lectures which he has attended, in the work which he has done under the observation of one or more professors in the *Seminar*, the philological or archaeological or grammatical or historical society, the laboratory, etc., and above all in his dissertation, rather than in the examination. Cases of the rejection of dissertations are not by any means rare; but cases of the rejection of a candidate whose dissertation has been accepted, by reason of an unsatisfactory examination, are rare. The German system has the very great merit of discouraging "cramming," which in the majority of cases is made useless by the wide range of the subjects and the latitude allowed the examiners. Matthew Arnold says (*Higher Schools and Universities on the Continent*, p. 231): "As I have again and again begged the English reader to remark, the examination-test is never used in Prussia as sufficient in itself; it is only used to make the assurance of a good education doubly sure; the really good education is regarded as the main assurance."

Theological students are examined for admission to orders by commissions appointed by the authorities of the church to which they belong; the state requires that they shall have pursued a course of theological study for at least three years at a German university, and shall pass a State Examination in philosophy, history and German literature at the end of the course, but not that they shall take a university degree. By a law passed in 1882, a certificate of attendance at courses of lectures on these subjects in the philosophical faculty may replace the State Examination. Students of law, in the majority of cases, do not seek the doctor's degree; for their admission to the bar a course of legal study at the university for at least six semesters, and two examinations, for the positions of *Referendarius* and *Assessor* respectively, are prescribed. These examinations are held by commissions appointed by the Minister of Justice. The first, the *Referendariatsexamen*, coming at the close of the university course, is chiefly theoretical; the *Assessorexamen* is held four years later, and is chiefly practical. The interval between the two examinations must be spent in practical work, for which minute regulations are prescribed. Medical students have to pass the *tentamen physicum*, already referred to. The doctor's degree is almost always sought by them, though not necessary to practice; but it does not exempt from the State Examination. This latter is held from two and a half to three years after the *tentamen physicum*; the examining com-

* In universities where the faculty of philosophy has been divided, the process is the same in all the resulting faculties, and the degree bestowed is likewise Doctor of Philosophy.

mission is appointed by the government, but in fact consists almost exclusively of university professors. Licenses for the practice of dentistry, and of veterinary surgery, emanate also from the *Cultusministerium*. Dentists must have followed a medical course for two years at a university; veterinary surgeons must have completed a course of at least three and a half years, of which the first three semesters may be at a university. Apothecaries, among other severe requirements, have to show a certificate of at least three semesters' attendance at a university, or at the *Collegium Carolinum* at Brunswick, or at the Polytechnic Schools at Stuttgart or Carlsruhe.

Candidates for the *facultas docendi*, or right to teach in the higher schools (*Gymnasia*, *Progymnasia*, *Realschulen*, *höhere Bürgerschulen*) must likewise pass a State Examination, from which the attainment of the doctor's degree exempts only in this particular, that the doctor-dissertation is accepted in place of a dissertation for the subject in which the candidate expects to teach, so far as it covers the ground of that department; for any other subject he must write a new dissertation, six months' time being allowed him for this. The State Examination for the higher school service is extremely severe; in Prussia it is regarded as the most difficult of all the examinations for the Civil Service.

Statistics of the German Universities.—The following table, taken from the very valuable work of Conrad (*The German Universities for the Last Fifty Years*) shows the average attendance at all the universities of the German Empire (including Münster, but not Braunsberg) for each decennium during the fifty years beginning with 1831; also the numbers matriculated in 1830-31 and in 1882-3. It should be remembered that in the period, 1871-81, the university of Strassburg was reopened, and the territory of Germany increased by the addition of Alsace-Lorraine:

| | Number of matriculated students. | Per. 100,000 inhabitants. |
|--------------|-------------------------------------|------------------------------|
| 1830-31..... | 15,751 | 52.5 |
| '31-41..... | average 12,247 | 38.9 |
| '41-51..... | " 11,790 | 34.1 |
| '51-61..... | " 12,149 | 33.1 |
| '61-71..... | " 13,420 | 33.7 |
| '71-81..... | " 17,832 | 40.8 |
| '82-83..... | 24,187 | 52.5 |

In 1885 the number of matriculated students was 27,228, or 58.1 per 100,000; in 1890, 29,317, or 59.3 per 100,000; in 1890-91, 28,711, or 58.09, per 100,000.

The most striking fluctuations in attendance are exhibited by the theological faculties. The highest and lowest points reached are here given:

| <i>Protestant.</i> | <i>Catholic.</i> |
|--------------------|------------------|
| 1831.....4147 | 1831.....1801 |
| '51.....1631 | '40.....866 |
| '60.....2520 | '50.....1393 |
| '76.....1539 | '60.....1700 |
| | '80.....619 |

After 1881 a remarkable reaction sets in, as the following table shows:

| <i>Protestant.</i> | <i>Catholic.</i> |
|--------------------|------------------|
| 1882-83.....3168 | |
| '83-84.....3614 | 825 |
| '85.....4469 | 1080 |
| '86-87.....4584 | 1164 |
| '90.....4544 | 1262 |

In the other faculties the fluctuations have been much less striking. For complete statistics, and a careful discussion of the causes of the fluctuations, the reader is referred to the work of Conrad.

The following table, from Ascherson's *Universitätskalender* for the summer of 1891, gives the most recent statistics attainable of the attendance and number of teachers at the universities of the German Empire and of Switzerland, at Dorpat, and at the German-speaking universities of Austria-Hungary:

| | TEACHERS. (Summer, 1891.) | | | | | | STUDENTS. (Winter, 1890-91.) | | | | | | | |
|---------------------------------|------------------------------|---------------------------|----------------------|----------------------------------|-----------------------------|--------|---------------------------------|-----------|---------------------------------------------|------------------------|----------------------------------------------------------------|---------------------------------|-----------------------------------------|----------------------------|
| | Ordinary Professors. | Extraordinary Professors. | Honorary Professors. | Privatdozenten, Assistants, etc. | Teachers of Languages, etc. | Total. | Matriculated. | | | | | | | |
| | | | | | | | THEOLOGY. | | Jurisprudence, Political Economy, Forestry. | Medicine and Pharmacy. | Philosophy, Philology, History, Mathematics, Natural Sciences. | Total of Matriculated Students. | Unmatriculated, but Attending Lectures. | Grand Total of Attendance. |
| | | | | | | | Evangelical. | Catholic. | | | | | | |
| I.—German Empire. | | | | | | | | | | | | | | |

* Greek Orthodox.

The number of foreign students at the German universities for the summer of 1891 was given as 1930; of these 436 were Americans (nearly all from the United States), 331 Russians, 293 Austrians, 255 Swiss, 117 Englishmen. At the university of Berlin alone 208 Americans were registered.

The overcrowding of the German universities, or, more correctly, the overproduction of scholars in Germany, has become a very troublesome and difficult question for the authorities to deal with. In the theological faculties this problem has not yet to be faced; the contrary problem, that of a deficiency in the number of candidates for orders, having confronted the ecclesiastical authorities; nor has the number of intending physicians become alarmingly great. But in the faculty of law, and above all in that of philosophy, the multitude of candidates has greatly outgrown the number of places to be filled, giving rise to the expression *Hungercandidaten*, i.e., "candidates for starvation." In Prussia an overcrowding of the legal profession has been so marked at several periods that the Minister of Education has caused warning to be given to the *Abiturienten* in the gymnasia against too hasty selection of a course of legal study. "This was done at the beginning of the *thirties*, of the *fifties*, and now again of the *eighties*. In the former periods the caution took very speedy and very great effect, and on the present occasion likewise we shall probably not have long to wait for the turn of the tide." (Conrad, 1884.)

Toward the admission of women to the German universities not even the first step can be said to have been taken. Occasionally women have received permission to attend lectures, but even this has been very grudgingly granted.

Bibliography.—A. History. Von Savigny, *Geschichte des römischen Rechts im Mittelalter*, vol. iii., 2nd ed., Heidelberg, 1834; forms an excellent introduction to the subject.—Meiners, *Geschichte der Entstehung der hohen Schulen unsers Erdtheils*, 4 vols., Göttingen, 1802-5; quite antiquated.—A work of great importance is: Denifle, *Die Universitäten des Mittelalters bis 1400: Band I: Die Entstehung der Universitäten*, Berlin, 1885. (The reader should, however, see particularly the criticisms of this book in the introduction to the work of Kaufmann about to be mentioned.) Kaufmann, *Geschichte der deutschen Universitäten. Band I: Vorgeschichte*. A work of great value.—Paulsen, *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten*, Leipsic, 1885; also two excellent articles by the same author in von Sybel's *Historische Zeitschrift*, vol. xv. (1) *Gründung* and (2) *Organisation und Lebensordnungen der deutschen Universitäten im Mittelalter*.—Zarncke, *Die deutschen Universitäten im Mittelalter*, Leipsic, 1857.—Von Rümer, *Geschichte der Pädagogik*, vol. iv., 4th ed., Stuttgart, 1872. (An English translation from an earlier edition was published in the *American Journal of Education*, and reprinted therefrom, New York, 1859.)—Tholuck, Article: *Universitäten*, in Herzog's *Realencyclopädie für protestantische Theologie und Kirche*, vol. xvi.; gives an excellent account of the universities from the point of view of the Protestant theologian. By the same author: *Das akademische Leben des 17. Jahrhunderts*, 2 vols., Halle, 1853-4.—Döllinger, *Die Universitäten sonst und jetzt*, 2nd ed., Munich, 1871.—J. B. Meyer, *Deutsch Universitätsentwickelungen*, Berlin, 1875.—Muther, *Aus dem Universitäts- und Gelehrtenleben im Zeitalter der Reformation*, Erlangen, 1866.—Dolch, *Geschichte des deutschen Studententhums*, Leipsic, 1858.—The famous *Epistolæ Obscurorum Virorum*, 1515-1517 (published in a good edition by Böcking, Leipsic, 1858, 2nd ed., 1864) throw much light on the university life of the end of the 15th and beginning of the 16th century. Riggensbach, *Untergegangene deutsche Universitäten*, Basle, 1887. Of works on the separate universities there is a great number. Only the following need be mentioned here by way of example: Köpke, *Die Gründung der Friedrich-Wilhelms Universität zu Berlin*, Berlin, 1860; Thorbecke, *Geschichte der Universität Heidelberg, Abteilung i. Heidelberg*, 1886; Gretsche, *Die Universität Leipzig*, Leipsic, 1830; Kläpfel, *Geschichte und Beschreibung der Universität Tübingen*, Tübingen, 1849. For others see the bibliographical lists given by Paulsen and Kaufmanns.

B. Accounts of the universities in modern times, and discussions. Hamilton, Sir William, *Dissertations and Discussions*, 1852, App. iii.—Collard, *Trois universités allemandes*, Louvain, 1879-82. Hart, *German Universities*, New York, 1874. A good popular account, entertainingly written.—Howitt, *Student Life in Germany*, London, 1841.—Von Sybel, *Die deutschen Universitäten*, Bonn, 1874. (Second edition of *Die deutschen und die auswärtigen Universitäten*.)—Conrad, *The German Universities for the last Fifty Years*. Translated by Hutchinson, with a Preface by James Bryce. Glasgow, 1885. Extremely valuable, with excellent appendices.—Matthew Arnold, *Schools and Universities on the Continent*, London, 1868. (The chapters on Germany reprinted without change, under the title: *Higher Schools and Universities in Germany*, London, 1882.) On the whole an excellent account.—Hofmann, *The Question of a Division of the Philosophical Faculty*. Inaugural address. English translation with an appendix. Boston (Ginn), 1883.—Giesebrecht, *Ueber den Einfluss der Hochschulen auf die nationale Entwicklung*, Munich, 1870.—Flach, *Der deutsche Professor der Gegenwart*, Leipsic, 1886; by the same author: *Die Reform der Universitäten*, Hamburg, 1888. The bitterness of tone, the exaggerations, the personalities of Flach's works detract largely from the value of his criticisms; still, they lay bare a side of German university life of which the outsider rarely learns.

Lists of lectures are given in Ascherson's *Deutscher Universitäts-Kalender*, published at Berlin, and the *Deutsches Akademisches Jahrbuch* (Leipsic).

DUTCH AND BELGIAN UNIVERSITIES.—The universities of the Netherlands, like those of Protestant Germany, were founded by the state as schools for the maintenance of the principles of the Reformation and the education of the clergy; and afforded in the 16th and 17th centuries a grateful refuge to not a few of those Huguenot or Port-Royalist scholars whom persecution compelled to flee beyond the boundaries of France, as well as to the Puritan clergy who were driven from England. The earliest, that of Leyden, founded in 1575, commemorated the gallant and successful resistance of the citizens to the Spanish fleet under Requesens. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Douza was, for Leyden and the Dutch, what Münchausen afterwards was for Göttingen and the German universities, but with this difference: Leyden was the model on which the younger universities of the republic were constructed; Göttingen the model on which the older universities of the empire were reformed. Both Münchausen and Douza proposed a high ideal for the schools founded under their auspices; and both, as first Curators, labored with paramount influence in realizing this ideal for the same long period of thirty-two years. Under their patronage Leyden and Göttingen took the highest place among the universities of Europe; and both have only lost their relative supremacy by

the application in other seminaries of the same measures which had at first determined their superiority. The appointment of the professors at Leyden was vested in three (afterwards five) Curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province, the office being held for nine years, and eventually for life. With these was associated the mayor of Leyden for the time being. The University of Franeker was founded in 1585, on a somewhat less liberal basis than Leyden, the professors being required to declare their assent to the rule of faith embodied in the Heidelberg Catechism and the confession of the "Belgian Church." Its four faculties were those of theology, jurisprudence, medicine, and "the three languages and the liberal arts." For a period of twelve years (1610-1622) the reputation of the university was enhanced by the able teaching of William Ames ("Amesius"), a Puritan divine and moralist, who had been driven by Bancroft from Cambridge and from England. His fame and ability are said to have attracted to Franeker students from Hungary, Poland, and Russia.

Later, there were founded in 1600 the University of Harderwijk; in 1614 that of Groningen; and, in 1634, that of Utrecht. The restoration of the House of Orange, and establishment of the kingdom of the Netherlands (23d March, 1815), was followed by important changes in connection with the whole kingdom. The Universities of Franeker and Harderwijk were suppressed, while their place was taken by the newly founded centres at Ghent (1816) and Liège (1816). A uniform constitution was given both to the Dutch and Belgian universities. It was also provided that there should be attached to each a Board of Curators, consisting of five persons, "distinguished by their love of literature and science and by their rank in society." These Curators were to be nominated by the king, and at least three of them chosen from the province in which the university was situated, while the other two were to be chosen from adjacent provinces. After the redivision of the kingdom in 1831, Ghent and Liège were constituted state universities, and each received a subsidy from the Government. (See BELGIUM.)

In Holland, the foundation of the University of Amsterdam (1877) has more than repaired the loss of Franeker and Harderwijk, and the progress of this new centre during the ten years of its existence has been remarkably rapid, so that it bids fair to rival both Utrecht and Leyden. The higher education of women has made some progress in the Netherlands; and in 1883 there were eighteen women studying at Amsterdam, eleven at Groningen, four at Leyden, and seven at Utrecht.

Belgium at the present time has four universities; Liège and Ghent (state universities); Louvain (clerical); Brussels (free). In 1890, there was allotted in the budget the sum of 1,644,900 francs for university education. The following table gives the statistics of the Belgian universities for 1890:

| Universities. | Students of | | | | | Total. |
|---------------|-------------|----------------|-------------|-----------|-----------|--------|
| | Theology. | Jurisprudence. | Philosophy. | Medicine. | Sciences. | |
| Brussels..... | .. | 423 | 153 | 568 | 526 | 1670 |
| Ghent..... | .. | 189 | 62 | 193 | 172 | 616 |
| Liège..... | .. | 356 | 299 | 299 | 337 | 1207 |
| Louvain..... | 63 | 424 | 183 | 468 | 326 | 1454 |

Attached to the universities are various special schools of engineering, arts, manufactures, mining, etc., with a combined attendance of 913 students in 1888-89.

FRENCH UNIVERSITIES.—In France, or rather in the territory included within the boundaries of modern France, Montpellier was a recognized school of medical science as early as the 12th century. Guillaume VIII., lord of Montpellier, in the year 1181, proclaimed it a school of free resort, where any teacher of medical science, from whatever country, might give instruction. Before the end of the century it possessed also a faculty of jurisprudence, a branch of learning for which it afterwards became famed. The university of medicine and that of law continued, however, to be totally distinct bodies with different constitutions. Petrarch was sent by his father to Montpellier to study the civil law. On the 26th of October, 1289, Montpellier was raised by Nicholas IV. to the rank of a "studium generale," a mark of favor which, in a region where papal influence was so potent, resulted in a considerable accession of prosperity. The university also now included a faculty of arts; and there is satisfactory evidence of the existence of a faculty of theology before the close of the 14th century, although not formally recognized by the pope before the year 1421. In the course of the same century several colleges for poor students were also founded. The University of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond of Toulouse. In the year 1233 it first acquired its full privileges as a studium generale by virtue of a charter given by Gregory IX. This pontiff watched

over the university with especial solicitude, and through his exertions it soon became a noted centre of theological, and especially of Dominican, teaching. As a school of arts, jurisprudence, and medicine, although faculties of each existed, it never attained to any reputation. The University of Orléans had a virtual existence as a *studium generale* as early as the first half of the 13th century; but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of Orléans had an existence, it is said, as early as the 6th century, and subsequently supplied the nucleus for the foundation of a university at Blois; but of this university no records now exist. Orléans, in its organization, was modeled mainly on Paris, but its studies were complementary rather than in rivalry to the older university. The absorbing character of the study of the civil law, and the mercenary spirit in which it was pursued, had led the authorities at Paris to refuse to recognize it as a faculty. The study found a home at Orléans, where it was cultivated with an energy which attracted numerous students. In January, 1235, we find the bishop of Orléans soliciting the advice of Gregory IX. as to the expediency of countenancing a study which was prohibited in Paris. Gregory decided that the lectures might be continued; but he ordered that no beneficed ecclesiastic should be allowed to devote himself to so eminently secular a branch of learning. Orléans subsequently incorporated a Faculty of Arts, but its reputation from this period was always that of a school of legal studies, and in the 14th century its reputation in this respect was surpassed by no other university in Europe. Prior to the 13th century it had been famed for its classical learning, and Angers, which received its charter at the same time, also once enjoyed a like reputation, which, in a similar manner, it exchanged for that of a school for civilians and canonists. The roll of the university forwarded in 1378 to Clement VII. contains the names of 8 professors *utriusque juris*, 2 of civil and 2 of canon law, 72 licentiates, 284 bachelors of both the legal faculties, and 190 scholars. The University of Avignon was first recognized as a *studium generale* by Boniface VIII., in the year 1303, with power to grant degrees in jurisprudence, arts, and medicine. Its numbers declined somewhat during the residence of the popes, owing to the counter attractions of the *studium* attached to the curia; but after the return of the papal court to Rome it became one of the most frequented universities in France, and possessed at one time no less than seven colleges. The University of Cahors enjoyed the advantage of being regarded with especial favor by John XXII. In June, 1332, he conferred upon it privileges identical with those already granted to the University of Toulouse. In the following October, again following the precedent established at Toulouse, he appointed the *scholasticus* of the cathedral chancellor of the university. In November of the same year a bull, couched in terms almost identical with those of the Magna Charta of Paris, assimilated the constitution of Cahors to that of the oldest university. The two schools in France which, down to the close of the 14th century, most closely resembled Paris, were Orléans and Cahors. The civil immunities and privileges of the latter university were not, however, acquired until the year 1367, when Edward III. of England, in his capacity as Duke of Aquitaine, not only exempted the scholars from the payment of all taxes and imposts, but bestowed upon them the peculiar privileges known as *privilegium fori*. Cahors also received a license for Faculties of Theology and Medicine, but, like Orléans, it was chiefly known as a school of jurisprudence. It was a *studium generale* in the same three faculties that Grenoble, in the year 1339, received its charter from Benedict XII. The university never attained to much importance, and its annals are for the most part involved in obscurity. At the commencement of the 16th century it had ceased altogether to exist, was reorganized by Francis of Bourbon in 1542, and in 1565 was united to the University of Valence. The University of Perpignan, founded, according to Deniflé, in 1379, by Clement VII. (although tradition had previously ascribed its origin to Pedro IV. of Aragon), and that of Orange, founded in 1365 by Charles IV., were universities only by name and constitution, their names rarely appearing in contemporary chronicles, while their very existence becomes at times a matter for reasonable doubt.

In modern France, since the revolution, the word university has acquired a meaning widely different from that which it bears in other countries; the expression, "*Université de France*," being nearly equivalent to "national system of education of France." All the old universities of the country having been swept away at the revolution, education had fallen into abeyance. After various attempts at the establishment of primary, secondary, and central schools in the departments, the imperial government adopted a new system, by which the whole educational machinery of the country was centralized at Paris, and committed to a body called the University, with a Grand Master at its head, assisted by a Council. The system has since undergone various alterations. The governing body, as well for the higher educational institutes as for the elementary schools, is the ministry of public instruction, supported by a supreme educational council and 18 inspectors-general. France is divided into 16 educational districts, the so-called academies, within the bounds of which exist one or more of the Faculties of Theology, Law, Medicine, and Science and Literature. Such faculties are found in 18 towns, and in Paris; but only in the latter are the five co-existing faculties organized into a university. The monopoly, hitherto enjoyed by the University of France, of opening schools of law and medicine, and of conferring degrees, was abolished by a law passed in 1875.

There are 15 *facultés des lettres* at Paris, Aix, Besançon, Bordeaux, Caen, Clermont, Dijon, Lille, Grenoble, Lyon, Montpellier, Nancy, Poitiers, Rennes, and Toulouse. At all of these, except Aix, are also *facultés des sciences*, besides one at Marseilles. There are also 2 *facultés* of Protestant theology, 15 *facultés de droit*, and 6 *facultés de médecine*. In January, 1888, there were 4908 students of law; 5321 students of medicine; 2320 students of pharmacy. To the support of the *facultés* the sum of 11,600,370 francs was set down in the budget of 1891. The Roman Catholic theological *facultés* were suppressed in 1885, but the Catholic universities exist still on condition of their professors submitting to the usual State examinations.

SPANISH AND PORTUGUESE UNIVERSITIES.—In Spain, the universities at present existing are those of Barcelona, Grenada, Madrid (transferred in 1837 from Alcalá), Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid, and Zaragoza. They are all, with the exception perhaps of Madrid, in a lamentably depressed condition, and mainly under the influence of French ideas and modeled on French examples. But in Portugal, Coimbra, which narrowly escaped suppression in the 16th century as a suspected centre of political disaffection, is now a flourishing school. Its instruction is given gratis; but, as all members of the higher courts of judicature and administration in the realm are required to have graduated at the university, it is at the same time one of the most aristocratic schools in Europe. There are five faculties,—viz., Theology, Jurisprudence, Medicine, Mathematics, and Philosophy. Of these, that of law is by far the most flourishing, the number of students in this faculty nearly equaling the aggregate of all the rest. There is a valuable library, largely composed of collections formerly belonging to suppressed convents. As a school of theology, Coimbra is distinctly anti-ultramontane, and the progressive spirit of the university is shown by the fact that the rector has lately been instructed by the government to devise a scheme for the admission of women.

RUSSIAN UNIVERSITIES.—Russia possesses, besides Dorpat, already described among the German universities, seven other universities. (1) Helsingfors, in Finland, was originally established by Queen Christina in Abo (1640), and removed in 1826 to Helsingfors, where the original charter, signed by the celebrated Oxenstierna, is still preserved. It has four faculties, 38 professors, and 700 students. (2) Moscow is really the oldest Russian university, having been founded in 1755. It includes the Faculties of History, Physics, Jurisprudence, and Medicine; the professors are 69 in number, the students about 1660. (3) The University of St. Vladimir at Kieff, originally founded at Vilna in 1803, was removed from thence to Kieff in 1833; the students number about 900, and the library contains 107,000 volumes. (4) Kazan (1804) includes the same faculties as Moscow; the students are about 450 in number, and it has a library containing 80,000 volumes. (5) Hharkoff (1804) numbers 600 students, and its library 55,000 volumes. (6) St. Petersburg (1819) includes the four faculties of History, Physics, Jurisprudence, and Oriental languages, and numbers 1500 students. (7) Odessa, founded in 1865, represents the university of New Russia. Generally speaking, the universities of Russia are not frequented by the aristocratic classes; they are largely subsidized by the Government, and the annual fees payable by students are less than \$35 a head. In 1863 the statutes of all the universities were remodeled; and since that time there has been a tendency to impress upon them a more national character, as distinguished from mere imitation of those in Germany.

SWEDISH AND DANISH UNIVERSITIES.—Nearly contemporaneous with the foundation of Göttingen in Germany, were those of Upsala in Sweden (1477) and Copenhagen in Denmark (1479), which, although lying without the political boundaries of Germany, reflected her influence. The charter for Copenhagen was given by Sixtus IV. as early as 1475. The students attracted to this new centre were mainly from within the radius of the University of Cologne, and its statutes were little more than a transcript of those of the latter foundation. In Sweden the University of Lund, founded in 1668 and modeled on the same plan as its predecessor at Upsala, has adhered to its antiquated constitution with remarkable tenacity. At both these universities the mediæval division into "nations" is still in force among the students, the number at Upsala being no less than thirteen. The faculty at both centres is much below the modern requirements in point of numbers. The University of Christiana in Norway, founded in 1811, and the Swedish universities, are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observation applies to Copenhagen, where, however, the labors of Rusk and Madvig have done much to sustain the reputation of the university for learning. The University of Kiel (1665), on the other hand, has come much more under Teutonic influences, and is now a distinguished centre of scientific teaching. In 1890, the students at Upsala numbered 1791; at Lund, 855; at Christiana, 1620; at Copenhagen, 1300.

GREECE.—The University of Athens (founded May 22d, 1837) is modeled on the university systems of northern Germany and on a plan originally suggested by Professor Brandis. It includes four faculties—viz., theology, jurisprudence, medicine, and philosophy. The professors are upward of 60 in number; the students about 1500. There is also a school of pharmacy, chemistry, and anatomy, and a library of 130,000 volumes, with 800 manuscripts. In 1885, the budget contained 3,000,000 drachmas (\$600,000) as the governmental contribution to higher education.

AMERICAN UNIVERSITIES.—In the United States, popular usage employs the terms "university" and "college" indiscriminately of any higher institution of learning which possesses the power of conferring the usual academic degrees. This confusion prevails also in official nomenclature, for some of the oldest, richest, and most completely equipped of our universities still bear the name of "college," while in certain parts of the country, institutions inferior in endowment and in scholarly distinction to some of the secondary schools, are officially designated as "universities." Harvard and Yale, though long since equipped with the amplest facilities for university work, have only very recently put aside the name of "college," and the same is true also of Columbia and Princeton.

American universities may be classified in two ways: (a) with regard to their origin; or (b) with regard to their pædagogic character. Classified in the former way, they fall under three heads: (1) Universities that were originally endowed by private individuals; (2) universities that were established by some ecclesiastical body; and (3) universities that are founded and controlled by the state—meaning by the state, not the federal government, but the individual member of the Union.

In the first division, the best known examples are Harvard, Yale, Williams, Bowdoin, Amherst, Brown, Cornell, Johns Hopkins, and the Leland Stanford, Jr., University. To the second division belong Columbia, Trinity (Connecticut), Wesleyan, Union, Chicago, Princeton, Hamilton, Rochester, the University of the South, Racine, Kenyon, Lake Forest, Allegheny, and Oberlin. It must not be understood that these universities have necessarily remained essentially denominational in the *personnel* of their faculties, or that they now have any especial ecclesiastical leanings. This is true of some, to be sure, but others have only an historical connection with a particular church. Of the third division are the various state universities, the best known of which are the University of Vermont, the University of New York, the University of Virginia, the University of Michigan, the University of North Carolina, the University of Pennsylvania, the University of Indiana, the University of Illinois, and the University of California. In many instances the state, instead of establishing a new university, liberally aided an existing institution, claiming in return certain privileges and a share of control in its government. This is true, for example, of the relations of the state of New Hampshire with Dartmouth College; of Massachusetts with Harvard University, and of New Jersey with Princeton.

Classified with reference to their pædagogic character, American universities may be roughly grouped under two general heads: (1) Universities that are equipped for the prosecution of original investigation and research in the various departments of study, besides usually having connected with them the various professional schools, representing the faculties of law, medicine, theology, and natural science; and (2) universities, so-called, that perform chiefly the disciplinary and preparatory work which in Germany is the function of the *gymnasium* and the *real-schule*. (See GYMNASIA). These latter institutions have, in general, a prescribed course leading to the degree of Bachelor of Arts (modified in some cases as to the degrees of Bachelor of Letters, Bachelor of Science, or Bachelor of Philosophy), with the granting of which degree the responsibility of the institution usually ends.

Of the former class of universities, corresponding to the universities of Germany, are Harvard, Yale, Columbia, Princeton, Michigan, the Johns Hopkins University, Clark University, the University of Virginia, the University of Pennsylvania, the University of California, Boston University, the re-organized University of Chicago, Cornell University, and the North-Western University. In all of these, except Clark University, the gymnasial work is also done; but less stress is laid upon it than upon the more original work performed by those who have already received their first degree in Arts or Science, and who are consequently engaged in the special investigations that are to fit them for their life-work.

Among the institutions that belong to the second division, and that confine themselves chiefly to a very thorough performance of the gymnasial work leading to the first degree in Arts (and sometimes in Science), are Amherst, Williams, Bowdoin, Union, Trinity, Rutgers, Lafayette, Hampden-Sidney, Washington-and-Lee, Kenyon, Adelbert, Allegheny, Oberlin, Hobart, Vassar (for women), Wellesley (for women), Smith (for women), Olivet, St. Francis Xavier's, Haverford, Xenia, Fisk, Bates, Antioch, Charleston, Dickinson, Georgetown, Knox, Manhattan, Muhlenberg, Randolph-Macon, Swarthmore, Tufts, Wabash, Westminster, and William and Mary. Many of these offer facilities for advanced work in special lines of study, and some have faculties of law, but the "undergraduate course" in Arts forms in all, the most important portion of the university curriculum. The University of the State of New York is only an examining body like the University of London, or like Queen's in Ireland. See REGENT.

The organization of the universities of this country, and their local arrangements, differ considerably; but in the main, they reproduce the general features of the English and Scotch universities, with some marked exceptions. The teaching body is generally composed of Professors (Full Professors, Adjunct, Associate, or Assistant Professors), Tutors, Instructors, and Assistants. The organization is generally by departments, i.e., Greek, Latin, Mathematics, History, etc. At the head of each department is a full professor who exercises a general control over the work of the department, and

over the officers of instruction attached to it. To him the associate professors, tutors, etc., in the department, are responsible. He arranges the subjects of study, assigns the work of the subordinate instructors, and reports to the President or Chancellor from time to time upon the work accomplished. The President (or Chancellor) exercises a general supervision over the entire institution, and is the medium of communication between the faculty or faculties, and the "trustees," "overseers," "regents," or "governors" of the university—a body with whom usually rests the ultimate sovereignty of the institution, and who have exclusive control of the finances. These gentlemen are generally a body with the right of co-optation; but in some universities, as in Harvard and Dartmouth, the graduates elect a certain proportion of their number. In some of the state universities, as, for instance, the University of Michigan, the regents are elected by the popular vote, and the office has a semi-political significance. The right of interference with the internal concerns of the university is not always actively exercised. The trustees of Trinity (Conn.), for instance, meet regularly but once or twice a year, and practically only to ratify the action of the President and faculty. At Columbia, on the other hand, they meet every month, and exercise a very rigid control over even the purely educational policy of the university. The organization of the professors and instructors in American universities differs widely. In the institutions where most of the work is in Arts and Science, there is generally a single faculty. In the larger universities, the faculties are often wholly distinct, the President acting as the only bond between them. Each faculty, then, legislates independently of the others on matters affecting its own local interests, while questions affecting the university as a whole are left largely to the board of trustees, advised by the President and sometimes by the faculties acting separately. At Columbia, the German system of organization has been largely adopted and has been found to work smoothly and well. (See COLUMBIA COLLEGE.) In many colleges only professors are members of the faculties. In others, as at Yale, minor officers also have a seat, but with a fractional system of voting that makes the vote of a professor count for more than that of a tutor. Professors in American colleges receive a stated salary and are in nowise dependent upon the students' fees, except in the case of some of the faculties of medicine. This stated salary varies in the different institutions, according to the funds available, and also according to the nature of the work. In the older and wealthier universities, the average salary paid to a full professor is from \$2500 to \$4000. At Columbia, the highest salaries are paid, ranging from \$5000 to \$7500, this being practically necessary, however, owing to the increased cost of living in a city like New York. In all the older universities, there are chairs endowed by the generosity of private individuals, or of associations.

An American professor is always a teacher, and the amount of his time that must be devoted to actual lecturing and teaching (often as much as 18 hours per week), is usually prescribed for him by the college regulations. He has not the privilege accorded to the German professor, of "reading" or not, but must every year go through a certain number of courses of instruction, besides being expected, in many of the colleges, to assume a certain amount of responsibility for the morals and discipline of the undergraduates. This is a very serious obstacle in the way of his ability to carry on independent investigation and research, and makes the American professoriate a comparatively sterile body, though an improvement in this respect has been very noticeable in the past ten years. Harvard, Cornell, Columbia, the Johns Hopkins, and Clark University have now largely adopted the German conception of the professorial function, and allow the individual professor much greater liberty in the discharge of his duties than was formerly the case. Harvard, Columbia, and Cornell have likewise adopted the laudable plan of allowing each professor one year's leave of absence in seven, though with some diminution of salary.

The regular undergraduate course of study is one of four years; though it has been proposed at various times to cut it down to three, with an increase in the requirements for admission to the course. This is now invariably preceded either (1) by an entrance examination conducted by the university; or (2) the presentation of a certificate from a school licensed by the university to issue such a document. Harvard, Yale, and Williams, are among the universities that accept certificates from certain schools. The subjects for examination for entrance, are usually Greek, Latin, Algebra, Geometry, Arithmetic, English Grammar and Composition, Geography (ancient and modern), Ancient History, and French or German. Some few require also an elementary knowledge of Chemistry or Physics, and Plane Trigonometry; and some, United States History. Greek is in some institutions made optional, with the choice of substituting German.

The curricula of the various universities do not very greatly differ for the undergraduate student; but in a few universities, the power of electing studies is given to the student, with much less restriction than in others. The general practice is for the student to pursue a prescribed course for the first two years; and with the third year to elect such studies as his maturer judgment may regard as likely to be most useful to him. Complete liberty of selection is generally given him in his fourth, or "Senior" year. At Harvard and at the University of Virginia, however, from the outset, complete liberty of choice is permitted. (See HARVARD UNIVERSITY.) At the end of four years, the degree of Bachelor of Arts is conferred, usually with much ceremony, at the "Com-

ancement" (q.v.). This degree (as said before, the degree of Bachelor of Letters, Science, or Philosophy is sometimes given instead of that in Arts) admits the graduate to university studies in those institutions that afford facilities for advanced work. The pursuit of special studies (usually three, as in Germany) under the direction of university professors, followed by the preparation of a dissertation upon some point connected with his major subject, and by a series of examinations, public or private, leads to the higher degree of Doctor of Philosophy (Ph.D.).

In general, the undergraduates of an American university lodge in the college buildings, as at Oxford and Cambridge. They usually arrange for their meals outside the college walls, at eating clubs, boarding-houses, or restaurants. At Harvard (q.v.), board in the Memorial Hall is provided upon payment of a moderate sum per week. At Brown, Clark, Columbia, the University of the City of New York, the University of Pennsylvania, the Johns Hopkins University and a few others, the German plan prevails of leaving the students to find their own lodgings where they please.

The American universities whose origin antedates the Revolution are these: Harvard (1638); William and Mary (1693); Yale (1701); Princeton (1746); University of Pennsylvania (1753); Columbia (1754); Brown (1764); Rutgers (1766); Dartmouth (1769).

The following table, taken from the report of the commissioner of education for 1895-6, gives the statistics of universities and colleges for men and for both sexes in the United States:

| | Location. | Name. | Year of opening. | Religious denomination controlling. | Professors and instructors. | Students. |

* Statistics of 1894-95.

CANADIAN UNIVERSITIES.—In Canada the M'Gill College and University at Montreal was founded by royal charter in 1821 (amended in 1852) on the foundation of the Honorable James M'Gill, who died at Montreal on the 19th of December, 1813. A number of colleges and schools throughout the province stand in the relation of affiliated institutions. The university is Protestant, but undenominational. It includes the faculties of arts, applied sciences, medicine, and law. In 1885 the total number of students, including women, was 526. The University of Toronto was originally established by royal charter in 1827, under the title of King's College, with certain religious restrictions, resembling those at that time in force at the English universities; but in 1834 these restrictions were abolished, and in 1849 the designation of the university was changed into that of the University of Toronto. In 1873 further amendments were made in the constitution of the university. The Chancellor was made elective for a period of three years by Convocation, which was at the same time reorganized so as to include all graduates in law, medicine, and surgery, all masters of arts, and bachelors of arts of three years' standing, all doctors of science, and bachelors of science of three years' standing. The powers of the Senate were also extended to all branches of literature, science, and the arts, to granting certificates of proficiency to women, and to affiliating colleges. The work of instruction is performed by University College, which is maintained out of the endowment of the provincial university, and governed by a Council composed of the residents and the professors. Its several chairs include classical literature, logic and rhetoric, mathematics and natural philosophy, chemistry and experimental philosophy, history and English literature, mineralogy and geology, metaphysics and ethics, meteorology and natural history, and lectureships on Oriental literature, German, and French. Other universities and colleges with power to confer degrees are the Victoria University at Cobourg (1836), supported by the Methodist Church of Canada; Queen's University, Kingston (1841), representing the Presbyterian body; and the University of Trinity College, Toronto, founded in 1851 on the suppression of the faculty of divinity in King's College. Lennoxville is a centre for university instruction in conformity with Church of England principles. See CANADA.

AUSTRALIAN UNIVERSITIES.—In Australia, the University of Sydney was incorporated by an act of the colonial legislature which received the royal assent 9th December, 1851, and on the 27th February, 1858, a royal charter was granted conferring on graduates of the university the same rank, style, and precedence as are enjoyed by graduates of universities within the United Kingdom. Sydney is also one of the institutions associated with the University of London, from which certificates of having received a due course of instruction may be received with a view to admission to degrees. There are four faculties—viz., arts, law, medicine, and science. The design of the university is to supply the means of a liberal education to all orders and denominations, without any distinction whatever. An act for the purpose of facilitating the erection of colleges in connection with different religious bodies was, however, passed by the legislature during the session of 1884, and since that time colleges representing the Episcopalian, Presbyterian, and Roman Catholic churches have been founded. In 1885 the total number of students attending lectures in the university was 206.

The University of Melbourne, in the colony of Victoria, was incorporated and

endowed by royal act of the 22d of January, 1853. This act was amended June 7th 1881. Here, also, no religious tests are imposed on admission to any degree or election to any office. The Council is empowered, after due examination, to confer degrees in all the faculties (excepting divinity) which can be conferred in any university within the British dominions. It is also authorized to affiliate colleges; and Trinity College (Church of England) was accordingly founded in 1870, and Ormond College (Presbyterian) in 1879. The founding of a university for Queensland has been for some time in contemplation. The University of Adelaide in South Australia (founded mainly by the exertions and munificence of Sir Walter Watson Hughes) was incorporated by an act of the colonial legislature in 1874, in which year it was further endowed by Sir Thomas Elder. In 1881 letters patent were granted by the English Crown whereby degrees conferred by the university were constituted of equal validity with those of any university of the United Kingdom. The faculties in the university are those of arts, medicine, law, science, and music. The number of matriculations since the foundation amounted, in 1886, to 284, the number of undergraduates in that year being 90.

The University of New Zealand, founded in 1870, and reconstituted in 1874 and 1875, is empowered by royal charter to grant several degrees of bachelor and master of arts, and bachelor and doctor in law, medicine, and music. Women are admitted to degrees. To this the Auckland University College, Nelson College, Canterbury College, and the University of Otago, stand in the relation of affiliated institutions. This last-named institution was founded in 1869 by an order of the provincial council, with the power of conferring degrees in arts, medicine, and law, and received as an endowment 100,000 acres of pastoral land. It was opened in 1871 with a staff of three professors, all in the faculty of arts. In 1872 the provincial council further subsidized it by a grant of a second 100,000 acres of land, and the university was now enabled to make considerable additions to the staff of professors and lecturers, to establish a lectureship in law, and to lay the foundations of a medical school. In 1874 an agreement was made between the University of New Zealand and that of Otago, whereby the functions of the former were restricted to the examination of candidates for matriculation, for scholarships, and for degrees; while the latter bound itself to become affiliated to the University of New Zealand, to hold in abeyance its power of granting degrees, and to waive the claim which it had advanced to a royal charter. As the result of this arrangement, the University of Otago became possessed of 10,000 acres of land, which had been set apart for university purposes in the former province of Southland. In 1877 a School of Mines was established in connection with the university.

INDIAN UNIVERSITIES.—In India, the oldest universities date from 1857,—that of Calcutta having been incorporated January 24th, Bombay, July 18th, Madras, September 5th in that year. At these three universities the instruction is mainly in English. "A university in India," says Sir R. Temple, "is a body for examining candidates for degrees, and for conferring degrees. It has the power of prescribing text-books, standards of instruction, and rules of procedure, but is not an institution for teaching. Its governance and management are vested in a body of fellows, some of whom are *ex officio*, being the chief European functionaries of the state. The remainder are appointed by the government, being generally chosen as representative men in respect of eminent learning, scientific attainment, official position, social status, or personal worth. Being a mixed body of Europeans and natives, they thus comprise all that is best and wisest in that division of the empire to which the university belongs, and fairly represent most of the phases of thought and philosophic tendencies observable in the country. The fellows in their corporate capacity form the Senate. The affairs of the university are conducted by the Syndicate, consisting of a limited number of members elected from among the fellows. The faculties comprise arts and philosophy, law, medicine, and civil engineering. A degree in natural and physical science has more recently been added." The Punjab University was incorporated in 1883—the Punjab University College, prior to that date, having conferred titles only and not degrees. The main object of this university is the encouragement of the study of the Oriental languages and literature, and the rendering accessible to native students the results of European scientific teaching through the medium of their own vernacular. The Oriental Faculty is here the oldest, and the degree of B.O.L. (Bachelor of Oriental Literature) is given as the result of its examinations. At the Oriental College the instruction is given wholly in the native languages. In 1887, the Senate at Cambridge, England, adopted resolutions whereby some forty-nine collegiate institutions already affiliated to the latter body were affiliated to the University of Cambridge, their students thus becoming entitled to the remission of one year in the ordinary statutable requirements with respect to residence at Cambridge. It is at these institutions, and the colleges of the first or second grade in the other presidencies, that the instruction is given. See Lethbridge, *High Education in India* (1882).

Besides the works already cited, the reader is referred to Cantoni, *La Questione Universitaria* (Milan, 1874); Seeley, *Lectures and Essays*, pp. 182–216 (1870); Humphrey's *Higher Education in America and Europe*; Newman, *The Idea of a University* (1873); id., *Rise and Progress of Universities* (1872); Tappan, *University Education*; Wooton, *Guide to Degrees in Arts, Sciences, etc.* (1887); Wood, *Degrees, Gowns, and Hoods* (1883); id., *Ecclesiastical and Academic Colors* (1884); Burgess, *The American*

University (1882); Porter, *American Colleges and the American Public* (1875); Thwing, *American Colleges* (2d. ed., 1883); Coubertin, *Universités Transatlantiques* (1890).

UNIVERSITY EXTENSION, briefly defined, is an attempt to carry the university to the people, when the people cannot come to the university. It is at once a missionary and a democratic movement. While proceeding from generous and enlightened college men, it is at the same time part of the general progress of the English people during the nineteenth century. The Reform Bill of 1832, the Chartist movement from 1838 to 1848, the widening of the suffrage, and the recent establishment of popular education, are only landmarks in the rising flood. The idea of extending more widely university privileges to the English people by means of local colleges was proposed by William Sewall, of Oxford, in the year 1850. The idea was not realized until 1876, when University College at Bristol was established by the joint efforts of two Oxford colleges. Many pioneer attempts were made by university men in the direction of higher popular education. The founding of mechanics' institutes, beginning with Dr. Birkbeck's lectures to workmen in Glasgow in 1800 and with the Birkbeck Institute in London, in 1823, led the way to a long line of popular establishments, in which college men rendered good educational service as teachers and lecturers. The social influence of the French Revolution of 1848 made itself deeply felt in England. In 1854, Frederick Denison Maurice founded the Workingmen's College in London. University graduates like Thomas Hughes, John Ruskin, J. S. Brewer, and J. R. Seeley lent a hand in the conduct of evening classes. A desire to improve the standards of adult education led Dr. Temple and other university men in London to establish a system of examinations for mechanics' institutes. From this beginning proceeded the entire system of local examinations for the benefit of middle class schools and teachers. Oxford University gave its sanction to this movement in 1857. Cambridge and other universities followed the example of Oxford, and thus gradually the whole system of popular education was taken in hand.

In 1867 Professor James Stuart, of Cambridge, was invited by the North of England Council for the Education of Women to lecture upon the art of teaching. He consented to illustrate the subject by giving eight lectures upon astronomy to classes of ladies in Leeds, Liverpool, Manchester, and Sheffield. In connection with these classes were developed three of the principal educational characteristics of University Extension: (1) Circuit lectures; (2) the use of a printed syllabus, to save note-taking and serve as a means of review and home study; (3) weekly written exercises, prepared by students at home in their own time, in answer to proposed questions, and sent by post to the lecturer for correction. This first experiment proved very successful, and led to the institution of ladies' lectures in Cambridge, and finally to the institution of Newnham College. By invitation, Professor Stuart soon extended his course of instruction to workmen and co-operative societies in the North of England. In this connection originated the fourth feature of University Extension—namely, the class, for public review and discussion of the lecture. The fifth characteristic, or final written examination, was added in 1873, when Cambridge University formally sanctioned this system of educational work and began to apply the machinery of local examinations to the testing of the results of local lectures. Two kinds of certificates are now issued—"Pass" and "Distinction." They are said to imply quite as good work as that usually tested by university examinations in similar lines of work.

Unit courses of twelve lectures are now given by Cambridge men in three groups of subjects: (1) literature and history; (2) science, and (3) art appreciation. Extension students who have passed satisfactory examinations in six consecutive unit courses in one group, and two other unit courses, together with examinations in Latin, one other foreign language, and in algebra and Euclid, are now admitted to Cambridge University with credit for one year's advanced standing, and may obtain the bachelor's degree by two years' further study in residence. Thus the middle wall of partition between the university and the people is completely broken down. Any talented young workingman whose mind is awakened by University Extension lectures can now enjoy a regular college course, if he has the necessary persistence. Local prizes and university scholarships are awarded to extension students in order to encourage the highest work and afford periods of special study at the university.

One of the clearest and most concise descriptions of the University Extension system is that written by a Northumberland miner, who had attended extension lectures for several terms: "Any town or village which is prepared to provide an audience, and pay the necessary fees, can secure a course of twelve lectures on any subject taught in the University, by a lecturer who has been educated at the University, and who is specially fitted for lecturing work. A syllabus of the course is printed and put into the hands of students. This syllabus is a great help to persons not accustomed to note-taking. Questions are given on each lecture, and written answers can be sent in by any one, irrespective of age or sex. All the lectures, except the first, are preceded by a class, which lasts about an hour. In this class the students and the lecturer talk over the previous lecture. The written answers are returned with such corrections as the lecturer deems necessary. At the end of the course an examination is held and certificates are awarded to the successful candidates. These lectures are called University Extension Lectures. They impart, so far as each subject is treated, a university education."

Oxford began, 1878, to engage in University Extension work. Her lecturers have followed much the same methods as those of Cambridge, although it has been found expedient in many localities to give shorter courses of instruction. Oxford has generously equipped her lecturers with so-called "Traveling Libraries," or working collections of standard books, for use in communities where library facilities are inadequate to the needs of extension classes. Where local libraries exist, co-operation with extension work is usually afforded. A so-called "University Extension Table" is often supplied with those books which readers are likely to find useful. Oxford men have developed a very attractive style of interleaved syllabus for note-taking. It is customary in England to make the printed syllabus interesting to the reader by means of striking quotations and thoughtful suggestions. Oxford extension is under the direction of a university committee, the secretary of which is Mr. M. E. Sadler, joint author with H. J. Mackinder, of a little book on "University Extension: Has it a Future?" Mr. Sadler advocates state aid for University Extension.

The London Society for the Extension of University Teaching was organized in 1876. Its object is to bring university teaching within reach of persons of all classes and of both sexes living in London and its neighborhood, and to work in as close connection with the Universities of Oxford, Cambridge, and London as may be possible. Upon the Council of this society are representatives not only of the great universities but of the following London institutions: Bedford College, Birkbeck Institute, City of London College, College for Men and Women, King's College, London Institution, Queen's College, Royal Institution, University College, and the Workingmen's College. Thus all the higher educational forces of the great metropolis are combined for the extension of university teaching. Extension lectures are given at some of these institutions and at a great number of other centres in different parts of London. Gresham College, a sixteenth-century endowment for the education of busy people, has come into special prominence in connection with University Extension. Another prominent centre is Toynbee Hall, or the Universities' Settlements in East London. One of the best agencies in extension work is to be found in these colonies of university men, these social and educational missions in the industrial quarters of London. People's lectures in great halls are now given for the purpose of awakening public interest in extension courses, which aim not so much at mass meetings as at the formation of intelligent classes for real study. The practical management of the London Society is under the direction of Dr. R. D. Roberts, author of "Eighteen Years of University Extension" (Macmillan, 1891). Dr. Roberts is also the present assistant secretary of Cambridge University Extension. He is an earnest advocate of the establishment of a Teaching University in London, for the purpose of co-ordinating the higher educational interests of the metropolis, and providing advantages that are not offered by the present University of London, which is merely an examining body. See UNIVERSITY SETTLEMENTS.

The London Society employed thirty-eight lecturers in 1889-90, eight of whom also lectured for Cambridge and two for Oxford. Cambridge had upon her staff twenty-four, and Oxford the same number. The men engaged in extension work are not usually members of any academic faculty, although they sometimes hold fellowships and minor academic positions. The policy of rewarding good extension lecturers by appointments to fellowships seems to be growing in favor. Any university man can become an extension lecturer if his academic record, his syllabus, and his method of lecturing are approved by competent authority. Junior lecturers are sometimes sent out to observe the methods of their seniors. The reflex influence of improved methods of lecturing has already made itself felt upon the English colleges. Summer schools are now maintained by Oxford, Cambridge, and the University of Edinburgh. This device, like the English Home Reading Circles, was borrowed from Chautauqua, as English educators frankly admit. Some of the best professors and public men in England lecture to extension students in the summer season. Extension courses are now offered not only by Oxford and Cambridge, but by the Welsh and Irish colleges and by the Universities of Scotland and Australia. In the year 1889-90 there were more than 250 centres of University Extension in England and more than 41,000 attendants upon lectures.

In America the spirit of University Extension was known long before the name came into current use. As early as 1808 Professor Benjamin Silliman, of Yale College, began to give popular courses of lectures in chemistry to the people of New Haven. He and other college men extended this kind of work to the Mechanics' Institute of New Haven and to popular audiences in Hartford, Salem, Boston—in fact throughout New England and the country at large. The old lyceum system of public lectures was promoted chiefly by college men, and it has proved of great educational value in the North and West, where it still survives. College men have also lectured to the people in connection with farmers' institutes, teachers' institutes, and summer schools of the college and of the Chautauqua type. Many universities, like Harvard, Yale, Columbia, Pennsylvania, the Johns Hopkins, and state institutions, South and West, have long been in the habit of offering public courses of lectures. University men in Baltimore lent a hand in the formation of a Workingmen's Institute and lectured to the members in 1879-80. Biological lectures to the employés of the Baltimore and Ohio Railroad were printed for home study in 1882.

Perhaps the first conscious attempt in this country to introduce University Extension

methods was made in the fall and winter of 1887 by individual instructors and graduate students in the department of history and politics at the Johns Hopkins University. Local and systematic courses of lectures were then or afterwards given to church societies, workingmen's clubs, guilds, teachers' associations, Young Men's Christian Associations, Chautauqua circles, Epworth Leagues, and other organizations, usually with a printed syllabus, oral discussions, and examinations. The idea was extended from Baltimore to Washington (1888-91), to Philadelphia (1890), also to the American Library Association (1887-90), and to Chautauqua (1888-91) by repeated public presentations of the subject by Dr. Herbert B. Adams. Successful experiments in University Extension have been made by Dr. E. W. Bemis, a Johns Hopkins graduate, in connection with public libraries in the cities of Buffalo and St. Louis.

A project for University Extension was drawn up by H. B. Adams and adopted by the managers of Chautauqua as early as the summer of 1887. A plan was published in September of that year giving a history of University Extension, its aims, methods of work, organization, and the cost of courses. It was proposed to revive in the United States the original idea of a university as a voluntary association of students and itinerant lecturers, and to promote good citizenship by the popular study of social science, economics, history, literature, and natural science. Co-operation was proposed with American colleges, public libraries, mechanics' institutes, lyceums, labor-unions, Young Men's Christian Associations, and local branches of Chautauqua. This plan has served a good missionary purpose, and has led to greater continuity and better methods in the educational work of the Chautauqua summer assemblies and local circles.

In November, 1887, in connection with the Brooklyn Teachers' Association, Mr. Seth T. Stewart, a Yale graduate and prominent educator, organized a movement called "University and School Extension." It is a comprehensive plan for guiding courses of reading in special subjects under the direction of competent professors chosen from the faculties of Harvard, Yale, Columbia, Princeton, and other well-known institutions. Elaborate and suggestive syllabuses representing various branches of literature, history, and science have been published and are now in extensive use. Under the auspices of University and School Extension, lectures were given by college professors from Harvard, Yale, Columbia, and Princeton, in the spring of 1891 at various educational centres in New York and Brooklyn. The courses at Columbia College were perhaps the most successful. The movement is full of promise, and is sanctioned by association with many eminent names of college presidents and other well-known educators.

The Philadelphia Society for the Extension of University Teaching was organized in June, 1890, with the Provost of the University of Pennsylvania as President, and Mr. George Henderson as Secretary. The latter went to England and made a careful study of the English system, and upon his return published an interesting report upon the subject. Practical work was begun in November, 1890, and before the close of the first season no less than 42 public courses of extension lectures had been given to large and enthusiastic audiences. One of the most experienced English lecturers, Mr. R. G. Moulton, of Cambridge, spent ten weeks in Philadelphia, and gave a strong impulse to the work. Not only cultivated and fashionable people in conservative Philadelphia, but also the working-classes, became interested in the movement. Dr. Pepper resigned active leadership in April, 1891, and Professor E. J. James was chosen to be his successor. The Philadelphia organization is now known as "The American Society for the Extension of University Teaching," and is diligently engaged in missionary work for the promotion of University Extension throughout the country.

The Regents of the University of the State of New York have taken a decided interest in the higher education of the people. The subject of University Extension was publicly presented by their secretary, Mr. Melvil Dewey, at Albany, in July, 1889. In the spring of 1891 a bill was passed by the New York Legislature appropriating \$10,000 for the organization of University Extension. The money is not to be used for the payment of local lecturers, but simply for the general promotion of the cause. University Extension has been formally adopted by the faculty and Regents of the University of Wisconsin, and has been tried with great success in the States of Minnesota, Indiana, and other parts of the West.

The best method of introducing college or University Extension courses in any part of the country is for a community to organize with an efficient local secretary, and to raise by subscription a guarantee fund for the payment of expenses, which ought not to be more than \$350 for a course of twelve lectures. A fee of \$25 per lecture is quite reasonable. The application for a lecturer should be made to the nearest college or university. The entire burden of management and of finance should be assumed by the locality. By proper advertising and a local canvass for the sale of tickets, a large part of the necessary expense can be met, so that only a certain proportion of the guarantee fund will need to be collected. It is too much to expect, unless circumstances are highly favorable, that receipts should balance expenditures. The higher education, indeed all education, is far from being self-supporting. In England an extension course is considered successful if one half the cost is met by admission fees. Tickets for the entire course should be sold at a reasonable figure, perhaps \$1, or \$1.50 for a double ticket admitting a gentleman and lady. In England the price varies from one shilling to one pound, according to the character of the community. A University Extension audience should be as miscellaneous as a church congregation, or public school.

Courses should be organized under the auspices of leading citizens, with the mayor or some representative public man at the head; and the lectures should be given in some neutral place like the town hall, public library, high school, or academy. Teachers and librarians can be very helpful in organizing local branches of University Extension. Graduates of colleges, young men and young women, ought everywhere to be apostles of the new movement. The American Collegiate Alumnae Associations, East and West, have been especially active in the work of educational propaganda. Miss Helen Dawes Brown, a Vassar graduate, read a paper on "University Extension" before the Association of Collegiate Alumnae, October 26, 1889, in which she quoted Thoreau's striking remark: "It is time we had uncommon schools, that we did not leave off our education when we begin to be men and women. It is time that villages were universities."

The literature of University Extension includes the official publications of University Extension Boards, reports of conferences and summer meetings, and a vast number of plans, announcements, and published syllabuses. Important for the student are papers by Albert Grey, M.P., E. T. Cook, and Dr. R. D. Roberts in the sixteenth volume of *Health Exhibition Literature*, London, 1884. R. G. Moulton's detailed account of *The University Extension Movement, with an Introduction by Professor Stuart, M.P.*, was published in 1885. In Stedman's *Oxford: Its Life and Schools*, M. E. Sadler has a chapter on University Extension. Sadler's *Suggestions for the Future Development of University Extension Teaching* were published in 1891. In Mullinger's *History of the University of Cambridge* there is a chapter on Local Examinations and University Extension. Of recent date are the books of Sadler and Mackinder on *University Extension: Has it a Future?* and of Dr. Roberts on *Eighteen Years of University Extension*. An excellent paper on *University Extension in England*, by Robert A. Woods, of Toynbee Hall, was published in *The Andover Review* for March, 1891. *The Paternoster Review* for December, 1890, and *The Quarterly Review*, April, 1891, also contain articles upon the subject. Oxford publishes a *University Extension Gazette*, while *The University Extension Journal* represents both Cambridge and London.

Various contributions to the subject have appeared in the United States. Papers on University Extension by Dr. Herbert B. Adams were printed in the Report of the Commissioner of Education for 1885-86, pp. 749-768, and in the *Johns Hopkins University Studies* (November, 1887), 5th Series, xi., pp. 457-469. His address before the State Historical Society of Wisconsin, January 28, 1891, on "The Higher Education of the People," was published by the Society. See also his article on "University Extension in America," in *The Forum*, July, 1891, and his "American View of University Extension" in *The Review of Reviews* (American edition), July, 1891. A more elaborate report upon the subject by Dr. Adams is to be published by the U. S. Bureau of Education. Dr. Wm. T. Harris, U. S. Commissioner of Education, read a paper on *University and School Extension* before the National Educational Association, at St. Paul, Minnesota, in July, 1890. His address in New York on "What the Universities can do for the People" has also been printed. Mr. Seth T. Stewart, of Brooklyn, has issued a great number of circulars and syllabuses representing University Extension. Melvil Dewey's address (1889) on *The Extension of the University of the State of New York*, in the *Proceedings of the 27th Convocation*, is a very suggestive contribution. President T. C. Chamberlin, of the University of Wisconsin, gave an address upon "University Extension" before the Wisconsin Teachers' Association, December 29, 1890. Highly valuable is George Henderson's Report upon "The University Extension Movement in England" (1890). R. G. Moulton's *Lecturer's Notes on the Working of University Extension* and other useful papers have been issued by the American Society for the Extension of University Teaching (Secretary's Office, 1602 Chestnut Street, Philadelphia). Mr. Skidmore's articles on "University Extension" appeared in *Lippincott's Magazine* in October, 1890, and in May, 1891. A full account of the Philadelphia movement, with many suggestive papers from various parts of the country, may be found in John Wanamaker's *Book News*, Philadelphia, May, 1891. An article on "University Extension and the University of the Future," the substance of addresses delivered before the Johns Hopkins and other universities, by R. G. Moulton, appeared in the *Johns Hopkins University Studies*, March-April, 1891, 9th Series, iii.-iv., pp. 219-232. A *University Extension Journal* is (1893) published by the American Society for the Extension of University Teaching.

UNIVERSITY OF FRANCE. See **UNIVERSITY.**

UNIVERSITY SETTLEMENTS. One of the most practical attempts to elevate the degraded masses of large cities is of recent origin, and consists in the establishment in tenement districts of settlements or houses where educated men and women live either permanently or temporarily, and work among the poor. The first step in this direction was taken in 1867 by Edward Denison, a graduate of Oxford, who went to live in the east end of London for the purpose of studying the wants and grievances of the poor, and of doing educational work among them. A similar task was undertaken in Oxford by Arnold Toynbee, another university graduate, whose zealous labors led to his early death in 1883, but whose deeds and name were perpetuated by the founding in Whitechapel, East London, Jan. 10, 1885, of Toynbee Hall, and later of Oxford Hall. These build-

ings were established and are maintained by graduates of Oxford and Cambridge, both lay and clerical, who reside there, and by associating on equal terms with the poor and uneducated, put their culture to use in bettering the mental, moral, and physical condition of their less fortunate brothers and sisters. The educational element has been perhaps the most prominent, for the needs of the artisan class, as well as of the lowest grade of society, have been considered, and Toynbee Hall has become the centre of University Extension work in that part of the city. A college settlement was opened, in 1891, in Canningtown, London, by students of Mansfield College (Cong.), Oxford.

A College Settlement was established in New York in the fall of 1889 by graduates of some of the women's colleges of the United States. The building, No. 95 Rivington St., is situated in one of the most crowded tenement districts of the "East Side," and among a foreign population.

The period of residence varies from three months to a year or longer, and as each inmate pays a weekly sum for board, the house is almost entirely self-supporting. The workers, among whom is a physician, are chiefly graduates of Smith, Wellesley, Vassar, and Bryn Mawr. Children and youth are the principal objects of attention, and the instrumentalities employed are a library, a penny provident bank, familiar talks and lectures, classes in sewing, cooking, gymnastics, etc., and clubs of various kinds which require a weekly fee and are self-supporting. A system of friendly house visitation is pursued, and much work is done in connection with other charitable institutions and with churches in the vicinity.

In 1891, May 14, a University Settlement Society was organized in New York by graduates of Yale, Columbia, Princeton and other colleges, for the purpose of conducting by means of "neighborhood houses" work similar to that done in London, and by the College Settlements Association, already described; making use as a nucleus of a Neighborhood Guild at 147 Forsyth St. long in successful operation and carried on by college-bred men. In October of that same year, a building in one of the tenement districts of Boston was purchased by graduates of Andover Theological Seminary and other ex-collegians; was denominated "Andover House," and was set apart for educational and religious work, according to the following methods:

1. Careful social analysis of the neighborhood.
2. Personal contact with the people for all purposes of sympathy and help.
3. Co-operation with all forces which act directly or indirectly for the elevation of the neighborhood, and with the general social agencies of the city.
4. Investigation of abuses, with appeal to proper parties for remedy.
5. Organization of clubs for social improvement among working-men, boys, etc.
6. Classes in elementary and advanced subjects.
7. Direct religious work as occasion may offer, when it may fitly be carried out without interfering with the churches.

In every instance, experiments of this kind have been rewarded with remarkable success, and among the opportunities afforded those who engage in them, that of studying social, economic, and political problems is not the least.
